ERRATUM TO: DEFORMATION QUANTIZATION IN ALGEBRAIC GEOMETRY

AMNON YEKUTIELI

ABSTRACT. This note contains a correction of the *proofs* of the main results of the paper [A. Yekutieli, Deformation quantization in algebraic geometry, Adv. Math. 198 (2005), 383-432]. The results are correct as originally stated.

0. INTRODUCTION

This note contains a correction of the *proofs* of the main results of [\[Ye1\]](#page-8-0), namely Theorems 0.1 and 0.2. The results are correct as originally stated.

The mistake in my original proofs was discovered Michel Van den Bergh, and I thank him for calling my attention to it. The way to fix the proofs is essentially contained in his paper [\[VdB\]](#page-8-1).

Let me begin by explaining the mistake. As can be seen in Example [0.1](#page-1-0) below, the mistake itself is of a rather elementary nature, but it was obscured by the complicated context.

Suppose K is a field of characteristic 0, and X is a smooth separated n-dimensional scheme over $\mathbb K$. Recall that the coordinate bundle Coor X is an infinite dimensional bundle over X, with free action by the group $GL_{n,K}$. The quotient bundle is by definition

$$
LCC X := \operatorname{Coor} X / GL_{n,\mathbb{K}},
$$

and the projection $\pi_{gl} : \text{Coor } X \to \text{LCC } X$ is a $\text{GL}_{n,\mathbb{K}}$ -torsor.

The erroneous (implicit) assertion in [\[Ye1\]](#page-8-0) is that the de Rham complexes satisfy

$$
(\pi_{\mathrm{gl}*}\,\Omega_{\mathrm{Coor}\,X})^{\mathrm{GL}_n(\mathbb{K})}=\Omega_{\mathrm{LCC}\,X}.
$$

From that I deduced (incorrectly, top of page 424) that the Maurer-Cartan form ω_{MC} is a global section of the sheaf

$$
\Omega^1_{\mathrm{LCC}\, X}\mathbin{\widehat\otimes}_{\mathcal O_{\mathrm{LCC}\, X}}\pi_{\mathrm{lcc}}^{\widehat\ast}(\mathcal P_{X}\otimes_{\mathcal O_{X}}\mathcal T^0_{\mathrm{poly},X}).
$$

(This false, as can be seen from [\[VdB,](#page-8-1) Lemma 6.5.1]). This led to many incorrect formulas in [\[Ye1,](#page-8-0) Section 7].

The correct thing to do is to work with the infinitesimal action of the Lie algebra $\mathfrak{g} := \mathfrak{gl}_n(\mathbb{K})$. For $v \in \mathfrak{g}$ one has the contraction (inner derivative) ι_v , which is a degree −1 derivation of the de Rham complex $\pi_{gl*}\Omega_{\text{Coor }X}$. Recall that the Lie derivative is $L_v := d \circ \iota_v + \iota_v \circ d$. A local section $\omega \in \pi_{gl*} \Omega_{\text{Coor } X}$ is said to be **g**-invariant if $\iota_v(\omega) = L_v(\omega) = 0$ for all $v \in \mathfrak{g}$. According to [\[VdB,](#page-8-1) Lemma 9.2.3] one has

$$
(\pi_{\mathrm{gl}*}\,\Omega_{\mathrm{Coor}\,X})^{\mathfrak{g}}=\Omega_{\mathrm{LCC}\,X}.
$$

Date: 13 August 2007.

2 AMNON YEKUTIELI

It is worthwhile to note that in my incorrect proof there was no need to invoke Kontsevich's property (P5) from [\[Ko\]](#page-8-2). The correct proof does require property (P5) – cf. [\[VdB,](#page-8-1) Lemma 9.2.1].

Example 0.1. Here is a simplified example. Suppose G is the affine algebraic group $GL_{1,\mathbb{K}} = \text{Spec } \mathbb{K}[t, t^{-1}]$, and X is the variety G, with regular left action. The group of rational points is $G(\mathbb{K}) = \mathbb{K}^{\times}$. The action of G on X is free, the invariant ring is $\mathcal{O}(X)^{\overline{G}(\mathbb{K})} = \mathbb{K}$, and the quotient is $X/G = \text{Spec }\mathbb{K}$. For the de Rham complex

$$
\Omega(X) = \mathcal{O}(X) \oplus \Omega^1(X) = \mathbb{K}[t, t^{-1}] \oplus \mathbb{K}[t, t^{-1}] \cdot dt
$$

we have $\Omega(X)^{G(\mathbb{K})} \neq \mathbb{K}$, since it contains $t^{-1}dt$. But for the infinitesimal action of the Lie algebra $\mathfrak{g} := \mathfrak{gl}_1(\mathbb{K})$ it is easy to see that $\Omega(X)^{\mathfrak{g}} = \mathbb{K}$.

After some deliberation I decided that the best way to present the erratum is by completely rewriting [\[Ye1,](#page-8-0) Section 7]. This is Section 1 below. Section 2 contains some additional minor corrections to [\[Ye1\]](#page-8-0).

1. THE GLOBAL L_{∞} QUASI-ISOMORPHISM

This is a revised version of [\[Ye1,](#page-8-0) Section 7]. In this section we prove the main results of the paper [\[Ye1\]](#page-8-0), namely Theorem 0.1 (which is repeated here as Corollary [1.19\)](#page-8-3), and Theorem 0.2 (which is repeated here, with more details, as Theorem [1.2\)](#page-2-0). Throughout $\mathbb K$ is a field containing $\mathbb R$, and X is a smooth irreducible separated ndimensional scheme over K. We use all notation, definitions and results of [\[Ye1,](#page-8-0) Sections 1-6] freely. However the bibliography references relate to the list at the end of this note.

Suppose $U = \{U_0, \ldots, U_m\}$ is an open covering of the scheme X, consisting of affine open sets, each admitting an étale coordinate system, namely an étale morphism $U_i \to \mathbf{A}_{\mathbb{K}}^n$. For every i let $\sigma_i : U_i \to \text{LCC } X$ be the corresponding section of $\pi_{\text{lcc}} : \text{LCC } X \to X$, and let σ be the resulting simplicial section (see [\[Ye1,](#page-8-0) Theorem 6.5]).

Let M be a bounded below complex of quasi-coherent \mathcal{O}_X -modules. The mixed resolution $Mix_{\mathbf{U}}(\mathcal{M})$ was defined in [\[Ye1,](#page-8-0) Section 6]. For any integer i let

$$
G^i \operatorname{Mix}_{\boldsymbol{U}}(\mathcal{M}) := \bigoplus\nolimits_{j=i}^\infty \operatorname{Mix}_{\boldsymbol{U}}^j(\mathcal{M}),
$$

so $\{G^i \text{Mix}_U(\mathcal{M})\}_{i \in \mathbb{Z}}$ is a descending filtration of $\text{Mix}_U(\mathcal{M})$ by subcomplexes, with G^i Mix $_U(\mathcal{M}) =$ Mix $_U(\mathcal{M})$ for $i \leq 0$, and $\bigcap_i G^i$ Mix $_U(\mathcal{M}) = 0$. Let

$$
\operatorname{gr}^i_{\mathrm{G}}\operatorname{Mix}_{\boldsymbol{U}}(\mathcal{M}) := \mathrm{G}^i\operatorname{Mix}_{\boldsymbol{U}}(\mathcal{M}) / \operatorname{G}^{i+1}\operatorname{Mix}_{\boldsymbol{U}}(\mathcal{M})
$$

and $\operatorname{gr}_G \operatorname{Mix}_{\mathbf{U}}(\mathcal{M}) := \bigoplus_i \operatorname{gr}_G^i \operatorname{Mix}_{\mathbf{U}}(\mathcal{M}).$

By [\[Ye1,](#page-8-0) Proposition 6.3], if \mathcal{G}_X is either $\mathcal{T}_{\text{poly},X}$ or $\mathcal{D}_{\text{poly},X}$, then $\text{Mix}_{U}(\mathcal{G}_X)$ is a sheaf of DG Lie algebras on X , and the inclusion

$$
\eta_{\mathcal{G}} : \mathcal{G}_X \to \text{Mix}_{U}(\mathcal{G}_X)
$$

is a DG Lie algebra quasi-isomorphism.

Note that if $\phi : \text{Mix}_U(\mathcal{M}) \to \text{Mix}_U(\mathcal{N})$ is a homomorphism of complexes that respects the filtration $\{G^i \text{Mix}_U\}$, then there exists an induced homomorphism of complexes

$$
\mathrm{gr}_{G}(\phi) : \mathrm{gr}_{G} \operatorname{Mix}_{\mathbf{U}}(\mathcal{M}) \to \mathrm{gr}_{G} \operatorname{Mix}_{\mathbf{U}}(\mathcal{N}).
$$

Suppose $\mathcal G$ and $\mathcal H$ are sheaves of DG Lie algebras on a topological space Y. An \mathcal{L}_{∞} morphism $\Psi : \mathcal{G} \to \mathcal{H}$ is a sequence of sheaf morphisms $\psi_j : \prod^j \mathcal{G} \to \mathcal{H}$, such that for every open set $V \subset Y$ the sequence $\{\Gamma(V, \psi_j)\}_{j\geq 1}$ is an L_{∞} morphism $\Gamma(V,\mathcal{G}) \to \Gamma(V,\mathcal{H})$. If $\psi_1 : \mathcal{G} \to \mathcal{H}$ is a quasi-isomorphism then Ψ is called an L_{∞} quasi-isomorphism.

Recall that there is a canonical quasi-isomorphism of complexes of \mathcal{O}_X -modules

(1.1) U¹ : Tpoly,X → Dpoly,X.

According to [\[Ye2,](#page-8-4) Theorem 4.17], the induced homomorphism

$$
\mathrm{gr}_G(\mathrm{Mix}_{\mathbf{U}}(\mathcal{U}_1)) : \mathrm{gr}_G \mathrm{Mix}_{\mathbf{U}}(\mathcal{T}_{\mathrm{poly},X}) \to \mathrm{gr}_G \mathrm{Mix}_{\mathbf{U}}(\mathcal{D}_{\mathrm{poly},X})
$$

is a quasi-isomorphism.

Theorem 1.2. Let X be an irreducible smooth separated K-scheme. Let $U =$ ${U_0, \ldots, U_m}$ be an open covering of X consisting of affine open sets, each admitting an étale coordinate system, and let σ be the associated simplicial section of the bundle LCC $X \to X$. Then there is an induced L_{∞} quasi-isomorphism

$$
\Psi_{\sigma} = {\Psi_{\sigma;j}}_{j \geq 1} : \text{Mix}_{\mathbf{U}}(\mathcal{T}_{\text{poly},X}) \rightarrow \text{Mix}_{\mathbf{U}}(\mathcal{D}_{\text{poly},X}).
$$

The homomorphism $\Psi_{\sigma;1}$ respects the filtration $\{G^i \text{Mix}_{\text{LI}}\},$ and

$$
\mathrm{gr}_{\mathbf{G}}(\Psi_{\sigma;1}) = \mathrm{gr}_{\mathbf{G}}(\mathrm{Mix}_{\boldsymbol{U}}(\mathcal{U}_1)).
$$

Proof. Let Y be some K-scheme, and denote by K_Y the constant sheaf. For any p we view Ω_Y^p as a discrete inv K_Y-module, and we put on $\Omega_Y = \bigoplus_{p \in \mathbb{N}} \Omega_Y^p$ direct sum dir-inv structure. So Ω_Y is a discrete (and hence complete) \overrightarrow{DG} algebra in Dir Inv Mod K_Y .

We shall abbreviate $A := \Omega_{\text{Coor } X}$, so that $A^0 = \mathcal{O}_{\text{Coor } X}$ etc. As explained above, A is a DG algebra in Dir Inv Mod $\mathbb{K}_{\text{Coor } X}$, with discrete (but not trivial) dir-inv module structure.

There are sheaves of DG Lie algebras $\mathcal{A}\,\widehat{\otimes}\,\mathcal{T}_{\text{poly}}(\mathbb{K}[[t]])$ and $\mathcal{A}\,\widehat{\otimes}\,\mathcal{D}_{\text{poly}}(\mathbb{K}[[t]])$ on the scheme Coor X. The differentials are $d_{\text{for}} = d \otimes \mathbf{1}$ and $d_{\text{for}} + \mathbf{1} \otimes d_{\mathcal{D}}$ respectively. As explained just prior to [\[Ye1,](#page-8-0) Theorem 3.16], $\mathcal U$ extends to a continuous $\mathcal A$ multilinear L_{∞} morphism

$$
\mathcal{U}_{\mathcal{A}} = \{\mathcal{U}_{\mathcal{A};j}\}_{j \geq 1}: \mathcal{A} \mathbin{\widehat{\otimes}} \mathcal{T}_{\text{poly}}(\mathbb{K}[[\boldsymbol{t}]]) \rightarrow \mathcal{A} \mathbin{\widehat{\otimes}} \mathcal{D}_{\text{poly}}(\mathbb{K}[[\boldsymbol{t}]])
$$

of sheaves of DG Lie algebras on Coor X.

The MC form $\omega := \omega_{MC}$ is a global section of $\mathcal{A}^1 \,\widehat{\otimes}\, \mathcal{T}_{\text{poly}}^0(\mathbb{K}[[t]])$ satisfying the MC equation in the DG Lie algebra $\mathcal{A} \,\widehat{\otimes}\, \mathcal{T}_{\text{poly}}(\mathbb{K}[[t]])$. See [\[Ye1,](#page-8-0) Proposi-tion 5.9. According to [\[Ye1,](#page-8-0) Theorem 3.16], the global section $\omega' := \mathcal{U}_{\mathcal{A},1}(\omega) \in$ $\mathcal{A}^1\widehat{\otimes}\mathcal{D}^0_{\text{poly}}(\mathbb{K}[[t]])$ is a solution of the MC equation in the DG Lie algebra $\mathcal{A} \, \widehat{\otimes} \, \mathcal{D}_{\text{poly}}(\mathbb{K}[[t]])$, and there is a continuous \mathcal{A} -multilinear L_{∞} morphism

$$
\mathcal{U}_{\mathcal{A},\omega}=\{\mathcal{U}_{\mathcal{A},\omega;j}\}_{j\geq 1}:\big(\mathcal{A}\mathbin{\widehat{\otimes}} \mathcal{T}_{\mathrm{poly}}(\mathbb{K}[[t]])\big)_\omega\to \big(\mathcal{A}\mathbin{\widehat{\otimes}} \mathcal{D}_{\mathrm{poly}}(\mathbb{K}[[t]])\big)_\omega.
$$

between the twisted DG Lie algebras. The formula is

(1.3)
$$
\mathcal{U}_{\mathcal{A},\omega;j}(\gamma_1\cdots\gamma_j)=\sum_{k\geq 0}\frac{1}{(j+k)!}\mathcal{U}_{\mathcal{A},j+k}(\omega^k\cdot\gamma_1\cdots\gamma_j)
$$

for $\gamma_1,\ldots,\gamma_j\in\mathcal{A}\,\widehat{\otimes}\,\mathcal{T}_{\text{poly}}(\mathbb{K}[[t]])$. The two twisted DG Lie algebras have differentials $d_{for} + ad(\omega)$ and $d_{for} + ad(\omega') + 1 \otimes d_{\mathcal{D}}$ respectively.

This sum in [\(1.3\)](#page-2-1) is actually finite, the number of nonzero terms in it depending on the bidegree of $\gamma_1 \cdots \gamma_j$. Indeed, if $\gamma_1 \cdots \gamma_j \in \mathcal{A}^q \hat{\otimes} \mathcal{T}_{\text{poly}}^p(\mathbb{K}[[t]])$, then

(1.4)
$$
\mathcal{U}_{\mathcal{A};j+k}(\omega^k \cdot \gamma_1 \cdots \gamma_j) \in \mathcal{A}^{q+k} \widehat{\otimes} \mathcal{D}_{\text{poly}}^{p+1-j-k}(\mathbb{K}[[t]]),
$$

which is is zero for $k > p - j + 2$; see proof of [\[Ye2,](#page-8-4) Theorem 3.23].

By [\[Ye1,](#page-8-0) Theorem 5.6] (the universal Taylor expansions) there are canonical isomorphisms of graded Lie algebras in Dir Inv Mod $\mathbb{K}_{\text{Coor } X}$

(1.5)
$$
\mathcal{A} \widehat{\otimes} \mathcal{T}_{\text{poly}}(\mathbb{K}[[t]]) \cong \mathcal{A} \widehat{\otimes}_{\mathcal{A}^0} \pi_{\text{coor}}^{\widehat{*}}(\mathcal{P}_X \otimes_{\mathcal{O}_X} \mathcal{T}_{\text{poly},X})
$$

and

(1.6)
$$
\mathcal{A} \widehat{\otimes} \mathcal{D}_{\text{poly}}(\mathbb{K}[[t]]) \cong \mathcal{A} \widehat{\otimes}_{\mathcal{A}^0} \pi_{\text{coor}}^{\widehat{\ast}}(\mathcal{P}_X \otimes_{\mathcal{O}_X} \mathcal{D}_{\text{poly},X}).
$$

[\[Ye1,](#page-8-0) Proposition 5.8] tells us that

$$
d_{\text{for}} + ad(\omega) = \nabla_{\mathcal{P}}
$$

under these identifications. Therefore

(1.7)
$$
\mathcal{U}_{\mathcal{A},\omega} = \{ \mathcal{U}_{\mathcal{A},\omega;j} \}_{j\geq 1} : \mathcal{A} \widehat{\otimes}_{\mathcal{A}^0} \pi_{\mathrm{coor}}^{\widehat{*}}(\mathcal{P}_X \otimes_{\mathcal{O}_X} \mathcal{T}_{\mathrm{poly},X}) \rightarrow \mathcal{A} \widehat{\otimes}_{\mathcal{A}^0} \pi_{\mathrm{coor}}^{\widehat{*}}(\mathcal{P}_X \otimes_{\mathcal{O}_X} \mathcal{D}_{\mathrm{poly},X})
$$

is a continuous \mathcal{A} -multilinear L_{∞} morphism between these DG Lie algebras, whose differentials are $\nabla_{\mathcal{P}}$ and $\nabla_{\mathcal{P}}+1\otimes d_{\mathcal{D}}$ respectively. As in the proof of [\[Ye1,](#page-8-0) Theorem 5.6], under the identifications [\(1.5\)](#page-3-0) and [\(1.6\)](#page-3-1) we have the equality

(1.8)
$$
\mathcal{U}_{\mathcal{A};1} = \mathbf{1} \otimes \pi_{\mathrm{coor}}^{\widehat{\ast}}(\mathbf{1} \otimes \mathcal{U}_1),
$$

i.e. it is the pullback of the map [\(1.1\)](#page-2-2).

Let us filter the DG algebra A by the descending filtration $\{G^i\mathcal{A}\}_{i\in\mathbb{Z}}$, where $G^iA := \bigoplus_{j=i}^{\infty} \mathcal{A}^i$. The DG Lie algebras appearing in equation [\(1.7\)](#page-3-2) inherit this filtration. From formulas [\(1.3\)](#page-2-1) and [\(1.4\)](#page-3-3) we see that the homomorphism of complexes $\mathcal{U}_{\mathcal{A},\omega;1}$ respects the filtration, and from [\(1.8\)](#page-3-4) we see that

$$
\operatorname{gr}_G(\mathcal{U}_{\mathcal{A}, \omega; 1}) = \operatorname{gr}_G(\mathcal{U}_{\mathcal{A}; 1}) = \mathbf{1} \otimes \pi_{\mathrm{coor}}^{\widehat{\ast}}(\mathbf{1} \otimes \mathcal{U}_1).
$$

Let $n := \dim X$. As noted earlier, the action of $\mathfrak{g} := \mathfrak{gl}_n(\mathbb{K})$ gives

$$
(\pi_{gl*} \mathcal{A})^{\mathfrak{g}} = (\pi_{gl*} \Omega_{\text{Coor } X})^{\mathfrak{g}} = \Omega_{\text{LCC } X}.
$$

According to [\[VdB,](#page-8-1) Lemma 9.2.1], the L_{∞} morphism $\mathcal{U}_{\mathcal{A},\omega}$ commutes with the action of the Lie algebra $\mathfrak g$. Therefore $\mathcal U_{\mathcal A,\omega}$ descends (i.e. restricts) to a continuous $\Omega_{\text{LCC }X}$ -multilinear L_{∞} morphism

(1.9)
$$
\begin{aligned}\n\mathcal{U}_{\mathcal{A},\omega}^{\mathfrak{g}} : \Omega_{\text{LCC } X} \widehat{\otimes}_{\mathcal{O}_{\text{LCC } X}} \pi_{\text{loc}}^{\widehat{\ast}}(\mathcal{P}_{X} \otimes_{\mathcal{O}_{X}} \mathcal{T}_{\text{poly}, X}) \\
&\to \Omega_{\text{LCC } X} \widehat{\otimes}_{\mathcal{O}_{\text{LCC } X}} \pi_{\text{loc}}^{\widehat{\ast}}(\mathcal{P}_{X} \otimes_{\mathcal{O}_{X}} \mathcal{D}_{\text{poly}, X}).\n\end{aligned}
$$

The DG Lie algebras in formula [\(1.9\)](#page-3-5) also have filtrations $\{G^j\}_{j\in\mathbb{Z}}$, the homomorphism $\mathcal{U}_{\mathcal{A},\omega;1}^{\mathfrak{g}}$ respects this filtration, and we now have

$$
(1.10) \qquad \qquad \mathrm{gr}_G(\mathcal{U}_{\mathcal{A},\omega;1}^{\mathfrak{g}})=\mathrm{gr}_G(\mathcal{U}_{\mathcal{A};1}^{\mathfrak{g}})=\mathbf{1}\otimes \pi_{\mathrm{lcc}}^{\widehat{*}}(\mathbf{1}\otimes \mathcal{U}_1).
$$

According to [\[Ye1,](#page-8-0) Theorem 6.4] there are induced operators

$$
\Psi_{\sigma;j} := \sigma^*(\mathcal{U}_{\mathcal{A},\omega;j}^{\mathfrak{g}}) : \prod\nolimits^j \text{Mix}_{\mathbf{U}}(\mathcal{T}_{\text{poly},X}) \to \text{Mix}_{\mathbf{U}}(\mathcal{D}_{\text{poly},X})
$$

for $j \geq 1$. The L_{∞} identities in [\[Ye1,](#page-8-0) Definition 3.7], when applied to the L_{∞} morphism $\mathcal{U}_{\mathcal{A},\omega}^{\mathfrak{g}},$ are of the form considered in [\[Ye1,](#page-8-0) Theorem 6.4(iii)]. Therefore these

identities are preserved by σ^* , and we conclude that the sequence $\Psi_{\sigma} = {\Psi_{\sigma,j}}_{j=1}^{\infty}$ is an L_{∞} morphism. Furthermore, $\Psi_{\sigma;1}$ respects the filtration $\{G^i \text{Mix}_U\}$, and from [\(1.10\)](#page-3-6) we get

(1.11)
$$
\mathrm{gr}_G(\Psi_{\sigma;1}) = \mathrm{gr}_G(\sigma^*(\mathcal{U}_{\mathcal{A};1}^{\mathfrak{g}})) = \mathrm{gr}_G(\mathrm{Mix}_{\mathbf{U}}(\mathcal{U}_1)).
$$

According to [\[Ye2,](#page-8-4) Theorem 4.17] the homomorphism $\operatorname{gr}_G(\operatorname{Mix}_U(\mathcal{U}_1))$ is a quasiisomorphism. Since the complexes ${\rm Mix}_{\bm{U}}(\mathcal{T}_{\text{poly},X})$ and ${\rm Mix}_{\bm{U}}(\mathcal{D}_{\text{poly},X})$ are bounded below, and the filtration is nonnegative and exhaustive, it follows that $\Psi_{\sigma;1}$ is also a quasi-isomorphism.

Corollary 1.12. Taking global sections in Theorem [1.2](#page-2-0) we get an L_{∞} quasi-isomorphism

$$
\Gamma(X,\Psi_{\pmb{\sigma}})=\{\Gamma(X,\Psi_{\pmb{\sigma};j})\}_{j\geq 1}: \Gamma\big(X,\operatorname{Mix}_{\pmb{U}}(\mathcal{T}_{\operatorname{poly},X})\big)\rightarrow \Gamma\big(X,\operatorname{Mix}_{\pmb{U}}(\mathcal{D}_{\operatorname{poly},X})\big).
$$

Proof. Theorem [1.2](#page-2-0) tells us that $\Psi_{\sigma;1}$ is a quasi-isomorphisms of complexes of sheaves. By [\[Ye1,](#page-8-0) Theorem 6.2] it follows that

$$
\Gamma(X,\Psi_{\pmb{\sigma};1}):\Gamma\big(X,\operatorname{Mix}_{\pmb{U}}(\mathcal{T}_{\operatorname{poly},X})\big)\rightarrow\Gamma\big(X,\operatorname{Mix}_{\pmb{U}}(\mathcal{D}_{\operatorname{poly},X})\big)
$$

is a quasi-isomorphism.

Corollary 1.13. The data (U, σ) induces a bijection

$$
\begin{aligned} \mathrm{MC}(\Psi_{\pmb{\sigma}}): \ \mathrm{MC}\Big(\Gamma\big(X,\mathrm{Mix}_{\pmb{U}}(\mathcal{T}_{\mathrm{poly},X})\big)[[\hbar]]^+\Big) \\ & \xrightarrow{\simeq} \ \mathrm{MC}\Big(\Gamma\big(X,\mathrm{Mix}_{\pmb{U}}(\mathcal{D}_{\mathrm{poly},X})\big)[[\hbar]]^+\Big). \end{aligned}
$$

Proof. Use Corollary [1.12](#page-4-0) and [\[Ye1,](#page-8-0) Corollary 3.10].

Recall that $\mathcal{T}_{\text{poly}}(X) = \Gamma(X, \mathcal{T}_{\text{poly}, X})$ and $\mathcal{D}_{\text{poly}}^{\text{nor}}(X) = \Gamma(X, \mathcal{D}_{\text{poly}, X}^{\text{nor}})$; and the latter is the DG Lie algebra of global poly differential operators that vanish if one of their arguments is 1.

Suppose $f : X' \to X$ is an étale morphism. According to [\[Ye2,](#page-8-4) Prposition 4.6] there are DG Lie algebra homomorphisms f^* : $\mathcal{T}_{\text{poly}}(X) \to \mathcal{T}_{\text{poly}}(X')$ and $f^* : \mathcal{D}_{\text{poly}}^{\text{nor}}(X) \to \mathcal{D}_{\text{poly}}^{\text{nor}}(X')$. These homomorphisms extend to formal coefficients, and we get functions

$$
\mathrm{MC}(f^*): \mathrm{MC}\big(\mathcal{T}_{\mathrm{poly}}(X)[[\hbar]]^+\big) \to \mathrm{MC}\big(\mathcal{T}_{\mathrm{poly}}(X')[[\hbar]]^+\big)
$$

etc.

One says that X is a D-affine variety if $H^q(X, M) = 0$ for every quasi-coherent left \mathcal{D}_X -module M and every $q > 0$.

Theorem 1.14. Let X be an irreducible smooth separated K -scheme. Assume X is D-affine. Then there is a canonical function

$$
Q: \mathrm{MC}\big(\mathcal{T}_{\mathrm{poly}}(X)[[\hbar]]^+\big) \to \mathrm{MC}\big(\mathcal{D}^{\mathrm{nor}}_{\mathrm{poly}}(X)[[\hbar]]^+\big)
$$

called the quantization map. It has the following properties:

- (i) The function Q preserves first order terms.
- (ii) The function Q respects étale morphisms. Namely if X' is another D -affine scheme, with quantization map Q' , and if $f: X' \to X$ is an étale morphism, then

$$
Q' \circ \mathrm{MC}(f^*) = \mathrm{MC}(f^*) \circ Q.
$$

(iii) If X is affine, then Q is bijective.

$$
\Box
$$

6 AMNON YEKUTIELI

(iv) The function Q is characterized as follows. Choose an open covering $U =$ ${U_0, \ldots, U_m}$ of X consisting of affine open sets, each admitting an étale coordinate system. Let σ be the associated simplicial section of the bundle $LCC X \rightarrow X$. Then there is a commutative diagram

$$
\begin{array}{ccc}\n\mathrm{MC}\big(\mathcal{T}_{\text{poly}}(X)[[\hbar]]^+\big) & \xrightarrow{\quad \mathcal{Q}} & \mathrm{MC}\big(\mathcal{D}_{\text{poly}}^{\text{nor}}(X)[[\hbar]]^+\big) \\
\mathrm{MC}(\eta_{\mathcal{T}})\big] & & \mathrm{MC}(\eta_{\mathcal{D}})\big]\n\end{array}
$$

 $MC(\Gamma(X, \text{Mix}_{\mathbf{U}}(\mathcal{T}_{\text{poly},X}))[[\hbar]]^+) \xrightarrow{MC(\Psi_{\sigma})} MC(\Gamma(X, \text{Mix}_{\mathbf{U}}(\mathcal{D}_{\text{poly},X}))[[\hbar]]^+)$

in which the arrows $MC(\Psi_{\sigma})$ and $MC(\eta_{\mathcal{D}})$ are bijections. Here Ψ_{σ} is the L_{∞} quasi-isomorphism from Theorem [1.2](#page-2-0), and $\eta_{\tau}, \eta_{\mathcal{D}}$ are the inclusions of DG Lie algebras.

Let's elaborate a bit on the statement above. It says that to any MC solution $\alpha = \sum_{j=1}^{\infty} \alpha_j \hbar^j \in \mathcal{T}_{\text{poly}}^1(X)[[\hbar]]^+$ there corresponds an MC solution $\beta = \sum_{j=1}^{\infty} \beta_j \hbar^j \in \mathcal{D}^{\text{nor},1}(X)[[\hbar]]^+$. The element $\beta = O(\alpha)$ is uniquely determined up $\sum_{j=1}^{\infty} \beta_j \hbar^j \in \mathcal{D}_{poly}^{nor,1}(X)[[\hbar]]^+$. The element $\beta = Q(\alpha)$ is uniquely determined up to gauge equivalence by the group $\exp(\mathcal{D}_{poly}^{\text{nor},0}(X)[[\hbar]]^+)$. Given any local sections $f, g \in \mathcal{O}_X$ one has

(1.15)
$$
\frac{1}{2}(\beta_1(f,g) - \beta_1(g,f)) = \alpha_1(f,g) \in \mathcal{O}_X.
$$

The quantization map Q can be calculated (at least in theory) using the collection of sections σ and the universal formulas for deformation in [\[Ye1,](#page-8-0) Theorem 3.13].

We'll need a lemma before proving the theorem.

Lemma 1.16. Let $f, g \in \mathcal{O}_X = \mathcal{D}_{\text{poly},X}^{-1}$ be local sections.

(1) For any $\beta \in \text{Mix}_{\mathbf{U}}^{0}(\mathcal{D}_{\text{poly}, X}^{1})$ one has

 $[[\beta, f], g] = \beta(g, f) - \beta(f, g) \in \text{Mix}_{\mathbf{U}}^0(\mathcal{O}_X).$

- (2) For any $\beta \in \text{Mix}_{\mathbf{U}}^1(\mathcal{D}_{\text{poly},X}^0) \oplus \text{Mix}_{\mathbf{U}}^2(\mathcal{D}_{\text{poly},X}^{-1})$ one has $[[\beta, f], g] = 0$.
- (3) Let $\gamma \in \text{Mix}_{U}(\mathcal{D}_{\text{poly}, X})^{0}$, and define $\beta := (d_{\text{mix}} + d_{\mathcal{D}})(\gamma)$. Then $[[\beta, f], g] =$ 0.

Proof. (1) [\[Ye1,](#page-8-0)Proposition 6.3] implies that the embedding ([\[Ye1,](#page-8-0) (6.1)]:

$$
\begin{aligned}\n\text{Mix}_{\boldsymbol{U}}(\mathcal{D}_{\text{poly},X}) \\
&\subset \bigoplus_{p,q,r} \prod_{j \in \mathbb{N}} \prod_{i \in \Delta_j^m} g_{i*} \, g_i^{-1} \left(\Omega^q(\Delta^j_{\mathbb{K}}) \,\widehat{\otimes}\, (\Omega^p_X \otimes_{\mathcal{O}_X} \mathcal{P}_X \otimes_{\mathcal{O}_X} \mathcal{D}_{\text{poly},X}^r) \right)\n\end{aligned}
$$

is a DG Lie algebra homomorphism. So by continuity we might as well assume that $\beta = aD$ with $a \in \Omega_X^0 = \mathcal{O}_X$ and $D \in \mathcal{D}_{poly,X}^1$. Moreover, since the Lie bracket of $\Omega_X \otimes_{\mathcal{O}_X} \mathcal{P}_X \otimes_{\mathcal{O}_X} \mathcal{D}_{\text{poly},X}$ is Ω_X -bilinear, we may assume that $a = 1$, i.e. $\beta = D$. Now the assertion is clear from the definition of the Gerstenhaber Lie bracket, see [\[Ko,](#page-8-2) Section 3.4.2].

(2) Applying the same reduction as above, but with $D \in \mathcal{D}_{poly,X}^r$ and $r \in \{0, -1\}$, we get $[[D, f], g] \in \mathcal{D}_{\text{poly}, X}^{r-2} = 0.$

(3) By part (2) it suffices to show that $[[\beta, f], g] = 0$ for $\beta := d_{\mathcal{D}}(\gamma)$ and $\gamma \in$ $\text{Mix}_{\mathbf{U}}^{0}(\mathcal{D}_{\text{poly},X}^{0}).$ As explained above we may further assume that $\gamma = D \in \mathcal{D}_{\text{poly},X}^{0}.$ Now the formulas for $d_{\mathcal{D}}$ and $[-,-]$ in [\[Ko,](#page-8-2) Section 3.4.2] imply that $[[d_{\mathcal{D}}(D), f], g] = 0.$

Proof of Theorem [1.14](#page-4-1). Step 1. Take an open covering U as in property (iv). Since the sheaves $\mathcal{D}_{poly,X}^{\text{nor},p}$ are quasi-coherent left \mathcal{D}_X -modules, it follows that $\text{H}^q(X, \mathcal{D}_{poly,X}^{\text{nor},p})$ 0 for all p and all $q > 0$. Therefore $\Gamma(X, \mathcal{D}_{\text{poly},X}^{\text{nor}}) = \text{R}\Gamma(X, \mathcal{D}_{\text{poly},X}^{\text{nor}})$ in the derived category D(Mod K). Now by [\[Ye1,](#page-8-0) Theorem 3.12] the inclusion $\mathcal{D}_{poly,X}^{nor} \to \mathcal{D}_{poly,X}$ is a quasi-isomorphism, and by [\[Ye1,](#page-8-0) Theorem 6.2(1)] the inclusion $\mathcal{D}_{\text{poly},X} \to$ $\text{Mix}_{U}(\mathcal{D}_{\text{poly},X})$ is a quasi-isomorphism. According to [\[Ye1,](#page-8-0) Theorem 6.2(2)] we have $\Gamma(X, \text{Mix}_{U}(\mathcal{D}_{\text{poly}, X})) = \text{R}\Gamma(X, \text{Mix}_{U}(\mathcal{D}_{\text{poly}, X}))$. The conclusion is that

(1.17)
$$
\mathcal{D}_{\text{poly}}^{\text{nor}}(X) = \Gamma(X, \mathcal{D}_{\text{poly},X}^{\text{nor}}) \to \Gamma(X, \text{Mix}_{U}(\mathcal{D}_{\text{poly},X}))
$$

is a quasi-isomorphism of complexes of K-modules. But in view of [\[Ye1,](#page-8-0) Proposition 6.3], this is in fact a quasi-isomorphism of DG Lie algebras.

From [\(1.17\)](#page-6-0) we deduce that

$$
\eta_{\mathcal{D}}: \mathcal{D}^\mathrm{nor}_{\mathrm{poly}}(X)[[\hbar]]^+ \to \Gamma\big(X,\mathrm{Mix}_{\mathbf{U}}(\mathcal{D}_{\mathrm{poly},X})\big)[[\hbar]]^+
$$

is a quasi-isomorphism of DG Lie algebras. Using [\[Ye1,](#page-8-0) Corollary 3.10] we see that $MC(\eta_{\mathcal{D}})$ is bijective. Therefore the diagram in property (iv) defines Q uniquely.

According to Corollary [1.13,](#page-4-2) the arrow marked $MC(\Psi_{\sigma})$ is a bijection. So we have estanlished property (iv), except for the independence of the open covering.

Step 2. The left vertical arrow comes from the DG Lie algebra homomorphism

$$
\eta_{\mathcal{T}}: \mathcal{T}_{\text{poly}}(X)[[\hbar]]^+ \to \Gamma(X, \text{Mix}_{\boldsymbol{U}}(\mathcal{T}_{\text{poly},X}))[[\hbar]]^+,
$$

which is a quasi-isomorphism when $H^q(X, \mathcal{T}_{poly,X}^p) = 0$ for all p and all $q > 0$. So in case X is affine, the quantization map Q is bijective. This establishes property (iii) .

Step 3. Now suppose $U' = \{U'_0, \ldots, U'_{m'}\}$ is another such affine open covering of X, with sections $\sigma'_i: U'_i \to \text{LCC} X$. Without loss of generality we may assume that $m' \geq m$, and that $U_i' = U_i$ and $\sigma_i' = \sigma_i$ for all $i \leq m$. There is a morphism of simplicial schemes $f: U \to U'$, that is an open and closed embedding. Correspondingly there is a commutative diagram

$$
\begin{array}{ccc}\n\operatorname{MC}(\mathcal{T}_{\text{poly}}(X)[[\hbar]]^{+}) & \xrightarrow{Q} & \operatorname{MC}(\mathcal{D}_{\text{poly}}^{\text{nor}}(X)[[\hbar]]^{+}) \\
& \operatorname{MC}(\eta_{\tau}) \Big\downarrow & & \operatorname{MC}(\eta_{\mathcal{D}}) \Big\downarrow \\
\operatorname{MC}(\Gamma(X, \operatorname{Mix}_{\mathbf{U}'}(\mathcal{T}_{\text{poly}, X}))[[\hbar]]^{+}) & \xrightarrow{\operatorname{MC}(\Psi_{\sigma'})} \operatorname{MC}(\Gamma(X, \operatorname{Mix}_{\mathbf{U}'}(\mathcal{D}_{\text{poly}, X}))[[\hbar]]^{+}) \\
& \operatorname{MC}(\Gamma(X, \operatorname{Mix}_{\mathbf{U}}(\mathcal{T}_{\text{poly}, X}))[[\hbar]]^{+}) & \xrightarrow{\operatorname{MC}(\Psi_{\sigma})} \operatorname{MC}(\Gamma(X, \operatorname{Mix}_{\mathbf{U}}(\mathcal{D}_{\text{poly}, X}))[[\hbar]]^{+}),\n\end{array}
$$

where the vertical arrows on the right are bijections. We conclude that Q is independent of U and σ . This concludes the proof of property (iv).

Step 4. Suppose $f: X' \to X$ is an étale morphism. Then we can choose an affine open covering \boldsymbol{U}' of X' that refines \boldsymbol{U} in the obvious sense. Each of the open sets U'_{i} inherits an étale coordinate system, and hence a section $\sigma'_{i}: U'_{i} \to \text{LCC } X'$. We

get a commutative diagram

$$
\begin{array}{ccc}\n\mathrm{MC}\big(\Gamma(X,\mathrm{Mix}_{\mathbf{U}}(\mathcal{T}_{\mathrm{poly},X}))[[\hbar]]^{+}\big) & \xrightarrow{\mathrm{MC}(\Psi_{\sigma})} & \mathrm{MC}\big(\Gamma(X,\mathrm{Mix}_{\mathbf{U}}(\mathcal{D}_{\mathrm{poly},X}))[[\hbar]]^{+}\big) \\
& & \mathrm{MC}(f^{*})\bigg\downarrow & & \mathrm{MC}(\Psi_{\sigma}) & \mathrm{MC}(f^{*})\bigg\downarrow & & \mathrm{NC}(\Psi_{\sigma})\n\end{array}
$$

 $\mathrm{MC}(\Gamma(X',\mathrm{Mix}_{\boldsymbol{U}'}(\mathcal{T}_{\mathrm{poly},X'}))[[\hbar]]^+) \xrightarrow{\mathrm{MC}(\Psi_{\boldsymbol{\sigma}'})} \mathrm{MC}(\Gamma(X',\mathrm{Mix}_{\boldsymbol{U}'}(\mathcal{D}_{\mathrm{poly},X'}))[[\hbar]]^+),$ This proves property (ii).

Step 5. Finally we must show that Q preserves first order terms, i.e. property (i). Let

$$
\alpha = \sum_{j=1}^{\infty} \alpha_j \hbar^j \in \mathcal{T}_{\text{poly}}(X)^1[[\hbar]]^+
$$

be an MC solution, and let

$$
\beta = \sum_{j=1}^{\infty} \beta_j \hbar^j \in \mathcal{D}_{\text{poly}}^{\text{nor}}(X)^1[[\hbar]]^+
$$

be an MC solution such that $\beta = Q(\alpha)$ modulo gauge equivalence. This means that there exists some

$$
\gamma = \sum_{k \geq 1} \gamma_k \hbar^k \in \Gamma(X,\mathrm{Mix}_{{\mathbf{U}}}({\mathcal{D}}_{\mathrm{poly},X}))^0[[\hbar]]^+
$$

such that

$$
\sum_{j\geq 1} \frac{1}{j!} \Psi_{\boldsymbol{\sigma};j}(\alpha^j) = \exp(\mathrm{af})(\exp(\gamma))(\beta),
$$

with notation as in [\[Ye1,](#page-8-0) Lemma 3.2]. Cf. [Ye1, Theorem 3.8]. In the first order term (i.e. the coefficient of \hbar^1) of this equation we have

(1.18)
$$
\Psi_{\sigma;1}(\alpha_1) = \beta_1 - (d_{\text{mix}} + d_{\mathcal{D}})(\gamma_1);
$$

see [\[Ye1,](#page-8-0) equation (3.3)].

In order to apply Lemma [1.16\(](#page-5-0)2), we are interested in in the component of $\Psi_{\sigma;1}(\alpha_1)$ living in the summand $\text{Mix}_{\mathbf{U}}^0(\mathcal{D}_{\text{poly},X}^1)$. But this is exactly

$$
\mathrm{gr}^0_{\mathrm{G}}(\Psi_{\sigma;1})(\alpha_1) \in \mathrm{gr}^0_{\mathrm{G}} \operatorname{Mix}_{\mathbf{U}}(\mathcal{D}^1_{\mathrm{poly},X}) = \operatorname{Mix}^0_{\mathbf{U}}(\mathcal{D}^1_{\mathrm{poly},X}).
$$

Since according to Theorem [1.2](#page-2-0) we have

$$
\mathrm{gr}^0_{\mathrm{G}}(\Psi_{\sigma;1}) = \mathrm{gr}^0_{\mathrm{G}}(\mathrm{Mix}_{\boldsymbol{U}}(\mathcal{U}_1)),
$$

it follows that the component we are interested in is

$$
gr_G^0(Mix_{\boldsymbol{U}}(\mathcal{U}_1))(\alpha_1)=\mathcal{U}_1(\alpha_1).
$$

Now take any two local sections $f, g \in \mathcal{O}_X$. Using Lemma [1.16](#page-5-0) we get

$$
[[\Psi_{\sigma,1}(\alpha_1),f],g] = [[\mathcal{U}_1(\alpha_1),f],g] = \mathcal{U}_1(\alpha_1)(g,f) - \mathcal{U}_1(\alpha_1)(f,g) = -2\alpha_1(f,g),
$$

$$
[[\beta_1, f], g] = \beta_1(g, f) - \beta_1(f, g)
$$

and

$$
[[(d_{\text{mix}} + d_{\mathcal{D}})(\gamma_1), f], g] = 0.
$$

Combining these equations with equation (1.18) we see that equation (1.15) indeed holds. So the proof is done. \Box **Corollary 1.19.** Let X be an irreducible smooth separated K -scheme. Assume X is D -affine. Then the quantization map Q of Theorem [1.14](#page-4-1) may be interpreted as a canonical function

$$
Q: \frac{\{\text{formal Poisson structures on } X\}}{\text{gauge equivalence}} \to \frac{\{\text{deformation quantities of } \mathcal{O}_X\}}{\text{gauge equivalence}}.
$$

The quantization map Q preserves first order terms, and commutes with étale morphisms $f: X' \to X$. If X is affine then Q is bijective.

Proof. By definition the left side is $MC(\mathcal{T}_{poly}(X)[[\hbar]]^+)$. On the other hand, accord-ing to [\[Ye1,](#page-8-0) Theorem 1.13] every deformation quantization of \mathcal{O}_X can be trivialized globally, and by [\[Ye1,](#page-8-0) Proposition 1.14] any gauge equivalence between globally trivialized deformation quantizations is a global gauge equivalence. Hence the right side is $MC(\mathcal{D}_{poly}^{nor}(X)[[\hbar]]^+)$.

2. Miscellaneous Errors

Here is a list of minor errors in the paper [\[Ye1\]](#page-8-0).

(1) Section 3, bottom of page 395: the formula should be

$$
\mathrm{af}(\gamma)(\omega) := [\gamma, \omega] - \mathrm{d}(\gamma) = \mathrm{ad}(\gamma)(\omega) - \mathrm{d}(\gamma) \in \mathfrak{m} \mathbin{\widehat{\otimes}} \mathfrak{g}^1,
$$

(2) Definition 5.2, page 411: the formula should be

$$
\nabla_{\mathcal{P}}:\mathcal{P}_X\to\Omega^1_X\otimes_{\mathcal{O}_X}\mathcal{P}_X.
$$
