11 March 2008

Abstract

This paper evaluates some generalised Euler sums involving the digamma function.

Introduction

In response to a letter from Goldbach in 1742 (see [2, p.253]), Euler commenced his investigation of infinite series of the form

$$\sum_{n=1}^{\infty} \frac{H_n^{(p)}}{n^q}$$

where $H_n^{(p)}$ is the generalised harmonic number defined by $H_n^{(p)} = \sum_{k=1}^n \frac{1}{k^p}$.

In this short paper we consider related series of the form

$$\sum_{n=0}^{\infty} \frac{\psi\left(n + \frac{1}{2}\right)}{(2n+1)^2} = -\frac{1}{8}[\gamma\pi^2 + 7\zeta(3)]$$

$$\sum_{n=0}^{\infty} \frac{\psi\left(n + \frac{1}{2}\right)}{(2n+1)^4} = -\frac{1}{96}[3\pi^2\zeta(3) + \pi^4\gamma + 93\zeta(5)]$$

where $\psi(x)$ is the digamma function which is the logarithmic derivative of the gamma function $\psi(x) = \frac{d}{dx} \log \Gamma(x)$ and $\zeta(s)$ is the Riemann zeta function.

We note that [12, p.20]

$$\psi\left(n + \frac{1}{2}\right) = -\gamma - 2\log 2 + 2\sum_{k=1}^n \frac{1}{2k-1} = \psi\left(\frac{1}{2}\right) + 2\sum_{k=1}^n \frac{1}{2k-1}$$

where γ is Euler's constant. References to some of the extensive work undertaken on Euler sums may be found in [4].

Using contour integration, de Doelder [4b] has considered series of the form

$$\sum_{n=1}^{\infty} \frac{(-1)^{n-1}}{n^2} \left[\psi \left(n + \frac{1}{2} \right) - \psi \left(\frac{1}{2} \right) \right] = 2\pi G - \frac{7}{2} \zeta(3)$$

as corrected in equation (6.30r) of [4a]. In the above equation G is Catalan's constant defined by

$$G = \sum_{n=0}^{\infty} \frac{(-1)^n}{(2n+1)^2}$$

Proof

In 1985 Berndt [1] gave an elementary proof of Kummer's Fourier series expansion for $\log \Gamma(x)$

$$(1) \quad \log \Gamma(x) = \frac{1}{2} \log \pi - \frac{1}{2} \log \sin \pi x + \sum_{k=1}^{\infty} \frac{(\gamma + \log 2\pi k) \sin 2k\pi x}{\pi k}, \quad 0 < x < 1$$

(this formula was originally derived by Kummer in 1847 [9]). Reference to the well-known Fourier series [13, p.148]

$$\log[2 \sin \pi x] = - \sum_{k=1}^{\infty} \frac{\cos 2k\pi x}{k}, \quad 0 < x < 1$$

confirms that (1) is properly described as a Fourier series expansion for $\log \Gamma(x)$

$$(1a) \quad \log \Gamma(x) = \frac{1}{2} \log(2\pi) + \frac{1}{2} \sum_{k=1}^{\infty} \frac{\cos 2k\pi x}{k} + \sum_{k=1}^{\infty} \frac{(\gamma + \log 2\pi k) \sin 2k\pi x}{\pi k}$$

We now multiply (1a) across by $\sin(2n+1)\pi x$ and integrate term by term. We have the familiar trigonometric formula

$$2 \cos 2k\pi x \sin(2n+1)\pi x = \sin(2k+2n+1)\pi x - \sin(2k-2n-1)\pi x$$

and integration results in

$$\begin{aligned} 2 \int_0^1 \cos 2k\pi x \sin(2n+1)\pi x dx &= - \frac{\cos(2k+2n+1)\pi x}{(2k+2n+1)\pi} + \frac{\cos(2k-2n-1)\pi x}{(2k-2n-1)\pi} \Big|_0^1 \\ &= \frac{2}{(2k+2n+1)\pi} - \frac{2}{(2k-2n-1)\pi} \end{aligned}$$

We then have

$$S_1 = \frac{1}{2} \sum_{k=1}^{\infty} \frac{1}{k} \int_0^1 \cos 2k\pi x \sin(2n+1)\pi x dx = \frac{1}{2\pi} \sum_{k=1}^{\infty} \left[\frac{1}{k(2k+2n+1)} - \frac{1}{k(2k-2n-1)} \right]$$

By partial fractions and letting $a = 2n+1$ we see that

$$\frac{1}{(2k+a)k} = \frac{1}{a} \left(\frac{1}{k} - \frac{2}{2k+a} \right)$$

and therefore

$$\begin{aligned} \frac{1}{(2k+a)k} - \frac{1}{(2k-a)k} &= \frac{1}{a} \left(\frac{1}{k} - \frac{2}{2k+a} \right) + \frac{1}{a} \left(\frac{1}{k} - \frac{2}{2k-a} \right) \\ &= \frac{1}{a} \left[\frac{1}{k} - \frac{1}{k+(a/2)} + \frac{1}{k} - \frac{1}{k-(a/2)} \right] \end{aligned}$$

Then, using the well known expression for the digamma function [14, p.108]

$$\psi(x) = -\gamma - \frac{1}{x} + \sum_{k=1}^{\infty} \left(\frac{1}{k} - \frac{1}{k+x} \right)$$

we see that

$$S_1 = \frac{1}{2\pi a} [\psi(a/2) + \psi(-a/2) + 2\gamma]$$

We have the well known formula [12, p.14]

$$\psi(-x) = \psi(x) + \pi \cot \pi x + \frac{1}{x}$$

and hence we get

$$S_1 = \frac{1}{2\pi a} \left[2\psi(a/2) + \pi \cot(\pi a/2) + \frac{2}{a} + 2\gamma \right]$$

Since $a = 2n+1$ this becomes

$$S_1 = \frac{1}{(2n+1)\pi} \left[\psi\left(n + \frac{1}{2}\right) + \frac{1}{2n+1} + \gamma \right]$$

and using the identity [12, p.20]

$$\psi\left(n + \frac{1}{2}\right) = -\gamma - 2\log 2 + 2\sum_{k=1}^n \frac{1}{2k-1}$$

we obtain

$$S_1 = \frac{1}{(2n+1)\pi} \left[-2\log 2 + 2\sum_{k=1}^n \frac{1}{2k-1} + \frac{1}{2n+1} \right]$$

It is readily seen that

$$\frac{1}{2} \int_0^1 \log(2\pi) \sin(2n+1)\pi x dx = \frac{\log(2\pi)}{(2n+1)\pi}$$

and since $\int_0^1 \sin(2n+1)\pi x \cos 2k\pi x dx = 0$ we deduce that

$$(2) \quad \int_0^1 \log\Gamma(x) \sin(2n+1)\pi x dx = \frac{1}{(2n+1)\pi} \left[\log\left(\frac{\pi}{2}\right) + \frac{1}{2n+1} + 2\sum_{k=1}^n \frac{1}{2k-1} \right]$$

As noted by Kölbig [8], this integral was incorrectly reported in Nielsen's book [11, p.203]. The result was corrected in the fifth edition of Gradshteyn and Ryzhik [6, No.6.443 2]).

The integral in (2) may also be written as

$$(2a) \quad \int_0^1 \log\Gamma(x) \sin(2n+1)\pi x dx = \frac{1}{(2n+1)\pi} \left[\log(2\pi) + \gamma + \frac{1}{2n+1} + \psi\left(n + \frac{1}{2}\right) \right]$$

We then multiply (2a) by $\frac{1}{2n+1}$ and make the summation

$$S_2 = \sum_{n=0}^{\infty} \frac{1}{2n+1} \int_0^1 \log\Gamma(x) \sin(2n+1)\pi x dx$$

$$= \frac{\log(2\pi) + \gamma}{\pi} \sum_{n=0}^{\infty} \frac{1}{(2n+1)^2} + \frac{1}{\pi} \sum_{n=0}^{\infty} \frac{1}{(2n+1)^3} + \frac{1}{\pi} \sum_{n=0}^{\infty} \frac{\psi\left(n + \frac{1}{2}\right)}{(2n+1)^2}$$

which may also be written as

$$\begin{aligned} S_2 &= \sum_{n=0}^{\infty} \frac{1}{2n+1} \int_0^1 \log \Gamma(x) \sin(2n+1)\pi x \, dx \\ &= \frac{1}{\pi} \log \pi \sum_{n=0}^{\infty} \frac{1}{(2n+1)^2} + \frac{1}{\pi} \sum_{n=0}^{\infty} \frac{1}{(2n+1)^3} + \frac{2}{\pi} \sum_{n=0}^{\infty} \frac{1}{(2n+1)^2} \sum_{k=1}^n \frac{1}{2k-1} \end{aligned}$$

It is well known that

$$\sum_{n=0}^{\infty} \frac{1}{(2n+1)^s} = (1-2^{-s})\zeta(s)$$

and we therefore have

$$\sum_{n=0}^{\infty} \frac{1}{(2n+1)^2} = \frac{\pi^2}{8} \quad \sum_{n=0}^{\infty} \frac{1}{(2n+1)^3} = \frac{7}{8}\zeta(3)$$

Hence we obtain

$$(3) \quad S_2 = \frac{\pi}{8} [\log(2\pi) + \gamma] + \frac{7\zeta(3)}{8\pi} + \frac{1}{\pi} \sum_{n=0}^{\infty} \frac{\psi\left(n + \frac{1}{2}\right)}{(2n+1)^2}$$

Assuming we may validly change the order of summation and integration, we have

$$\sum_{n=0}^{\infty} \frac{1}{2n+1} \int_0^1 \log \Gamma(x) \sin(2n+1)\pi x \, dx = \int_0^1 \log \Gamma(x) \sum_{n=0}^{\infty} \frac{\sin(2n+1)\pi x}{2n+1} \, dx$$

For $0 < x < 1$ we have the Fourier expansion [13, p.149]

$$\sum_{n=0}^{\infty} \frac{\sin(2n+1)\pi x}{2n+1} = \frac{\pi}{4}$$

and therefore we obtain for the left-hand side

$$(4) \quad S_2 = \frac{\pi}{4} \int_0^1 \log \Gamma(x) \, dx = \frac{\pi}{8} \log(2\pi)$$

where we have used Raabe's integral [15, p.261] $\int_0^1 \log \Gamma(x) dx = \frac{1}{2} \log(2\pi)$.

Equating (3) and (4) gives us

$$(5) \quad \sum_{n=0}^{\infty} \frac{\psi\left(n + \frac{1}{2}\right)}{(2n+1)^2} = -\frac{1}{8}[\gamma\pi^2 + 7\zeta(3)]$$

Independent confirmation of the above identity was soon forthcoming because, most fortuitously, I also spotted it in Milgram's paper [10]; this identity was originally obtained by Jordan [7] in 1973.

Emboldened by the success of the first example, we now continue this procedure. As before, the identity in (1a) is multiplied by $\frac{1}{(2n+1)^3}$ and we make the summation

$$(6) \quad \begin{aligned} & \sum_{n=0}^{\infty} \frac{1}{(2n+1)^3} \int_0^1 \log \Gamma(x) \sin(2n+1)\pi x dx = \\ & \frac{\log(2\pi) + \gamma}{\pi} \sum_{n=0}^{\infty} \frac{1}{(2n+1)^4} + \frac{1}{\pi} \sum_{n=0}^{\infty} \frac{1}{(2n+1)^5} + \frac{1}{\pi} \sum_{n=0}^{\infty} \frac{\psi\left(n + \frac{1}{2}\right)}{(2n+1)^4} \\ & = \frac{\pi^3}{96} [\log(2\pi) + \gamma] + \frac{31\zeta(5)}{32\pi} + \frac{1}{\pi} \sum_{n=0}^{\infty} \frac{\psi\left(n + \frac{1}{2}\right)}{(2n+1)^4} \end{aligned}$$

Assuming we may validly change the order of summation and integration, we have

$$\sum_{n=0}^{\infty} \frac{1}{(2n+1)^3} \int_0^1 \log \Gamma(x) \sin(2n+1)\pi x dx = \int_0^1 \log \Gamma(x) \sum_{n=0}^{\infty} \frac{\sin(2n+1)\pi x}{(2n+1)^3} dx$$

We have the well-known Fourier series from Tolstov's book [13, p.149] for $0 \leq x \leq 1$

$$\sum_{n=0}^{\infty} \frac{\sin(2n+1)\pi x}{(2n+1)^3} = \frac{\pi^3}{8} (x - x^2)$$

and hence we have

$$\int_0^1 \log \Gamma(x) \sum_{n=0}^{\infty} \frac{\sin(2n+1)\pi x}{(2n+1)^3} dx = \frac{\pi^3}{8} \int_0^1 (x-x^2) \log \Gamma(x) dx$$

We note that Espinosa and Moll [5] report the following two integrals

$$(6a) \quad \int_0^1 x \log \Gamma(x) dx = \frac{1}{4} \log(2\pi) - \log A$$

$$(6b) \quad \int_0^1 x^2 \log \Gamma(x) dx = \frac{\zeta(3)}{4\pi^2} + \frac{1}{6} \log(2\pi) - \log A$$

where the Glaisher-Kinkelin constant A is defined by

$$\log A = \frac{1}{12} - \zeta'(-1)$$

We then obtain

$$(7) \quad \frac{\pi^3}{8} \int_0^1 (x-x^2) \log \Gamma(x) dx = \frac{\pi^3}{96} \log(2\pi) - \frac{\pi \zeta(3)}{32}$$

and equating (6) and (7) we get

$$(8) \quad \sum_{n=0}^{\infty} \frac{\psi\left(n + \frac{1}{2}\right)}{(2n+1)^4} = -\frac{1}{96} \left[3\pi^2 \zeta(3) + \pi^4 \gamma + 93\zeta(5) \right]$$

On the assumption that γ and π each have a weight of one and that $\zeta(n)$ has a weight of n , we see that all of the terms of the above identity have a weight equal to five (and this feature of homogeneity is also present in the standard Euler sums).

In a similar way we may be able to determine an expression for $\sum_{n=0}^{\infty} \frac{\psi\left(n + \frac{1}{2}\right)}{(2n+1)^4}$ provided

we can evaluate $\int_0^1 x^4 \log \Gamma(x) dx$. As a minimum, this will require the following result

from [3] and [12, p.209]

$$2 \int_0^z t \log \Gamma(a+t) dt = \left(\frac{1}{4} - \frac{1}{2}a + \frac{1}{2}a^2 - 2 \log A \right) z + \left(\frac{1}{2} \log(2\pi) - \frac{1}{2}a + \frac{1}{4} \right) z^2$$

$$-\frac{1}{2}z^2 + z^2 \log \Gamma(z+a) - (a-1)^2 [\log \Gamma(z+a) - \log \Gamma(a)] + (2a-3) [\log G(z+a) - \log G(a)]$$

$$-2[\log \Gamma_3(z+a) - \log \Gamma_3(a)]$$

where the double and triple gamma functions (due to Barnes) are defined by

$$[\Gamma_2(1+x)]^{-1} = G(1+x) = (2\pi)^{\frac{x}{2}} \exp\left[-\frac{1}{2}(\gamma x^2 + x^2 + x)\right] \prod_{k=1}^{\infty} \left\{ \left(1 + \frac{x}{k}\right)^k \exp\left(\frac{x^2}{2k} - x\right) \right\}$$

and

$$\Gamma_3(1+x) = G_3(1+x) = \exp(c_1 x + c_2 x^2 + c_3 x^3) F(x)$$

where

$$F(x) = \prod_{k=1}^{\infty} \left\{ \left(1 + \frac{x}{k}\right)^{-\frac{1}{2}k(k+1)} \exp\left(\frac{1}{2}\left(1 + \frac{1}{k}\right)kx - \frac{1}{4}\left(1 + \frac{1}{k}\right)x^2 + \frac{1}{6k}\left(1 + \frac{1}{k}\right)x^3\right) \right\}$$

and the constants are

$$c_1 = \frac{3}{8} - \frac{1}{4} \log(2\pi) - \log A, \quad c_2 = \frac{1}{4} \left[\gamma + \log(2\pi) + \frac{1}{2} \right]$$

$$c_3 = -\frac{1}{6} \left[\gamma + \zeta(2) + \frac{3}{2} \right]$$

In this regard, Jordan [7] has reported that

$$4^{n+1} \sum_{k=1}^{\infty} \frac{L_k}{(2k-1)^{2n}} = \zeta(2n+1) + 4\zeta(2n) \log 2 - 2 \sum_{j=1}^{n-1} \zeta(2j) \zeta(2n+1-2j)$$

$$\text{where } L_k = \sum_{j=1}^k \frac{1}{2j-1} = \frac{1}{2} \left[\psi\left(k + \frac{1}{2}\right) - \psi\left(\frac{1}{2}\right) \right].$$

Kölbig [8] also showed that

$$\int_0^1 \log \Gamma(x) \cos(2n+1)\pi x dx = \frac{2}{\pi^2} \left[\frac{\log(2\pi) + \gamma}{(2n+1)^2} + 2 \sum_{k=1}^{\infty} \frac{\log k}{4k^2 - (2n+1)^2} \right]$$

and completing the summation we have

$$\begin{aligned}
\sum_{n=1}^{\infty} \frac{1}{(2n+1)^2} \int_0^1 \log \Gamma(x) \cos(2n+1)\pi x dx &= \frac{2[\log(2\pi) + \gamma]}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{(2n+1)^4} \\
&+ \frac{4}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{(2n+1)^2} \sum_{k=1}^{\infty} \frac{\log k}{4k^2 - (2n+1)^2} \\
(9) \qquad \qquad \qquad &= \frac{[\log(2\pi) + \gamma]\pi^2}{48} \\
&+ \frac{4}{\pi^2} \sum_{n=1}^{\infty} \frac{1}{(2n+1)^2} \sum_{k=1}^{\infty} \frac{\log k}{4k^2 - (2n+1)^2}
\end{aligned}$$

Assuming we may validly change the order of summation and integration, we have

$$\sum_{n=1}^{\infty} \frac{1}{(2n+1)^2} \int_0^1 \log \Gamma(x) \cos(2n+1)\pi x dx = \int_0^1 \log \Gamma(x) \sum_{n=1}^{\infty} \frac{\cos(2n+1)\pi x}{(2n+1)^2} dx$$

and we then employ the Fourier series [13, p.149] for $0 \leq t \leq \pi$

$$\sum_{n=1}^{\infty} \frac{\cos(2n+1)t}{(2n+1)^2} = \frac{\pi^2 - 2\pi t}{8}$$

to obtain

$$= \frac{\pi^2}{8} \int_0^1 \log \Gamma(x) [1 - 2x] dx$$

Using (6a) this becomes

$$(10) \qquad \qquad \qquad = \frac{\pi^2}{8} \left[\frac{1}{4} \log(2\pi) + \log A \right]$$

Equating (9) and (10) gives us

$$(11) \qquad \sum_{n=1}^{\infty} \frac{1}{(2n+1)^2} \sum_{k=1}^{\infty} \frac{\log k}{4k^2 - (2n+1)^2} = \frac{\pi^4}{384} [\log(2\pi) + 12 \log A - 2\gamma]$$

In passing, we also note from [11, p.203]

$$\int_0^1 \log \Gamma(x) \cos 2n\pi x dx = \frac{1}{4n}$$

and hence the summation gives us

$$\sum_{n=1}^{\infty} \frac{1}{n^2} \int_0^1 \log \Gamma(x) \cos 2n\pi x dx = \frac{1}{4} \zeta(3)$$

Assuming we may validly change the order of summation and integration, we have

$$\sum_{n=1}^{\infty} \frac{1}{n^2} \int_0^1 \log \Gamma(x) \cos 2n\pi x dx = \int_0^1 \log \Gamma(x) \sum_{n=1}^{\infty} \frac{\cos 2n\pi x}{n^2} dx$$

and we then employ the well-known Fourier series [13, p.148]

$$\sum_{n=1}^{\infty} \frac{\cos 2n\pi x}{n^2} = \pi^2 \left(x^2 - x + \frac{1}{6} \right) = \pi^2 B_2(x)$$

and obtain the definite integral

$$\int_0^1 B_2(x) \log \Gamma(x) dx = \frac{\zeta(3)}{4\pi^2}$$

which is in agreement with [5].

In a recent preprint entitled ‘‘Euler-Hurwitz series’’ (to be submitted to arXiv) the author has employed (5) to compute the following integral

$$\int_0^1 \frac{\sqrt{v}}{1-v} \left[\frac{7}{8} \zeta(3) - \frac{1}{4} \Phi \left(v, 2, \frac{1}{2} \right) \right] dv = \frac{21}{8} \zeta(3) - \frac{3}{2} \log 2 \zeta(2)$$

where $\Phi(v, s, a)$ is the Hurwitz-Lerch zeta function [12, p.121] defined by

$$\Phi(v, s, a) = \sum_{n=0}^{\infty} \frac{v^n}{(n+a)^s}$$

Series involving the digamma function were extensively explored by Coffey [3a] in 2005. His paper included a number of series of the form

$$\sum_{n=1}^{\infty} \frac{1}{n^2} \sum_{r=0}^{q-1} \left[\gamma + \psi \left(n + \frac{r}{q} \right) \right] = q \left[\left(q^2 + \frac{1}{2q} \right) \zeta(3) + \pi \sum_{j=1}^{q-1} \text{Cl}_2 \left(\frac{2\pi j}{q} \right) \right] - q \zeta(2) \log q$$

where the Clausen integral [12, p.111] is defined by

$$\text{Cl}_2(t) = - \int_0^t \log \left[2 \sin \frac{x}{2} \right] dx = \sum_{n=1}^{\infty} \frac{\sin nt}{n^2}, \quad 0 \leq x \leq 2\pi$$

However, it is not immediately clear to the author how equations (5) and (8) above may be derived directly from Coffey's paper [3a].
