# Propagation Rules of Subsystem Codes 

Salah A. Aly<br>Department of Computer Science<br>Texas A\&M University<br>College Station, TX 77843, USA<br>Email: salah@cs.tamu.edu

#### Abstract

We demonstrate propagation rules of subsystem code constructions by extending, shortening and combining given subsystem codes. Given an $[[n, k, r, d]]_{q}$ subsystem code, we drive new subsystem codes with parameters $[[n+1, k, r, \geq d]]_{q}$, $[[n-1, k+1, r, \geq d-1]]_{q},[[n, k-1, r+1, d]]_{q}$. We present the short subsystem codes. The interested readers shall consult our companion papers for upper and lower bounds on subsystem codes parameters, and introduction, trading dimensions, families, and references on subsystem codes [1], [2], [3] and references therein.

Subsystem Codes. Let $\mathcal{H}$ be the Hilbert space $C^{q^{n}}=\mathbf{C}^{q} \otimes$ $\mathbf{C}^{q} \otimes \ldots \otimes \mathbf{C}^{q}$. Let $Q$ be a quantum code such that $\mathcal{H}=$ $Q \oplus Q^{\perp}$, where $Q^{\perp}$ is the orthogonal complement of $Q$. Recall definition of the error model acting in qubits [4], [3]. We can define the subsystem code $Q$ as follows

Definition 1: An $[[n, k, r, d]]_{q}$ subsystem code is a decomposition of the subspace $Q$ into a tensor product of two vector spaces A and B such that $Q=A \otimes B$, where $\operatorname{dim} A=k$ and $\operatorname{dim} B=r$. The code $Q$ is able to detect all errors of weight less than $d$ on subsystem $A$.

Subsystem codes can be constructed from the classical codes over $\mathbf{F}_{q}$ and $\mathbf{F}_{q^{2}}$. The Euclidean construction of subsystem code is given as follows [1], [3].

Lemma 2 (Euclidean Construction): If $C$ is a $k^{\prime}$ dimensional $\mathbf{F}_{q}$-linear code of length $n$ that has a $k^{\prime \prime}$ dimensional subcode $D=C \cap C^{\perp}$ and $k^{\prime}+k^{\prime \prime}<n$, then there exists an

$$
\left[\left[n, n-\left(k^{\prime}+k^{\prime \prime}\right), k^{\prime}-k^{\prime \prime}, \operatorname{wt}\left(D^{\perp} \backslash C\right)\right]\right]_{q}
$$

subsystem code.

## I. Subsystem Codes vers. Co-subsystem Codes

In this section we show how one can trade the dimensions of subsystem and co-subsystem to obtain new codes from a given subsystem or stabilizer code. The results are obtained by exploiting the symplectic geometry of the space. A remarkable consequence is that nearly any stabilizer code yields a series of subsystem codes.

Our first result shows that one can decrease the dimension of the subsystem and increase at the same time the dimension of the co-subsystem while keeping or increasing the minimum distance of the subsystem code.

Theorem 3: Let $q$ be a power of a prime $p$. If there exists an $((n, K, R, d))_{q}$ subsystem code with $K>p$ that is pure to $d^{\prime}$, then there exists an $((n, K / p, p R, \geq d))_{q}$ subsystem code that
is pure to $\min \left\{d, d^{\prime}\right\}$. If a pure $((n, p, R, d))_{q}$ subsystem code exists, then there exists a $((n, 1, p R, d))_{q}$ subsystem code.

Proof: See [1], [2]
Replacing $\mathbf{F}_{p}$-bases by $\mathbf{F}_{q}$-bases in the proof of the previous theorem yields the following variation of the previous theorem for $\mathbf{F}_{q}$-linear subsystem codes.

Theorem 4: Let $q$ be a power of a prime $p$. If there exists a pure $\mathbf{F}_{q}$-linear $[[n, k, r, d]]_{q}$ subsystem code with $r>0$, then there exists a pure $\mathbf{F}_{q}$-linear $[[n, k+1, r-1, d]]_{q}$ subsystem code.

Proof: See [1], [2]
Theorem 5 (Generic methos): If there exists an ( $\mathbf{F}_{q}$-linear) $[[n, k, d]]_{q}$ stabilizer code that is pure to $d^{\prime}$, then there exists for all $r$ in the range $0 \leq r<k$ an ( $\mathbf{F}_{q}$-linear) $[[n, k-r, r, \geq d]]_{q}$ subsystem code that is pure to $\min \left\{d, d^{\prime}\right\}$. If a pure $\left(\mathbf{F}_{q^{-}}\right.$ linear) $[[n, k, r, d]]_{q}$ subsystem code exists, then a pure $\left(\mathbf{F}_{q^{-}}\right.$ linear) $[[n, k+r, d]]_{q}$ stabilizer code exists.

Proof: See [1], [2]
Using this theorem we can derive many families of subsystem codes derived from families of stabilizer codes as shown in Table 1

## II. Propagation Rules

Let $C_{1} \leq \mathbf{F}_{q}^{n}$ and $C_{2} \mathbf{F}_{q}^{n}$ be two classical codes defined over $F_{q}$. The direct sum of $C_{1}$ and $C_{2}$ is a code $C \leq \mathbf{F}_{q}^{2 n}$ defined as follows

$$
\begin{equation*}
C=C_{1} \oplus C_{2}=\left\{u v \mid u \in C_{1}, v \in C_{2}\right\} . \tag{1}
\end{equation*}
$$

In a matrix form the code $C$ can be described as

$$
C=\left(\begin{array}{cc}
C_{1} & 0 \\
0 & C_{2}
\end{array}\right)
$$

An $\left[n, k_{1}, d_{1}\right]_{q}$ classical code $C_{1}$ is a subcode in an $\left[c, k_{2}, d_{2}\right]_{q}$ if every codeword $v$ in $C_{1}$ is also a codeword in $C_{2}$, hence $k_{1} \leq k_{2}$. We say that an $\left[\left[n, k_{1}, r_{1}, d_{1}\right]\right]_{q}$ subsystem code $Q_{1}$ is a subcode in an $\left[\left[n, k_{2}, r_{2}, d_{2}\right]\right]_{q}$ subsystem code $Q_{2}$ if every codeword $|v\rangle$ in $Q_{1}$ is also a codeword in $Q_{2}$ and $k_{1}+r_{1} \leq k_{2}+r_{1}$.

Notation. Let $q$ be a power of a prime integer $p$. We denote by $\mathbf{F}_{q}$ the finite field with $q$ elements. We use the notation $(x \mid y)=\left(x_{1}, \ldots, x_{n} \mid y_{1}, \ldots, y_{n}\right)$ to denote the concatenation of two vectors $x$ and $y$ in $\mathbf{F}_{q}^{n}$. The symplectic weight of $(x \mid y) \in \mathbf{F}_{q}^{2 n}$ is defined as

$$
\operatorname{swt}(x \mid y)=\left\{\left(x_{i}, y_{i}\right) \neq(0,0) \mid 1 \leq i \leq n\right\}
$$

| Family | Stabilizer $[[n, k, d]]_{q}$ | Subsystem $[[n, k-r, r, d]]_{q}, k>r \geq 0$ |

Fig. 1. Families of subsystem codes from stabilizer codes

We define $\operatorname{swt}(X)=\min \{\operatorname{swt}(x) \mid x \in X, x \neq 0\}$ for any nonempty subset $X \neq\{0\}$ of $\mathbf{F}_{q}^{2 n}$.

The trace-symplectic product of two vectors $u=(a \mid b)$ and $v=\left(a^{\prime} \mid b^{\prime}\right)$ in $\mathbf{F}_{q}^{2 n}$ is defined as

$$
\langle u \mid v\rangle_{s}=\operatorname{tr}_{q / p}\left(a^{\prime} \cdot b-a \cdot b^{\prime}\right)
$$

where $x \cdot y$ denotes the dot product and $\operatorname{tr}_{q / p}$ denotes the trace from $\mathbf{F}_{q}$ to the subfield $\mathbf{F}_{p}$. The trace-symplectic dual of a code $C \subseteq \mathbf{F}_{q}^{2 n}$ is defined as

$$
C^{\perp_{s}}=\left\{v \in \mathbf{F}_{q}^{2 n} \mid\langle v \mid w\rangle_{s}=0 \text { for all } w \in C\right\}
$$

We define the Euclidean inner product $\langle x \mid y\rangle=\sum_{i=1}^{n} x_{i} y_{i}$ and the Euclidean dual of $C \subseteq \mathbf{F}_{q}^{n}$ as

$$
C^{\perp}=\left\{x \in \mathbf{F}_{q}^{n} \mid\langle x \mid y\rangle=0 \text { for all } y \in C\right\}
$$

We also define the Hermitian inner product for vectors $x, y$ in $\mathbf{F}_{q^{2}}^{n}$ as $\langle x \mid y\rangle_{h}=\sum_{i=1}^{n} x_{i}^{q} y_{i}$ and the Hermitian dual of $C \subseteq \mathbf{F}_{q^{2}}^{n}$ as

$$
C^{\perp_{h}}=\left\{x \in \mathbf{F}_{q^{2}}^{n} \mid\langle x \mid y\rangle_{h}=0 \text { for all } y \in C\right\}
$$

Theorem 6: Let $C$ be a classical additive subcode of $\mathbf{F}_{q}^{2 n}$ such that $C \neq\{0\}$ and let $D$ denote its subcode $D=C \cap C^{\perp_{s}}$. If $x=|C|$ and $y=|D|$, then there exists a subsystem code $Q=A \otimes B$ such that
i) $\operatorname{dim} A=q^{n} /(x y)^{1 / 2}$,
ii) $\operatorname{dim} B=(x / y)^{1 / 2}$.

The minimum distance of subsystem $A$ is given by
(a) $d=\operatorname{swt}\left(\left(C+C^{\perp_{s}}\right)-C\right)=\operatorname{swt}\left(D^{\perp_{s}}-C\right)$ if $D^{\perp_{s}} \neq C$; (b) $d=\operatorname{swt}\left(D^{\perp_{s}}\right)$ if $D^{\perp_{s}}=C$.

Thus, the subsystem $A$ can detect all errors in $E$ of weight less than $d$, and can correct all errors in $E$ of weight $\leq\lfloor(d-1) / 2\rfloor$.

## A. Extending Subsystem Codes

We derive new subsystem codes from known ones by extending and shortening the length of the code.

Theorem 7: If there exists an $((n, K, R, d))_{q}$ Clifford subsystem code with $K>1$, then there exists an $((n+1, K, R, \geq$ $d))_{q}$ subsystem code that is pure to 1 .

Proof: We first note that for any additive subcode $X \leq$ $\mathbf{F}_{q}^{2 n}$, we can define an additive code $X^{\prime} \leq \mathbf{F}_{q}^{2 n+2}$ by

$$
X^{\prime}=\left\{(a \alpha \mid b 0) \mid(a \mid b) \in X, \alpha \in \mathbf{F}_{q}\right\}
$$

We have $\left|X^{\prime}\right|=q|X|$. Furthermore, if $(c \mid e) \in X^{\perp_{s}}$, then $(c \alpha \mid e 0)$ is contained in $\left(X^{\prime}\right)^{\perp_{s}}$ for all $\alpha$ in $\mathbf{F}_{q}$, whence $\left(X^{\perp_{s}}\right)^{\prime} \subseteq\left(X^{\prime}\right)^{\perp_{s}}$. By comparing cardinalities we find that equality must hold; in other words, we have

$$
\left(X^{\perp_{s}}\right)^{\prime}=\left(X^{\prime}\right)^{\perp_{s}}
$$

By Theorem 6, there are two additive codes $C$ and $D$ associated with an $((n, K, R, d))_{q}$ Clifford subsystem code such that

$$
|C|=q^{n} R / K
$$

and

$$
|D|=\left|C \cap C^{\perp_{s}}\right|=q^{n} /(K R)
$$

We can derive from the code $C$ two new additive codes of length $2 n+2$ over $\mathbf{F}_{q}$, namely $C^{\prime}$ and $D^{\prime}=C^{\prime} \cap\left(C^{\prime}\right)^{\perp_{s}}$. The codes $C^{\prime}$ and $D^{\prime}$ determine a $\left(\left(n+1, K^{\prime}, R^{\prime}, d^{\prime}\right)\right)_{q}$ Clifford subsystem code. Since

$$
\begin{aligned}
D^{\prime} & =C^{\prime} \cap\left(C^{\prime}\right)^{\perp_{s}}=C^{\prime} \cap\left(C^{\perp_{s}}\right)^{\prime} \\
& =\left(C \cap C^{\perp_{s}}\right)^{\prime}
\end{aligned}
$$

we have $\left|D^{\prime}\right|=q|D|$. Furthermore, we have $\left|C^{\prime}\right|=q|C|$. It follows from Theorem 6 that
(i) $K^{\prime}=q^{n+1} / \sqrt{\left|C^{\prime}\right|\left|D^{\prime}\right|}=q^{n} / \sqrt{|C||D|}=K$,
(ii) $R^{\prime}=\left(\left|C^{\prime}\right| /\left|D^{\prime}\right|\right)^{1 / 2}=(|C| /|D|)^{1 / 2}=R$,
(iii) $d^{\prime}=\operatorname{swt}\left(\left(D^{\prime}\right)^{\perp_{s}} \backslash C^{\prime}\right) \geq \operatorname{swt}\left(\left(D^{\perp_{s}} \backslash C\right)^{\prime}\right)=d$.

Since $C^{\prime}$ contains a vector $(\mathbf{0} \alpha \mid \mathbf{0} 0)$ of weight 1 , the resulting subsystem code is pure to 1 .

Corollary 8: If there exists an $[[n, k, r, d]]_{q}$ subsystem code with $k>0$ and $0 \leq r<k$, then there exists an $[[n+1, k, r, \geq$ $d]]_{q}$ subsystem code that is pure to 1 .

## B. Shortening Subsystem Codes

We can also shorten the length of a subsystem code and still trade the dimensions of the new subsystem code and its co-subsystem code as shown in the following Lemma.

Theorem 9: If an $((n, K, R, d))_{q}$ pure subsystem code $Q$ exists, then there is a pure subsystem code $Q_{p}$ with parameters $((n-1, q K, R, \geq d-1))_{q}$.

Proof: We know that existence of the pure subsystem code $Q$ with parameters $((n, K, R, d))_{q}$ implies existence of a pure stabilizer code with parameters $((n, K R, \geq d))_{q}$ for $n \geq$ 2 and $d \geq 2$ from [2], Theorem 2.]. By [5, Theorem 70], there exist a pure stabilizer code with parameters $((n-1, q K R, \geq$ $d-1))_{q}$. This stabilizer code can be seen as $((n-1, q K R, 0, \geq$ $d-1))_{q}$ subsystem code. By using [2] Theorem 2.], there exists a pure $\mathbf{F}_{q}$-linear subsystem code with parameters ( $(n-$ $1, q K, R, \geq d-1))_{q}$ that proves the claim.
Analog of the previous Theorem is the following Lemma.
Lemma 10: If an $\mathbf{F}_{q}$-linear $[[n, k, r, d]]_{q}$ pure subsystem code $Q$ exists, then there is a pure subsystem code $Q_{p}$ with parameters $[[n-1, k+1, r, \geq d-1]]_{q}$.

Proof: We know that existence of the pure subsystem code $Q$ implies existence of a pure stabilizer code with parameters $[[n, k+r, \geq d]]_{q}$ for $n \geq 2$ and $d \geq 2$ by using [2, Theorem 2. and Theorem 5.]. By [5, Theorem 70], there exist a pure stabilizer code with parameters $[[n-1, k+$ $r+1, \geq d-1]]_{q}$. This stabilizer code can be seen as an $[[n-1, k+r+1,0, \geq d-1]]_{q}$ subsystem code. By using [2. Theorem 3.], there exists a pure $\mathbf{F}_{q}$-linear subsystem code with parameters $[[n-1, k+1, r, \geq d-1]]_{q}$ that proves the claim.

We can also prove the previous Theorem by defining a new code $C_{p}$ from the code $C$ as follows.

Theorem 11: If there exists a pure subsystem code $Q=$ $A \otimes B$ with parameters $((n, K, R, d))_{q}$ with $n \geq 2$ and $d \geq 2$, then there is a subsystem code $Q_{p}$ with parameters $((n-$ $1, K, q R, \geq d-1))_{q}$.

Proof: By Theorem 6, if an $((n, K, R, d))_{q}$ subsystem code $Q$ exists for $K>1$ and $1 \leq R<K$, then there exists an additive code $C \in \mathbf{F}_{q}^{2 n}$ and its subcode $D \leq \mathbf{F}_{q}^{2 n}$ such that $|C|=q^{n} R / K$ and $|D|=\left|C \cap C^{\perp_{s}}\right|=q^{n} / K R$. Furthermore, $d=\operatorname{minswt}\left(D^{\perp_{s}} \backslash C\right)$. Let $w=\left(w_{1}, w_{2}, \ldots, w_{n}\right)$ and $u=$ $\left(u_{1}, u_{2}, \ldots, u_{n}\right)$ be two vectors in $\mathbf{F}_{q}^{n}$. W.l.g., we can assume that the code $D^{\perp_{s}}$ is defined as

$$
D^{\perp_{s}}=\left\{(u \mid w) \in \mathbf{F}_{q}^{2 n} \mid w, u \in \mathbf{F}_{q}^{n}\right\}
$$

Let $w_{-1}=\left(w_{1}, w_{2}, \ldots, w_{n-1}\right)$ and $u_{-1}=$ $\left(u_{1}, u_{2}, \ldots, u_{n-1}\right)$ be two vectors in $\mathbf{F}_{q}^{n-1}$. Also, let $D_{p}^{\perp_{s}}$ be the code obtained by puncturing the first coordinate of $D^{\perp_{s}}$, hence

$$
D_{p}^{\perp_{s}}=\left\{\left(u_{-1} \mid w_{-1}\right) \in \mathbf{F}_{q}^{2 n-2} \mid w_{-1}, u_{-1} \in \mathbf{F}_{q}^{n-1}\right\}
$$

since the minimum distance of $D^{\perp_{s}}$ is at least 2 , it follows that $\left|D_{p}^{\perp_{s}}\right|=\left|D^{\perp_{s}}\right|=K^{2}|C|=K^{2} q^{n} R / K=q^{n} R K$ and the minimum distance of $D_{p}^{\perp_{s}}$ is at least $d-1$. Now, let us
construct the dual code of $D_{p}^{\perp_{s}}$ as follows.

$$
\begin{aligned}
\left(D_{p}^{\perp_{s}}\right)^{\perp_{s}}= & \left\{\left(u_{-1} \mid w_{-1}\right) \in \mathbf{F}_{q}^{2 n-2} \mid\right. \\
& \left.\left(0 u_{-1} \mid 0 w_{-1}\right) \in D, w_{-1}, u_{-1} \in \mathbf{F}_{q}^{n-1}\right\}
\end{aligned}
$$

Furthermore, if $\left(u_{-1} \mid w_{-1}\right) \in D_{p}$, then $\left(0 u_{-1} \mid 0 w_{-1}\right) \in D$. Therefore, $D_{p}$ is a self-orthogonal code and it has size given by

$$
\left|D_{p}\right|=q^{2 n-2} /\left|D_{p}^{\perp_{s}}\right|=q^{n-2} / R K
$$

We can also puncture the code $C$ to the code $C_{p}$ at the first coordinate, hence

$$
\begin{aligned}
C_{p}= & \left\{\left(u_{-1} \mid w_{-1}\right) \in \mathbf{F}_{q}^{2 n-2} \mid w_{-1}, u_{-1} \in \mathbf{F}_{q}^{n-1}\right. \\
& \left.\left(a w_{-1} \mid b u_{-1}\right) \in C, a, b \in F_{q}\right\} .
\end{aligned}
$$

Clearly, $D \subseteq C$ and if $a=b=0$, then the vector $\left(0 u_{-1} \mid 0 w_{-1}\right) \in D$, therefore, $\left(u_{-1}, w_{-1}\right) \in D_{p}$. This gives us that $D_{p} \subseteq C_{p}$. Furthermore, hence $|C|=\left|C_{p}\right|$. The dual code $C_{p}^{\perp_{s}}$ can be defined as

$$
\begin{aligned}
C_{p}^{\perp_{s}}= & \left\{\left(u_{-1} \mid w_{-1}\right) \in \mathbf{F}_{q}^{2 n-2} \mid w_{-1}, u_{-1} \in \mathbf{F}_{q}^{n-1}\right. \\
& \left.\left(e w_{-1} \mid f u_{-1}\right) \in C^{\perp_{s}}, e, f \in F_{q}\right\}
\end{aligned}
$$

Also, if $e=f=0$, then $D_{p} \subseteq C_{p}^{\perp_{s}}$, furthermore,

$$
\begin{align*}
D_{p}^{\perp s}= & C_{p} \cup C_{p}^{\perp_{s}}=\left\{\left(u_{-1} \mid w_{-1}\right) \in \mathbf{F}_{q}^{2 n-2} \mid\right.  \tag{2}\\
& \left.\left(0 u_{-1} \mid 0 w_{-1}\right) \in D\right\} \tag{3}
\end{align*}
$$

Therefore there exists a subsystem code $Q_{p}=A_{p} \otimes B_{p}$. Also, the code $D_{p}^{\perp_{s}}$ is pure and has minimum distance at least $d-1$. We can proceed and compute the dimension of subsystem $A_{p}$ and co-subsystem $B_{p}$ from Theorem 6 as follows.
(i) $K_{p} \quad=\quad q^{n-1} / \sqrt{\left|C_{p}\right|\left|D_{p}\right|} \quad=$ $q^{n-1} / \sqrt{\left(q^{n} R / K\right)\left(q^{n-2} / R K\right)}=K$,
(ii) $R_{p}=\left(\left|C_{p}\right| /\left|D_{p}^{\prime}\right|\right)^{1 / 2}=\left(\left(q^{n} R / K\right) /\left(q^{n-2} / R K\right)\right)^{1 / 2}=$ $q R$,
(iii) $d_{p}=\operatorname{swt}\left(\left(D_{p}\right)^{\perp_{s}} \backslash C_{p}\right)=\operatorname{swt}\left(\left(D^{\perp_{s}} \backslash C_{p}\right)\right) \geq d-1$.

Therefore, there exists a subsystem cod with parameters $((n-1, K, q R, \geq d-1))_{q}$.

The minimum distance condition follows since the code $Q$ has $d=\operatorname{minswt}\left(D^{\perp_{s}} \backslash C\right)$ and the code $Q_{p}$ has minimum distance as $Q$ reduced by one. So, the minimum weight of $D_{p}^{\perp_{s}} \backslash C_{p}$ is at least the minimum weight of $\left(D^{\perp_{s}} \backslash C\right)-1$

$$
\begin{aligned}
d_{p} & =\operatorname{minswt}\left(D_{p}^{\perp_{s}} \backslash C_{p}\right) \\
& \geq \operatorname{minswt}\left(D^{\perp_{s}} \backslash C\right)-1=d-1
\end{aligned}
$$

If the code $Q$ is pure, then $\min \operatorname{swt}\left(D^{\perp_{s}}\right)=d$, therefore, the new code $Q_{p}$ is pure since $d_{p}=\operatorname{minswt}\left(D_{p}^{\perp_{s}}\right) \geq d$.

We conclude that if there is a subsystem code with parameters $((n-1, K, q R, \geq d-1))_{q}$, using [2, Theorem 2.], there exists a code with parameters $((n-1, q K, R, \geq d-1))_{q}$.

## C. Reducing Dimension

We also can reduce dimension of the subsystem code for fixed length $n$ and minimum distance $d$, and still obtain a new subsystem code with improved minimum distance as shown in the following results.

Theorem 12: If a (pure) $\mathbf{F}_{q}$-linear $[[n, k, r, d]]_{q}$ subsystem code $Q$ exists for $d \geq 2$, then there exists an $\mathbf{F}_{q}$-linear $[[n, k-$ $\left.\left.1, r, d_{e}\right]\right]_{q}$ subsystem code $Q_{e}$ (pure to d) such that $d_{e} \geq d$.

Proof: Existence of the $[[n, k, r, d]]_{q}$ subsystem code $Q$, implies existence of two additive codes $C \leq \mathbf{F}_{q}^{2 n}$ and $D \leq$ $\mathbf{F}_{q}^{2 n}$ such that $|C|=q^{n-k+r}$ and $|D|=\left|C \cap C^{\perp_{s}}\right|=q^{n-k-r}$. Furthermore, $d=\operatorname{minswt}\left(D^{\perp_{s}} \backslash C\right)$ and $D \subseteq D^{\perp_{s}}$.

The idea of the proof comes by extending the code $D$ by some vectors from $D^{\perp_{s}} \backslash\left(C \cup C^{\perp_{s}}\right)$. Let us choose a code $D_{e}$ of size $\left|q^{n+1-r-k}\right|=q|D|$. We also ensure that the code $D_{e}$ is self-orthogonal. Clearly extending the code $D$ to $D_{e}$ will extend both the codes $C$ and $C^{\perp_{s}}$ to $C_{e}$ and $C_{e}^{\perp_{s}}$, respectively. Hence $C_{e}=q|C|=q^{n+1+r-k}$ and $D_{e}=C_{e} \cap C_{e}^{\perp s}$.

There exists a subsystem code $Q_{e}$ stabilized by the code $C_{e}$. The result follows by computing parameters of the subsystem code $Q_{e}=A_{e} \otimes B_{e}$.
(i) $K_{e}=$ $=\quad q^{n} / \sqrt{\left|C_{e}\right|\left|D_{e}\right|}$ $q^{n} /\left(\left(q^{n+1+r-k}\right)\left(q^{n+1-k-r}\right)\right)^{1 / 2}=q^{k-1}$,
(ii) $R_{e}=\left(\left|C_{e}\right| /\left|D_{e}\right|\right)^{1 / 2}$ $\left(\left(q^{n+1} R / K\right) /\left(q^{n+1} / R K\right)\right)^{1 / 2}=q^{r}$,
(iii) $d_{e}=\operatorname{swt}\left(\left(D_{e}\right)^{\perp_{s}} \backslash C_{e}\right) \geq \operatorname{swt}\left(\left(D^{\perp_{s}} \backslash C_{e}\right)\right)=d$. If the inequality holds, then the code is pure to $d$.
Arguably, It follows that the set $\left(D_{e}^{\perp_{s}} \backslash C_{e}\right)$ is a subset of the set $D^{\perp_{s}} \backslash C$ because $C \leq C_{e}$, hence the minimum weight $d_{e}$ is at least $d$.

Lemma 13: Suppose an $[[n, k, r, d]]_{q}$ linear pure subsystem code $Q$ exists generated by the two codes $C, D \leq \mathbf{F}_{q}^{2 n}$. Then there exist linear $\left[\left[n-m, k^{\prime}, r^{\prime}, d^{\prime}\right]\right]_{q}$ and $\left[\left[n-m, k^{\prime}+r^{\prime}-\right.\right.$ $\left.\left.r^{\prime \prime}, r^{\prime \prime}, d^{\prime}\right]\right]_{q}$ subsystem codes with $k^{\prime} \geq k-m, r^{\prime} \geq r, 0 \leq$ $r^{\prime \prime}<k^{\prime}+r^{\prime}$, and $d^{\prime} \geq d$ for any integer $m$ such that there exists a codeword of weight $m$ in $\left(D^{\perp_{s}} \backslash C\right)$.

Proof: [Sketch] This lemma 13 can be proved easily by mapping the subsystem code $Q$ into a stabilizer code. By using [4, Theorem 7.], and the new resulting stabilizer code can be mapped again to a subsystem code with the required parameters.

## D. Combining Subsystem Codes

We can also construct new subsystem codes from given two subsystem codes. The following theorem shows that two subsystem codes can be merged together into one subsystem code with possibly improved distance or dimension.

Theorem 14: Let $Q_{1}$ and $Q_{2}$ be two pure subsystem codes with parameters $\left[\left[n_{1}, k_{1}, r_{1}, d_{1}\right]\right]_{2}$ and $\left[\left[n_{2}, k_{2}, r_{2}, d_{2}\right]\right]_{2}$ for $k_{2}+r_{2} \leq n_{1}$, respectively. Then there exists a subsystem code with parameters $\left[\left[n_{1}+n_{2}-k_{2}-r_{2}, k_{1}+r_{1}-r, r, d\right]\right]_{2}$, where $d \geq \min \left\{d_{1}, d_{1}+d_{2}-k_{2}-r_{2}\right\}$ and $0 \leq r<k_{1}+r_{1}$.

Proof: Existence of an $\left[\left[n_{i}, k_{i}, r_{i}, d_{i}\right]\right]_{2}$ pure subsystem code $Q_{i}$ for $i \in\{1,2\}$, implies existence of a pure stabilizer code $S_{i}$ with parameters $\left[\left[n_{i}, k_{i}+r_{i}, d_{i}\right]\right]_{2}$ with $k_{2}+r_{2} \leq n_{1}$, see [2]. Therefore, by [4, Theorem 8.], there exists a stabilizer
code with parameters $\left[\left[n_{1}+n_{2}-k_{2}-r_{2}, k_{1}+r_{1}, d\right]\right]_{2}, d \geq$ $\min \left\{d_{1}, d_{1}+d_{2}-k_{2}-r_{2}\right\}$. But this code gives us a subsystem code with parameters $\left[\left[n_{1}+n_{2}-k_{2}-r_{2}, k_{1}+r_{1}-r, r, \geq d\right]\right]_{2}$ with $k_{2}+r_{2} \leq n_{1}$ and $0 \leq r<k_{1}+r_{1}$ that proves the claim.

Theorem 15: Let $Q_{1}$ and $Q_{2}$ be two pure subsystem codes with parameters $\left[\left[n, k_{1}, r_{1}, d_{1}\right]\right]_{q}$ and $\left[\left[n, k_{2}, r_{2}, d_{2}\right]\right]_{q}$, respectively. If $Q_{2} \subseteq Q_{1}$, then there exists an [[2n, $k_{1}+k_{2}+r_{1}+$ $\left.\left.r_{2}-r, r, d\right]\right]_{q}$ pure subsystem code with minimum distance $d \geq \min \left\{d_{1}, 2 d_{2}\right\}$ and $0 \leq r<k_{1}+k_{2}+r_{1}+r_{2}$.

Proof: Existence of a pure subsystem code with parameters $\left[\left[n, k_{i}, r_{i}, d_{i}\right]\right]_{q}$ implies existence of a pure stabilizer code with parameters $\left[\left[n, k_{i}+r_{i}, d_{i}\right]\right]_{q}$ using [2, Theorem 4.]. But by using [5] Lemma 74.], there exists a pure stabilizer code with parameters $\left[\left[2 n, k_{1}+k_{2}+r_{1}+r_{2}, d\right]\right]_{q}$ with $d \geq \min \left\{2 d_{2}, d_{1}\right\}$. By [2, Theorem 2., Corollary 6.], there must exist a pure subsystem code with parameters $\left[\left[2 n, k_{1}+k_{2}+r_{1}+r_{2}-r, r, d\right]\right]_{q}$ where $d \geq \min \left\{2 d_{2}, d_{1}\right\}$ and $0 \leq r<k_{1}+k_{2}+r_{1}+r_{2}$, which proves the claim.

We can recall the trace alternative product between two codewords of a classical code and the proof of Theorem 15 can be stated as follows.

Lemma 16: Let $Q_{1}$ and $Q_{2}$ be two pure subsystem codes with parameters $\left[\left[n, k_{1}, r_{1}, d_{1}\right]\right]_{q}$ and $\left[\left[n, k_{2}, r_{2}, d_{2}\right]\right]_{q}$, respectively. If $Q_{2} \subseteq Q_{1}$, then there exists an $\left[\left[2 n, k_{1}+k_{2}, r_{1}+\right.\right.$ $\left.\left.r_{2}, d\right]\right]_{q}$ pure subsystem code with minimum distance $d \geq$ $\min \left\{d_{1}, 2 d_{2}\right\}$.

Proof: Existence of the code $Q_{i}$ with parameters $\left[\left[n, K_{i}, R_{i}, d_{i}\right]\right]_{q}$ implies existence of two additive codes $C_{i}$ and $D_{i}$ for $i \in\{1,2\}$ such that $\left|C_{i}\right|=q^{n} R_{i} / K_{i}$ and $\left|D_{i}\right|=\left|C \cup C^{\perp_{s}}\right|=q^{n} / R_{i} K_{i}$.

We know that there exist additive linear codes $D_{i} \subseteq D_{i}^{\perp a}$, $D_{i} \subseteq C_{i}$, and $D_{i} \subseteq C_{i}^{\perp_{a}}$. Furthermore, $D_{i}=C_{i} \cap C_{i}^{\perp a}$ and $d_{i}=w t\left(D_{i}^{\perp a} \backslash C_{i}\right)$. Also, $C_{i}=q^{n+r_{i}-k_{i}}$ and $|D|=q^{n-r_{i}-k_{i}}$.

Using the direct sum definition between to linear codes, let us construct a code $D$ based on $D_{1}$ and $D_{2}$ as

$$
D=\left\{(u, u+v) \mid u \in D_{1}, v \in D_{2}\right\} \leq \mathbf{F}_{q^{2}}^{2 n}
$$

The code $D$ has size of $|D|=q^{2 n-\left(r_{1}+r_{2}+k_{1}+k_{2}\right)=\left|D_{1}\right|\left|D_{2}\right|}$. Also, we can define the code $C$ based on the codes $C_{1}$ and $C_{2}$ as

$$
C=\left\{(a, a+b) \mid a \in C_{1}, b \in C_{2}\right\} \leq \mathbf{F}_{q^{2}}^{2 n} .
$$

The code $C$ is of size $|C|=\left|C_{1}\right|\left|C_{2}\right|=q^{2 n+r_{1}+r_{2}-k_{1}-k_{2}}$. But the trace-alternating dual of the code $D$ is

$$
D^{\perp_{a}}=\left\{\left(u^{\prime}+v^{\prime} \mid, v^{\prime}\right) \mid u^{\prime} \in D_{1}^{\perp_{a}}, v^{\prime} \in D_{2}^{\perp_{a}}\right\}
$$

We notice that $\left(u^{\prime}+v^{\prime}, v^{\prime}\right)$ is orthogonal to $(u, u+v)$ because, from properties of the product,

$$
\begin{aligned}
\left\langle(u, u+v) \mid\left(u^{\prime}+v^{\prime}, v^{\prime}\right)\right\rangle_{a} & =\left\langle u \mid u^{\prime}+v^{\prime}\right\rangle_{a}+\left\langle u+v \mid v^{\prime}\right\rangle_{a} \\
& =0
\end{aligned}
$$

holds for $u \in D_{1}, v \in D_{2}, u^{\prime} \in D_{1}^{\perp_{a}}$, and $v^{\prime} \in D_{2}^{\perp_{a}}$.

Therefore, $D \subseteq D^{\perp_{a}}$ is a self-orthogonal code with respect to the trace alternating product. Furthermore, $C^{\perp_{a}}=\left\{\left(a^{\prime}+\right.\right.$ $\left.\left.b^{\prime}, b^{\prime}\right) \mid a^{\prime} \in C_{1}^{\perp_{a}}, b^{\prime} \in C_{2}^{\perp_{a}}\right\}$. Hence, $C \cap C^{\perp_{a}}=\{(a, a+$ b) $\left.\cap\left(a a+b^{\prime}, b^{\prime}\right)\right\}=D$. Therefore, there exists an $\mathbf{F}_{q}$-linear subsystem code $Q=A \otimes B$ with the following parameters.
i)

$$
\begin{aligned}
K & =|A|=q^{2 n} /(|C||D|)^{1 / 2} \\
& =\frac{q^{2 n}}{\sqrt{\left(q^{2 n} R_{1} R_{2} / K_{1} K_{2}\right)\left(q^{2 n} / K_{1} K_{2} R_{1} R_{2}\right)}} \\
& =\frac{q^{2 n}}{\sqrt{q^{2 n+r_{1}+r_{2}-k_{1}-k_{2}} q^{2 n-r_{1}-r_{2}-k_{1}-k_{2}}}} \\
& =q^{k_{1} k_{2}}=K_{1} K_{2} .
\end{aligned}
$$

ii) $R=\left(\frac{|C|}{|D|}\right)^{1 / 2}=R_{1} R_{2}$.
iii) the minimum distance is a direct consequence.

Theorem 17: If there exist two pure subsystem quantum codes $Q_{1}$ and $Q_{2}$ with parameters $\left[\left[n_{1}, k_{1}, r_{1}, d_{1}\right]\right]_{q}$ and $\left[\left[n_{2}, k_{2}, r_{2}, d_{2}\right]\right]_{q}$, respectively. Then there exists a pure subsystem code $Q^{\prime}$ with parameters $\left[\left[n_{1}+n_{2}, k_{1}+k_{2}+r_{1}+r_{2}-r, r, \geq\right.\right.$ $\left.\left.\min \left(d_{1}, d_{2}\right)\right]\right]_{q}$.

Proof: This Lemma can be proved easily from [2, Theorem 5.] and [5, Lemma 73.]. The idea is to map a pure subsystem code to a pure stabilizer code, and once again map the pure stabilizer code to a pure subsystem code.

Theorem 18: If there exist two pure subsystem quantum codes $Q_{1}$ and $Q_{2}$ with parameters $\left[\left[n_{1}, k_{1}, r_{1}, d_{1}\right]\right]_{q}$ and $\left[\left[n_{2}, k_{2}, r_{2}, d_{2}\right]\right]_{q}$, respectively. Then there exists a pure subsystem code $Q^{\prime}$ with parameters $\left[\left[n_{1}+n_{2}, k_{1}+k_{2}, r_{1}+r_{2}, \geq\right.\right.$ $\left.\left.\min \left(d_{1}, d_{2}\right)\right]\right]_{q}$.

Proof: Existence of the code $Q_{i}$ with parameters $\left[\left[n, K_{i}, R_{i}, d_{i}\right]\right]_{q}$ implies existence of two additive codes $C_{i}$ and $D_{i}$ for $i \in\{1,2\}$ such that $\left|C_{i}\right|=q^{n} R_{i} / K_{i}$ and $\left|D_{i}\right|=\left|C \cup C^{\perp_{s}}\right|=q^{n} / R_{i} K_{i}$.

Let us choose the codes $C$ and $D$ as follows.

$$
C=C_{1} \oplus C_{2}=\left\{u v \mid v \in C_{1}, v \in C_{2}\right\}
$$

and

$$
D=D_{1} \oplus D_{2}=\left\{a b \mid a \in D_{1}, b \in C_{2}\right\}
$$

respectively. From this construction, and since $D_{1}$ and $D_{2}$ are self-orthogonal codes, it follows that $D$ is also a selforthogonal code. Furthermore, $D_{1} \subseteq C_{1}$ and $D_{2} \subseteq C_{2}$, then

$$
D_{1} \oplus D_{2} \subseteq C_{1} \oplus C_{2}
$$

hence $D \subseteq C$. The code $C$ is of size

$$
\begin{aligned}
|C| & =\left|C_{1}\right|\left|C_{2}\right|=q^{\left(n_{1}+n_{2}\right)-\left(k_{1}+k_{2}\right)+\left(r_{1}+r_{2}\right)} \\
& =q^{n_{1}} q^{n_{2}} R_{1} R_{2} / K_{1} K_{2}
\end{aligned}
$$

and $D$ is of size

$$
\begin{aligned}
|D| & =\left|D_{1}\right|\left|D_{2}\right|=q^{\left(n_{1}+n_{2}\right)-\left(k_{1}+k_{2}\right)-\left(r_{1}+r_{2}\right)} \\
& =q^{n_{1}} q^{n_{2}} / R_{1} R_{2} K_{1} K_{2}
\end{aligned}
$$

On the other hand,

$$
C^{\perp_{s}}=\left(C_{1} \oplus C_{2}\right)^{\perp_{s}}=C_{2}^{\perp_{s}} \oplus C_{1}^{\perp_{s}} \supseteq D_{2} \oplus D_{1}
$$

Furthermore, $C \cap C^{\perp_{s}}=\left(C_{1} \oplus C_{2}\right) \cap\left(C_{2}^{\perp_{s}} \cap C_{1}^{\perp_{s}}\right)=D$.
Therefore, there exists a subsystem code $Q=A \otimes B$ with the following parameters.
i)

$$
\begin{aligned}
K & =|A|=q^{n_{1}+n_{2}} /(|C||D|)^{1 / 2} \\
& =\frac{q^{n_{1}+n_{2}}}{\sqrt{\left(q^{n_{1}+n_{2}} R_{1} R_{2} / K_{1} K_{2}\right)\left(q^{n_{1}+n_{2}} / K_{1} K_{2} R_{1} R_{2}\right)}} \\
& =\frac{q^{n_{1}+n_{2}}}{\sqrt{q^{n_{1}+n_{2}+r_{1}+r_{2}-k_{1}-k_{2}} q^{n_{1}+n_{2}-r_{1}-r_{2}-k_{1}-k_{2}}}} \\
& =q^{k_{1} k_{2}}=K_{1} K_{2}=\left|A_{1}\right|\left|A_{2}\right| .
\end{aligned}
$$

ii)

$$
\begin{aligned}
R & =\left(\frac{|C|}{|D|}\right)^{1 / 2}=\sqrt{\frac{q^{n_{1}} q^{n_{2}} R_{1} R_{2} / K_{1} K_{2}}{q^{n_{1}} q^{n_{2}} / R_{1} R_{2} K_{1} K_{2}}} \\
& =R_{1} R_{2}=\left|B_{1}\right|\left|B_{2}\right|
\end{aligned}
$$

iii) the minimum weight of $D^{\perp_{s}} \backslash C$ is at least the minimum weight of $D_{1}^{\perp_{s}} \backslash C_{1}$ or $D_{2}^{\perp_{s}} \backslash C_{2}$.

$$
\begin{aligned}
d & =\min \left\{\operatorname{swt}\left(D_{1}^{\perp_{s}} \backslash C_{1}\right),\left(D_{2}^{\perp_{s}} \backslash C_{2}\right)\right\} \\
& \geq \min \left\{d_{1}, d_{2}\right\}
\end{aligned}
$$

Theorem 19: Given two pure subsystem codes $Q_{1}$ and $Q_{2}$ with parameters $\left[\left[n_{1}, k_{1}, r_{1}, d_{1}\right]\right]_{q}$ and $\left[\left[n_{2}, k_{2}, r_{2}, d_{2}\right]\right]_{q}$, respectively, with $k_{2} \leq n_{1}$. An $\left[\left[n_{1}+n_{2}-k_{2}, k_{1}+r_{1}+r_{2}-\right.\right.$ $r, r, d]]_{q}$ subsystem code exists such that $d \geq \min \left\{d_{1}, d_{1}+\right.$ $\left.d_{2}-k_{2}\right\}$ and $0 \leq r<k_{1}+r_{1}+r_{2}$.

Proof: The proof is a direct consequence as shown in the previous theorems.

Theorem 20: If an $((n, K, R, d))_{q^{m}}$ pure subsystem code exists, then there exists a pure subsystem code with parameters $((n m, K, R, \geq d))_{q}$. Consequently, if a pure subsystem code with parameters $((n m, K, R, \geq d))_{q}$ exists, then there exist a subsystem code with parameters $((n, K, R, \geq\lfloor d / m\rfloor))_{q^{m}} .$.

Proof: Existence of a pure subsystem code with parameters $((n, K, R, d))_{q^{m}}$ implies existence of a pure stabilizer code with parameters $((n, K R, d))_{q^{m}}$ using [2], Theorem 5.]. By [5, Lemma 76.], there exists a stabilizer code with parameters $((n m, K R, \geq d))_{q}$. From [2, Theorem 2,5.], there exists a pure subsystem code with parameters $((n m, K, R, \geq d))_{q}$ that proves the first claim. By [5, Lemma 76.] and [2, Theorem $2,5$.$] , and repeating the same proof, the second claim is a$ consequence.
[t]

## III. Special and Short Subsystem Codes $[[8,1,2,3]]_{2}$ AND $[[6,1,1,3]]_{3}$

In this section we present the shortest subsystem codes over $\mathbf{F}_{2}$ and $\mathbf{F}_{3}$ fields. Theorem 5 implies that a stabilizer code with parameters $[[n, k, d]]_{q}$ gives subsystem codes with parameters $[[n, k-r, r, d]]_{q}$, see the tables in [1].

| $\mathrm{n} \backslash \mathrm{k}$ | $\mathrm{k}-1$ | k | $\mathrm{k}+1$ |
| :---: | :---: | :---: | :---: |
| $\mathrm{n}-1$ | $[r+2, d-1]_{q}$ | $[\leq r+2, d]_{q},[r+1, d-1]_{q}$ | $[r, d-1]_{q}$ |
| n | $[r+1, d]_{q},[r+1, \geq d]_{q}$ | $[r, d]_{q} \rightarrow[\leq r, \geq d]_{q}$ | $[r-1, d]_{q}$ |
|  |  | $\rightarrow[\geq r, \leq d]_{q}$ |  |
| $\mathrm{n}+1$ | $[\geq r, \geq d]_{q}$ | $[\geq r, d]_{q},[r, \geq d]_{q}$ |  |

Fig. 2. Existence of subsystem propagation rules

Consider a stabilizer code with parameters $[[8,3,3]]_{2}$. This code can be used to derive $[[8,2,1,3]]_{2}$ and $[[8,1,2,3]]_{2}$ subsystem codes. We give an explicit construction of these codes. Further, we claim that $[[8,1,2,3]]_{2}$ and $[[8,2,1,3]]_{2}$ are the shortest nontrivial binary subsystem codes. We show the stabilizer and normalizer matrices for these codes. Also, we prove their minimum distances using the weight enumeration of these codes. We present two codes with less length, however we can not tolerate more than 2 gauge qubits. The following example shows $[[8,1,2,3]]$ short subsystem code over $\mathbf{F}_{2}$.

Example 21:

$$
\begin{align*}
& D_{S}=\left[\begin{array}{llllllll}
X & I & Y & I & Z & Y & X & Z \\
Y & I & Y & X & I & Z & Z & X \\
I & X & Y & Y & Z & X & Z & I \\
I & Y & I & Z & Y & X & X & Z \\
I & I & X & Z & X & Y & Z & Y
\end{array}\right]  \tag{4}\\
& D_{S}^{\perp}=\left[\begin{array}{llllllll}
X & I & I & I & I & I & Z & Y \\
Y & I & I & I & I & Y & X & X \\
I & X & I & I & I & Y & Y & X \\
I & Y & I & I & I & I & X & Z \\
I & I & X & I & I & Y & Z & I \\
I & I & Y & I & I & I & Z & X \\
I & I & I & X & I & Y & I & Z \\
I & I & I & Y & I & Y & Y & Y \\
I & I & I & I & X & I & Y & Z \\
I & I & I & I & Y & Y & Z & Z \\
I & I & I & I & I & Z & X & Y
\end{array}\right]  \tag{5}\\
& C_{S}=\left[\begin{array}{llllllll}
X & I & Y & I & Z & Y & X & Z \\
Y & I & Y & X & I & Z & Z & X \\
I & X & Y & Y & Z & X & Z & I \\
I & Y & I & Z & Y & X & X & Z \\
I & I & X & Z & X & Y & Z & Y \\
\hline Y & I & I & I & I & Y & X & X \\
I & X & I & I & I & Y & Y & X
\end{array}\right]  \tag{6}\\
& C_{S}^{\perp}=\left[\begin{array}{llllllll}
X & I & Y & I & Z & Y & X & Z \\
Y & I & Y & X & I & Z & Z & X \\
I & X & Y & Y & Z & X & Z & I \\
I & Y & I & Z & Y & X & X & Z \\
I & I & X & Z & X & Y & Z & Y \\
\hline X & I & I & I & I & I & Z & Y \\
I & I & I & Y & I & Y & Y & Y
\end{array}\right] \tag{7}
\end{align*}
$$

We notice that the matrix $D_{S}$ generates the code $D=C \cap$ $C^{\perp_{s}}$. Furthermore, dimensions of the subsystems $A$ and $B$ are
given by $k=\operatorname{dim} D^{\perp_{s}}-\operatorname{dim} C=(11-7) / 2=2$ and $r=$ $\operatorname{dim} C-\operatorname{dim} D=(7-5) / 2=1$. Hence we have $[[8,2,1,3]]_{2}$ and $[[8,1,2,3]]_{2}$ subsystem codes.

We show that the subsystem codes $[[8,1,2,3]]_{2}$ is not better than the stabilizer code $[[8,3,3]]_{2}$ in terms of syndrome measurement. The reason is that the former needs $8-1-2=5$ syndrome measurements, while the later needs also $8-3=5$ measurements. This is an obvious example where subsystem codes have no superiority in terms of syndrome measurements.

We post an open question regarding the threshold value and fault tolerant gate operations for this code. We do not know at this time if the code $[[8,1,2,3]]_{2}$ has better threshold value and less fault-tolerant operations. Also, does the subsystem code with parameters $[[8,1,3,3]]_{2}$ exist?

No nontrivial $[[7,1,1,3]]_{2}$ exists. There exists a trivial $[[7,1,1,3]]_{2}$ code obtained by simply extending the $[[7,1,3]]_{2}$ code as the $[[5,1,3]]_{2}$ code. We show the smallest subsystem code with length 7 must have at most minimum weight equals to 2 . Since $[[7,2,2]]_{2}$ exists, then we can construct the stabilizer and normalizer matrices as follows.

$$
\begin{align*}
D_{S} & =\left[\begin{array}{lllllll}
X & X & X & X & I & I & I \\
Y & Y & Y & Y & I & I & I \\
I & I & I & I & X & I & I \\
I & I & I & I & I & X & I \\
I & I & I & I & I & I & X
\end{array}\right]  \tag{8}\\
D_{S}^{\perp} & =\left[\begin{array}{lllllll}
X & I & I & X & I & I & I \\
Y & I & I & Y & I & I & I \\
I & X & I & X & I & I & I \\
I & Y & I & Y & I & I & I \\
I & I & X & X & I & I & I \\
I & I & Y & Y & I & I & I \\
I & I & I & I & X & I & I \\
I & I & I & I & I & X & I \\
I & I & I & I & I & I & X
\end{array}\right] \tag{9}
\end{align*}
$$

Clearly, from our construction and using Theorem 55 there must exist a subsystem code with parameters $k$ and $r$ given as follows. $\operatorname{dim} D^{\perp_{s}}=9 / 2$ and $\operatorname{dim} C=7 / 2$. Also, $\operatorname{dim} D=$ $5 / 2$ and $\min \left(D^{\perp_{s}} \backslash C\right)=2$. Therefore,,$k=(9-7) / 2=1$ and $r=(7-5) / 2=1$. Consequently, the parameters of the subsystem code are $[[7,1,1,2]]_{2}$.

This example shows $[[6,1,1,3]]$ short subsystem code over $\mathrm{F}_{3}$.

Example 22: We give a nontrivial short subsystem code over $\mathbf{F}_{3}$. This is derived from the $[[6,2,3]]_{3}$ graph quantum
code. Also, we show in [1] an example for an $[[6,1,1,3]]_{7}$ subsystem code over $\mathbf{F}_{7}$. Consider the field $\mathbf{F}_{3}$ and let $C \subseteq$ $\mathbf{F}_{3}^{12}$ be a linear code defined by the following generator matrix.
$C=\left[\begin{array}{llllll|llllll}1 & 0 & 0 & 0 & 2 & 0 & 0 & 2 & 0 & 2 & 0 & 2 \\ 0 & 1 & 0 & 0 & 0 & 2 & 1 & 0 & 1 & 0 & 1 & 0 \\ 0 & 0 & 1 & 0 & 2 & 0 & 0 & 1 & 0 & 1 & 0 & 1 \\ 0 & 0 & 0 & 1 & 0 & 2 & 2 & 0 & 2 & 0 & 2 & 0 \\ \hline 0 & 0 & 0 & 0 & 1 & 0 & 0 & 2 & 0 & 1 & 0 & 0 \\ 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 1 & 0\end{array}\right]=\left[\begin{array}{c}S \\ \hline X_{1} \\ Z_{1}\end{array}\right]$.
Let the symplectic inner product $\langle(a \mid b) \mid(c \mid d)\rangle_{s}=a \cdot d-b \cdot c$. Then the symplectic dual of $C$ is generated by

$$
C^{\perp_{s}}=\left[\begin{array}{c}
S \\
\hline X_{2} \\
Z_{2}
\end{array}\right]
$$

where $X_{2}=\left[\begin{array}{llllll|llllll}0 & 0 & 0 & 0 & 0 & 1 & 1 & 0 & 2 & 0 & 0 & 0\end{array}\right]$ and
$Z_{2}=\left[\begin{array}{llllll|llllll}0 & 0 & 0 & 0 & 0 & 0 & 0 & 1 & 0 & 1 & 0 & 1\end{array}\right]$. The matrix $S$ generates the code $D=C \cap C^{\perp_{s}}$. Now $D$ defines a $[[6,2,3]]_{3}$ stabilizer code. Therefore, $\operatorname{swt}\left(D^{\perp_{s}} \backslash D\right)=3$. It follows that $\operatorname{swt}\left(D^{\perp_{s}} \backslash C\right) \geq \operatorname{swt}\left(D^{\perp_{s}}\right)=3$. By [3, Theorem 4], we have a $\left[\left[6,\left(\operatorname{dim} D^{\perp_{s}}-\operatorname{dim} C\right) / 2,(\operatorname{dim} C-\operatorname{dim} D) / 2,3\right]\right]_{3}$ viz. a $[[6,1,1,3]]_{3}$ subsystem code.

We can also have a trivial $[[6,1,1,3]]_{2}$ code. This trivial extension seems to argue against the usefulness of subsystem codes and if they will really lead to improvement in performance. An obvious open question is if there exist nontrivial $[[6,1,1,3]]_{2}$ or $[[7,1,1,3]]_{2}$ subsystem codes.
