The Bi-Musquash Conjecture

by Jon Henry Sanders jon\_sanders@partech.com

## Bi-Musquash Conjecture

A construction (attributed to Conway) for 'doubling' a thrackled m-gon of odd length m to get a thrackled 2mgon (of even length) was given in [1]. Has anyone noticed that if this construction is applied to an odd length musquash we get a 'bi-musquash', i.e., a thrackled  $n$ -gon,  $n = 2m$ , m odd, with the property that row 1 of the intersection table generates the odd rows and row 2 generates the even rows? More precisely, for the definition of a 'bi-musquash' we require that  $\cdot$ :

(d') If  $e_1$  intersects edges in the order:  $e_{k1}, \ldots, e_{kn-3}$ , and  $e_2$  intersects edges in the order  $e_{j1}, \ldots, e_{jn-3}$  then for (odd)  $i = 3, 5, \ldots, n-1$ , edge *ei* intersects edges in the order  $e_{k_1+i-1}, \ldots, e_{k_n-3+i-1}$ , and for (even)  $i = 4, \ldots, i$ *. . , n,* edge *e*i intersects edges in the order : *ej*1+*i−*2*, . . . , ejn−*3+*i−*2 , where the edge subscripts are computed modulo *n*. Note that by this definition, an even musquash is automatically a bi-musquash. Remarks of [2,3] imply that bi-musquashes must have n/2 rotational symmetry and indeed the drawing of the bi-musquash of length 14 [Fig.1], as well the 'chordal representation'  $2$  of it's Gauss word [Fig.2] exhibit this. I guess the conjecture to prove<sup>3</sup> would be that bi- musquashes do not exist for  $n = 4m$  and that they are essentially<sup>4</sup> unique for each n, with  $n = 2 \pmod{4}$ . The intersection table of bi-musquash 14 is shown below.

8	$\overline{ }$	12	5	10	3	13	6			9
9	8	6	13	$\overline{4}$	11		14	5	12	10
10	9	14	7	12	5		8	13	6	11
11		8	┑	6	13		$\overline{2}$	7	14	12
12		$\mathbf{2}$	9	14	$\overline{7}$	3	10	1	8	13
13	12	10	3	8	1	11	$\overline{4}$	9	$\mathbf{2}$	14
14	13	$\overline{4}$		$\overline{2}$	9	5	12	3	10	$\mathbf{1}$
$\mathbf{1}$	14	12	5	10	3	13	6		$\overline{4}$	2
⌒	$\mathbf 1$	6	13	$\overline{4}$		7	14	5	12	3
	2	14	7	12	5		$8\,$	13	6	4
4	3	8	┑	6	13	9	$\mathbf{2}$	7	14	
	4	$\overline{2}$	9	14	7	3	10		8	6
	5	10		8		11	4	9	っ	
	6	4		⌒		5	12	3		8

Intersection Table of Bi-Musquash 14

The first two rows generate the table in the required way. In general, the conjecture is that the first two rows (generators) of a bi-musquash of length 2p, p odd, are either:

## SET1

**Row 1:**  $p+1$ ,  $p$ ,  $2p-2$ ,  $p-2$ ,  $2p-4$ ,  $p-4$ ,  $\ldots$ ,  $p+3$ ,  $3$ ,  $2p-1$ ,  $p-1$ ,  $2p-3$ ,  $p-3$ ,  $\ldots$ ,  $p+4$ ,  $4$ ,  $p+2$ **Row 2:**  $p+2$ ,  $p+1$ ,  $p-1$ ,  $2p-1$ ,  $p-3$ ,  $2p-3$ , ...,  $4$ ,  $p+4$ ,  $p$ ,  $2p$ ,  $p-2$ ,  $2p-2$ , ...,  $5$ ,  $p+5$ ,  $p+3$ 

or

## SET2 **Row 1:**  $p$ ,  $2p-2$ ,  $p-2$ ,  $2p-4$ ,  $p-4$ , ...,  $p+3$ ,  $3$ ,  $2p-1$ ,  $p-1$ ,  $2p-3$ ,  $p-3$ , ...,  $p+4$ ,  $4$ ,  $p+2$ ,  $p+1$ **Row 2:** p+1, p-1,2p-1, p-3,2p-3,..., 4,p+4, p, 2p,p-2,2p-2,...,5,p+5,p+3,p+2,

each giving rise to a mirror image of the other.

gon". Thus the case  $n = 6$  of the bi-musquash conjecture needs to be modified appropriately.

<sup>&</sup>lt;sup>1</sup> This is a modification of condition (d) of [2].

<sup>2</sup> i.e., the arrangement of the symbols of a Gauss word around a circle with a chord drawn between each pair of identical symbols

 $3$  G. Cairns has pointed out to me that " there are two inequivalent musquash of the 6-gon; one being the Conway doubling of the 3-

i.e., there exist precisely two and they are reflections of each other
