

# MULTICOMPLEXES AND SPECTRAL SEQUENCES

DAVID E. HURTUBISE

ABSTRACT. In this note we discuss examples of multicomplexes whose differentials differ from those in the associated spectral sequence. The examples are constructed from an explicit algebraic example of a double complex whose associated spectral sequence has a nonzero  $d^2$  differential.

## 1. INTRODUCTION

Let  $R$  be a principal ideal domain. A first quadrant **multicomplex**  $X$  is a bigraded  $R$ -module  $\{X_{p,q}\}_{p,q \in \mathbb{Z}_+}$  with differentials

$$d_i : X_{p,q} \rightarrow X_{p-i,q+i-1} \quad \text{for all } i = 0, 1, \dots$$

that satisfy

$$\sum_{i+j=n} d_i d_j = 0 \quad \text{for all } n.$$

A first quadrant multicomplex such that  $d_i = 0$  for all  $i \geq 2$  is called a **double complex** (or a **bicomplex**). For the basic properties of multicomplexes we refer the reader to [22, 2] and [55, 5].

An  $E^k$  first quadrant **spectral sequence** is a sequence of bigraded  $R$ -modules  $\{E_{s,t}^r\}_{s,t \in \mathbb{Z}_+}$  with differentials

$$d^r : E_{s,t}^r \rightarrow E_{s-r,t+r-1}^r$$

such that for all  $r \geq k$  there is a given isomorphism  $H(E^r) \approx E^{r+1}$  [66, 6]. Every first quadrant multicomplex determines an  $E^0$  first quadrant spectral sequence. However, not every first quadrant spectral sequence comes from a multicomplex.

Moreover, the differentials  $d^r$  in the spectral sequence associated to a first quadrant multicomplex are in general different from the homomorphisms induced by the differentials  $d_i$  in the multicomplex. (Note that using the term **differential** to describe the homomorphisms  $d_i$  in a multicomplex is misleading since there is no guarantee that  $(d_i)^2$  is zero.) The purpose of this note is to demonstrate this distinction by presenting explicit algebraic examples of multicomplexes where the differential  $d^r$  in the associated spectral sequence is different than the homomorphism induced by  $d_r$ .

The motivation for constructing examples that show the distinction between multicomplexes and their associated spectral sequences comes from the author's work on

Morse-Bott homology with A. Banyaga [11, 1] and the discovery that the Morse-Bott-Smale chain complex is in fact a multicomplex. For more details see the introduction to [11, 1].

## 2. THE SPECTRAL SEQUENCE ASSOCIATED TO A FILTERED CHAIN COMPLEX

In this section we clarify the meaning (and the bigrading) of the isomorphism  $H(E^r) \approx E^{r+1}$ , and we recall the definition of the differentials  $d^r : E_{s,t}^r \rightarrow E_{s-r,t+r-1}^r$  in an  $E^k$  spectral sequence coming from a filtered chain complex. This section follows Chapter 9 of [66, 6].

An  $E^k$  spectral sequence consists of a sequence of bigraded modules  $\{E_{s,t}^r\}$  over a principal ideal domain  $R$  for  $r \geq k$ . The grading  $s$  is called the **filtered degree**, the grading  $t$  is called the **complementary degree**, and the sum  $s+t$  is called the **total degree**. The differential  $d^r : E_{s,t}^r \rightarrow E_{s-r,t+r-1}^r$  satisfies  $(d^r)^2 = 0$ . If we define

$$\begin{aligned}\bar{Z}_{s,t}^r &= \ker(d^r : E_{s,t}^k \rightarrow E_{s-r,t+r-1}) \\ \bar{B}_{s,t}^r &= \text{im}(d^r : E_{s,t}^k \rightarrow E_{s-r,t+r-1}),\end{aligned}$$

then  $\bar{B}_{s,t}^r \subseteq \bar{Z}_{s,t}^r$ , and by definition there is a given isomorphism  $E_{s,t}^{r+1} \approx \bar{Z}_{s,t}^r / \bar{B}_{s,t}^r$ .

Let  $(C_*, \partial)$  be a filtered chain complex that is bounded below by  $s = 0$ . That is, suppose that we have a filtration

$$F_0 C_* \subset \cdots \subset F_{s-1} C_* \subset F_s C_* \subset F_{s+1} C_* \subset \cdots$$

where  $F_s C_*$  is a chain subcomplex of  $C_*$  for all  $s$ , i.e.  $\partial(F_s C_{s+t}) \subseteq F_s C_{s+t-1}$  for all  $t$ . The filtration is said to be **convergent** if  $\bigcap_s F_s C_* = 0$  and  $\bigcup_s F_s C_* = C_*$ . Define

$$\begin{aligned}Z_{s,t}^r &= \{c \in F_s C_{s+t} \mid \partial c \in F_{s-r} C_{s+t-1}\} \\ Z_{s,t}^\infty &= \{c \in F_s C_{s+t} \mid \partial c = 0\}.\end{aligned}$$

The bigraded  $R$ -modules in the spectral sequence associated to the filtration are defined as

$$\begin{aligned}E_{s,t}^r &= Z_{s,t}^r / (Z_{s-1,t+1}^{r-1} + \partial Z_{s+r-1,t-r+2}^{r-1}) \\ E_{s,t}^\infty &= Z_{s,t}^\infty / (Z_{s-1,t+1}^\infty + (\partial C_{s+t+1} \cap F_s C_{s+t})),\end{aligned}$$

where  $A + B$  denotes the free abelian group generated by the elements of  $A$  and  $B$ , and the differential  $d^r : E_{s,t}^r \rightarrow E_{s-r,t+r-1}^r$  is defined by the following diagram.

$$\begin{array}{ccc} Z_{s,t}^r & \xrightarrow{\quad \partial \quad} & Z_{s-r,t+r-1}^r \\ \downarrow & & \downarrow \\ Z_{s,t}^r / (Z_{s-1,t+1}^{r-1} + \partial Z_{s+r-1,t-r+2}^{r-1}) & \xrightarrow{d^r} & Z_{s-r,t+r-1}^r / (Z_{s-r-1,t+r}^{r-1} + \partial Z_{s-1,t+1}^{r-1}) \end{array}$$

The  $R$ -module  $E_{s,t}^r$  is isomorphic to  $\bar{Z}_{s,t}^{r-1} / \bar{B}_{s,t}^{r-1}$  via an isomorphism given by the Noether Isomorphism Theorem.

For a proof of the following theorem see Section 9.1 of [66, 6].

**Theorem 1.** *If the filtration on the chain complex  $(C_*, \partial)$  is convergent and bounded below, then the above spectral sequence converges to the bigraded  $R$ -module  $GH_*(C_*, \partial)$  associated to the filtration  $F_s H_*(C_*, \partial) \equiv \text{im}[H_*(F_s C_*, \partial) \rightarrow H_*(C_*, \partial)]$ . That is,*

$$E_{s,t}^\infty \approx \bigcap_r Z_{s,t}^r / \bigcup_r (Z_{s-1,t+1}^{r-1} + \partial Z_{s+r-1,t-r+2}^{r-1}) \approx GH_*(C_*, \partial)_{s,t}$$

where  $GH_*(C_*, \partial)_{s,t} \equiv F_s H_{s+t}(C_*, \partial) / F_{s-1} H_{s+t}(C_*, \partial)$ .

### 3. THE SPECTRAL SEQUENCE ASSOCIATED TO A MULTICOMPLEX

A first quadrant multicomplex  $(\{X_{p,q}\}_{p,q \in \mathbb{Z}_+}, \{d_i\}_{i \in \mathbb{Z}_+})$  can be **assembled** to form a filtered chain complex  $((CX)_*, \partial)$  by summing along the diagonals. That is, suppose that we are given a bigraded  $R$ -module  $\{X_{p,q}\}_{p,q \in \mathbb{Z}_+}$  and homomorphisms

$$d_i : X_{p,q} \rightarrow X_{p-i,q+i-1} \quad \text{for all } i = 0, 1, \dots$$

that satisfy

$$\sum_{i+j=n} d_i d_j = 0 \quad \text{for all } n.$$

$$\begin{array}{ccccccc} \vdots & & \vdots & & \vdots & & \vdots \\ X_{0,3} & \xleftarrow{d_1} & X_{1,3} & \xleftarrow{d_1} & X_{2,3} & \xleftarrow{d_1} & X_{3,3} & \cdots \\ \downarrow d_0 & \swarrow d_0 & \downarrow d_0 & \swarrow d_2 & \downarrow d_0 & \swarrow d_2 & \downarrow d_0 & \\ X_{0,2} & \xleftarrow{d_1} & X_{1,2} & \xleftarrow{d_1} & X_{2,2} & \xleftarrow{d_1} & X_{3,2} & \cdots \\ \downarrow d_0 & \swarrow d_0 & \downarrow d_0 & \swarrow d_2 & \downarrow d_0 & \swarrow d_3 & \downarrow d_0 & \\ X_{0,1} & \xleftarrow{d_1} & X_{1,1} & \xleftarrow{d_1} & X_{2,1} & \xleftarrow{d_1} & X_{3,1} & \cdots \\ \downarrow d_0 & \swarrow d_0 & \downarrow d_0 & \swarrow d_2 & \downarrow d_0 & \swarrow d_3 & \downarrow d_0 & \\ X_{0,0} & \xleftarrow{d_1} & X_{1,0} & \xleftarrow{d_1} & X_{2,0} & \xleftarrow{d_1} & X_{3,0} & \cdots \end{array}$$

If we define

$$(CX)_n \equiv \bigoplus_{p+q=n} X_{p,q}$$

and  $\partial_n = d_0 \oplus \cdots \oplus d_n$  for  $n \in \mathbb{Z}_+$ , then the above relations imply that  $\partial_n \circ \partial_{n+1} = 0$ .

$$\begin{array}{ccccccc}
\cdots & X_{3,0} & \xrightarrow{d_0} & 0 & & & \\
& \oplus & \searrow^{d_1} & \oplus & & & \\
\cdots & X_{2,1} & \xrightarrow{d_0} & X_{2,0} & \xrightarrow{d_0} & 0 & \\
& \oplus & \searrow^{d_1} & \oplus & \searrow^{d_1} & \oplus & \\
\cdots & X_{1,2} & \xrightarrow{d_0} & X_{1,1} & \xrightarrow{d_0} & X_{1,0} & \xrightarrow{d_0} & 0 \\
& \oplus & \searrow^{d_1} & \oplus & \searrow^{d_1} & \oplus & \searrow^{d_1} & \oplus \\
\cdots & X_{0,3} & \xrightarrow{d_0} & X_{0,2} & \xrightarrow{d_0} & X_{0,1} & \xrightarrow{d_0} & X_{0,0} & \xrightarrow{d_0} & 0 \\
& \parallel & & \parallel & & \parallel & & \parallel & & \parallel \\
\cdots & (CX)_3 & \xrightarrow{\partial_3} & (CX)_2 & \xrightarrow{\partial_2} & (CX)_1 & \xrightarrow{\partial_1} & (CX)_0 & \xrightarrow{\partial_0} & 0
\end{array}$$

Moreover, the chain complex  $((CX)_*, \partial)$  has an obvious filtration given by

$$F_s(CX)_n \equiv \bigoplus_{\substack{p+q=n \\ p \leq s}} X_{p,q}.$$

Note that the restriction  $q \leq s$  determines a second filtration on a double complex, but it does **not** determine a filtration on a general multicomplex.

The bigraded module associated to the above filtration is

$$G((CX)_*)_{s,t} = F_s(CX)_{s+t}/F_{s-1}(CX)_{s+t} \approx X_{s,t}$$

for  $s, t \in \mathbb{Z}_+$ , and the  $E^1$  term of the associated spectral sequence is given by

$$E_{s,t}^1 = Z_{s,t}^1 / (Z_{s-1,t+1}^0 + \partial Z_{s,t+1}^0)$$

where

$$Z_{s,t}^1 = \{c \in F_s(CX)_{s+t} \mid \partial c \in F_{s-1}(CX)_{s+t-1}\}$$

and

$$Z_{s,t}^0 = \{c \in F_s(CX)_{s+t} \mid \partial c \in F_s(CX)_{s+t-1}\} = F_s(CX)_{s+t}.$$

The group  $Z_{s,t}^1/Z_{s-1,t+1}^0$  is the group of  $(s+t)$ -cycles in the quotient chain complex  $F_s(CX)_*/F_{s-1}(CX)_*$ , and the group of  $(s+t)$ -boundaries in  $F_s(CX)_*/F_{s-1}(CX)_*$  is

$$\partial Z_{s,t+1}^0 / (Z_{s-1,t+1}^0 \cap \partial Z_{s,t+1}^0) \approx (Z_{s-1,t+1}^0 + \partial Z_{s,t+1}^0) / Z_{s-1,t+1}^0$$

where the isomorphism is given by the Noether Isomorphism Theorem. Therefore,

$$\begin{aligned} E_{s,t}^1 &= Z_{s,t}^1 / (Z_{s-1,t+1}^0 + \partial Z_{s,t+1}^0) \\ &\approx \frac{Z_{s,t}^1 / Z_{s-1,t+1}^0}{(Z_{s-1,t+1}^0 + \partial Z_{s,t+1}^0) / Z_{s-1,t+1}^0} \\ &\approx \frac{Z_{s,t}^1 / Z_{s-1,t+1}^0}{\partial Z_{s,t+1}^0 / (Z_{s-1,t+1}^0 \cap \partial Z_{s,t+1}^0)} \end{aligned}$$

and we see that  $E_{s,t}^1 \approx H_{s+t}(X_{s,*}, d_0)$  where  $(X_{s,*}, d_0)$  denotes the chain complex

$$\cdots \xrightarrow{d_0} X_{s,3} \xrightarrow{d_0} X_{s,2} \xrightarrow{d_0} X_{s,1} \xrightarrow{d_0} X_{s,0} \xrightarrow{d_0} 0.$$

The differential  $d^1$  on the  $E^1$  term of the spectral sequence is defined by the following diagram

$$\begin{array}{ccc} Z_{s,t}^1 & \xrightarrow{\quad \partial \quad} & Z_{s-1,t}^1 \\ \downarrow & & \downarrow \\ Z_{s,t}^1 / (Z_{s-1,t+1}^0 + \partial Z_{s,t+1}^0) & \xrightarrow{d^1} & Z_{s-1,t}^1 / (Z_{s-2,t+1}^0 + \partial Z_{s-1,t+1}^0) \end{array}$$

and it is natural to ask whether or not there is a connection between the differential  $d^1 : E_{s,t}^1 \rightarrow E_{s-1,t}^1$  in the spectral sequence and the homomorphism  $d_1 : X_{s,t} \rightarrow X_{s-1,t}$  in the multicomplex.

It is an easy exercise to show that the relations

$$\begin{aligned} d_0 d_1 + d_1 d_0 &= 0 \\ d_0 d_2 + d_1 d_1 + d_2 d_0 &= 0 \end{aligned}$$

imply that the homomorphism  $d_1$  induces a differential  $\bar{d}_1 : E_{s,t}^1 \rightarrow E_{s-1,t}^1$ , i.e.  $(\bar{d}_1)^2 = 0$ . Moreover, one can show that the differential  $\bar{d}_1$  coincides with the differential  $d^1 : E_{s,t}^1 \rightarrow E_{s-1,t}^1$ . This is a standard fact for double complexes, and the proof for double complexes carries over to multicomplexes (see for instance Section 14 of [33, 3], or Section 3.2.1 of [44, 4]). Thus, we have the following.

**Theorem 2.** *Let  $(\{X_{p,q}\}_{p,q \in \mathbb{Z}_+}, \{d_i\}_{i \in \mathbb{Z}_+})$  be a first quadrant multicomplex and  $((CX)_*, \partial)$  the associated assembled chain complex. Then the  $E^1$  term of the spectral sequence associated to the filtration of  $(CX)_*$  determined by the restriction  $p \leq s$  is given by  $E_{s,t}^1 \approx H_{s+t}(X_{s,*}, d_0)$  where  $(X_{s,*}, d_0)$  denotes the following chain complex.*

$$\cdots \xrightarrow{d_0} X_{s,3} \xrightarrow{d_0} X_{s,2} \xrightarrow{d_0} X_{s,1} \xrightarrow{d_0} X_{s,0} \xrightarrow{d_0} 0$$

Moreover, the  $d^1$  differential on the  $E^1$  term of the spectral sequence is induced from the homomorphism  $d_1$  in the multicomplex.

4. MULTICOMPLEXES WHERE  $d^r \neq d_r$ 

Theorem 2 should sound familiar to anyone acquainted with double complexes. However, the examples in this section show that Theorem 2 does **not** generalize to include the higher differentials in the spectral sequence associated to a multicomplex. In fact, the pattern suggested by Theorem 2 breaks down when  $r = 2$ . That is, the differential  $d^r$  in the spectral sequence is **not** necessarily induced from the homomorphism  $d_r$  when  $r \geq 2$ . To paraphrase Section 11 of [22, 2], when  $r \geq 2$  the differential  $d^r$  is induced from  $d_r$  only on those classes which contain elements  $x$  such that  $d_i(x) = 0$  for all  $i < r$  “which rarely happens”.

**Example 3** (A double complex with  $d^2 \neq 0$ ).

It is well known that the spectral sequence associated to a double complex does not necessarily degenerate at  $E^2$ . That is, there is no guarantee that  $d^r = 0$  for  $r \geq 2$ . This first example is a small algebraic example that demonstrates this phenomena.

Consider the following first quadrant double complex

$$\begin{array}{ccccc}
 & & d_1 & & d_1 & & \\
 & & \longleftarrow & & \longleftarrow & & \\
 0 & & & 0 & & 0 & \\
 \downarrow d_0 & & & \downarrow d_0 & & \downarrow d_0 & \\
 \langle x_{0,1} \rangle & \xleftarrow{d_1} & \langle x_{1,1} \rangle & \xleftarrow{d_1} & 0 & & \\
 \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 & & \\
 0 & \xleftarrow{d_1} & \langle x_{1,0} \rangle & \xleftarrow{d_1} & \langle x_{2,0} \rangle & & 
 \end{array}$$

where  $\langle x_{p,q} \rangle$  denotes the free abelian group generated by  $x_{p,q}$ , the groups  $X_{p,q} = 0$  for  $p + q > 2$ , and the homomorphisms  $d_0$  and  $d_1$  satisfy the following:  $d_0(x_{1,1}) = x_{1,0}$ ,  $d_1(x_{1,1}) = x_{0,1}$ , and  $d_1(x_{2,0}) = x_{1,0}$ . The conditions  $(d_0)^2 = (d_1)^2 = 0$  and  $d_0d_1 + d_1d_0 = 0$  are satisfied trivially, and the assembled chain complex associated to this double complex is as follows.

$$\begin{array}{cccccccc}
 \dots & 0 & \xrightarrow{d_0} & 0 & & & & \\
 & \oplus & \searrow d_1 & \oplus & & & & \\
 \dots & 0 & \xrightarrow{d_0} & \langle x_{2,0} \rangle & \xrightarrow{d_0} & 0 & & \\
 & \oplus & \searrow d_1 & \oplus & \searrow d_1 & \oplus & & \\
 \dots & 0 & \xrightarrow{d_0} & \langle x_{1,1} \rangle & \xrightarrow{d_0} & \langle x_{1,0} \rangle & \xrightarrow{d_0} & 0 \\
 & \oplus & \searrow d_1 & \oplus & \searrow d_1 & \oplus & \searrow d_1 & \oplus \\
 \dots & 0 & \xrightarrow{d_0} & 0 & \xrightarrow{d_0} & \langle x_{0,1} \rangle & \xrightarrow{d_0} & 0 \xrightarrow{d_0} 0 \\
 & \parallel & & \parallel & & \parallel & & \parallel \\
 \dots & 0 & \xrightarrow{\partial_3} & (CX)_2 & \xrightarrow{\partial_2} & (CX)_1 & \xrightarrow{\partial_1} & 0 \xrightarrow{\partial_0} 0
 \end{array}$$

To see this pick any  $r \in \mathbb{Z}_+$  with  $r \geq 2$ , and consider the following first quadrant double complex

$$\begin{array}{ccccccccccc}
 0 & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & \cdots & \xleftarrow{d_1} & 0 \\
 \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 & & & & \downarrow d_0 \\
 \langle x_{0,r-1} \rangle & \xleftarrow{d_1} & \langle x_{1,r-1} \rangle & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & \cdots & \xleftarrow{d_1} & 0 \\
 \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 & & & & \downarrow d_0 \\
 0 & \xleftarrow{d_1} & \langle x_{1,r-2} \rangle & \xleftarrow{d_1} & \langle x_{2,r-2} \rangle & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & \cdots & \xleftarrow{d_1} & 0 \\
 \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 & & & & \downarrow d_0 \\
 \vdots & & \vdots & & \vdots & & \vdots & & & & \vdots \\
 \downarrow d_0 & & & & \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 \\
 0 & \xleftarrow{d_1} & \cdots & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & \langle x_{r-2,1} \rangle & \xleftarrow{d_1} & \langle x_{r-1,1} \rangle & \xleftarrow{d_1} & 0 \\
 \downarrow d_0 & & & & \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 \\
 0 & \xleftarrow{d_1} & \cdots & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & \langle x_{r-1,0} \rangle & \xleftarrow{d_1} & \langle x_{r,0} \rangle
 \end{array}$$

where the groups  $X_{p,q} = 0$  for  $p + q > r$  and the homomorphisms  $d_0$  and  $d_1$  satisfy the following for  $p + q = r$ .

$$\begin{aligned}
 d_0(x_{p,q}) &= x_{p,q-1} \\
 d_1(x_{p,q}) &= x_{p-1,q}
 \end{aligned}$$

The conditions  $(d_0)^2 = (d_1)^2 = 0$  and  $d_0d_1 + d_1d_0 = 0$  are satisfied trivially, and the assembled chain complex associated to this double complex is as follows.

$$\begin{array}{ccccccc}
 \dots & 0 & \xrightarrow{d_0} & 0 & & & \\
 & \oplus & \searrow^{d_1} & \oplus & & & \\
 \dots & 0 & \xrightarrow{d_0} & \langle x_{r,0} \rangle & \xrightarrow{d_0} & 0 & \\
 & \oplus & \searrow^{d_1} & \oplus & \searrow^{d_1} & \oplus & \\
 \dots & 0 & \xrightarrow{d_0} & \langle x_{r-1,1} \rangle & \xrightarrow{d_0} & \langle x_{r-1,0} \rangle & \xrightarrow{d_0} & 0 \\
 & & \searrow^{d_1} & & \searrow^{d_1} & & \searrow^{d_1} & \\
 & \vdots & & \vdots & & \vdots & & \vdots \\
 & \oplus & & \oplus & & \oplus & & \oplus \\
 \dots & 0 & \xrightarrow{d_0} & \langle x_{1,r-1} \rangle & \xrightarrow{d_0} & \langle x_{1,r-2} \rangle & \xrightarrow{d_0} & 0 & \dots \\
 & \oplus & \searrow^{d_1} & \oplus & \searrow^{d_1} & \oplus & \searrow^{d_1} & \oplus & \\
 \dots & 0 & \xrightarrow{d_0} & 0 & \xrightarrow{d_0} & \langle x_{0,r-1} \rangle & \xrightarrow{d_0} & 0 & \dots \\
 & \parallel & & \parallel & & \parallel & & \parallel & \\
 \dots & 0 & \xrightarrow{\partial_{r+1}} & (CX)_r & \xrightarrow{\partial_r} & (CX)_{r-1} & \xrightarrow{\partial_{r-1}} & 0 & \dots
 \end{array}$$

As in the previous example, the homology  $H_n((CX)_*, \partial)$  of the assembled chain complex is trivial for all  $n \in \mathbb{Z}_+$  because the kernel of  $\partial_r$  is trivial and all the generators  $x_{0,r-1}, x_{1,r-2}, \dots, x_{r-1,0}$  of  $(CX)_{r-1}$  are in the image of  $\partial_r$ . The  $E^1$  term of the associated spectral sequence has  $E_{0,r-1}^1 = \langle x_{0,r-1} \rangle$ ,  $E_{r,0}^1 = \langle x_{r,0} \rangle$ , and  $E_{s,t}^1 = 0$  for all other values of  $s$  and  $t$ . Moreover,  $E^1 \approx E^2 \approx \dots \approx E^{r-1}$ . Once again, Theorem 1 implies that the differential  $d^r$  must be nonzero (even though  $d_r = 0$ ), and as in the previous example, the diagram

$$\begin{array}{ccc}
 Z_{r,0}^r & \xrightarrow{\partial} & Z_{0,r-1}^r \\
 \downarrow & & \downarrow \\
 Z_{r,0}^r / (Z_{r-1,1}^{r-1} + \partial Z_{2r-1,-r+2}^{r-1}) & \xrightarrow{d^r} & Z_{0,r-1}^r / (Z_{-1,r}^{r-1} + \partial Z_{r-1,1}^{r-1})
 \end{array}$$

can be used to show that  $d^r$  is surjective. (Note that  $Z_{r,0}^r$  is generated by  $x_{1,r-1} - x_{2,r-2} + \dots + (-1)^{r-1}x_{r,0}$ .)

**Example 5** (Multicomplexes with  $d_r \neq 0$  and  $d^i = 0$  for all  $i \geq 2$ ).

The preceding examples show that the spectral sequence associated to a multicomplex with  $d_r = 0$  for all  $r \geq 2$  may not degenerate at  $E^2$  (or even  $E^r$  where  $r$  is arbitrarily large). These examples can be modified to show that there exist multicomplexes where  $d_r \neq 0$  for  $r$  arbitrarily large but the associated spectral sequences degenerate at  $E^2$ .

We begin with a multicomplex where  $d_2 \neq 0$  but its associated spectral sequence degenerates at  $E^2$ . Consider the following first quadrant multicomplex

$$\begin{array}{ccccccc}
 & & 0 & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & 0 \\
 & & \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 \\
 & & \langle x_{0,1} \rangle & \xleftarrow{d_1} & \langle x_{1,1} \rangle & \xleftarrow{d_1} & 0 \\
 & & \downarrow d_0 & \swarrow d_0 & \downarrow d_0 & \searrow d_2 & \downarrow d_0 \\
 & & 0 & \xleftarrow{d_1} & \langle x_{1,0} \rangle & \xleftarrow{d_1} & \langle x_{2,0} \rangle
 \end{array}$$

where the groups  $X_{p,q} = 0$  for  $p+q > 2$ , the homomorphisms  $d_0$  and  $d_1$  are the same as in Example 3, and  $d_2(x_{2,0}) = x_{0,1}$ . The homomorphisms  $d_i : X_{p,q} \rightarrow X_{p-i,q+i-1}$  satisfy  $\sum_{i+j=n} d_i d_j = 0$  for all  $n$  trivially, and the assembled chain complex associated to this multicomplex is as follows.

$$\begin{array}{ccccccccccc}
 \dots & 0 & \xrightarrow{d_0} & 0 & & & & & & & \\
 & \oplus & \searrow d_1 & \oplus & & & & & & & \\
 \dots & 0 & \xrightarrow{d_0} & \langle x_{2,0} \rangle & \xrightarrow{d_0} & 0 & & & & & \\
 & \oplus & \searrow d_1 & \oplus & \searrow d_1 & \oplus & & & & & \\
 \dots & 0 & \xrightarrow{d_0} & \langle x_{1,1} \rangle & \xrightarrow{d_0} & \langle x_{1,0} \rangle & \xrightarrow{d_0} & 0 & & & \\
 & \oplus & \searrow d_1 & \oplus & \searrow d_1 & \oplus & \searrow d_1 & \oplus & & & \\
 \dots & 0 & \xrightarrow{d_0} & 0 & \xrightarrow{d_0} & \langle x_{0,1} \rangle & \xrightarrow{d_0} & 0 & \xrightarrow{d_0} & 0 & \\
 & \parallel & & \parallel & & \parallel & & \parallel & & \parallel & \\
 \dots & 0 & \xrightarrow{\partial_3} & (CX)_2 & \xrightarrow{\partial_2} & (CX)_1 & \xrightarrow{\partial_1} & 0 & \xrightarrow{\partial_0} & 0 & 
 \end{array}$$

Referring back to Example 3 we see that the diagram

$$\begin{array}{ccc}
 Z_{2,0}^r & \xrightarrow{\partial} & Z_{2-r,r-1}^r \\
 \downarrow & & \downarrow \\
 Z_{2,0}^r / (Z_{1,1}^{r-1} + \partial Z_{r+1,-r+2}^{r-1}) & \xrightarrow{d^r} & Z_{2-r,r-1}^r / (Z_{1-r,r}^{r-1} + \partial Z_{1,1}^{r-1})
 \end{array}$$

shows that  $d^r = 0$  for all  $r \geq 2$  since  $\partial_2(x_{1,1} - x_{2,0}) = 0$ , and hence the associated spectral sequence degenerates at  $E^2$ .

To generalize this example to produce a multicomplex where  $d_r \neq 0$  for  $r$  arbitrarily large but the associated spectral sequence still degenerates at  $E^2$  we start with the double complex from Example 4 and add a single homomorphism  $d_r$  defined by  $d_r(x_{r,0}) = (-1)^r x_{0,r-1}$ . Further details are left to the reader.

**Example 6** (A multicomplex with  $d^2 \neq 0$ ,  $d_2 \neq 0$  and  $d^2 \neq d_2$ ).

Consider the following first quadrant multicomplex

$$\begin{array}{ccccccc}
 & & 0 & \xleftarrow{d_1} & 0 & \xleftarrow{d_1} & 0 \\
 & & \downarrow d_0 & & \downarrow d_0 & & \downarrow d_0 \\
 & & \langle x_{0,1}, \tilde{x}_{0,1} \rangle & \xleftarrow{d_1} & \langle x_{1,1} \rangle & \xleftarrow{d_1} & 0 \\
 & & \downarrow d_0 & \swarrow & \downarrow d_0 & \searrow d_2 & \downarrow d_0 \\
 & & 0 & \xleftarrow{d_1} & \langle x_{1,0} \rangle & \xleftarrow{d_1} & \langle x_{2,0}, \tilde{x}_{2,0} \rangle
 \end{array}$$

where the groups  $X_{p,q} = 0$  for  $p + q > 2$ , and the homomorphisms  $d_i$  for  $i = 0, 1, 2$  satisfy the following.

$$\begin{aligned}
 d_0(x_{1,1}) &= x_{1,0} \\
 d_1(x_{1,1}) &= x_{0,1} \\
 d_1(x_{2,0}) &= x_{1,0} \\
 d_1(\tilde{x}_{2,0}) &= 0 \\
 d_2(\tilde{x}_{2,0}) &= \tilde{x}_{0,1} \\
 d_2(x_{2,0}) &= 0
 \end{aligned}$$

The homomorphisms  $d_i : X_{p,q} \rightarrow X_{p-i,q+i-1}$  satisfy  $\sum_{i+j=n} d_i d_j = 0$  for all  $n$  trivially, and the assembled chain complex associated to this multicomplex is as follows.

$$\begin{array}{cccccccc}
 \dots & 0 & \xrightarrow{d_0} & 0 & & & & \\
 & \oplus & \searrow d_1 & \oplus & & & & \\
 \dots & 0 & \xrightarrow{d_0} & \langle x_{2,0}, \tilde{x}_{2,0} \rangle & \xrightarrow{d_0} & 0 & & \\
 & \oplus & \searrow d_1 & \oplus & \searrow d_1 & \oplus & & \\
 \dots & 0 & \xrightarrow{d_0} & \langle x_{1,1} \rangle & \xrightarrow{d_0} & \langle x_{1,0} \rangle & \xrightarrow{d_0} & 0 \\
 & \oplus & \searrow d_1 & \oplus & \searrow d_1 & \oplus & \searrow d_1 & \oplus \\
 \dots & 0 & \xrightarrow{d_0} & 0 & \xrightarrow{d_0} & \langle x_{0,1}, \tilde{x}_{0,1} \rangle & \xrightarrow{d_0} & 0 \xrightarrow{d_0} 0 \\
 & \parallel & & \parallel & & \parallel & & \parallel \\
 \dots & 0 & \xrightarrow{\partial_3} & (CX)_2 & \xrightarrow{\partial_2} & (CX)_1 & \xrightarrow{\partial_1} & 0 \xrightarrow{\partial_0} 0
 \end{array}$$
