# Discrete realization of group symmetric LOCC-detection of maximally entangled state 

Masahito Hayashi ${ }^{1, *}$<br>${ }^{1}$ Graduate School of Information Sciences, Tohoku University, Aoba-ku, Sendai, 980-8579, Japan

Group symmetric LOCC measurement for detecting maximally entangled state is considered. Usually, this type measurement has continuous-valued outcomes. However, any realizable measurement has finite-valued outcomes. This paper proposes discrete realizations of such a group symmetric LOCC measurement.

## I. INTRODUCTION

Testing of maximally entangled state is a useful method for guaranteeing the quality of generated maximally entangled states. However, if we require a group symmetric condition for this method, the optimal test often requires infinite-valued measurement. Since any realizable measurement has a finite number of outcomes, it is needed to discretize the optimal measurement.

Now, we focus on the bipartite system $\mathcal{H}_{d} \otimes \mathcal{H}_{d}$, in which, the party $A$ and $B$ have the computational bases $\left\{|i\rangle_{A}\right\}_{i=0}^{d-1}$ and $\left\{|i\rangle_{B}\right\}_{i=0}^{d-1}$, respectively. When our target is testing whether the generated state is sufficiently close to the maximal entangled state

$$
\left|\phi_{A B}^{0}\right\rangle=\frac{1}{\sqrt{d}} \sum_{i=0}^{d-1}|i\rangle_{A} \otimes|i\rangle_{B}
$$

under a group symmetric condition, the optimal test can be given by

$$
\begin{align*}
T_{i n v}^{1, A \rightarrow B} & :=\int d|\varphi \otimes \bar{\varphi}\rangle\langle\varphi \otimes \bar{\varphi}| \nu(d \varphi) \\
& =\left|\phi_{A, B}^{0}\right\rangle\left\langle\phi_{A, B}^{0}\right|+\frac{1}{d+1}\left(I-\left|\phi_{A, B}^{0}\right\rangle\left\langle\phi_{A, B}^{0}\right|\right), \tag{1}
\end{align*}
$$

where $\nu$ is the group invariant probability measure on the set of pure states, and $\varphi$ and $\bar{\varphi}$ are given as $\varphi=$ $\sum_{i=0}^{d-1} \varphi_{i}|i\rangle_{A}$ and $\bar{\varphi}=\sum_{i=0}^{d-1} \overline{\varphi_{i}}|i\rangle_{B}$. This measurement can be realized by the following procedure. In the first step, the system $A$ performs the local group covariant measurement $\int d|\varphi\rangle\langle\varphi| \nu(d \varphi)$, and sends the system $B$ the outcome $\varphi$. In the second step, the system $B$ performs the two-valued measurement $\{|\bar{\varphi}\rangle\langle\bar{\varphi}|, I-|\bar{\varphi}\rangle\langle\bar{\varphi}|\}$. When Bob obtains the event corresponding to $\{|\bar{\varphi}\rangle\langle\bar{\varphi}|$, we support the maximal entangled state $\left|\phi_{A B}^{0}\right\rangle$.

This detection procedure can be generalize as follows. First, Alice performs a local measurement:

$$
M=\left\{p_{i}\left|u_{i}\right\rangle\left\langle u_{i}\right|\right\}_{i}, \quad\left\|u_{i}\right\|=1, \quad 0 \leq p_{i} \leq 1
$$

and sends Bob the outcome $i$. Bob perform the twovalued measurement $\left\{\left|\overline{u_{i}}\right\rangle\left\langle\overline{u_{i}}\right|, I-\left|\overline{u_{i}}\right\rangle\left\langle\overline{u_{i}}\right|\right\}$. When Bob

[^0]obtain the event corresponding to $\left|\overline{u_{i}}\right\rangle\left\langle\overline{u_{i}}\right|$, we support the maximal entangled state $\left|\phi_{A B}^{0}\right\rangle$. This test can be written as the positive semi-definite matrix $T(M)$ :
\[

$$
\begin{equation*}
T(M) \stackrel{\text { def }}{=} \sum_{i} p_{i}\left|u_{i} \otimes \overline{u_{i}}\right\rangle\left\langle u_{i} \otimes \overline{u_{i}}\right| . \tag{2}
\end{equation*}
$$

\]

Indeed, when the local dimension $d$ is 2 , $\mathrm{D}^{\prime}$ Ariano et al. 11 and Hayashi et al. 2] obtained the discrete ownway LOCC realization of the test $T_{i n v}^{1, A \rightarrow B}$ as test $T(M)$ with an appropriate choice of the local measurement $M$. However, its general dimensional case was an open problem. In this paper, employing the concepts of symmetric informationally complete POVM (SIC-POVM) and mutually unbiased bases (MUB), we propose discrete ownway LOCC realizations of $T_{i n v}^{1, A \rightarrow B}$. Also, the optimality of the proposed realization scheme is shown.

Next, we consider the case when Alice's system (Bob's system) is given as $\mathcal{H}_{A_{1}} \otimes \mathcal{H}_{A_{2}}\left(\mathcal{H}_{B_{1}} \otimes \mathcal{H}_{B_{2}}\right)$ and the dimensions of all components coincide, i.e., $\operatorname{dim} \mathcal{H}_{A_{1}}=$ $\operatorname{dim} \mathcal{H}_{A_{2}}=\operatorname{dim} \mathcal{H}_{B_{1}}=\operatorname{dim} \mathcal{H}_{B_{2}}=d$. In this case, we focus on the covariant POVM $M_{\text {cov, }}^{2}$ :

$$
\begin{aligned}
& M_{c o v, u}^{2}\left(d g_{1} d g_{2}\right) \\
& \stackrel{\text { def }}{=} d^{2}\left(g_{1} \otimes g_{2}\right)|u\rangle\langle u|\left(g_{1} \otimes g_{2}\right)^{*} \nu\left(d g_{1}\right) \nu\left(d g_{2}\right),
\end{aligned}
$$

where the vector $u$ is a maximally entangled state and $\nu$ is the group invariant probability measure on $\operatorname{SU}(d)$. The optimal test is given as the test $T_{i n v}^{2, A \rightarrow B} \stackrel{\text { def }}{=} T\left(M_{c o v, u}^{2}\right)$, which has the form [3]:

$$
\begin{align*}
& T_{i n v}^{2, A \rightarrow B} \\
= & \left|\phi_{A, B}^{0}\right\rangle\left\langle\phi_{A, B}^{0}\right| \otimes\left|\phi_{A, B}^{0}\right\rangle\left\langle\phi_{A, B}^{0}\right| \\
& +\frac{1}{d^{2}-1}\left(I-\left|\phi_{A, B}^{0}\right\rangle\left\langle\phi_{A, B}^{0}\right|\right) \otimes\left(I-\left|\phi_{A, B}^{0}\right\rangle\left\langle\phi_{A, B}^{0}\right|\right) . \tag{3}
\end{align*}
$$

Indeed, The positive semi-definite matrix $T_{i n v}^{2, A \rightarrow B}$ does not depend on the choice of the maximally entangled state $u$. In this paper, employing the concept of Clifford group, we provide a discrete own-way LOCC realization of $T_{i n v}^{2, A \rightarrow B}$ when the local system is given as a composite system of a prime-dimensional system. Also, the optimality of the proposed realizaion scheme is shown.

## II. DISCRETE OWN-WAY LOCC REALIZATION OF $T_{i n v}^{1, A \rightarrow B}$

## A. Realizing scheme by SIC-POVM

In order to design the test $T_{i n v}^{1, A \rightarrow B}$, we focus on the concept "symmetric informationally complete POVM (SIC-POVM)". A rank-one POVM $\left\{p_{i}\left|u_{i}\right\rangle\left\langle u_{i}\right|\right\}$ on $\mathcal{H}_{A}=$ $\mathbb{C}^{d}$ is called a symmetric informationally complete POVM (SIC-POVM), if it satisfies the following conditions:

$$
\begin{align*}
\#\{i\} & =d^{2} \\
p_{i} & =\frac{1}{d} \\
\left|\left\langle u_{i} \mid u_{j}\right\rangle\right|^{2} & =\frac{1}{d+1} \text { for } i \neq j \tag{4}
\end{align*}
$$

Currently, an SIC-POVM analytically is constructed when the dimension $d$ is $2,3[5,7], 4[4,7], 5[7], 6[6], 7[8], 8[5]$, or 19 [8]. Also, its existence is numerically verified up to $d=45$ [4]. As is shown in Appendix A. any SIC-POVM $M_{s i c}=\left\{p_{i}\left|u_{i}\right\rangle\left\langle u_{i}\right|\right\}_{i}$ satisfies

$$
\begin{equation*}
T\left(M_{s i c}\right)=T_{i n v}^{1, A \rightarrow B} \tag{5}
\end{equation*}
$$

that is, the test $T_{i n v}^{1, A \rightarrow B}$ can be realized by an SICPOVM. Moreover, if a POVM $M=\left\{M_{i}\right\}_{i}$ on $\mathcal{H}_{A}$ satisfies

$$
T(M)=T_{i n v}^{1, A \rightarrow B}
$$

the inequality

$$
\#\{i\} \geq d^{2}
$$

holds. This is because the rank of the operator $T_{i n v}^{1, A \rightarrow B}$ (which equal $d^{2}$ ) is less than the number of the elements of POVM $M_{i}$. Hence, we obtain

$$
\begin{equation*}
\min \left\{\#\{i\} \mid T\left(\left\{M_{i}\right\}_{i}\right)=T_{i n v}^{1, A \rightarrow B}\right\}=d^{2} \tag{6}
\end{equation*}
$$

if there exists an SIC-POVM on $\mathbb{C}^{d}$. That is, the proposed realizing scheme by SIC-POVM is optimal in the sense of (6).

## B. Realizing scheme by MUB

However, any SIC-POVM is not a randomized combination of projection valued measures as well as a projection valued measure. Since a projection valued measure (PVM) are more realizable than other POVM, it is more desired to design Alice's POVM as a randomized combination of PVMs. For this purpose, we focus on mutually unbiased bases. $d+1$ orthonormal bases $\left\{\mathcal{B}_{1}, \ldots, \mathcal{B}_{d+1}\right\}$ are called mutually unbiased bases (MUB) if

$$
|\langle u \mid v\rangle|^{2}=\frac{1}{d}, \forall u \in \mathcal{B}_{i}, \forall v \in \mathcal{B}_{j}, i \neq j
$$

The existence of MUB is shown when $d$ is a prime [9] or a prime power [10]. Bandyopadhyay et al. gave a more explicit form in these cases [11]. Any mutually unbiased bases $\left\{\mathcal{B}_{1}, \ldots, \mathcal{B}_{d+1}\right\}$ make the POVM $M_{\mathcal{B}_{1}, \ldots, \mathcal{B}_{k}}$, i.e.,

$$
M_{\mathcal{B}_{1}, \ldots, \mathcal{B}_{d+1}}=\left\{\frac{1}{d+1}\left|u_{i, j}\right\rangle\left\langle u_{i, j}\right|\right\}_{i, j}
$$

where $\mathcal{B}_{j}=\left\{u_{1, j}, \ldots, u_{d, j}\right\}$. This POVM always produces the desired test $T_{i n v}^{1, A \rightarrow B}$ as

$$
\begin{equation*}
T\left(M_{\mathcal{B}_{1}, \ldots, \mathcal{B}_{d+1}}\right)=T_{i n v}^{1, A \rightarrow B} \tag{7}
\end{equation*}
$$

which is shown in Appendix B This construction of the test $T_{i n v}^{1, A \rightarrow B}$ is optimal in the following sense. Let $\left\{M^{j}\right\}$ be the set of projection-valued measures. A randomized combination of $\left\{M^{j}\right\}$, i.e., $M=\sum_{j} p_{j} M_{j}$ satisfies

$$
\begin{equation*}
T(M)=T_{i n v}^{1, A \rightarrow B} \tag{8}
\end{equation*}
$$

Then, as is proven in Appendix C

$$
\begin{equation*}
\#\{j\} \geq d+1 \tag{9}
\end{equation*}
$$

which implies the optimality of the POVM consisting of MUB. Hence,

$$
\begin{equation*}
\min _{M_{j}: \mathrm{PVM}}\left\{\#\{j\} \mid T\left(\sum p_{j} M_{j}\right)=T_{i n v}^{1, A \rightarrow B}\right\}=d+1 \tag{10}
\end{equation*}
$$

if $d$ is a prime or a prime power. That is, the proposed realizing scheme by MUB is optimal in the sense of (10).

## III. DISCRETE OWN-WAY LOCC REALIZATION OF $T_{i n v}^{2, A \rightarrow B}$

Next, we proceed to the case when both local systems consist of two subsystems. Given a finite group $G$ and its projective representation $f$ on $\mathcal{H}_{A_{1}}=\mathbb{C}^{d}$, by regarding $\mathcal{H}_{A_{2}}$ as the dual space of $\mathcal{H}_{A_{1}}$, the matrix $f(g)$ can be regarded as an element $|f(g)\rangle$ of $\mathcal{H}_{A_{1}} \otimes \mathcal{H}_{A_{2}}$.

Theorem 1 We assume the two conditions: (1) The representation $f$ is irreducible. (2) The action $f \otimes \bar{f}$ of $G$ to $\mathcal{H}_{A_{1}} \otimes \mathcal{H}_{A_{2}}$ has only two irreducible components, i.e., the irreducible subspaces of $\mathcal{H}_{A_{1}} \otimes \mathcal{H}_{A_{2}}$ for the action

$$
v_{1} \otimes v_{2} \rightarrow f(g) v_{1} \otimes \overline{f(g)} v_{2}
$$

are only the one-dimensional space $<\phi_{A_{1}, A_{2}}^{0}>$ and its orthogonal space $<\phi_{A_{1}, A_{2}}^{0}>^{\perp}$. Then, the resolution $M_{f}=\left\{\frac{d^{2}}{|G|}\left|\frac{1}{\sqrt{d}} f(g)\right\rangle\left\langle\frac{1}{\sqrt{d}} f(g)\right|\right\}_{g \in G}$ satisfies the condition for a POVM, and

$$
\begin{equation*}
T\left(M_{f}\right)=T_{i n v}^{2, A \rightarrow B} \tag{11}
\end{equation*}
$$

Its proof is given in Appendix $D$ This theorem yields a discrete own-way LOCC realization of $T_{i n v}^{2, A \rightarrow B}$ from the representation $f$ satisfying the above two conditions.

For example, Clifford group satisfies this assumption. For readers' convenience, we give its definition and prove that Clifford group satisfies this assumption. Clifford group $\mathrm{C}(d)$ for $d$-dimensional system is given by

$$
\begin{aligned}
\mathrm{C}(d) & :=\left\{U \in \mathrm{U}(d) \mid U \mathrm{GP}(d) U^{\dagger}=\mathrm{GP}(d)\right\} \\
\operatorname{GP}(d) & :=\left\{e^{\sqrt{-1} \xi} W(i, j) \mid \xi \in \mathbb{R}, i, j \in \mathbb{Z}\right\} \\
\mathrm{I}(d) & :=\left\{e^{\sqrt{-1} \xi} \mid \xi \in \mathbb{R}\right\}
\end{aligned}
$$

where

$$
\begin{aligned}
Z & :=\sum_{j=0}^{d-1} \omega^{j}|j\rangle\langle j|, \quad X:=\sum_{j=0}^{d-1}|j+1\rangle\langle j| \\
W(i, j) & :=X^{i} Z^{j}
\end{aligned}
$$

and $\omega$ is the $d$-th root of 1. As is shown in Appendix E the natural representation of the group $\mathrm{C}(d)$ satisfies the conditions (1) and (2). Then, the natural projective representation of the group $\mathrm{C}(d) / \mathrm{I}(d)$ also satisfies the conditions (1) and (2). As is shown in Lemma 5 in Appleby [8], when $d$ is prime, the cardinality $|\mathrm{C}(d) / \mathrm{I}(d)|$ is $d^{3}\left(d^{2}-1\right)$. In the general case,

$$
|\mathrm{C}(d) / \mathrm{I}(d)|=d^{2}\left(\sum_{n=0}^{d-1} \nu(n, d) \nu(n+1, d)\right)
$$

where $\nu(n, d)$ is the number of distinct ordered pairs $(x, y) \in \mathbb{Z}_{d}^{2}$ such that $x y=n(\bmod d)$.

## IV. DISCUSSION

This paper has treated discretization of onw-way LOCC protocols. Using the concepts of symmetric informationally complete POVM (SIC-POVM), mutually unbiased bases (MUB), and Clifford group, we have proposed discrete own-way LOCC realizations of $T_{i n v}^{1, A \rightarrow B}$ and $T_{i n v}^{2, A \rightarrow B}$. This result indicates the importance of these concept in discrete mathematics. Since the existence of SIC-POVM and MUB is proven in limited cases, we cannot construct a discrete own-way LOCC realization of $T_{i n v}^{1, A \rightarrow B}$ in the general case. Thus, further investigation for these concepts are required.

While the optimal test is given as $T_{i n v}^{3, A \rightarrow B}$ when the local system consists of three subsystems by Hayashi [3], its discretization has not been obtained. Since the optimal test $T_{i n v}^{3, A \rightarrow B}$ is closely related to GHZ state [3], its discretization may be related to GHZ state. Its construction remains as a future research.

Further, the optimal protocol is often given as a protocol with infinite elements in quantum information. In such a case, it is required to discretize this protocol. This kind of discretization is an interesting interdisciplinary topic between quantum information and discrete mathematics.

## APPENDIX A: PROOF OF (5)

First, we show that $u_{1} \otimes \overline{u_{1}}, \ldots, u_{d^{2}} \otimes \overline{u_{d^{2}}}$ are linearly independent. We choose complex numbers $a_{1}, \ldots, a_{d^{2}}$ such that

$$
\sum_{i} a_{i} u_{i} \otimes \overline{u_{i}}=0
$$

Taking trace, we have

$$
a_{1}+\sum_{i \neq 1} a_{i}=0
$$

On the other hand,

$$
0=\left\langle u_{1} \otimes \overline{u_{1}} \mid \sum_{i} a_{i} u_{i} \otimes \overline{u_{i}}\right\rangle=a_{1}+\frac{1}{d+1} \sum_{i \neq 1} a_{i} .
$$

Hence, we obtain $a_{1}=0$. Similarly, we can show $a_{i}=0$, which implies the linear independence.

Since the dimension of $\mathcal{H}_{A} \otimes \mathcal{H}_{B}$ is $d^{2}$, any element of $\mathcal{H}_{A} \otimes \mathcal{H}_{B}$ can be expressed as

$$
\sum_{j} a_{i} u_{i} \otimes \overline{u_{i}}
$$

We can calculate

$$
\begin{aligned}
& \left\langle\sum_{i} a_{i} u_{i} \otimes \overline{u_{i}}\right| T\left(M_{\text {sic }}\right)\left|\sum_{j} a_{j} u_{j} \otimes \overline{u_{j}}\right\rangle \\
= & \left\langle\sum_{i} a_{i} u_{i} \otimes \overline{u_{i}}\right|\left(\sum_{k} \frac{1}{d}\left|u_{k} \otimes \overline{u_{k}}\right\rangle\left\langle u_{k} \otimes \overline{u_{k}}\right|\right)\left|\sum_{j} a_{j} u_{j} \otimes \overline{u_{j}}\right\rangle \\
= & \frac{d+2}{(d+1)^{2}}\left|\sum_{k} a_{k}\right|^{2}+\frac{d}{(d+1)^{2}} \sum_{k}\left|a_{k}\right|^{2} .
\end{aligned}
$$

On the other hand, its norm is calculated as

$$
\left\|\sum_{j} a_{j} u_{j} \otimes \overline{u_{j}}\right\|=\frac{1}{d+1}\left|\sum_{k} a_{k}\right|^{2}+\frac{d}{d+1} \sum_{k}\left|a_{k}\right|^{2} .
$$

Since

$$
\left|\left\langle\phi_{A, B}^{0} \mid \sum_{j} a_{j} u_{j} \otimes \overline{u_{j}}\right\rangle\right|^{2}=\frac{1}{d}\left|\sum_{j} a_{j}\right|^{2}
$$

we obtain

$$
\begin{aligned}
& \left\langle\sum_{i} a_{i} u_{i} \otimes \overline{u_{i}}\right| T_{i n v}^{1, A \rightarrow B}\left|\sum_{j} a_{j} u_{j} \otimes \overline{u_{j}}\right\rangle \\
= & \left\langle\sum_{i} a_{i} u_{i} \otimes \overline{u_{i}}\right|\left(\frac{d}{d+1}\left|\phi_{A, B}^{0}\right\rangle\left\langle\phi_{A, B}^{0}\right|+\frac{1}{d+1} I\right) \\
& \left|\sum_{j} a_{j} u_{j} \otimes \overline{u_{j}}\right\rangle \\
= & \frac{d}{d+1} \frac{1}{d}\left|\sum_{j} a_{j}\right|^{2} \\
& +\frac{1}{d+1}\left(\frac{1}{d+1}\left|\sum_{k} a_{k}\right|^{2}+\frac{d}{d+1} \sum_{k}\left|a_{k}\right|^{2}\right) \\
= & \left\langle\sum_{i} a_{i} u_{i} \otimes \overline{u_{i}}\right| T\left(M_{s i c}\right)\left|\sum_{j} a_{j} u_{j} \otimes \overline{u_{j}}\right\rangle .
\end{aligned}
$$

Therefore, we obtain (5).

## APPENDIX B: PROOF OF (7)

We focus on the subspace $<\phi_{A, B}^{0}>^{\perp}$ orthogonal to $\phi_{A, B}^{0}$. The subspace $\mathcal{B}_{j}^{\prime}=<u_{1, j} \otimes \overline{u_{1, j}}-$ $\frac{1}{d} \phi_{A, B}^{0}, \ldots, u_{d-1, j} \otimes \overline{u_{d-1, j}}-\frac{1}{d} \phi_{A, B}^{0}>$ belongs to the subspace $<\phi_{A, B}^{0}>^{\perp}$, and its dimension is $d-1$. Since
$\left\langle u_{i, j} \otimes \overline{u_{i, j}}-\frac{1}{d} \phi_{A, B}^{0} \left\lvert\, u_{i^{\prime}, j^{\prime}} \otimes \overline{u_{i^{\prime}, j^{\prime}}}-\frac{1}{d} \phi_{A, B}^{0}\right.\right\rangle=0, \quad j \neq j^{\prime}$,

The spaces $\mathcal{B}_{1}^{\prime}, \ldots, \mathcal{B}_{d+1}^{\prime}$ are orthogonal to each other. Since the dimension of the subspace $<\phi_{A, B}^{0}>^{\perp}$ is $d^{2}-$ 1, the subspace $<\phi_{A, B}^{0}>^{\perp}$ is spanned by the spaces $\mathcal{B}_{1}^{\prime}, \ldots, \mathcal{B}_{d+1}^{\prime}$. Therefore, any element of the space $\mathcal{H}_{A} \otimes$ $\mathcal{H}_{B}$ can be expressed as $\sum_{j=1}^{d+1} \sum_{i=1}^{d} a_{i, j} u_{i, j} \otimes \overline{u_{i, j}}$. In the following, we abbreviate the sum $\sum_{j=1}^{d+1} \sum_{i=1}^{d}$ as $\sum_{j, i}$.

We calculate

$$
\begin{aligned}
& \left\langle\sum_{j, i} a_{i, j} u_{i, j} \otimes \overline{u_{i, j}}\right| T\left(M_{\mathcal{B}_{1}, \ldots, \mathcal{B}_{d+1}}\right)\left|\sum_{j^{\prime}, i^{\prime}} a_{i^{\prime}, j^{\prime}} u_{i^{\prime}, j^{\prime}} \otimes \overline{u_{i^{\prime}, j^{\prime}}}\right\rangle \\
= & \left\langle\sum_{j, i} a_{i, j} u_{i, j} \otimes \overline{u_{i, j}}\right|\left(\sum_{l, k} \frac{1}{d+1}\left|u_{k, l} \otimes \overline{u_{k, l}}\right\rangle\left\langle u_{k, l} \otimes \overline{u_{k, l}}\right|\right) \\
= & \left.\frac{1}{d+1} \sum_{l, k} \right\rvert\, \sum_{j, i}\left\langle a_{i^{\prime}, j^{\prime}} u_{i^{\prime}, j^{\prime}} \otimes \overline{u_{i^{\prime}, j^{\prime}}}\right\rangle \\
= & \left.\frac{1}{d}\left|\sum_{j, l} a_{i, j} a_{i, i}^{2}-\frac{u_{k, l}}{}\right|\left|a_{i, j} u_{i, j} \otimes \overline{u_{i, j}}\right\rangle\right|^{2} \\
d(d+1) & \sum_{j}\left|\sum_{i} a_{i, j}\right|^{2}+\frac{1}{d+1} \sum_{j, i}\left|a_{i, j}\right|^{2}
\end{aligned}
$$

On the other hand, its norm is calculated as

$$
\begin{aligned}
& \left\|\sum_{j, i} a_{i, j} u_{i, j} \otimes \overline{u_{i, j}}\right\| \\
= & \frac{1}{d}\left|\sum_{j, i} a_{i, j}\right|^{2}-\frac{1}{d} \sum_{j}\left|\sum_{i} a_{i, j}\right|^{2}+\sum_{j, i}\left|a_{i, j}\right|^{2}
\end{aligned}
$$

Since

$$
\left|\left\langle\phi_{A, B}^{0} \mid \sum_{j, i} a_{i, j} u_{i, j} \otimes \overline{u_{i, j}}\right\rangle\right|^{2}=\frac{1}{d}\left|a_{i, j} u_{i, j}\right|^{2}
$$

we obtain

$$
\begin{aligned}
&\left\langle\sum_{j, i} a_{i, j} u_{i, j} \otimes \overline{u_{i, j}}\right| T_{i n v}^{1, A \rightarrow B}\left|\sum_{j^{\prime}, i^{\prime}} a_{i^{\prime}, j^{\prime}} u_{i^{\prime}, j^{\prime}} \otimes \overline{u_{i^{\prime}, j^{\prime}}}\right\rangle \\
&=\left\langle\sum_{j, i} a_{i, j} u_{i, j} \otimes \overline{u_{i, j}}\right| \frac{d}{d+1}\left|\phi_{A, B}^{0}\right\rangle\left\langle\phi_{A, B}^{0}\right|+\frac{1}{d+1} I \\
&\left|\sum_{j^{\prime}, i^{\prime}} a_{i^{\prime}, j^{\prime}} u_{i^{\prime}, j^{\prime}} \otimes \overline{u_{i^{\prime}, j^{\prime}}}\right\rangle \\
&= \frac{1}{d}\left|\sum_{j, i} a_{i, j}\right|^{2}-\frac{1}{d(d+1)} \sum_{j}\left|\sum_{i} a_{i, j}\right|^{2}+\frac{1}{d+1} \sum_{j, i}\left|a_{i, j}\right|^{2} \\
&=\left\langle\sum_{j, i} a_{i, j} u_{i, j} \otimes \overline{u_{i, j}}\right| T\left(M_{\mathcal{B}_{1}, \ldots, \mathcal{B}_{d+1}}\right)\left|\sum_{j^{\prime}, i^{\prime}} a_{i^{\prime}, j^{\prime}} u_{i^{\prime}, j^{\prime}} \otimes \overline{u_{i^{\prime}, j^{\prime}}}\right\rangle .
\end{aligned}
$$

Therefore, we obtain (7).

## APPENDIX C: PROOF OF (9)

Let $M^{j}=\left\{\left|u_{i, j}\right\rangle\left\langle u_{i, j}\right|\right\}$. We focus on the projection $P$ to the subspace $<\phi_{A, B}^{0}>^{\perp}$ orthogonal to $\phi_{A, B}^{0}$ and the subspace $\mathcal{B}_{j}^{\prime \prime} \stackrel{\text { def }}{=}<u_{1, j} \otimes \overline{u_{1, j}}, \ldots, u_{d, j} \otimes \overline{u_{d, j}}>$. The image $P \mathcal{B}_{j}^{\prime \prime}$ is $<u_{1, j} \otimes \overline{u_{1, j}}-\frac{1}{d} \phi_{A, B}^{0}, \ldots, u_{d-1, j} \otimes \overline{u_{d-1, j}}-$ $\frac{1}{d} \phi_{A, B}^{0}>$. The condition (8) implies that the sum of the rank of the space $P \mathcal{B}_{j}^{\prime \prime}$ is greater than $d^{2}-1$, i.e., the dimension of the space $<\phi_{A, B}^{0}>^{\perp}$. Thus, $\#\{j\}(d-1) \geq$ $d^{2}-1$, which implies the inequality (9).

## APPENDIX D: PROOF OF THEOREM 1

First, we prove that $M_{f}$ satisfies the condition for POVM. The irreducibility of the action $f$ guarantees that

$$
\begin{aligned}
& \frac{d}{|G|} \sum_{g \in G}\langle k| f(g)|l\rangle\left\langle l^{\prime}\right| f(g)\left|k^{\prime}\right\rangle \\
= & \langle k|\left(\frac{d}{|G|} \sum_{g \in G} f(g)|l\rangle\left\langle l^{\prime}\right| f(g)\right)\left|k^{\prime}\right\rangle \\
= & \langle k|\left\langle l \mid l^{\prime}\right\rangle I\left|k^{\prime}\right\rangle=\delta_{k, k^{\prime}} \delta_{l, l^{\prime}} .
\end{aligned}
$$

we obtain

$$
\begin{aligned}
& \left.\frac{d}{|G|} \sum_{g \in G} \right\rvert\,\left.\langle f(g)|\left(\sum_{k, l} a_{k, l}|k\rangle \otimes|l\rangle\right)\right|^{2} \\
= & \frac{d}{|G|} \sum_{g \in G} \sum_{k, l} \sum_{k^{\prime}, l^{\prime}} a_{k, l} \overline{a_{k^{\prime}, l^{\prime}}} \overline{\langle k| f(g)|l\rangle}\left\langle l^{\prime}\right| f(g)\left|k^{\prime}\right\rangle \\
= & \sum_{k, l} a_{k, l} \overline{a_{k, l}},
\end{aligned}
$$

which implies

$$
\frac{d^{2}}{|G|} \sum_{g \in G}\left|\frac{1}{\sqrt{d}} f(g)\right\rangle\left\langle\frac{1}{\sqrt{d}} f(g)\right|=I_{A_{1}, A_{2}}
$$

Hence, $M_{f}=\left\{\frac{d^{2}}{|G|}\left|\frac{1}{\sqrt{d}} f(g)\right\rangle\left\langle\frac{1}{\sqrt{d}} f(g)\right|\right\}_{g \in G}$ is a POVM.
Next, we show (11). We focus on the action of the group $G \times G$ to the total space $\mathcal{H}_{A_{1}} \otimes \mathcal{H}_{A_{2}} \otimes \mathcal{H}_{B_{1}} \otimes \mathcal{H}_{B_{2}}$ as

$$
\begin{aligned}
& u_{1} \otimes u_{2} \otimes v_{1} \otimes v_{2} \\
& \quad \mapsto f\left(g_{1}\right) u_{1} \otimes \overline{f\left(g_{2}\right)} u_{2} \otimes \overline{f\left(g_{1}\right)} v_{1} \otimes f\left(g_{2}\right) v_{2}
\end{aligned}
$$

for $u_{i} \in \mathcal{H}_{A_{i}}, v_{i} \in \mathcal{H}_{B_{i}}$, and any pair $\left(g_{1}, g_{2}\right) \in G \times G$. Due to the condition (2), the irreducible decomposition of the space $\mathcal{H}_{A_{1}} \otimes \mathcal{H}_{A_{2}} \otimes \mathcal{H}_{B_{1}} \otimes \mathcal{H}_{B_{2}}$ is given as $<\phi_{A_{1}, B_{1}}^{0}>\otimes<\phi_{A_{2}, B_{2}}^{0}>\oplus<\phi_{A_{1}, B_{1}}^{0}>\otimes<\phi_{A_{2}, B_{2}}^{0}>^{\perp}$ $\oplus<\phi_{A_{1}, B_{1}}^{0}>^{\perp} \otimes<\phi_{A_{2}, B_{2}}^{0}>\oplus<\phi_{A_{1}, B_{1}}^{0}>^{\perp} \otimes<$ $\phi_{A_{2}, B_{2}}^{0}>^{\perp}$.

As is checked below, the test $T\left(M_{f}\right)$ is invariant for this action:

$$
\begin{aligned}
& f\left(g_{1}\right) \otimes \overline{f\left(g_{2}\right)} \otimes \overline{f\left(g_{1}\right)} \otimes f\left(g_{2}\right) T\left(M_{f}\right)\left(f\left(g_{1}\right) \otimes \overline{f\left(g_{2}\right)} \otimes \overline{f\left(g_{1}\right)} \otimes f\left(g_{2}\right)\right)^{\dagger} \\
= & \frac{d^{2}}{|G|} \sum_{g \in G}\left|\frac{1}{d} f\left(g_{1}\right) f(g) f\left(g_{2}\right)^{\dagger} \otimes \overline{f\left(g_{1}\right) f(g) f\left(g_{2}\right)^{\dagger}}\right\rangle\left\langle\frac{1}{d} f\left(g_{1}\right) f(g) f\left(g_{2}\right)^{\dagger} \otimes \overline{f\left(g_{1}\right) f(g) f\left(g_{2}\right)^{\dagger}}\right| \\
= & \frac{d^{2}}{|G|} \sum_{g^{\prime} \in G}\left|\frac{1}{d} f\left(g^{\prime}\right) \otimes \overline{f\left(g^{\prime}\right)}\right\rangle\left\langle\frac{1}{d} f\left(g^{\prime}\right) \otimes \overline{f\left(g^{\prime}\right)}\right|=T\left(M_{f}\right),
\end{aligned}
$$

where we denote $g_{1} g g_{2}^{-1}$ by $g^{\prime}$. Hence, the test $T\left(M_{f}\right)$ has the form

$$
\begin{aligned}
& T\left(M_{f}\right) \\
= & a\left|\phi_{A_{1}, B_{1}}^{0}\right\rangle\left\langle\phi_{A_{1}, B_{1}}^{0}\right| \otimes\left|\phi_{A_{2}, B_{2}}^{0}\right\rangle\left\langle\phi_{A_{2}, B_{2}}^{0}\right| \\
& +b\left(I-\left|\phi_{A_{1}, B_{1}}^{0}\right\rangle\left\langle\phi_{A_{1}, B_{1}}^{0}\right|\right) \otimes\left|\phi_{A_{2}, B_{2}}^{0}\right\rangle\left\langle\phi_{A_{2}, B_{2}}^{0}\right| \\
& +c\left|\phi_{A_{1}, B_{1}}^{0}\right\rangle\left\langle\phi_{A_{1}, B_{1}}^{0}\right| \otimes\left(I-\left|\phi_{A_{2}, B_{2}}^{0}\right\rangle\left\langle\phi_{A_{2}, B_{2}}^{0}\right|\right) \\
& +d\left(I-\left|\phi_{A_{1}, B_{1}}^{0}\right\rangle\left\langle\phi_{A_{1}, B_{1}}^{0}\right|\right) \otimes\left(I-\left|\phi_{A_{2}, B_{2}}^{0}\right\rangle\left\langle\phi_{A_{2}, B_{2}}^{0}\right|\right) .
\end{aligned}
$$

Since $f(g)$ is the unitary matrix, $\frac{1}{\sqrt{d}} f(g)$ is a maximally entangled state on $\mathcal{H}_{A_{1}} \otimes \mathcal{H}_{A_{2}}$. Since $\left|\frac{1}{\sqrt{d}} f(g)\right\rangle$ is maximally entangled, Lemma 5 in Hayashi [3] yields that
$T\left(M_{f}\right)=\left|\phi_{A_{1}, B_{1}}^{0} \otimes \phi_{A_{2}, B_{2}}^{0}\right\rangle\left\langle\phi_{A_{1}, B_{1}}^{0} \otimes \phi_{A_{2}, B_{2}}^{0}\right|+P T\left(M_{f}\right) P$,
where

$$
P \stackrel{\text { def }}{=}\left(I-\left|\phi_{A_{2}, B_{2}}^{0}\right\rangle\left\langle\phi_{A_{2}, B_{2}}^{0}\right|\right) \otimes\left(I-\left|\phi_{A_{1}, B_{1}}^{0}\right\rangle\left\langle\phi_{A_{1}, B_{1}}^{0}\right|\right) .
$$

This relation implies that $b=c=0$. Thus, the relation
$\operatorname{Tr} T\left(M_{f}\right)=d^{2}$ yields

$$
\begin{aligned}
& T\left(M_{f}\right) \\
& =\left|\phi_{A_{1}, B_{1}}^{0}\right\rangle\left\langle\phi_{A_{1}, B_{1}}^{0}\right| \otimes\left|\phi_{A_{2}, B_{2}}^{0}\right\rangle\left\langle\phi_{A_{2}, B_{2}}^{0}\right| \\
& \quad+\frac{1}{d^{2}-1}\left(I-\left|\phi_{A_{1}, B_{1}}^{0}\right\rangle\left\langle\phi_{A_{1}, B_{1}}^{0}\right|\right) \otimes\left(I-\left|\phi_{A_{2}, B_{2}}^{0}\right\rangle\left\langle\phi_{A_{2}, B_{2}}^{0}\right|\right)
\end{aligned}
$$

it is sufficient to show the condition (2). the irreducible spaces of the subgroup $\operatorname{GP}(d) \subset \mathrm{C}(d)$ are $d^{2}$ one-dimensional subspaces generated by $|W(i, j)\rangle$ for $i, j$. The representation of $\operatorname{GP}(d)$ on each irreducible subspaces is different. Thus, the irreducible subspace of the larger group $\mathrm{C}(d)$ should be represented as the direct sum of these subspaces. As is shown in Lemma 1 in Appleby [8], for any $(i, j)$ and any $F \in \mathrm{SL}\left(2, \mathbb{Z}_{\bar{d}}\right)$, there exists an element $U \in \mathrm{C}(d)$ such that $f(U) \otimes \overline{f(U)}|W(i, j)\rangle=$ $e^{\sqrt{-1} \delta_{i, j,, F}}|W(F(i, j))\rangle$, where
which implies (11).

## APPENDIX E: PROOF OF IRREDUCIBILITY

It is known that the natural representation of the subgroup $\mathrm{GP}(d) \subset \mathrm{C}(d)$ satisfies the condition (1). Hence,

For any pair $(i, j)=\neq(0,0)$, there exists an element $F \in \mathrm{SL}\left(2, \mathbb{Z}_{\bar{d}}\right)$ such that $(i, j)=F(1,0)$. Since any irreducible subspace should be spanned by the subset of $\{|W(i, j)\rangle\}_{i, j}$, the space spanned by $\{|W(i, j)\rangle\}_{(i, j) \neq(0,0)}$ is irreducible. Thus, the condition (2) holds.
