#### Abstract

We describe $\operatorname{Forb}\left\{K_{1,3}, \overline{K_{1,3}}\right\}$, the class of graphs $G$ such that $G$ and its complement $\bar{G}$ are claw-free. With few exceptions, it is made of graphs whose connected components consist of cycles of length at least 4, paths or isolated vertices, and of the complements of these graphs. Considering the hypergraph $\mathcal{H}^{(3)}(G)$ made of the 3 -element subsets of the vertex set of a graph $G$ on which $G$ induces a clique or an independent subset, we deduce from above a description of the Boolean sum $G \dot{+} G^{\prime}$ of two graphs $G$ and $G^{\prime}$ giving the same hypergraph. We indicate the role of this latter description in a reconstruction problem of graphs up to complementation.

Key words: Graphs, claw-free graphs, cliques, independent subsets, Paley graphs

## 1 Results and motivation

Our notations and terminology mostly follow [1]. The graphs we consider in this paper are undirected, simple and have no loop. That is a graph is a pair $G:=(V, \mathcal{E})$, where $\mathcal{E}$ is a subset of $[V]^{2}$, the set of 2 -element subsets of $V$. Elements of $V$ are the vertices of $G$ and elements of $\mathcal{E}$ its edges. We denote by $V(G)$ the vertex set of $G$ and by $E(G)$ its edge set. We look at

[^0]members of $[V]^{2}$ as unordered pairs of distinct vertices. If $A$ is a subset of $V$, the pair $G_{\upharpoonright A}:=\left(A, \mathcal{E} \cap[A]^{2}\right)$ is the graph induced by $G$ on $A$. The complement of $G$ is the simple graph $\bar{G}$ whose vertex set is $V$ and whose edges are the unordered pairs of nonadjacent and distinct vertices of $G$, that is $\bar{G}=(V, \overline{\mathcal{E}})$, where $\overline{\mathcal{E}}=[V]^{2} \backslash \mathcal{E}$. We denote by $K_{3}$ the complete graph on 3 vertices and by $K_{1,3}$ the graph made of a vertex linked to a $\overline{K_{3}}$, this graph is called a claw. We denote by $A_{6}$ the graph on 6 vertices made of a $K_{3}$ bounded by three $K_{3}$ (cf. Figure 1) and by $C_{n}$ the $n$-element cycle, $n \geq 4$. We denote by $P_{9}$ the Paley graph on 9 vertices (cf. Figure 1). Note that $P_{9}$ is isomorphic to its complement $\overline{P_{9}}$ and also to $K_{3} \square K_{3}$, the cartesian product of $K_{3}$ by itself (see [1] page 30 if needed for a definition of the cartesian product of graphs, and see [8] page 176 and [1] page 28 for a definition and basic properties of Paley graphs).

Fig. 1.
Given a set $\mathcal{F}$ of graphs, we denote by $\operatorname{Forb\mathcal {F}}$ the class of graphs $G$ such that no member of $\mathcal{F}$ is isomorphic to an induced subgraph of $G$. Members of $\operatorname{Forb}\left\{K_{3}\right\}$, resp. $F o r b\left\{K_{1,3}\right\}$ are called triangle-free, resp. claw-free graphs. The main result of this note asserts:
Theorem 1.1 The class $\operatorname{Forb}\left\{K_{1,3}, \overline{K_{1,3}}\right\}$ consists of $A_{6}$, of the induced subgraphs of $P_{9}$, of graphs whose connected components consist of cycles of length at least 4, paths or isolated vertices, and of the complements of these graphs.
As an immediate consequence of Theorem 1.1, note that the graphs $A_{6}$ and $\overline{A_{6}}$ are the only members of $\operatorname{Forb}\left\{K_{1,3}, \overline{K_{1,3}}\right\}$ which contain a $K_{3}$ and a $\overline{K_{3}}$ with no vertex in common.

From Theorem 1.1 we obtain a characterization of the Boolean sum of two graphs having the same 3 -homogeneous subsets. For that, we say that a subset of vertices of a graph $G$ is homogeneous if it is a clique or an independent set (note that if the word homogeneous is used with this meaning in Ramsey theory; in other areas of graph theory it has other meanings, several in fact). Let $\mathcal{H}^{(3)}(G)$ be the hypergraph having the same vertices as $G$ and whose hyperedges are the 3 -element homogeneous subsets of $G$. Given two graphs $G$ and $G^{\prime}$ on the same vertex set $V$, we recall that the Boolean sum $G \dot{+} G^{\prime}$ of $G$ and $G^{\prime}$ is the graph on $V$ whose edges are unordered pairs $e$ of distinct vertices such that $e \in E(G)$ if and only if $e \notin E\left(G^{\prime}\right)$. Note that $E\left(G \dot{+} G^{\prime}\right)$ is the symmetric difference $E(G) \Delta E\left(G^{\prime}\right)$ of $E(G)$ and $E\left(G^{\prime}\right)$. The graph $G \dot{+} G^{\prime}$ is also called the symmetric difference of $G$ and $G^{\prime}$ and denoted by $G \Delta G^{\prime}$ in
[1].
Given a graph $U$ with vertex set $V$, the edge-graph of $U$ is the graph $S(U)$ whose vertices are the edges $u$ of $U$ and whose edges are unordered pairs $\{u, v\}$ such that $u=\{x, y\}, v=\{x, z\}$ for three distinct elements $x, y, z \in V$ such that $\{y, z\}$ is not an edge of $U$. Note that the edge-graph $S(U)$ is a spanning subgraph of $L(U)$, the line-graph of $U$, not to be confused with it.

Claw-free graphs and triangle-free graphs are related by means of the edgegraph construction. Indeed, as it is immediate to see, for every graph $U$, we have:

$$
\begin{equation*}
U \in \operatorname{Forb}\left\{K_{1,3}\right\} \Longleftrightarrow S(U) \in \operatorname{Forb}\left\{K_{3}\right\} \tag{1}
\end{equation*}
$$

Our characterization is this:
Theorem 1.2 Let $U$ be a graph. The following properties are equivalent:
(1) There are two graphs $G$ and $G^{\prime}$ having the same 3-element homogeneous subsets such that $U:=G \dot{+} G^{\prime}$;
(2) $S(U)$ and $S(\bar{U})$ are bipartite;
(3) (i) Either $U$ is an induced subgraph of $P_{9}$,
(ii) or the connected components of $U$, or of its complement $\bar{U}$, are cycles of even length, paths or isolated vertices.
As a consequence, if the graph $U$ satisfying Property (1) is disconnected, then $U$ contains no 3 -element cycle, moreover, if $U$ contains no 3 -element cycle then each connected component of $U$ is a cycle of even length, a path, or an isolated vertex, in particular $U$ is bipartite.

The implication $(2) \Rightarrow(3)$ in Theorem 1.2 follows immediately from Theorem 1.1. Indeed, suppose that Property (2) holds, that is $S(U)$ and $S(\bar{U})$ are bipartite, then from Formula (11) and from the fact that $S\left(A_{6}\right)$ and $S\left(C_{n}\right)$, $n \geq 4$, are respectively isomorphic to $C_{9}$ and to $C_{n}$, we have:

$$
U \in \operatorname{Forb}\left\{K_{1,3}, \overline{K_{1,3}}, A_{6}, \overline{A_{6}}, C_{2 n+1}, \overline{C_{2 n+1}}: n \geq 2\right\} .
$$

From Theorem 1.1, Property (3) holds. The other implications, obtained by more straigthforward arguments, are given in Subsection 2.3,

This leaves open the following:
Problem 1.3 Which pairs of graphs $G$ and $G^{\prime}$ with the same 3-element homogeneous subsets have a given Boolean sum $U:=G \dot{+} G^{\prime}$ ?

A partial answer, motivated by the reconstruction problem discussed below, is given in [3]. We mention that two graphs $G$ and $G^{\prime}$ as above are determined by the graphs induced on the connected components of $U:=G \dot{+} G^{\prime}$ and on a system of distinct representatives of these connected components (Proposition 10 (3]).

A quite natural problem, related to the study of Ramsey numbers for triples, is this:
Problem 1.4 Which hypergraphs are of the form $\mathcal{H}^{(3)}(G)$ ?

An asymptotic lower bound of the size of $\mathcal{H}^{(3)}(G)$ in terms of $|V(G)|$ was established by A.W.Goodman [4].

The motivation for Theorem 1.2 (and thus Theorem 1.1) originates in a reconstruction problem on graphs that we present now. Considering two graphs $G$ and $G^{\prime}$ on the same set $V$ of vertices, we say that $G$ and $G^{\prime}$ are isomorphic up to complementation if $G^{\prime}$ is isomorphic to $G$ or to the complement $\bar{G}$ of $G$. Let $k$ be a non-negative integer, we say that $G$ and $G^{\prime}$ are $k$-hypomorphic up to complementation if for every $k$-element subset $K$ of $V$, the graphs $G_{\uparrow K}$ and $G_{\lceil K}^{\prime}$ induced by $G$ and $G^{\prime}$ on $K$ are isomorphic up to complementation. Finally, we say that $G$ is $k$-reconstructible up to complementation if every graph $G^{\prime}$ which is $k$-hypomorphic to $G$ up to complementation is in fact isomorphic to $G$ up to complementation. The following problem emerged from a question of P.Ille [6]:
Problem 1.5 For which pairs $(k, v)$ of integers, $k<v$, every graph $G$ on $v$ vertices is $k$-reconstructible up to complementation?

It is immediate to see that if the conclusion of the problem above is positive, $v$ is distinct from 3 and 4 and, with a little bit of thought, that if $v \geq 5$ then $k \geq 4$ (see Proposition 4.1 of [2]). With J. Dammak, G. Lopez [2] and [3] we proved that the conclusion is positive if:
(i) $4 \leq k \leq v-3$ or
(ii) $4 \leq k=v-2$ and $v \equiv 2(\bmod 4)$.

We do not know if in (ii) the condition $v \equiv 2(\bmod 4)$ can be dropped. For $4 \leq k=v-1$, we checked that the conclusion holds if $v=5$ and noticed that for larger values of $v$ it could be negative or extremely hard to obtain, indeed, a positive conclusion would imply that Ulam's reconstruction conjecture holds (see Proposition 19 of [3]).

The reason for which Theorem 1.2 plays a role in that matter relies on the following result, an easy consequence of the famous Gottlieb-Kantor theorem on incidence matrices ([5,7]).
Proposition 1.6 (Proposition 2.4 [2]) Let $t \leq \min (k, v-k)$ and $G$ and $G^{\prime}$ be two graphs on the same set $V$ of $v$ vertices. If $G$ and $G^{\prime}$ are $k$-hypomorphic up to complementation then they are t-hypomorphic up to complementation.

Indeed, if $3 \leq k \leq v-3$, Proposition 1.6 tells us that two graphs $G$ and $G^{\prime}$ which are $k$-hypomorphic up to complementation are 3-hypomorphic up to complementation, which amounts to the fact that $G$ and $G^{\prime}$ have the same 3-homogeneous subsets. A carefull study of such pairs $G, G^{\prime}$ allows to deal with the case $v=k+3$ and $v \equiv 1 \bmod 4$ (see [3]). Other cases use properties of the rank of some incidence matrices; notably a result of R.M. Wilson [9] on incidence matrices (and also the Gottlieb-Kantor theorem). In these cases the conclusion is stronger: $G^{\prime}$ or $\overline{G^{\prime}}$ is equal to $G$ (see [2]).

## 2 Proofs

Let $U$ be a graph. For an unordered pair $e:=\{x, y\}$ of distinct vertices, we set $U(e)=1$ if $e \in E(U)$ and $U(e)=0$ otherwise. Let $x \in V(U)$; we denote by $N_{U}(x)$ and $d_{U}(x)$ the neighborhood and the degree of $x$ (that is $N_{U}(x):=\{y \in V(U):\{x, y\} \in E(U)\}$ and $\left.d_{U}(x):=\left|N_{U}(x)\right|\right)$. Set $U_{(2)}:=$ $\left\{x \in V(U): d_{U}(x) \leq 2\right\}$, thus $\bar{U}_{(2)}=\left\{x \in V(U): d_{\bar{U}}(x) \leq 2\right\}$.

### 2.1 Proof of Theorem 1.1.

Trivially, the graphs described in Theorem 1.1 belong to $\operatorname{Forb}\left\{K_{1,3}, \overline{K_{1,3}}\right\}$. We deduce the converse from Lemmas 2.1 and 2.2 below.
Lemma 2.1 Let $U$ be graph, $U \in \operatorname{Forb}\left\{K_{1,3}, K_{3}\right\}$ if and only if the connected components of $U$ are cycles of length at least 4, paths or isolated vertices.
The bull is the graph $B_{5}$ on 5 vertices made of a $K_{3}$ and two additional edges linked to $K_{3}$ and with no common vertex; let $E_{6}$ be the graph on 6 vertices made by a square bounded by two $K_{3}$ with a common vertex. If $v, w$ are two vertices of $P_{9}$, we denote by $P_{9-v}$, resp. $P_{9-v w}$, the graph obtained from $P_{9}$ by deleting the vertex $v$, resp. the vertices $v$ and $w$. Since the automorphisms of $P_{9}$ act transitively on the vertices, on the edges and on the non-edges, the graph $P_{9-v}$, considered up to an isomorphism, does not depend upon the vertex $v$, similarly, if $v$ and $w$ are distinct, the graph $P_{9-v w}$ only depends upon the fact that the unordered pair $\{u, v\}$ is or is not an edge. In order to distinguish between these two cases, we will denote by $P_{9-\varepsilon}$ the graph obtained by deleting the edge $\varepsilon$. Note that $B_{5}$ and $P_{9-v}$ are isomorphic to their complements and also note that $B_{5}, E_{6}, \overline{E_{6}}, P_{9-\varepsilon}, \overline{P_{9-\varepsilon}}, P_{9-v}$ are induced subgraphs of $P_{9}$. These graphs are represented Figure 2.

Fig. 2.

Lemma 2.2 Let $U \in \operatorname{Forb}\left\{K_{1,3}, \overline{K_{1,3}}\right\}$. If $U$ contains a $K_{3}$ and $a \overline{K_{3}}$ then $U$ is isomorphic to one of the following nine graphs: the bull $B_{5}, A_{6}, \overline{A_{6}}, E_{6}, \overline{E_{6}}$, $P_{9-\varepsilon}, \overline{P_{9-\varepsilon}}, P_{9-v}, P_{9}$.
With these two Lemmas, the proof of Theorem 1.1 is immediate. Indeed, let $U \in \operatorname{Forb}\left\{K_{1,3}, \overline{K_{1,3}}\right\}$. If $U$ contains no $K_{3}$ then according to Lemma 2.1, the connected components of $U$ are cycles of length at least 4, paths or isolated vertices, thus $U$ has the form announced in Theorem 1.1. If $U$ contains no $\overline{K_{3}}$ then via Lemma 2.1 applied to $\bar{U}$ we get the same conclusion. If $U$ contains a $K_{3}$ and a $\overline{K_{3}}$ then Lemma 2.2 tells us that except $A_{6}$ and $\overline{A_{6}}$, each of the graph listed above is isomorphic to an induced subgraph of $P_{9}$. Thus $U$ has the form announced in Theorem 1.1.

### 2.1.1 Proof of Lemma 2.1.

The proof is a consequence of the following trivial observation.
Claim 1 If $U \in \operatorname{Forb}\left\{K_{1,3}\right\}$, every $x \in V(U) \backslash U_{(2)}$ belongs to a $K_{3}$.
Indeed, let $U \in \operatorname{Forb}\left\{K_{1,3}, K_{3}\right\}$. According to Claim 1, $V(U)=U_{(2)}$, thus the connected components of $U$ are cycles, paths or isolated vertices, and since $U \in \operatorname{Forb}\left\{K_{3}\right\}$, the cycles have length at least four. The converse is immediate.

### 2.1.2 Ingredients of the proof of Lemma 2.2.

The proof of Lemma 2.2 given in Subsection 2.1.3 below is a case by case analysis using the following claims.
Claim 2 An arbitrary graph $U$ which contains a $K_{3}$ and a $\overline{K_{3}}$ contains a $K_{3}$ and $a \overline{K_{3}}$ with some vertex in common.
The proof is immediate and is omitted (in fact $U$ contains at least five 3element homogeneous subsets).
Claim 3 A graph $U$ belongs to Forb $\left\{K_{1,3}, \overline{K_{1,3}}\right\}$ if and only if $U(\{x, a\})=$ $U(\{x, b\}) \neq U(\{y, a\})=U(\{y, b\})$ imply $U(\{x, y\})=U(\{a, b\})$ for every 4tuple $(x, y, a, b)$ of distinct vertices.
Proof. Immediate.
In Claim 4 to Claim 7 below, we consider a graph $U \in \operatorname{Forb}\left\{K_{1,3}, \overline{K_{1,3}}\right\}$.
Claim 4 The inequality $\left|N_{U}(x) \cap N_{\bar{U}}(y)\right| \leq 2$ holds for every unordered pair $\{x, y\}$ of distinct vertices.
Proof. Let $A:=N_{U}(x) \cap N_{\bar{U}}(y)$. According to Claim 3, $U(\{a, b\})=U(\{x, y\})$ for every unordered pair $\{a, b\} \in[A]^{2}$. Hence, if $|A| \geq 3, A$ contains either a $K_{3}$ or a $\overline{K_{3}}$. In particular $U$ contains either a $\overline{K_{1,3}}$ or a $K_{1,3}$, a contradiction.

Claim 5 If $U$ contains $a K_{3}$ and a $\overline{K_{3}}$ with a vertex in common then the graph induced by $U$ on the union of their vertices is a bull.
Proof. Let $A:=\{x, a, b\}$ and $B:=\{x, c, d\}$ be the vertex set of a $K_{3}$ and a $\overline{K_{3}}$ respectively. Since $U$ is claw-free then $\bar{U}$ contains at least one edge from
the vertex $a$ to the set $\{c, d\}$ and an edge from the vertex $b$ to the set $\{c, d\}$. Two such edges cannot meet, otherwise $\bar{U}$ would not be claw-free. For the same reason $U$ contains two disjoint edges from $\{c, d\}$ to $\{a, b\}$. The resulting graph is a bull as claimed.
Claim 6 Let $x$ be a vertex belonging to a $\overline{K_{3}}$. Then two $K_{3}$ containing $x$ cannot have an edge in common.
Proof. Supppose the contrary. Let $\{x, e, f\}$ be the vertices of a $\overline{K_{3}},\{x, a, b\}$ and $\{x, b, c\}$ be the vertices of two $K_{3}$. According to Claim 5 the graph induced by $U$ on $\{x, a, b, e, f\}$ is a bull. With no loss of generality, we may suppose that $\{a, e\}$ and $\{b, f\}$ are two edges of $U$, in which case $\{a, f\}$ and $\{b, e\}$ are not edges of $U$. The graph induced by $U$ on $\{x, b, c, e, f\}$ is a bull too. Hence $\{c, e\}$ must be an edge of $U$ whereas $\{c, f\}$ is not an edge of $U$. It follows that $\{x, a, c\} \subseteq N_{U}(b) \cap N_{\bar{U}}(f)$, contradicting Claim 4 ,
Claim 7 If a vertex $x$ belongs to $a \overline{K_{3}}$ then $d_{U}(x) \leq 4$. Moreover, the graph $W$ induced by $U$ on the union of the vertices of the $\overline{K_{3}}$ and the neighbourhood of $x$ is isomorphic to $\overline{A_{6}}$ or to $\overline{E_{6}}$ if $d_{U}(x)=3$ and to $\overline{P_{9-\varepsilon}}$ if $d_{U}(x)=4$.
Proof. Let $\{x, e, f\}$ be the vertices of a $\overline{K_{3}}$.
Let $U^{\prime}$ be the graph induced by $U$ on $N_{U}(x)$. According to Claim6, $d_{U^{\prime}}(y) \leq$ 1 for every vertex $y \in N_{U}(x)$. Since in addition $U^{\prime}$ cannot contain a $\overline{K_{3}}$, $\left|V\left(U^{\prime}\right)\right| \leq 4$. In fact, $U^{\prime}$ consists of an edge and an isolated vertex if $\left|V\left(U^{\prime}\right)\right|=$ 3 and it consists of two disjoint edges if $\left|V\left(U^{\prime}\right)\right|=4$. We have $V\left(U^{\prime}\right)=$ $N_{U}(x)$, hence $\left|V\left(U^{\prime}\right)\right|=d_{U}(x)$ and thus $d_{U}(x) \leq 4$. Suppose $d_{U}(x)=3$. Let $\{a, b, c\}:=N_{U}(x)$; according to Claim 5 we may suppose that the graph induced by $U$ on $\{x, a, b, e, f\}$ is a bull. Since the graph induced on $\{x, e, f\}$ is a $\overline{K_{3}}$, and $c$ is a neighbour of $x$ then at most one of the unordered pairs $\{c, e\},\{c, f\}$ is an edge. If none of these unordered pairs is an edge then $W$ is isomorphic to $\overline{A_{6}}$, otherwise $W$ is isomorphic to $\overline{E_{6}}$ as claimed. Suppose $d_{U}(x)=4$. Let $\{a, b, c, d\}:=N_{U}(x)$; we may suppose that the graph induced by $U$ on $\{x, a, b, e, f\}$ is the bull with $\{a, e\},\{b, f\} \in E(U)$. The graph induced on $\{x, c, d, e, f\}$ is a bull too. We may suppose $\{e, c\},\{d, f\} \in E(U)$ and $\{c, f\},\{d, e\} \notin E(U)$.

In this case $W$ is isomorphic to $\overline{P_{9-\varepsilon}}$ as claimed.

### 2.1.3 Proof of Lemma 2.2.

Let $U \in \operatorname{Forb}\left\{K_{1,3}, \overline{K_{1,3}}\right\}$ and suppose that $U$ contains a $K_{3}$ and a $\overline{K_{3}}$. Let $V:=V(U)$. Then, obviously, $|V| \geq 5$. Claim 2 insures that $U$ contains a $K_{3}$ and a $\overline{K_{3}}$ with a common vertex. Let $x$ be such a vertex; according to Claim 7, we have $d_{U}(x) \leq 4$ and by the same claim applied to $\bar{U}$, we also have $d_{\bar{U}}(x) \leq 4$, proving $|V| \leq 9$.

Case 1. $|V|=5$. From Claim 廌 $U$ is a bull.

Case 2. $|V|=6$. Then either $d_{U}(x)=3$ or $d_{\bar{U}}(x)=3$. In the first case, $V$ is the union of the vertices of the $\overline{K_{3}}$ and the neighbourhood of $x$, hence by Claim [7, $U$ is isomorphic to $\overline{A_{6}}$ or to $\overline{E_{6}}$. In the second case, the same argument yields that $U$ is isomorphic to $A_{6}$ or to $E_{6}$.

Case 3. $|V|=7$. Then either (a) $d_{U}(x)=4$ or (b) $d_{\bar{U}}(x)=4$ or (c) $d_{U}(x)=d_{\bar{U}}(x)=3$. According to Claim [7, in case (a) $U$ is isomorphic to $\overline{P_{9-\varepsilon}}$ and in case (b) to $P_{9-\varepsilon}$. Case (c) reduces to (a) or (b). Indeed, suppose that Case (c) holds. Let $\{a, b, c\}:=N_{U}(x)$ and $\{e, f, g\}:=N_{\bar{U}}(x)$. We may suppose that $\{a, b\} \in E(U),\{e, f\} \notin E(U)$ and the graph induced by $U$ on $\{x, a, b, e, f\}$ is the bull considered in the proof of Claim[7. Moreover, by Claim 6. $\{c, a\},\{c, b\} \notin E(U)$. Since $\{c, x, e, f\}$ cannot form a $K_{1,3}$, either $\{c, e\}$ or $\{c, f\}$ do not belong to $E(U)$. Suppose $\{c, f\} \notin E(U)$ (the case $\{c, e\} \notin E(U)$ will be similar). Then $a$ belongs to a $K_{3}$ and a $\overline{K_{3}}$. If $\{a, g\} \in E(U)$, then $d_{U}(a)=4$ hence, from case (a), $U$ is isomorphic to $\overline{P_{9-\varepsilon}}$. If $\{a, g\} \notin E(U)$, then necessarily $\{b, g\} \in E(U)$ (otherwise $\{x, a, b, g\}$ forms a $\left.\overline{K_{1,3}}\right)$. Necessarily $\{f, g\} \in E(U)$, otherwise $\{b, a, f, g\}$ forms a $K_{1,3}$. Hence, $f$ belongs to a $K_{3}$ and a $\overline{K_{3}}$, also $d_{\bar{U}}(f)=4$. Thus from case (b), $U$ is isomorphic to $P_{9-\varepsilon}$.

Case 4. $|V|=8$. In this case, either $d_{U}(x)=4$ or $d_{\bar{U}}(x)=4$. Suppose $d_{U}(x)=4$ (otherwise, replace $U$ by $\left.\bar{U}\right)$. Let $\{a, b, c, d\}:=N_{U}(x)$ and $\{e, f, g\}:=N_{\bar{U}}(x)$. We may suppose that $\{a, b\} \in E(U),\{e, f\} \notin E(U)$. According to Claim 6, $\{u, v\} \notin E(U)$ whenever $u \in\{a, b\}$ and $v \in\{c, d\}$, thus $\{c, d\} \in E(U)$. Let $U_{-g}$ be the graph induced by $U$ on $V \backslash\{g\}$. It satisfies (a) of Case 3. Hence it is isomorphic to $\overline{P_{9-\varepsilon}}$ and we may suppose that $E\left(U_{-g}\right)=A$, where

$$
A:=\{\{x, a\},\{x, b\},\{x, c\},\{x, d\},\{a, b\},\{c, d\},\{e, a\},\{e, c\},\{f, b\},\{f, d\}\}
$$

According to Claim 6 applied to $\bar{U},\{g, e\},\{g, f\} \in E(U)$. If $\{a, g\} \in E(U)$ also $\{d, g\} \in E(U)$ (otherwise, $\{a, g, e, d\}$ forms a $\left.\overline{K_{1,3}}\right),\{c, g\} \notin E(U)$ (otherwise, $\{g, f, c, a\}$ forms a $\left.K_{1,3}\right),\{b, g\} \notin E(U)$ (otherwise, $\{g, b, e, d\}$ forms a $\left.K_{1,3}\right)$, hence $U$ is isomorphic to $P_{9-v}$. If $\{a, g\} \notin E(U)$, then $\{b, g\} \in E(U)$ (otherwise, $\{a, b, x, g\}$ forms a $\overline{K_{1,3}}$ ), then $\{d, g\} \notin E(U)$ (otherwise, $\{d, g, b, e\}$ forms a $\left.K_{1,3}\right),\{c, g\} \in E(U)$ (otherwise, $\{c, b, f, g\}$ forms a $\left.\overline{K_{1,3}}\right)$. Thus $U$ is isomorphic to $P_{9-v}$.

Case 5. $|V|=9$. In this case $d_{U}(x)=4$. Let $\{a, b, c, d\}:=N_{U}(x)$ and $\{e, f, g, h\}:=N_{\bar{U}}(x)$. Let $U_{-h}$ be the graph induced by $U$ on $V \backslash\{h\}$. It satisfies the hypothesis of Case 4. Hence it is isomorphic to $P_{9-v}$. Up to a relabeling, we may suppose that:

$$
\begin{equation*}
E\left(U_{-h}\right)=A \cup\{\{g, a\},\{g, d\},\{g, e\},\{g, f\}\} \tag{2}
\end{equation*}
$$

Since $a$ belongs to a $\overline{K_{3}}$, then, by claim 7, we have $d_{U}(a) \leq 4$, hence
$\{a, h\} \notin E(U)$. Similarly, $\{d, h\} \notin E(U)$ and $\{g, h\} \notin E(U)$. Hence, the unordered pairs $\{c, h\},\{b, h\},\{f, h\},\{e, h\}$ belong to $E(U)$. Taking account of Formula (2), this yields that $U$ is isomorphic to $P_{9}$.

### 2.2 Ingredients for the proof of Theorem 1.2.

The proof of the equivalence between Properties (1) and (2) of Theorem 1.2 relies on the following lemma.

Lemma 2.3 Let $G$ and $G^{\prime}$ be two graphs on the same vertex set $V$ and let $U:=G \dot{+} G^{\prime}$. Then, the following properties are equivalent:
(a) $G$ and $G^{\prime}$ have the same 3-element homogeneous subsets;
(b) $U(\{x, y\})=U(\{x, z\}) \neq U(\{y, z\}) \Longrightarrow G(\{x, y\}) \neq G(\{x, z\})$ for all distinct elements $x, y, z$ of $V$.
(c) The sets $A_{1}:=E(U) \cap E(G)$ and $A_{2}:=E(U) \backslash E(G)$ divide $V(S(U))$ into two independent sets and also the sets $B_{1}:=E(\bar{U}) \cap E(G)$ and $B_{2}:=$ $E(\bar{U}) \backslash E(G)$ divide $V(S(\bar{U}))$ into two independent sets.
Proof. Observe first that Property (b) is equivalent to the conjunction of the following properties:
$\left(b_{U}\right)$ : If $\{u, v\}$ is an edge of $S(U)$ then $u \in E(G)$ iff $v \notin E(G)$.
and
$\left(b_{\bar{U}}\right)$ : If $\{u, v\}$ is an edge of $S(\bar{U})$ then $u \in E(G)$ iff $v \notin E(G)$.
$(a) \Longrightarrow(b)$. Let us show $(a) \Longrightarrow\left(b_{U}\right)$.
Let $\{u, v\} \in E(S(U))$, then $u, v \in E(U)$. By contradiction, we may suppose that $u, v \in E(G)$ (the other case implies $u, v \in E\left(G^{\prime}\right)$ thus is similar). Since $u$ and $v$ are edges of $U=G \dot{+} G^{\prime}$ then $u, v \notin E\left(G^{\prime}\right)$. Let $w:=\{y, z\}$ such that $u=\{x, y\}, v=\{x, z\}$. Then $w \notin E(U)$ and thus $w \in E(G)$ iff $w \in E\left(G^{\prime}\right)$.
If $w \in E(G),\{x, y, z\}$ is an homogeneous subset of $G$. Since $G$ and $G^{\prime}$ have the same 3-element homogeneous subsets, $\{x, y, z\}$ is an homogeneous subset of $G^{\prime}$. Hence, since $u, v \notin E\left(G^{\prime}\right), w=\{y, z\} \notin E\left(G^{\prime}\right)$, thus $w \notin E(G)$, a contradiction.
If $w \notin E(G)$, then $w \notin E\left(G^{\prime}\right)$; since $u, v \notin E\left(G^{\prime}\right)$ it follows that $\{x, y, z\}$ is an homogeneous subset of $G^{\prime}$. Consequently $\{x, y, z\}$ is an homogeneous subset of $G$. Since $u, v \in E(G)$, then $w \in E(G)$, a contradiction.
The implication $a) \Longrightarrow\left(b_{\bar{U}}\right)$ is similar.
$(b) \Longrightarrow(a)$. Let $T$ be a $K_{3}$ of $G$. Suppose that $T$ is not an homogeneous subset of $G^{\prime}$ then we may suppose $T=\{u, v, w\}$ with $u, v \in E\left(G^{\prime}\right)$ and $w \notin E\left(G^{\prime}\right)$ or $u, v \in E\left(\overline{G^{\prime}}\right)$ and $w \notin E\left(\overline{G^{\prime}}\right)$. In the first case $\{u, v\} \in E(S(\bar{U}))$, which contradicts Property $\left(b_{\bar{U}}\right)$, in the second case $\{u, v\} \in E(S(U))$, which contradicts Property $\left(b_{U}\right)$.
$(b) \Longrightarrow(c)$. First $V(S(U))=E(U)=A_{1} \cup A_{2}$ and $V(S(\bar{U}))=E(\bar{U})=B_{1} \cup B_{2}$. Let $u, v$ be two distinct elements of $A_{1}$ (respectively $A_{2}$ ). Then $u, v \in E(G)$ (respectively $u, v \notin E(G)$ ). From $\left(b_{U}\right)$ we have $\{u, v\} \notin E(S(U))$. Then $A_{1}$ and $A_{2}$ are independent sets of $V(S(U))$. The proof that $B_{1}$ and $B_{2}$ are independent
sets of $V(S(\bar{U}))$ is similar.
$(c) \Longrightarrow(b)$. This implication is trivial.

### 2.3 Proof of Theorem 1.2.

Implication $(1) \Longrightarrow(2)$ follows directly from implication $(a) \Longrightarrow(c)$ of Lemma 2.3. Indeed, Property (c) implies trivially that $S(U)$ and $S(\bar{U})$ are bipartite.
$(2) \Longrightarrow(1)$. Suppose that $S(U)$ and $S(\bar{U})$ are bipartite. Let $\left\{A_{1}, A_{2}\right\}$ and $\left\{B_{1}, B_{2}\right\}$ be respectively a partition of $V(S(U))=E(U)$ and $V(S(\bar{U}))=E(\bar{U})$ into independent sets. Note that $A_{i} \cap B_{j}=\emptyset$, for $i, j \in\{1,2\}$. Let $G, G^{\prime}$ be two graphs with the same vertex set as $U$ such that $E(G)=A_{1} \cup B_{1}$ and $E\left(G^{\prime}\right)=A_{2} \cup B_{1}$. Clearly $E\left(G \dot{+} G^{\prime}\right)=A_{1} \cup A_{2}=E(U)$. Thus $U=G \dot{+} G^{\prime}$. To conclude that Property (1) holds, it suffices to show that $G$ and $G^{\prime}$ have the same 3-element homogeneous subsets, that is Property (a) of Lemma 2.3 holds. For that, note that $A_{1}=E(U) \cap E(G), A_{2}=E(U) \backslash E(G), B_{1}=E(\bar{U}) \cap E(G)$ and $B_{2}=E(\bar{U}) \backslash E(G)$ and thus Property (c) of Lemma 2.3 holds. It follows that Property (a) of this lemma holds.

The proof of implication $(2) \Longrightarrow(3)$ was given in Section 1. For the converse implication, let $U$ be a graph satisfying Property (3). It is clear from Figure 1 that $S\left(P_{9}\right)$ is bipartite. Since $\overline{P_{9}}$ is isomorphic to $P_{9}, S\left(\overline{P_{9}}\right)$ is bipartite too. Thus, if $U$ is isomorphic to an induced subgraph of $P_{9}$, Property (2) holds. If not, we may suppose that the connected components of $U$ are cycles of even length, paths or isolated vertices (otherwise, replace $U$ by $\bar{U}$ ). In this case, $S(U)$ is trivially bipartite. In order to prove that Property 2 holds, it suffices to prove that $S(\bar{U})$ is bipartite too. This is a direct consequence of the following claim:
Claim 8 If $U$ is a bipartite graph, then $S(\bar{U})$ is bipartite too.
Proof. If $c: V(U) \rightarrow \mathbb{Z} / 2 \mathbb{Z}$ is a colouring of $U$, set $c^{\prime}: V(S(\bar{U})) \rightarrow \mathbb{Z} / 2 \mathbb{Z}$ defined by $c^{\prime}(\{x, y\}):=c(x)+c(y)$.

With this, the proof of Theorem 1.2 is complete.
