# Periodic and solitary wave solutions to the Fornberg-Whitham equation

Jiangbo Zhou ∗, Lixin Tian

Nonlinear Scientific Research Center, Faculty of Science, Jiangsu University, Zhenjiang, Jiangsu 212013, China

## Abstract

In this paper, new travelling wave solutions to the Fornberg-Whitham equation

 $u_t - u_{xxt} + u_x + uu_x = uu_{xxx} + 3u_xu_{xx}$ 

are investigated. They are characterized by two parameters. The expresssions of the periodic and solitary wave solutions are obtained.

Key words: Fornberg-Whitham equation, solitary wave, periodic wave

# 1 Introduction

Recently, Ivanov [\[1\]](#page-9-0) investigated the integrability of a class of nonlinear dispersive wave equations

<span id="page-0-0"></span>
$$
u_t - u_{xxt} + \partial_x(\kappa u + \alpha u^2 + \beta u^3) = \nu u_x u_{xx} + \gamma u u_{xxx},\tag{1.1}
$$

where and  $\alpha, \beta, \gamma, \kappa, \nu$  are real constants.

The important cases of Eq. $(1.1)$  are:

The hyperelastic-rod wave equation

<span id="page-0-1"></span>
$$
u_t - u_{xxt} + 3uu_x = \gamma(2u_x u_{xx} + uu_{xxx}),
$$
\n(1.2)

Email address: zhoujiangbo@yahoo.cn (Jiangbo Zhou).

has been recently studied as a model, describing nonlinear dispersive waves in cylindrical compressible hyperelastic rods [\[2\]](#page-9-1)-[\[7\]](#page-9-2). The physical parameters of various compressible materials put  $\gamma$  in the range from -29.4760 to 3.4174  $|2,4|$ .

The Camassa-Holm equation

$$
u_t - u_{xxt} + 3uu_x = 2u_x u_{xx} + uu_{xxx}, \tag{1.3}
$$

describes the unidirectional propagation of shallow water waves over a flat bottom [\[8,](#page-9-4)[9\]](#page-9-5). It is completely integrable [\[1\]](#page-9-0) and admits, in addition to smooth waves, a multitude of travelling wave solutions with singularities: peakons, cuspons, stumpons and composite waves  $[9]-[12]$  $[9]-[12]$ . The solitary waves of Eq.[\(1.2\)](#page-0-1) are smooth if  $\kappa > 0$  and peaked if  $\kappa = 0$  [\[9,](#page-9-5)[10\]](#page-9-7). Its solitary waves are stable solitons [\[13](#page-9-8)[,14\]](#page-9-9), retaining their shape and form after interactions [\[15\]](#page-9-10). It models wave breaking  $|16|$ - $|18|$ .

The Degasperis-Procesi equation

<span id="page-1-0"></span>
$$
u_t - u_{xxt} + 4uu_x = 3u_x u_{xx} + uu_{xxx}, \tag{1.4}
$$

models nonlinear shallow water dynamics. It is completely integrable [\[1\]](#page-9-0) and has a variety of travelling wave solutions including solitary wave solutions, peakon solutions and shock waves solutions [\[20\]](#page-10-2)-[\[27\]](#page-10-3).

The Fornberg-Whitham equation

<span id="page-1-3"></span>
$$
u_t - u_{xxt} + u_x + uu_x = uu_{xxx} + 3u_x u_{xx}, \t\t(1.5)
$$

appeared in the study qualitative behaviors of wave-breaking [\[28\]](#page-10-4). It admits a wave of greatest height, as a peaked limiting form of the travelling wave solution [\[29\]](#page-10-5),  $u(x,t) = A \exp(-\frac{1}{2})$  $\frac{1}{2}$   $\Big|x-\frac{4}{3}\Big|$  $\frac{4}{3}t\vert$ ), where A is an arbitrary constant. It is not completely integrable [\[1\]](#page-9-0).

The regularized long-wave or BBM equation

<span id="page-1-1"></span>
$$
u_t - u_{xxt} + u_x + uu_x = 0,\t\t(1.6)
$$

and the modified BBM equation

<span id="page-1-2"></span>
$$
u_t - u_{xxt} + u_x + 3u^2 u_x = 0,
$$
\t(1.7)

have also been investigated by many authors [\[30\]](#page-10-6)-[\[38\]](#page-11-0).

Many efforts have been devoted to study Eq. $(1.2)$ - $(1.4)$ , $(1.6)$  and  $(1.7)$ , however, little attention was paid to study Eq. $(1.5)$ . In [\[39\]](#page-11-1), we constructed two types of bounded travelling wave solutions  $u(\xi)(\xi = x - ct)$  to Eq.[\(1.5\)](#page-1-3), which are defined on semifinal bounded domains and called kink-like and antikinklike wave solutions. In this paper, we continue to study the travelling wave solutions to Eq.  $(1.5)$ . Following Vakhnenko and Parkes's strategy in [\[19\]](#page-10-7), we obtain some periodic and solitary wave solutions  $u(\xi)$  to Eq.[\(1.5\)](#page-1-3) which are defined on  $(-\infty, +\infty)$ . The travelling wave solutions obtained in this paper are obviously different from those obtained in our previous work [\[39\]](#page-11-1). To the best of our knowledge, these solutions are new for Eq.[\(1.5\)](#page-1-3). Our work may help people to know deeply the described physical process and possible applications of the Fornberg-Whitham equation.

The remainder of the paper is organized as follows. In Section 2, for completeness and readability, we repeat Appendix A in  $|19|$ , which discuss the solutions to a first-order ordinary differential equaion. In Section 3, we show that, for travelling wave solutions, Eq. $(1.5)$  may be reduced to a first-order ordinary differential equation involving two arbitrary integration constants a and b. We show that there are four distinct periodic solutions corresponding to four different ranges of values of a and restricted ranges of values of b. A short conclusion is given in Section 4.

#### 2 Solutions to a first-order ordinary differential equaion

This section is due to Vakhnenko and Parkes (see Appendix A in [\[19\]](#page-10-7)). For completeness and readability, we repeat it in the following.

Consider solutions to the following ordinary differential equation

<span id="page-2-0"></span>
$$
(\varphi \varphi_{\xi})^2 = \varepsilon^2 f(\varphi), \tag{2.1}
$$

where

$$
f(\varphi) = (\varphi - \varphi_1)(\varphi - \varphi_2)(\varphi_3 - \varphi)(\varphi_4 - \varphi), \tag{2.2}
$$

and  $\varphi_1, \varphi_2, \varphi_3, \varphi_4$  are chosen to be real constants with  $\varphi_1 \leq \varphi_2 \leq \varphi \leq \varphi_3 \leq$  $\varphi_4.$ 

Following [\[40\]](#page-11-2) we introduce  $\zeta$  defined by

$$
\frac{d\xi}{d\zeta} = \frac{\varphi}{\varepsilon},\tag{2.3}
$$

so that  $Eq.(2.1)$  $Eq.(2.1)$  becomes

<span id="page-3-0"></span>
$$
(\varphi_{\zeta})^2 = f(\varphi). \tag{2.4}
$$

 $Eq.(2.4)$  $Eq.(2.4)$  has two possible forms of solution. The first form is found using result 254.00 in [\[41\]](#page-11-3). Its parametric form is

<span id="page-3-1"></span>
$$
\begin{cases}\n\varphi = \frac{\varphi_2 - \varphi_1 n \operatorname{sn}^2(w|m)}{1 - n \operatorname{sn}^2(w|m)},\\ \n\xi = \frac{1}{\varepsilon p}(w\varphi_1 + (\varphi_2 - \varphi_1)\Pi(n; w|m)),\n\end{cases} \tag{2.5}
$$

with  $w$  as the parameter, where

<span id="page-3-2"></span>
$$
m = \frac{(\varphi_3 - \varphi_2)(\varphi_4 - \varphi_1)}{(\varphi_4 - \varphi_2)(\varphi_3 - \varphi_1)}, p = \frac{1}{2}\sqrt{(\varphi_4 - \varphi_2)(\varphi_3 - \varphi_1)}, w = p\zeta,
$$
 (2.6)

and

$$
n = \frac{\varphi_3 - \varphi_2}{\varphi_3 - \varphi_1}.\tag{2.7}
$$

In  $(2.5)$  sn $(w|m)$  is a Jacobian elliptic function, where the notation is as used in Chapter 16 of [\[42\]](#page-11-4).  $\Pi(n; w|m)$  is the elliptic integral of the third kind and the notation is as used in Section 17.2.15 of [\[42\]](#page-11-4).

The solution to  $(2.1)$  is given in parametric form by  $(2.5)$  with w as the parameter. With respect to w,  $\varphi$  in [\(2.5\)](#page-3-1) is periodic with period  $2K(m)$ , where  $K(m)$  is the complete elliptic integral of the first kind. It follows from  $(2.5)$ that the wavelength  $\lambda$  of the solution to  $(2.1)$  is

<span id="page-3-3"></span>
$$
\lambda = \frac{2}{\varepsilon p} |\varphi_1 K(m) + (\varphi_2 - \varphi_1) \Pi(n|m)|, \tag{2.8}
$$

where  $\Pi(n|m)$  is the complete elliptic integral of the third kind.

When  $\varphi_3 = \varphi_4$ ,  $m = 1$ , [\(2.5\)](#page-3-1) becomes

<span id="page-3-4"></span>
$$
\begin{cases}\n\varphi = \frac{\varphi_2 - \varphi_1 n \tanh^2 w}{1 - n \tanh^2 w}, \\
\xi = \frac{1}{\varepsilon} (\frac{w \varphi_3}{p} - 2 \tanh^{-1}(\sqrt{n} \tanh w)).\n\end{cases} (2.9)
$$

The second form of solution of  $(2.5)$  is found using result 255.00 in [\[41\]](#page-11-3). Its

parametric form is

<span id="page-4-0"></span>
$$
\begin{cases}\n\varphi = \frac{\varphi_3 - \varphi_4 n \operatorname{sn}^2(w|m)}{1 - n \operatorname{sn}^2(w|m)},\\ \n\xi = \frac{1}{\varepsilon p} (w\varphi_4 - (\varphi_4 - \varphi_3)\Pi(n; w|m)),\n\end{cases} \tag{2.10}
$$

where  $m, p, w$  are as in  $(2.6)$ , and

$$
n = \frac{\varphi_3 - \varphi_2}{\varphi_4 - \varphi_2}.\tag{2.11}
$$

The solution to  $(2.1)$  is given in parametric form by  $(2.10)$  with w as the parameter. The wavelength  $\lambda$  of the solution to  $(2.1)$  is

<span id="page-4-4"></span>
$$
\lambda = \frac{2}{\varepsilon p} |\varphi_4 K(m) - (\varphi_4 - \varphi_3) \Pi(n|m)|. \tag{2.12}
$$

When  $\varphi_1 = \varphi_2$ ,  $m = 1$ , [\(2.10\)](#page-4-0) becomes

<span id="page-4-5"></span>
$$
\begin{cases}\n\varphi = \frac{\varphi_3 - \varphi_4 n \tanh^2 w}{1 - n \tanh^2 w}, \\
\xi = \frac{1}{\varepsilon} (\frac{w\varphi_2}{p} + 2 \tanh^{-1}(\sqrt{n} \tanh w)).\n\end{cases}
$$
\n(2.13)

# 3 Periodic and solitary wave solutions to  $Eq.(1.5)$  $Eq.(1.5)$

Eq. $(1.5)$  can also be written in the form

<span id="page-4-1"></span>
$$
(u_t + uu_x)_{xx} = u_t + uu_x + u_x.
$$
\n(3.1)

Let  $u = \varphi(\xi) + c$  with  $\xi = x - ct$  be a travelling wave solution to Eq.[\(3.1\)](#page-4-1), then it follows that

<span id="page-4-2"></span>
$$
(\varphi\varphi_{\xi})_{\xi\xi} = \varphi\varphi_{\xi} + \varphi_{\xi}.\tag{3.2}
$$

Integrating  $(3.2)$  twice with respect to  $\xi$ , we have

<span id="page-4-3"></span>
$$
(\varphi \varphi_{\xi})^2 = \frac{1}{4}(\varphi^4 + \frac{8}{3}\varphi^3 + a\varphi^2 + b),
$$
\n(3.3)

where *a* and *b* are two arbitrary integration constants.

Eq.[\(3.3\)](#page-4-3) is in the form of Eq.[\(2.1\)](#page-2-0) with  $\varepsilon = \frac{1}{2}$  $\frac{1}{2}$  and  $f(\varphi) = (\varphi^4 + \frac{8}{3})$  $\frac{8}{3}\varphi^3 +$  $a\varphi^2 + b$ ). For convenience we define  $g(\varphi)$  and  $h(\varphi)$  by

$$
f(\varphi) = \varphi^2 g(\varphi) + b, \text{ where } g(\varphi) = \varphi^2 + \frac{8}{3}\varphi + a,
$$
 (3.4)

$$
f'(\varphi) = 2\varphi h(\varphi), \text{ where } h(\varphi) = 2\varphi^2 + 4\varphi + a,
$$
\n(3.5)

and define  $\varphi_L$ ,  $\varphi_R$ ,  $b_L$ , and  $b_R$  by

$$
\varphi_L = -\frac{1}{2}(2 + \sqrt{4 - 2a}), \varphi_R = -\frac{1}{2}(2 - \sqrt{4 - 2a}), \tag{3.6}
$$

$$
b_L = -\varphi_L^2 g(\varphi_L) = \frac{a^2}{4} - 2a + \frac{8}{3} + \frac{2}{3}(2 - a)\sqrt{4 - 2a},\tag{3.7}
$$

$$
b_R = -\varphi_R^2 g(\varphi_R) = \frac{a^2}{4} - 2a + \frac{8}{3} - \frac{2}{3}(2 - a)\sqrt{4 - 2a}.
$$
 (3.8)

Obviously,  $\varphi_L$ ,  $\varphi_R$  are the roots of  $h(\varphi) = 0$ .

In the following, suppose that  $a < 2$  and  $a \neq 0$  such that  $f(\varphi)$  has three distinct stationary points:  $\varphi_L$ ,  $\varphi_R$ , 0 and comprise two minimums separated by a maximum. Under this assumption, Eq.[\(3.3\)](#page-4-3) has periodic and solitary wave solutions that have different analytical forms depending on the values of a and b as follows:

 $(1)$   $a < 0$ 

In this case  $\varphi_L < 0 < \varphi_R$  and  $f(\varphi_L) < f(\varphi_R)$ . For each value  $a < 0$ and  $0 < b < b_R$  (a corresponding curve of  $f(\varphi)$  is shown in Fig.1(a)), there are periodic inverted loop-like solutions to  $Eq.(3.3)$  $Eq.(3.3)$  given by  $(2.5)$  so that  $0 < m < 1$ , and with wavelength given by  $(2.8)$ ; see Fig. 2(a) for an example.

The case  $a < 0$  and  $b = b_R$  (a corresponding curve of  $f(\varphi)$  is shown in Fig.1(b)) corresponds to the limit  $\varphi_3 = \varphi_4 = \varphi_R$  so that  $m = 1$ , and then the solution is an inverted loop-like solitary wave given by  $(2.9)$  with  $\varphi_2 \leq \varphi < \varphi_R$ and

$$
\varphi_1 = -\frac{1}{6}(2 + 3\sqrt{4 - 2a} + 2\sqrt{4 + 6\sqrt{4 - 2a}}),\tag{3.9}
$$

$$
\varphi_2 = -\frac{1}{6}(2 + 3\sqrt{4 - 2a} - 2\sqrt{4 + 6\sqrt{4 - 2a}}),\tag{3.10}
$$

see Fig.3(a) for an example.

Fig. 1. The curve of  $f(\varphi)$ . (a)  $a = -50$ ,  $b = 233$ ; (b)  $a = -50$ ,  $b = 374.1346$ ; (c)  $a = 1.5, b = -0.05;$  (d)  $a = 1.5, b = 0;$  (e)  $a = \frac{16}{9}$  $\frac{16}{9}$ ,  $b = -0.1$ ; (f)  $a = \frac{16}{9}$  $\frac{10}{9}$ ,  $b = 0$ ; (g)  $a = 1.9, b = -0.24;$  (h)  $a = 1.9, b = -0.2010.$ 

$$
(2) \ 0 < a < \frac{16}{9}
$$

In this case  $\varphi_L < \varphi_R < 0$  and  $f(\varphi_L) < f(0)$ . For each value  $0 < a < \frac{16}{9}$ and  $b_R < b < 0$  (a corresponding curve of  $f(\varphi)$  is shown in Fig.1(c)), there are periodic hump-like solutions to Eq.[\(3.3\)](#page-4-3) given by  $(2.5)$  so that  $0 < m < 1$ , and with wavelength given by  $(2.8)$ ; see Fig.2(b) for an example.

The case  $0 < a < \frac{16}{9}$  and  $b = 0$  (a corresponding curve of  $f(\varphi)$  is shown in Fig.1(d)) corresponds to the limit  $\varphi_3 = \varphi_4 = 0$  so that  $m = 1$ , and then the solution can be given by [\(2.9\)](#page-3-4) with  $\varphi_1$  and  $\varphi_2$  given by the roots of  $g(\varphi) = 0$ , namely

$$
\varphi_1 = -\frac{4}{3} - \frac{1}{3}\sqrt{16 - 9a}, \varphi_2 = -\frac{4}{3} + \frac{1}{3}\sqrt{16 - 9a}.
$$
\n(3.11)

In this case we obtain a weak solution, namely the periodic upward-cusp wave

$$
\varphi = \varphi(\xi - 2j\xi_m), (2j - 1)\xi_m < \xi < (2j + 1)\xi_m, \ j = 0, \pm 1, \pm 2, \cdots, \ (3.12)
$$

where

$$
\varphi(\xi) = (\varphi_2 - \varphi_1 \tanh^2(\xi/4)) \cosh^2(\xi/4),
$$
\n(3.13)

and

$$
\xi_m = 4 \tanh^{-1} \sqrt{\frac{\varphi_2}{\varphi_1}},\tag{3.14}
$$

see Fig.3(b) for an example.

Fig. 2. Periodic solutions to Eq.[\(3.3\)](#page-4-3) with  $0 < m < 1$ . (a)  $a = -50$ ,  $b = 233$  so  $m = 0.7885$ ; (b)  $a = 1.5$ ,  $b = -0.05$  so  $m = 0.6893$ ; (c)  $a = \frac{16}{9}$ ,  $b = -0.1$  so  $m = 0.8254$ ; (d)  $a = 1.9$ ,  $b = -0.24$  so  $m = 0.6121$ .

Fig. 3. Solutions to Eq.[\(3.3\)](#page-4-3) with  $m = 1$ . (a)  $a = -50$ ,  $b = 374.1346$ ; (b)  $a = 1.5$ ,  $b = 0$ ; (c)  $a = \frac{16}{9}$ ,  $b = 0$ ; (d)  $a = 1.9$ ,  $b = -0.2010$ .

 $(3) a = \frac{16}{9}$ 9

In this case  $\varphi_L < \varphi_R < 0$  and  $f(\varphi_L) = f(0)$ . For  $a = \frac{16}{9}$  $\frac{10}{9}$  and each value  $b_R < b < 0$  (a corresponding curve of  $f(\varphi)$  is shown in Fig.1(e)), there are periodic hump-like solutions to Eq.[\(3.3\)](#page-4-3) given by [\(2.10\)](#page-4-0) so that  $0 < m < 1$ , and with wavelength given by  $(2.12)$ ; see Fig.2(c) for an example.

The case  $a = \frac{16}{9}$  $\frac{10}{9}$  and  $b = 0$  (a corresponding curve of  $f(\varphi)$  is shown in Fig.1(f)) corresponds to the limit  $\varphi_1 = \varphi_2 = \varphi_L = -\frac{4}{3}$  $\frac{4}{3}$  and  $\varphi_3 = \varphi_4 = 0$  so that  $m = 1$ . In this case neither  $(2.5)$  nor  $(2.10)$  is appropriate. Instead we consider Eq.[\(3.3\)](#page-4-3) with  $f(\varphi) = \frac{1}{4}\varphi^2(\varphi + \frac{4}{3})$  $\frac{4}{3}$ <sup>2</sup> and note that the bound solution has  $-\frac{4}{3}$  $\frac{4}{3} < \varphi \leq 0$ . On integrating Eq.[\(3.3\)](#page-4-3) and setting  $\varphi = 0$  at  $\xi = 0$  we obtain a weak solution

$$
\varphi = \frac{4}{3} \exp\left(-\frac{1}{2}|\xi|\right) - \frac{4}{3},\tag{3.15}
$$

i.e. a single peakon solution with amplitude  $\frac{4}{3}$ , see Fig.3(c).

$$
(4) \frac{16}{9} < a < 2
$$

In this case  $\varphi_L < \varphi_R < 0$  and  $f(\varphi_L) > f(0)$ . For each value  $\frac{16}{9} < a < 2$  and  $b_R < b < b_L$  (a corresponding curve of  $f(\varphi)$  is shown in Fig.1(g)), there are periodic hump-like solutions to Eq.[\(3.3\)](#page-4-3) given by  $(2.10)$  so that  $0 < m < 1$ , and with wavelength given by  $(2.12)$ ; see Fig.  $2(d)$  for an example.

The case  $\frac{16}{9} < a < 2$  and  $b = b_L$  (a corresponding curve of  $f(\varphi)$  is shown in Fig.1(h)) corresponds to the limit  $\varphi_1 = \varphi_2 = \varphi_L$  so that  $m = 1$ , and then the solution is a hump-like solitary wave given by [\(2.13\)](#page-4-5) with  $\varphi_L < \varphi \leq \varphi_3$ and

$$
\varphi_3 = \frac{1}{6}(-2 + 3\sqrt{4 - 2a} - 2\sqrt{4 - 6\sqrt{4 - 2a}}),\tag{3.16}
$$

$$
\varphi_4 = \frac{1}{6}(-2 + 3\sqrt{4 - 2a} + 2\sqrt{4 - 6\sqrt{4 - 2a}}),\tag{3.17}
$$

see Fig.3(d) for an example.

On the above, we have obtained expressions of parametric form for periodic and solitary wave solutions  $\varphi(\xi)$  to Eq.[\(3.3\)](#page-4-3). So in terms of  $u = \varphi(\xi) + c$ , we can get expressions for the periodic and solitary wave solutions  $u(\xi)$  to Eq.[\(1.5\)](#page-1-3).

# 4 Conclusion

In this paper, we have found expressions for new travelling wave solutions to the Fornberg-Whitham equation. These solutions depend, in effect, on two parameters a and m. For  $m = 1$ , there are inverted loop-like  $(a < 0)$ , single peaked ( $a = \frac{16}{9}$ )  $\frac{16}{9}$  and hump-like  $(\frac{16}{9} < a < 2)$  solitary wave solutions. For

 $m = 1, 0 < a < \frac{16}{9}$  or  $0 < m < 1, a < 2$  and  $a \neq 0$ , there are periodic hump-like wave solutions.
