Parameter-Free Deterministic Global Search with Central Force Optimization

Richard A. Formato¹

Abstract. This note describes a parameter-free implementation of Central Force Optimization for deterministic multidimensional search and optimization. The user supplies only one input: the objective function to be maximized, nothing more. The CFO equations of motion are simplified by assigning specific values to CFO's basic parameters, and this particular algorithmic implementation also includes hardwired internal parameters so that none is user-specified. The algorithm's performance is tested against a widely used suite of twenty three benchmark functions and compared to other state-of-the-art algorithms. CFO performs very well indeed.

Parameter-Free Deterministic Global Search with Central Force Optimization

Richard A. Formato¹

1. Introduction

Central Force Optimization (CFO) is a *deterministic* Nature-inspired metaheuristic for an evolutionary algorithm (EA) that performs multidimensional global search and optimization [1-13]. This note presents a parameter-free CFO implementation that requires only one user-specified input: the objective function to be maximized. It works quite well across a wide range of functions.

A major frustration with many EAs is the plethora of setup parameters. For example, the three Ant Colony Optimization (ACO) algorithms described in [14] (AS, *MAX-MIN*, ACS) require the user to specify parameters m (number of ants), ρ (pheromone evaporation rate), Q (pheromone length constant), α/β (weighting exponents for pheromone/heuristic information), τ_{\max}/τ_{\min} (upper/lower pheromone bounds), φ (pheromone decay coefficient), τ_0 (initial pheromone value), and q_0 (random variable crossover point). The generalized Particle Swarm Optimization (PSO) algorithm in [15] requires the user to specify a population size and six “suitable bounded coefficients” ($\chi, w^k, c_j, r_j, c_g, r_g$ with upper/lower bounds). The frustration of having to specify these numbers is compounded by the facts that (a) there usually is no methodology for picking “good” values; (b) the “right” parameters are often problem-specific; (c) the solutions often are sensitive to small changes; and (d) run upon run, exactly the same parameters never yield the same results because the algorithm is inherently stochastic.

CFO is quite different. It is based on Newton’s laws of motion and gravity for real masses moving through the real Universe; and just as these laws are mathematically precise, so too is CFO. It is completely deterministic at every step, with successive runs employing the same setup parameters yielding precisely the same results. Its inherent determinism distinguishes CFO from all the stochastic EAs that fail completely if randomness is removed. Moreover, CFO’s metaphor of gravitational kinematics appears to be more than a simple analogy. While many metaheuristics are inspired by natural processes, ant foraging or fish swarming, for example, the resulting algorithm is not (necessarily) an accurate mathematical model of the actual process. Rather, it truly is a metaphor. By contrast, CFO and real gravity appear to be much more closely related. Indeed, CFO’s “metaphor” actually may be reality, because its “probes” often exhibit behavior that is strikingly similar to that of gravitationally trapped near earth objects (NEOs). If so, the panoply of mathematical tools and techniques available in celestial mechanics may be applicable to CFO directly or with modification or extension (see [7-9]). In addition, CFO may be interpreted in different ways depending upon the underlying model (vector force field, gradient of gravitational potential, kinetic or total energy) [13]. These observations, although peripheral to the theme of this note, provide additional context for the CFO metaheuristic.

2. CFO Algorithm

Pseudocode for the parameter-free CFO implementation appears in Fig. 1. Simplification of the algorithm is achieved by hardwiring all of CFO's basic parameters, which results in simplified equations of motion as described below. CFO searches for the global *maxima* of an *objective*

```

Procedure CFO [ $f(\vec{x}), N_d, \Omega$ ]

Set internal parameters:  $N_t, F_{rep}^{init}, \Delta F_{rep}, F_{rep}^{\min}, \left(\frac{N_p}{N_d}\right)_{MAX}, \gamma_{start}, \gamma_{stop}, \Delta\gamma$ .

Initialize  $f_{\max}^{global}(\vec{x})$  = very large negative number, say,  $-10^{+4200}$ .

For  $N_p/N_d = 2$  to  $\left(\frac{N_p}{N_d}\right)_{MAX}$  by 2 :
    (a.0) Total number of probes:  $N_p = N_d \cdot \left(\frac{N_p}{N_d}\right)$ 

For  $\gamma = \gamma_{start}$  to  $\gamma_{stop}$  by  $\Delta\gamma$ :
    (a.1) Re-initialize data structures for Position/Acceleration vectors & Fitness matrix.
    (a.2) Compute IPD [see text].
    (a.3) Compute initial fitness matrix,  $M_0^p, 1 \leq p \leq N_p$ .
    (a.4) Initialize  $F_{rep} = F_{rep}^{init}$ .

For  $j = 0$  to  $N_t$  [or earlier termination criterion – see text]:
    (b) Compute probe position vectors,  $\vec{R}_j^p, 1 \leq p \leq N_p$  [eq.(2)].
    (c) Retrieve errant probes ( $1 \leq p \leq N_p$ ):
        If  $\vec{R}_j^p \cdot \hat{e}_i < x_i^{\min} \therefore \vec{R}_j^p \cdot \hat{e}_i = \max\{x_i^{\min} + F_{rep}(\vec{R}_{j-1}^p \cdot \hat{e}_i - x_i^{\min}), x_i^{\min}\}$ .
        If  $\vec{R}_j^p \cdot \hat{e}_i > x_i^{\max} \therefore \vec{R}_j^p \cdot \hat{e}_i = \min\{x_i^{\max} - F_{rep}(x_i^{\max} - \vec{R}_{j-1}^p \cdot \hat{e}_i), x_i^{\max}\}$ .
    (d) Compute fitness matrix for current probe distribution,  $M_j^p, 1 \leq p \leq N_p$ .
    (e) Compute accelerations using current probe distribution and fitnesses [eq. (1)].
    (f) Increment  $F_{rep}$ :  $F_{rep} = F_{rep} + \Delta F_{rep}$ ; If  $F_{rep} > 1 \therefore F_{rep} = F_{rep}^{\min}$ .
    (g) If  $j \geq 20$  and  $j \text{ MOD } 10 = 0 \therefore$ 
        (i) Shrink  $\Omega$  around  $\vec{R}_{best}$  [see text].
        (ii) Retrieve errant probes using procedure in Step (c).

Next  $j$ 
    (h) Reset  $\Omega$ 's boundaries to their starting values before shrinking.
    (i) If  $f_{\max}(\vec{x}) \geq f_{\max}^{global}(\vec{x}) \therefore f_{\max}^{global}(\vec{x}) = f_{\max}(\vec{x})$ .

Next  $\gamma$ 
Next  $N_p/N_d$ 

```

Fig. 1. CFO Pseudocode.

function $f(x_1, x_2, \dots, x_{N_d})$ defined on the N_d -dimensional decision space Ω : $x_i^{\min} \leq x_i \leq x_i^{\max}$, $1 \leq i \leq N_d$. The x_i are *decision variables*, and i the coordinate number. The value of $f(\vec{x})$ at point \vec{x} in Ω is its *fitness*. $f(\vec{x})$'s topology or "landscape" in the N_d -dimensional hyperspace is unknown, that is, there is no *a priori* information about the objective function's maxima. CFO searches Ω by flying "probes" through the space at discrete "time" steps (iterations). Each probe's location is specified by its position vector computed from two *equations of motion* that analogize their real-world counterparts for material objects moving through physical space under the influence of gravity without energy dissipation.

Equations of Motion. Probe p 's position vector at step j is $\vec{R}_j^p = \sum_{k=1}^{N_d} x_k^{p,j} \hat{e}_k$, where the $x_k^{p,j}$ are its coordinates and \hat{e}_k the unit vector along the x_k -axis. The indices j , $0 \leq j \leq N_t$, and p , $1 \leq p \leq N_p$, respectively, are the iteration number and probe number, where N_t and N_p are the corresponding *total* number of time steps and *total* number of probes.

In metaphorical "CFO space" each of the N_p probes experiences an acceleration created by the "gravitational pull" of "masses" in Ω . Probe p 's acceleration at step $j-1$ is given by

$$\vec{a}_{j-1}^p = \sum_{\substack{k=1 \\ k \neq p}}^{N_p} U(M_{j-1}^k - M_{j-1}^p) \cdot (M_{j-1}^k - M_{j-1}^p) \times \frac{(\vec{R}_{j-1}^k - \vec{R}_{j-1}^p)}{\|\vec{R}_{j-1}^k - \vec{R}_{j-1}^p\|}, \quad (1)$$

which is the first of CFO's two equations of motion. In (1), $M_{j-1}^p = f(x_1^{p,j-1}, x_2^{p,j-1}, \dots, x_{N_d}^{p,j-1})$ is the objective function's fitness at probe p 's location at time step $j-1$. Each of the other probes at that step (iteration) has associated with it fitness M_{j-1}^k , $k = 1, \dots, p-1, p+1, \dots, N_p$. $U(\cdot)$ is

the Unit Step function, $U(z) = \begin{cases} 1, & z \geq 0 \\ 0, & \text{otherwise} \end{cases}$. Note that $\vec{a}_{j-1}^p = 0$ for $\vec{R}_{j-1}^k = \vec{R}_{j-1}^p$, $k \neq p$,

because probe k then has coalesced with probe p and cannot exert any gravitational force on p . In this case, equation (1) becomes indeterminate because $M_{j-1}^k = M_{j-1}^p$ [16]. The acceleration \vec{a}_{j-1}^p causes probe p to move from position \vec{R}_{j-1}^p at step $j-1$ to position \vec{R}_j^p at step j according to the trajectory equation

$$\vec{R}_j^p = \vec{R}_{j-1}^p + \vec{a}_{j-1}^p, \quad j \geq 1, \quad (2)$$

which is CFO's second equation of motion. These simplified CFO equations result from hardwiring CFO's basic parameters to $G=2$, $\Delta t=1$, $\alpha=1$, and $\beta=1$ (see [1,12] for definitions and discussion of these parameters). Note that the "internal parameters" in Fig. 1 are *not* fundamental CFO parameters, but rather are specific to *this particular* CFO implementation.

Initial Probe Distribution. Every CFO run begins with an Initial Probe Distribution (IPD) defined by two variables: (a) the total number of probes used, N_p ; and (b) where the probes are placed inside Ω . The IPD used here is a an orthogonal array of $\frac{N_p}{N_d}$ probes per

dimension deployed uniformly on “probe lines” parallel to the coordinate axes and intersecting at a point that slides along Ω ’s principal diagonal. Fig. 2 provides a two-dimensional (2D) example of this type of IPD (nine probes shown on each probe line, two overlapping, but any number may be used). The probe lines are parallel to the x_1 and x_2 axes intersecting at a point on Ω ’s principal diagonal marked by position vector $\vec{D} = \vec{X}_{\min} + \gamma(\vec{X}_{\max} - \vec{X}_{\min})$, where $\vec{X}_{\min} = \sum_{i=1}^{N_d} x_i^{\min} \hat{e}_i$ and $\vec{X}_{\max} = \sum_{i=1}^{N_d} x_i^{\max} \hat{e}_i$ are the diagonal’s endpoint vectors. The parameter $0 \leq \gamma \leq 1$ determines where along the diagonal the probe lines intersect.

Fig. 3 shows a typical 2D IPD for different values of γ , while Fig. 4 provides a 3D example for various γ values. In Fig. 4 the principal diagonal is shown in red and the three orthogonal probe lines in blue. In this example each probe line contains six equally spaced probes. For certain values of γ three probes overlap at the probe lines’ intersection point on the diagonal. Of course, this IPD procedure is generalized to the N_d -dimensional decision space Ω to create N_d probe lines parallel to the N_d coordinate axes. While Fig. 2 shows equal numbers

Fig. 2. Variable 2D Initial Probe Distribution.

Fig. 3. Typical 2D IPDs for Different Values of γ .

Fig. 4. Typical Variable 3D IPD (Initial Probe Distribution) for the GSO f_{19} Function (probes as filled circles).

of probes on each probe line, a different number of probes per dimension can be used instead. For example, if equal probe spacing were desired in a decision space with unequal boundaries, or if overlapping probes were to be excluded in a symmetrical space, then unequal numbers could be used. Unequal numbers also might be appropriate if *a priori* knowledge of Ω 's landscape, however obtained, suggests denser sampling in one region.

Errant Probes. It is possible that a probe's acceleration computed from equation (1) may be too great to keep it inside Ω . If any coordinate $x_i < x_i^{\min}$ or $x_i > x_i^{\max}$, the probe enters a region of *unfeasible* solutions that are not valid for the problem at hand. The question (which arises in many algorithms) is what to do with an errant probe. While many schemes are possible, a simple, empirically determined one is used here. On a coordinate-by-coordinate basis, probes flying outside Ω are placed a fraction $\Delta F_{rep}^{\min} \leq F_{rep} \leq 1$ of the distance between the probe's starting coordinate and the corresponding boundary coordinate [see step (c) in Fig. 1 for details]. F_{rep} is the "repositioning factor" introduced in [2]. F_{rep} starts at an arbitrary initial value F_{rep}^{init} which then is incremented at each iteration by an arbitrary amount ΔF_{rep} (subject to $F_{rep}^{\min} \leq F_{rep} \leq 1$). This procedure improves Ω 's sampling by distributing probes throughout the space.

Adaptation. This particular CFO implementation includes adaptive decision space reconfiguration to improve convergence speed. Fig. 5 illustrates in 2D how Ω 's size is adaptively reduced around \vec{R}_{best} , the location of the probe with best fitness throughout the run up to the current iteration. Ω shrinks every 10th step beginning at step 20. Its boundary coordinates are reduced by one-half the distance from the best probe's position to each boundary on a coordinate-by-coordinate basis, *viz*, $x_i^{\min} = x_i^{\min} + \frac{\vec{R}_{best} \cdot \hat{e}_i - x_i^{\min}}{2}$ and $x_i^{\max} = x_i^{\max} - \frac{x_i^{\max} - \vec{R}_{best} \cdot \hat{e}_i}{2}$,

Fig. 5. Schematic 2D Decision Space Adaptation (constant \vec{R}_{best} for illustration only)

where the primed coordinate is Ω 's new boundary, and the dot denotes vector inner product. For clarity in the diagram, Fig. 5 shows \vec{R}_{best} as being fixed whereas generally it varies throughout a run. Changing Ω 's boundary every ten steps instead of some other interval was chosen arbitrarily.

Internal Parameters. The hardwired internal parameter values used for the implementation reported here are: $N_t = 1000$, $F_{rep}^{init} = 0.5$, $\Delta F_{rep} = 0.1$, $F_{rep}^{\min} = 0.05$, $\left(\frac{N_p}{N_d}\right)_{MAX} = 14$ for $N_d \leq 6$, $\left(\frac{N_p}{N_d}\right)_{MAX} = 6$ for $21 \leq N_d \leq 30$, $\gamma_{start} = 0$, $\gamma_{stop} = 1$, $\Delta\gamma = 0.1$. The

test for early termination is a difference between the average best fitness over 25 steps, including the current step, and the current best fitness of less than 10^{-6} (absolute value). This test is applied starting at iteration 35 (at least ten steps must be computed before testing for fitness saturation). The internal parameters, indeed all CFO-related parameters, have been chosen empirically. These particular values provide good results across a wide range of test functions. Beyond this empirical observation there currently is no methodology for choosing either CFO's basic parameters or the internal parameters for an implementation such as this one. There well may be (likely are) better parameter sets, which is an aspect of CFO development that merits further study.

3. Results

Group Search Optimizer (GSO) is a new, state-of-the-art stochastic metaheuristic that has gained some notoriety [17,18]. It mimics animal foraging behavior using the strategies of “producing” (searching for food) and “scrounging” (joining resources discovered by other group members). GSO was tested against a suite of twenty-three benchmark functions with dimensionalities ranging from 2 to 30, and also on a limited basis for scalability to 300 dimensions (see [17] for details). GSO thus provides a superior standard against which CFO can be evaluated. CFO was tested against the same twenty-three function 2-30D benchmark suite, and the results are reported here.

In [17] GSO was compared to two other stochastic algorithms, “PSO” and “GA”. PSO is a Particle Swarm implemented using “PSOt,” a MATLAB-based toolbox that includes standard and variant PSO algorithms. GA is a Genetic Algorithm implemented using the GAOT toolbox (genetic algorithm optimization toolbox). Recommended default parameter values were used for PSOt and GA. Thus, while this note compares CFO and GSO directly, it indirectly compares CFO to PSO and GA as well.

Table 1 summarizes CFO's results. F is the test function using the same function numbering as [17]. f_{\max} is the known global *maximum* (note that the negative of each benchmark in [17] is used here because, unlike the other algorithms, CFO locates maxima, not minima). $\langle \cdot \rangle$ denotes average value. Because GSO, PSO and GA are inherently stochastic, their performance must be described statistically. The statistical data for those algorithms in Table 1 are reproduced from [17]. Of course, no statistical description is needed for CFO because it is deterministic. N_{eval} is the total number of function evaluations made by CFO.

In the first group of high dimensionality unimodal functions ($f_1 - f_7$), CFO returned the best fitness on all seven functions, in one case by a wide margin (f_5). In the second set of six high dimensionality multimodal functions with many local maxima ($f_8 - f_{13}$), CFO performed best on three ($f_9 - f_{11}$) and essentially the same as GSO on f_8 . In the last group of ten multimodal functions with few local maxima ($f_{14} - f_{23}$), CFO returned the best fitness on four ($f_{20} - f_{23}$, and by wide margins on $f_{21} - f_{23}$); equal fitnesses on four ($f_{14}, f_{17}, f_{18}, f_{19}$); and only very slightly lower fitness on two (f_{15}, f_{16}).

Of the twenty-three benchmark functions, CFO's performance was not quite as good as the other algorithms' on only two (f_{12}, f_{13}). However, CFO's performance can be improved considerably if a second run is made using a smaller decision space based on the results of the first run. As an example, for f_{12} the thirty coordinates returned on the first run are in the range $[-1.03941458 \leq x_i \leq -0.99688049]$ (the known maximum is at the point $[-1]^{30}$). If based on this result Ω is shrunk from $[-50 \leq x_i \leq 50]$ to $[-5 \leq x_i \leq 5]$ and CFO run again, then the returned best fitness improves to -7.39354×10^{-35} with $N_{eval} = 273,780$, which is a good bit better than GSO's result.

Table 1. CFO Comparative Results for 23 Benchmark Functions

F^*	N_d	f_{\max}^*	<Best Fitness>/ Other Algorithm	- - - CFO - - -	
				Best Fitness	N_{eval}
Unimodal Functions (other algorithms: average of 1000 runs)					
f_1	30	0	-3.6927×10^{-37} / PSO	0	222,960
f_2	30	0	-2.9168×10^{-24} / PSO	0	237,540
f_3	30	0	-1.1979×10^{-3} / PSO	-6.1861×10^{-5}	397,320
f_4	30	0	-0.1078 / GSO	0	484,260
f_5	30	0	-37.3582 / PSO	-4.8623×10^{-5}	436,680
f_6	30	0	-1.6000×10^{-2} / GSO	0	176,580
f_7	30	0	-9.9024×10^{-3} / PSO	-1.2919×10^{-4}	399960
Multimodal Functions, Many Local Maxima (other algorithms: avg 1000 runs)					
f_8	30	12,569.5	12,569.4882 / GSO	12,569.4865	415,500
f_9	30	0	-0.6509 / GA	0	397,080
f_{10}	30	0	-2.6548×10^{-5} / GSO	4.7705×10^{-18}	518,820
f_{11}	30	0	-3.0792×10^{-2} / GSO	-1.7075×10^{-2}	235,800
f_{12}	30	0	-2.7648×10^{-11} / GSO	-2.1541×10^{-5}	292,080
f_{13}	30	0	-4.6948×10^{-5} / GSO	-1.8293×10^{-3}	360,000
Multimodal Functions, Few Local Maxima (other algorithms: avg 50 runs)					
f_{14}	2	-1	-0.9980 / GSO	-0.9980	78,176
f_{15}	4	-3.075×10^{-4}	-3.7713×10^{-4} / GSO	-5.6967×10^{-4}	143,152
f_{16}	2	1.0316285	1.031628 / GSO	1.03158	87,240
f_{17}	2	-0.398	-0.3979 / GSO	-0.3979	82,096
f_{18}	2	-3	-3 / GSO	-3	100,996
f_{19}	3	3.86	3.8628 / GSO	3.8628	160,338
f_{20}	6	3.32	3.2697 / GSO	3.3219	457,836
f_{21}	4	10	7.5439 / PSO	10.1532	251,648
f_{22}	4	10	8.3553 / PSO	10.4029	316,096
f_{23}	4	10	8.9439 / PSO	10.5364	304,312

* Negative of the functions in [17] are computed by CFO because CFO searches for maxima instead of minima.

4. Conclusion

Even though CFO is not nearly as highly developed as the other algorithms used for comparison, it performs very well against all of them while requiring nothing more than the objective function as a user input. CFO performed better than or essentially as well as GSO, GA and PSO on twenty one of twenty three test functions. By contrast, GSO compared to PSO and GA returned the best performance on only fifteen benchmarks. CFO's performance thus is considerably better than GSO's, which in turn performed better than PSO and GA.

CFO's further development lies along two lines: architecture and theory. While this note describes one particular CFO implementation that works well, there no doubt is room for improvement. It is clear that CFO's performance is a sensitive function of the IPD. Of course, there are limitless IPD possibilities. One potentially attractive approach applies precise geometric and combinatorial rules of construction to create function evaluation "centers" in a hypercube using extreme points, faces, and line segments [19-21]. Another improvement might be implementations that shrink Ω on successive independent runs as described above for f_{12} . On the theoretical front, gravitationally trapped Near Earth Objects may lead to a deeper understanding of the metaheuristic, as might alternative formulations involving the concepts of kinetic or total energy for masses moving in a gravitational field. These observations and the results reported here clearly show that CFO merits further study, and that there are many areas of potentially fruitful research. Hopefully this note will encourage talented researchers to become involved in CFO's further development.

The complete source code listing of the program used to generate the results reported here appears in the Appendix. The listing is available in electronic format upon request to the author (rf2@ieee.org).

Appendix: CFO Source Code Listing

```
'Program 'CFO_02-27-2010(arXiv#5).BAS' compiled with
'Power Basic/Windows Compiler 9.03 (www.PowerBasic.com).

'THIS IS THE PROGRAM USED TO GENERATE DATA FOR arXiv PAPER #5
'"Parameter-Free Global Search Using Central Force Optimization"

'March 2010.

'LAST MOD 03-03-2010 ~1728 HRS EST

'CHANGES MADE TO "CFO_11-26-09.BAS" TO CREATE THIS VERSION
'WHICH IS USED FOR arXiv CFO PSEUDORANDOMNESS PAPER VER #2:
'(1). OUTER LOOP Np/Nd = 2 to MaxProbesPerAxis by 2 ADDED
'(2). Np IGNORED & ARRAYS REDIMENSIONED AS REQUIRED BY (1).

'ADDITIONAL CHANGES MADE TO CFO_12-25-09.BAS TO CREATE THIS VERSION:
'(1). LOOPS ADDED TO VARY G AND ALPHA
'(2). SHRINK DS EVERY ?? STEPS INSTEAD OF 20
'(3). TERMINATE EARLY USING ?? STEP AVERAGE INSTEAD OF 50?

'IMPORTANT CHANGE MADE 01-15-10: MOVED REDIM STATEMENT INTO SUB CFO().
'THIS IS NECESSARY TO PROPERLY RE-INITIALIZE ALL MATRICES...

'SEPARATE ROSENROCK & SPHERE FUNCTIONS ADDED 02-02-10.

'PROBE RETRIEVAL SCHEME MODIFIED 02-07-2010 PER MAHAMED OMRAH's SUGGESTION.

'# STEPS FOR FITNESS SATURATION = 25, 02-07-2010.

'02-21-10: ADDED 3D IPD PLOTS FOR 3D FUNCTIONS.

'03-03-10: CHANGED VARIABLE NumProbesPerAxis% to NumProbesPerDimension%
AND MaxProbesPerAxis% to MaxProbesPerDimension%.

'NOTE: ALL PBM FUNCTIONS HAVE WIRE RADIUS SET TO 0.00001LAMBDA
'-----

'THIS PROGRAM IMPLEMENTS A SIMPLE VERSION OF "CENTRAL
'FORCE OPTIMIZATION." IT IS DISTRIBUTED FREE OF CHARGE
'TO INCREASE AWARENESS OF CFO AND TO ENCOURAGE EXPERI-
'MENTATION WITH THE ALGORITHM.

'CFO IS A MULTIDIMENSIONAL SEARCH AND OPTIMIZATION
'ALGORITHM THAT LOCATES THE GLOBAL MAXIMA OF A FUNCTION.
'UNLIKE MOST OTHER ALGORITHMS, CFO IS COMPLETELY DETERMIN-
'ISTIC, SO THAT EVERY RUN WITH THE SAME SETUP PRODUCES
'THE SAME RESULTS.

'Please email questions, comments, and significant
'results to: CFO_questions@yahoo.com. Thanks!

'(c) 2006-2010 Richard A. Formato

'ALL RIGHTS RESERVED WORLDWIDE

'THIS PROGRAM IS FREWARE. IT MAY BE COPIED AND
'DISTRIBUTED WITHOUT LIMITATION AS LONG AS THIS
'COPYRIGHT NOTICE AND THE GNUPLOT AND REFERENCE
'INFORMATION BELOW ARE INCLUDED WITHOUT MODIFICATION,
'AND AS LONG AS NO FEE OR COMPENSATION IS CHARGED,
'INCLUDING "TIE-IN" OR "BUNDLING" FEES CHARGED FOR
'OTHER PRODUCTS.

'-----
'THIS PROGRAM REQUIRES wgnuplot.exe TO DISPLAY PLOTS.
'Gnuplot is a copyrighted freeware plotting program
'available at http://www.gnuplot.info/index.html.

'IT ALSO REQUIRES A VERSION OF THE Numerical Electromagnetics
'Code (NEC) in order to run the PBM benchmarks. If this file
'is not present, a runtime error occurs. Remove the code
'that checks for the NEC EXE if there is no interest in the
'PBM functions.

'Suggestion: Read references 1 and 2 first (both available online at no charge)...

'1. "Central Force Optimization: A New Metaheuristic with Applications in Applied Electromagnetics,"  

'Progress in Electromagnetics Research, PIER 77, 425-491, 2007 (online). DOI:10.2528/PIER07082403  

'Abstract - Central Force Optimization (CFO) is a new deterministic multi-dimensional search  

'metaheuristic based on the metaphor of gravitational kinematics. It models "probes" that "fly"  

'through the decision space by analogy to masses moving under the influence of gravity. Equations  

'are developed for the probes' positions and accelerations using the analogy of particle motion  

'in a gravitational field. In the physical universe, objects traveling through three-dimensional  

'space become trapped in close orbits around highly gravitating masses, which is analogous to  

'locating the maximum value of an objective function. In the CFO metaphor, "mass" is a user-defined  

'function of the value of the objective function to be maximized. CFO is readily implemented in a  

'compact computer program, and sample pseudocode is presented. As tests of CFO's effectiveness,  

'an equalizer is designed for the well-known Fano load, and a 32-element linear array is synthesized.  

'CFO results are compared to several other optimization methods.

'2. "Pseudorandomness in Central Force Optimization"
'arXiv:1001.0317v1[cs.NE], online: www.arXiv.org  

'Abstract - Central Force Optimization is a deterministic metaheuristic for an evolutionary algorithm  

'that searches a decision space by flying probes whose trajectories are computed using a gravitational  

'metaphor. CFO benefits substantially from the inclusion of pseudorandom component (a numerical  

'sequence that is precisely known by specification or calculation but otherwise arbitrary). The essential  

'requirement is that the sequence is uncorrelated with the decision space topology, so that its  

'effect is to pseudorandomly distribute probes throughout the landscape. While this process may appear  

'to be similar to the randomness in an inherently stochastic algorithm, it is in fact significantly  

'different because CFO remains deterministic at every step. Three pseudorandom methods are discussed  

'(initial probe distribution, repositioning factor, and decision space adaptation). A sample problem  

'is presented in detail and summary data included for a 23-function benchmark suite. CFO's performance  

'is quite good compared to other highly developed, state-of-the-art algorithms.

'3. "Central Force Optimization: A New Nature Inspired Computational Framework for Multidimensional  

'Search and Optimization," Studies in Computational Intelligence (SCI), vol. 129, 221-238 (2008),  

'www.springerlink.com, Springer-Verlag Berlin Heidelberg 2008.  

'Abstract - This paper presents Central Force Optimization, a novel, nature inspired, deterministic  

'search metaheuristic for constrained multi-dimensional optimization. CFO is based on the metaphor  

'of gravitational kinematics. Equations are presented for the positions and accelerations experienced  

'by "probes" that "fly" through the decision space by analogy to masses moving under the influence of  

'gravity. In the physical universe, probe satellites become trapped in close orbits around highly  

'gravitating masses. In the CFO analogy, "mass" corresponds to a user-defined function of the value  

'of an objective function to be maximized. CFO is a simple algorithm that is easily implemented in  

'a compact computer program. A typical CFO implementation is applied to several test functions.  

'CFO exhibits very good performance, suggesting that it merits further study.
```

'4. Are Near Earth Objects the Key to Optimization Theory?
 arXiv:0912.1394v1[astro-ph.EP], online: www.arXiv.org
 Abstract: This note suggests that near earth objects and Central Force Optimization have something in common, that NEO theory may hold the key to solving some vexing problems in deterministic optimization: local trapping and proof of convergence. CFO analogizes Newton's laws to locate the global maxima of a function. The NEO-CFO nexus is the striking similarity between CFO's and an NEO's curves. Both exhibit oscillatory plateau-like regions connected by jumps, suggesting that CFO's metaphorical "gravity" indeed behaves like real gravity, thereby connecting NEOs and CFO and being the basis for speculating that NEO theory may address difficult issues in optimization.

'5. "Central Force Optimisation: A New Gradient-Like Metaheuristic for Multidimensional Search and Optimisation," International Journal of Bio-Inspired Computation, vol. 1, no. 4, 217-238 (2009).
 DOI: 10.1504/IJBIC.2009.024721
 Abstract: This paper introduces Central Force Optimization, a novel, Nature-inspired, deterministic search metaheuristic for constrained multidimensional optimization in highly multimodal, smooth, or discontinuous decision spaces. CFO is based on the metaphor of gravitational kinematics. The algorithm searches a decision space by "flying" its "probes" through the space by analogy to masses moving through physical space under the influence of gravity. Equations are developed for the probes' positions and accelerations using the gravitational metaphor. Small objects in our Universe can become trapped in close orbits around highly gravitating masses. In "CFO space" probes are attracted to "masses" created by a user-defined function of the value of an objective function to be maximized. CFO may be thought of in terms of a vector "force field" or, loosely, as a "generalized gradient" methodology because the force of gravity can be computed as the gradient of a scalar potential. The CFO algorithm is simple and easily implemented in a compact computer program. Its effectiveness is demonstrated by running CFO against several widely used benchmark functions. The algorithm exhibits very good performance, suggesting that it merits further study.

'6. "Central Force Optimization: A New Gradient-Like Optimization Metaheuristic," OFSEARCH, Journal of the Operational Research Society of India, vol. 46, no. 1, 25-51, 2009, Springer India.
 DOI: 10.1007/s12597-009-0004-z
 Abstract: This paper introduces Central Force Optimization as a new, Nature-inspired metaheuristic for multidimensional search and optimization based on the metaphor of gravitational kinematics. CFO is a "gradient-like" deterministic algorithm that explores a decision space by "flying" a group of "probes" whose trajectories are governed by equations analogous to the equations of gravitational motion in the physical Universe. This paper suggests the possibility of creating a new "hyperspace directional derivative" using the Unit Step function to create positive-definite "masses" in "CFO space." A simple CFO implementation is tested against several recognized benchmark functions with excellent results, suggesting that CFO merits further investigation.

'7. "Synthesis of Antenna Arrays Using Central Force Optimization," Mosharaka International Conference on Communications, Computers and Applications, MIC-CPE 2009. (Gubran Mohammad and Nihad Dib)
 Abstract: Central force optimization (CFO) technique is a new deterministic multi-dimensional search metaheuristic based on an analogy to classical particle kinematics in a gravitational field. CFO is a simple technique and is still in its infancy. To enhance its global search ability while keeping its simplicity, a new selection part is introduced in this paper. CFO is briefly presented and applied in the design of linear antenna array and the modified CFO is applied to the design of circular array. The results are compared with those obtained using other evolutionary optimization techniques.

'8. "Central Force Optimization and NEOs - First Cousins?" Journal of Multiple Valued Logic and Soft Computing (in press)
 Abstract: Central Force Optimization is a new deterministic multidimensional search and optimization algorithm based on the metaphor of gravitational kinematics. This paper describes CFO and suggests some possible directions for its future development. Because CFO is deterministic, it is more computationally efficient than stochastic algorithms and may lend itself well to "parameter tuning" implementations. But, like all deterministic algorithms, CFO is prone to local trapping. Oscillation in CFO's Davy curve appears to be a reliable harbinger of trapping. And there seems to be a reasonable basis for believing that trapping can be handled deterministically using the theory of gravitationally trapped Near Earth Objects. Deterministic mitigation of local trapping would be a major step forward in optimization theory. Finally, CFO may be thought of as a "gradient-like" algorithm utilizing the Unit Step function as a critical element, and it is suggested that a useful, new derivative-like mathematical construct might be defined based on the Unit Step.

'9. "Antenna Benchmark Performance and Array Synthesis Using Central Force Optimization," IET Microwaves, Antennas & Propagation (UK) (in press). DOI: 10.1049/iet-map.2009.0147 (with G. M. Qubati and N. I. Dib)
 Abstract - Central force optimization (CFO) is a new deterministic multi-dimensional search metaheuristic based on an analogy to classical particle kinematics in a gravitational field. CFO is a simple technique that is still in its infancy. This paper evaluates CFO's performance and provides further examples of its effectiveness by applying it to a set of "real world" antenna benchmarks and to pattern synthesis for linear and circular array antennas. A new selection scheme is introduced that enhances CFO's global search ability while maintaining its simplicity. The improved CFO algorithm is applied to the design of a circular array with very good results. CFO's performance on the antenna benchmarks and the synthesis problems is compared to that of other evolutionary optimization techniques.
