**Abstract** We present the SONG network and its prototype node at Teide Observatory.

## 1 The SONG project

SONG (Stellar Observations Network Group) is an initiative to construct a global network of 1-m robotic telescopes to ensure continuous monitoring ([1], [2]). The main scientific goals of the SONG project are asteroseismology of bright stars and follow-up and characterization of exoplanets by means of precise measurements of stellar surface motions and brightness variations.

Two instruments are foreseen on a SONG node: (1) a dual-colour lucky imaging camera; (2) a high-resolution ( $R \sim 120,000$ ) échelle spectrograph with wavelength coverage 4700-7000 Å and with a radial velocity precision down to  $< 2$  m/s.

The SONG network aims eventually at 8 nodes. The prototype SONG node is currently under construction at Observatorio del Teide, Tenerife (SONG-OT). Funding is approved for a second node at Delingha Observatory, China, with first light in 2013. A US proposal is in preparation for the funding of a US node, and a Danish proposal is currently under evaluation for funding of additional nodes.

## 2 The prototype SONG node

First light of the prototype SONG node, SONG-OT, is foreseen by the end of 2011. The evolution and current status of SONG-OT is illustrated in Figure 1.

**Building:** The removal of the STARE telescope, excavation and pouring of the concrete SONG pier took place in October/November 2010. The SONG container and dome support were installed in March 2011.

**Telescope and dome:** Factory acceptance is scheduled for the end of October 2011. Installation is expected in November/December 2011.

**Spectrograph and Lucky Imaging Cameras:** The instruments are developed and tested in Aarhus and Copenhagen, and are waiting for first light.

**Fig. 1** The evolution of SONG-OT between October 2010 and September 2011 (timeline from left to right, from top to bottom): the removal of the STARE telescope, the construction of the dome support and container, the telescope, the spectrograph, and an example of the échelle spectrum.

**Acknowledgements** We thank the Villum Foundation, the Carlsberg Foundation and The Danish Council for Independent Research — Natural Sciences for support for the SONG prototype. KU acknowledges financial support by the Spanish National Plan of R&D for 2010, project AYA2010-17803.
