## **Abstract**

### **Background**

Long noncoding RNAs (lncRNAs) are a recently discovered class of non-protein coding RNAs which have now increasingly been shown to be involved in a wide variety of biological processes as regulatory molecules. The functional role of many of the members of this class has been an enigma, except a few of them like Malat and HOTAIR. Little is known regarding the regulatory interactions between noncoding RNA classes. Recent reports have suggested that lncRNAs could potentially interact with other noncoding RNAs including microRNAs (miRNAs) and modulate their regulatory role through interactions. We hypothesized that long noncoding RNAs could participate as a layer of regulatory interactions with miRNAs. The availability of genome-scale datasets for argonaute targets across human transcriptome has prompted us to reconstruct a genome-scale network of interactions between miRNAs and lncRNAs.

### **Results**

We used well characterized experimental Photoactivatable-Ribonucleoside-Enhanced Crosslinking and Immunoprecipitation (PAR-CLIP) datasets and the recent genome-wide annotations for lncRNAs in public domain to construct a comprehensive transcriptome-wide map of miRNA regulatory elements. Comparative analysis revealed many of the miRNAs could target long noncoding RNAs, apart from the coding transcripts thus participating in a novel layer of regulatory interactions between noncoding RNA classes. We also find the miRNA regulatory elements have a positional preference, clustering towards the 3' and 5' ends of the long noncoding transcripts. We also further reconstruct a genome-wide map of miRNA interactions with lncRNAs as well as messenger RNAs.

### **Conclusions**

This analysis suggests widespread regulatory interactions between noncoding RNAs classes and suggests a novel functional role for lncRNAs. We also present the first transcriptome scale study on lncRNA-miRNA interactions and the first report of a genome-scale reconstruction of a noncoding RNA regulatory interactome involving lncRNAs.

### **Keywords**

Long noncoding RNA, microRNA, transcriptome, interactome, regulation, regulatory elements,

## Introduction

Recent advances in sequencing technologies have made genome-scale mapping of transcriptional potential possible at single-nucleotide resolutions [1,2]. A number of reports in the immediate past have suggested the pervasive transcriptional potential of eukaryotic genomes [3], also suggesting a large number of novel genomic loci which were previously not known to encode any functional transcripts [4]. Though consistent evidence now suggests the existence of a large number of previously uncharacterized transcripts, a vast majority of the transcripts surprisingly do not code for a functional protein, and are grouped into a general class of noncoding RNAs (ncRNAs) [5-7]. The amenability of transcriptome mapping on a genome scale has enormously added to the number of ncRNAs, with members in the class presently outnumbering protein coding genes by a few folds. Recent efforts globally, including collaborative efforts like the ENCODE [8] have been successful in characterizing the transcript structures and their expression profiles in a wide number of cell types. This has also been supplemented by the availability of computational tools to map and identify transcript isoforms and quantify expression profiles in different cell types and conditions [9].

The ncRNA class now encompasses a wide diversity of subclasses organized based on their size, structure, function and conservation. miRNAs have been one of the recently discovered and well characterized classes of ncRNAs and are small regulatory RNA molecules processed from larger precursors through a highly co-ordinated pathway [10]. Presently they are known to mediate post-transcriptional control of gene expression by binding to the 3' untranslated regions of coding genes [11-13]. This is modulated through a ribonucleoprotein complex called the RNA induced silencing complex (RISC) [14]. Argonaute (Ago) proteins are the catalytic component of RISC complex and the small ncRNA bound to Ago guides it to sequence complementary target [15]. The regulatory role of miRNAs encompass a wide variety of biological processes including development, organogenesis [16,17] and pathophysiology of a number of diseases including of the neuronal [18], cardiovascular [19] and infectious diseases [20-22], just to name a few. Another major class of recently discovered ncRNAs is the long noncoding RNAs (lncRNAs) [23,24]. Unlike the miRNAs, lncRNAs are longer, and by definition > 200 nucleotides in length and usually show less sequence conservation. lncRNAs presently also encompass the previously known classes of processed pseudogenes, antisense transcripts and the recently discovered regulatory large intergenic noncoding RNAs (lincRNAs) [25]. Though a small number of lncRNAs have been functionally characterized like HOTAIR [26,27], Xist [28] and Malat [29], a large number of members in the class remain functionally uncharacterized. Presently well characterized members of the class have been shown to be involved in regulatory roles in diverse processes like imprinting, X-inactivation and development.

Though much of the focus in ncRNA research is directed towards understanding the regulation of protein-coding genes mediated by them, it has been suggested previously that ncRNAs could form a well orchestrated regulatory interaction network [30]. There have been reports previously which have suggested examples of such regulation, for example miRNA-miRNA interaction [31]. Recently there have also been reports suggesting the possibility of a widespread interaction network involving competitive endogenous RNAs (ceRNAs) where ncRNAs could modulate regulatory RNA by binding and titrating them off their binding sites on protein coding messengers [32]. An example for this type of regulation is exemplified by HULC, an lncRNA expressed in hepatocellular carcinoma which binds miR-372 and forms a regulatory interaction [33]. Similarly reports suggest linc-MD1 could interact with miR-133 and miR-135 and promote muscle differentiation [34]. Similar examples have been described in

plant systems and encompass target mimicry [35,36]. The entire spectrum of ncRNA regulatory layer, especially the possibility of regulatory miRNAs-lncRNAs interactions remains unexplored.

We employed datasets in public domain for lncRNA annotations recently made available from the ENCODE project along with genome-wide cross linking immunoprecipitation (CLIP-Seq) datasets for four argonaute proteins [37,38]. We hypothesized that miRNAs and lncRNAs could form an interacting regulatory layer exemplifying the ceRNA hypothesis where multiple targets with multiple binding affinities compete for the regulatory RNAs and the members could modulate the regulation of each other by modulation of their relative concentrations (Supplementary File 1). We show that a subset of the annotated lncRNAs could indeed harbor miRNA recognition elements and be a part of the miRNA interaction network, thus playing a critical regulatory layer of interaction. We also integrate miRNA-target information to suggest a network of interactions between lncRNAs, miRNAs and protein-coding transcripts. To our knowledge this is the first transcriptome scale study on lncRNA-miRNA interactions and the first report of a genome-scale reconstruction of a noncoding RNA regulatory interactome involving lncRNAs.

## **Results and Discussion**

### **Identification of high-confidence microRNA recognition elements mapping to long noncoding RNAs**

The PAR-CLIP reads for HEK293 cells were downloaded from the NCBI Short Read Archive (ID SRA IDs: SRX020783, SRX020784, SRX020785, SRX020786) which amounted to a total of 1,93,01,715 CLIP-seq reads for Ago 1-4. The reads were further mapped to hg19 version of the human genome using a quality-aware reference mapping algorithm: Mapping and Assembly with qualities (MAQ). Mapping was performed with stringent criteria and allowed no mismatches. The Argonautes significantly overlap in their biological function. Ago1 has been shown to be involved in RNA-mediated post-transcriptional gene silencing, Ago2 shows slicer activity, Ago3 and Ago4 are required for RNA-mediated gene silencing (RNAi). Since there have been no significant differences reported between the mappings of reads for each of the Ago datasets, and since biologically their functions overlap, we merged the datasets as previously used for the analysis [39]. A total of 619208 hits were obtained for the Ago datasets. The number of reads mapping in each of the individual datasets is available as Table 2. To weed out potential noisy loci, we applied stringent criteria that all loci should be supported by at least 5 overlapping reads. The mappings were parsed to identify high-quality miRNA recognition elements using custom scripts. We defined the recognition element as a stretch of contiguous positions in the genome which matched the 5x read mapping criteria. A total of 15983 such consensus high confidence miRNA recognition element clusters were identified. These mapped to 113 lncRNA exons and 4480 mRNA exons from the GenCode annotation datasets [40]. We further also analyzed the relative contributions of each of the Ago datasets for each of the high-confidence miRNA recognition elements.

### **Identification of the cognate microRNAs for the microRNA recognition elements**

Argonaute proteins are a component of the RNA induced silencing complex and are intricate components modulating the function of the complex. CLIP-seq allows one to identify the miRNA recognition elements in the transcriptome. To understand the biological interactions between miRNAs and their cognate target transcripts, it is imperative to identify the miRNAs

corresponding to each of the miRNA recognition elements. We used miRanda [41] a popular computational algorithm to identify miRNAs binding to cognate miRNA recognition elements. Analysis revealed 51 miRNA-lncRNA interactions with 29 miRNAs targeting 25 lncRNA transcripts (Figure 2) (Table 1). We also predicted miRNA targets for all gencode annotated transcripts predicted to be bound with Agos. Out of the total 4480 lncRNA clusters, 416 protein coding transcripts were found to be targeted by 1253 miRNA (Supplementary File 2). The paucity in the number of known human miRNAs from the present analysis could be potentially be an effect of the paucity in the biological understanding of the repertoire of smallRNA species in humans and their biological mechanisms. Apart from miRNAs, other smallRNA species also has potential to be associated with Argonaute proteins [42]. We hope future in-depth understanding of smallRNA species, their biogenesis and mechanism of action could potentially throw light into the biological relevance of the remaining regulatory motifs.

### **Enrichment of microRNA regulatory elements in long noncoding RNA ends**

Analysis of the positional preference of miRNA regulatory elements in lncRNAs revealed a positional preference of the regulatory element to occur in both the 5' and 3' ends of the long noncoding RNAs (Figure 3). Such preferential positioning of the miRNA regulatory elements have been described previously for protein-coding transcripts [43], with clustering in the 3' un-translated regions of protein-coding genes. The biological significance of positional clustering in the ends of lncRNAs is uncertain at present though suggesting a possible pattern in organization of regulatory elements across transcripts.

### **Long noncoding RNAs as a part of the microRNA interaction network**

The present analysis suggests lncRNAs also harbor potential miRNA regulatory elements and could participate in the miRNA regulatory network. We reconstituted a comprehensive genome-wide network of RNA mediated interactions putting together the interactions from genome-wide analyses and validated miRNA-mRNA interactions. The network brings to light hitherto unknown complexity of RNA regulatory interactions and how long noncoding RNAs could play regulatory roles in the miRNA mediated interactions with mRNAs (Figure 4). The reconstituted interaction network has 314 miRNAs targeting 35 lncRNAs and 946 mRNAs. The interaction network consists of several small and large clusters. To exemplify how lncRNAs could participate in the miRNA-mRNA interaction network, (Figure 4B2) shows, hsa-mir-196a, which is experimentally known to target ENST0000040584, ENST00000242159, ENST00000313173 transcripts, encoded by the HOX cluster genes HOXC8, HOXA7 and HOXD8 [44], was also found to target lncRNAs ENST00000519935, ENST00000523790, and ENST00000489695. The mir-196 miRNAs are known to directly cleave HOX mRNAs and modulates development of axial patterning [44,45]. The human miRNA hsa-mir-196a has been previously shown to be associated with the pathogenesis of cancers including colorectal cancer cells and has been shown to induce a pro-oncogenic behavior in human cancer cells [46]. Thus lncRNAs could potentially modulate the pathogenesis of the disease by modulating the key partner, mir-196a. We hope with the increasing understanding of the key roles in different diseases processes, a network approach would allow to prioritize the functional studies of lncRNAs in disease processes.

## Materials and Methods

**PAR-CLIP Datasets:** We used transcriptome wide interaction data for miRNA-AGO available from PAR-CLIP studies [47]. The dataset provides the RNA-binding proteins (miRNA-AGO) target sites identified from the human embryonic kidney (HEK) 293 cell lines stable expressing Ago1-4. The read sequences (SRA IDs: SRX020783, SRX020784, SRX020785, SRX020786) of this study were fetched from Sequence Read Archive (SRA) from NCBI and were assembled using MAQ [48] reference assembly software to the hg19 version of the human genome from UCSC Genome Browser [49]. To identify only high-confidence miRNA recognition elements, we used an arbitrary cutoff of 5x and all loci with equal to or more than 5X coverage were filtered for the further analysis.

**Long noncoding RNA Datasets:** The manually annotated lncRNAs from Gencode Version 9 (May 2011 freeze, GRCh37) (<http://www.encodegenes.org/>) [40] were used for the analysis. The dataset contains both Ensembl and Havana annotations and the transcripts fall into six biotypes, viz, processed transcripts, antisense, lincRNA, ncRNA\_host, non\_coding and retained\_intron. The dataset had a total of 18878 long non-coding transcripts encompassing by 11004 genes. The former dataset of high-confidence miRNA recognition elements were mapped on the lncRNA exon positions using custom scripts.

**microRNA sequence datasets:** The dataset of mature miRNA sequences was derived from miRBase17 [50,51] for all annotated Human miRNAs. This dataset comprised of 1731 sequences. The dataset of validated miRNA targets were derived from miRecords [52].

**microRNA target predictions:** To identify the subset of miRNAs for the corresponding high-confidence AGO sites, we used a computational approach using a popular miRNA target prediction algorithm – miRanda [41]. miRanda uses dynamic programming and incorporates the free energy of the RNA duplex and miRNA binding rules to predict potential miRNA target sites. We used an empirical alignment score of 160 and minimum free energy of -20 kcal/mol. Similarly miRNA targets were predicted for all those messenger RNAs which harbored high confidence miRNA recognition elements.

**Positional preference of microRNA regulatory elements in long noncoding RNAs:** The positional preference of miRNAs across the lncRNA length was computed using in house scripts. We divided the entire length of the lncRNA into non-overlapping bins of 5 percent each. This was done to accommodate the diversity in lengths of the lncRNA. The frequencies of mapping miRNA regulatory elements were plotted for each of the bins

**microRNA-interaction network:** Both the interactions, viz, miRNA-lncRNA and miRNA-mRNA were compared and an unweighted network displaying lncRNA-miRNA and mRNA-miRNA interactions were created using Cytoscape 2.8.2 [53]. The targets were then searched on miRecords to check whether any of the high-confidence miRNA recognition elements overlap with validated target sites. The miRNA-mRNA interactions were also taken from literature. The entire workflow of the computational analysis is summarized in Figure 1.

## Conclusion

The present analysis illustrates the potential of integration of genome-wide experimental datasets to provide insights into novel biological regulatory interactions in the cell. Interactions for miRNAs with lncRNAs have been suggested to play an important role in modulating regulation mediated through miRNAs. This analysis also provides a genome-scale report and reconstruction of miRNA interaction with mRNAs as well as lncRNAs. We also show how such a network approach could potentially suggest the lncRNAs for functional validation.

The study is not without caveats. The first being limitation in the diversity of CLIP-seq datasets available in public domain. The datasets used in the analysis are limited to HEK293 cells. The second major caveat is that majority of miRNA recognition elements could not be tracked back to their cognate miRNAs.

With the advent of faster and cheaper sequencing technologies [54,55] we hope newer genome-wide CLIP-seq datasets would emerge. This would potentially provide a better picture of the depth of interactions and a perspective on the spatio-temporal organization of these networks. We hope the advancements in technology and insights into the biological function and regulatory mechanism of small RNA classes and discovery of novel members of this class including miRNAs would provide a better insight into the regulatory ramifications and suggest the cognate RNAs for the regulatory elements discovered through genome-wide screens. We also hope the availability of technology to identify targets of RNA binding proteins would open up newer avenues of understanding the functions and targets of many of the RNA binding proteins. This would also provide for the much needed base to understand biological processes and regulatory interactions of ncRNAs with coding transcripts as well as between them and how these proteins modulate these through binding to their respective partners.

## Acknowledgments

Authors thank Dr. Sridhar Sivasubbu and Dr. Chetana Sachidanandan for scientific inputs, which helped in formulating the study and preparation of the manuscript. Authors acknowledge scientific discussions and inputs from Mr. Gopal Gunanathan Jayaraj which helped in formulating the study. DB acknowledges a Senior Research Fellowship from CSIR, India. The study was funded by CSIR, India through Grant “Comparative genomics and biology of noncoding RNA (NWP0036)”.

predicted miRNA-lncRNA interactions are represented in blue nodes and total mRNA-miRNA interactions represented as black nodes.

- B1:** An interesting example from the network highlighted in orange showing interactions between An tion of network highlighting **miRNA:** (a) hsa-mir-9; **lncRNA:** (d) ENST00000500197.2, (e) ENST00000509783.1, (f) ENST00000511014.1, (h) ENST00000505030.1, (i) ENST00000504246.1; **mRNA:** (b) ENST00000384838.1, (c) ENST00000262095.2, (g) ENST00000491143.1, (j) ENST00000226574
- B2:** Another interesting example from the network highlighted in blue showing interactions between **miRNA:** (1) hsa-miR-196a, (5) hsa-miR-196b\*, (13) hsa-miR-196b; **lncRNA:** (4) ENST00000523790.1; (6) ENST00000489695.1, (12) ENST00000519935.1; **mRNA:** (2) ENST00000354032.4, (3) ENST00000384852.1, (7) ENST00000313173, (8) ENST0000024215, (9) ENST00000040584, (10) ENST00000304786.7, (11) ENST00000366839.4

## Supplementary Files Legends

**Supplementary File 1:** Schematic of the proposed hypothesis.

**Supplementary File 2: List of transcripts with the Ago binding sites.**
