

**REMARK ON THE PAPER "ON THE EIGENVALUES OF
THE WITTEN-LAPLACIAN ON COMPACT RIEMANNIAN
MANIFOLDS " BY Q.-M. CHENG AND L. ZENG**

S. ILIAS

On April 11, 2013, a preprint was posted on arXiv by Q.-M. Cheng and L. Zeng [1], about eigenvalues of the Witten-Laplacian acting on functions. However, it is very well known that the Witten Laplacian

$$\Delta_f := \Delta + \langle \nabla f, \cdot \rangle$$

on a compact measure metric space $(M, g, e^{-f} dv)$ is unitarily equivalent to the Schrödinger operator $\Delta + \frac{1}{2}\Delta f + \frac{1}{4}|\nabla f|^2$ on (M, g) and it has thus the same spectrum (see for instance [6]). Therefore, all the results of this above mentioned preprint are immediate consequences of that concerning the Schrödinger operator $\tilde{\Delta}_f := \Delta + \frac{1}{2}\Delta f + \frac{1}{4}|\nabla f|^2$ on (M, g) already obtained in the papers [2, 3, 4, 5, 7], provided replacing the potential q or V in that papers by $\frac{1}{2}\Delta f + \frac{1}{4}|\nabla f|^2$ (obviously, this is in particular, the case for the self shrinkers).

Using the same observation of unitary equivalence above, we also note that a lot of published results concerning eigenvalues of the Laplace-Witten operator, can be deduced from that concerning Schrödinger operators.
