## EXPANSION OF CONJUGACY CLASSES IN  $PSL<sub>2</sub>(q)$

SHELLY GARION

ABSTRACT. For any conjugacy class  $\mathcal{C}$  in  $G = \mathrm{PSL}_2(q)$  we compute  $\mathcal{C}^2$  and discuss whether  $\mathcal C$  contains a triple of elements whose product is 1 which generate  $G$ . Moreover, we determine which elements in  $G$  can be written as a product of two conjugate elements that generate G.

#### 1. INTRODUCTION

There is a great interest in expansion properties of conjugacy classes in finite simple (nonabelian) groups. Thompson conjectured that every finite simple group  $G$  has a conjugacy class C such that  $C^2 = G$ . This conjecture was verified for many families of finite simple groups, including the alternating groups and the sporadic groups, and Ellers and Gordeev [\[4\]](#page-13-0) proved this conjecture for all finite simple groups of Lie type defined over fields with more than 8 elements, but nevertheless it is still very much open today. On the other hand, the expansion of small enough conjugacy classes  $\mathcal C$  in sufficiently large finite simple groups, has been investigated by Schul [\[13\]](#page-14-0). Moreover, Guralnick and Malle [\[8\]](#page-13-1) showed that every finite simple group G has a conjugacy class  $\mathcal C$  that contains a triple of elements which have product 1 and generate G.

In this paper we consider *all* the conjugacy classes in the group  $G = \text{PSL}_2(q)$ , and extend previous results of Guralnick and Malle [\[8,](#page-13-1) Lemma 3.14, Lemma 3.15 and Theorem 7.1].

<span id="page-0-0"></span>**Theorem 1.** Let  $G = \text{PSL}_2(q)$  where  $q > 3$  and let C be a non-trivial G-conjugacy class. *Then* C contains elements x, y such that  $\langle x, y \rangle = G$ , with only the following exceptions:

- C *is a conjugacy class of an element of order* 2*;*
- $q = 9$  *and* C *is a conjugacy class of a unipotent element (of order* 3).

*In addition,* C contains three elements x, y, z such that  $xyz = 1$  and  $\langle x, y \rangle = G$  if and only *if one of the following holds:*

- C *is a conjugacy class of a semisimple element of a* q-minimal *order greater than* 3*;*
- q > 3 *is prime and* C *is a conjugacy class of a unipotent element.*

**Definition 1.** Let  $q = p^e$  be a prime power and let  $n > 1$  be an integer. Then n is called a q*-minimal* order if

 $e = \min\{f > 0 : p^f \equiv \pm 1 \mod (\gcd(2, n) \cdot n)\}.$ 

(Namely,  $PSL_2(p^e)$  contains an element of order n, but no  $PSL_2(p^f)$ ,  $f < e$  contains such an element.)

Note that similar results appear in [\[9,](#page-13-2) [10,](#page-14-1) [11\]](#page-14-2) regarding generation properties of  $PSL<sub>2</sub>(q)$ by a triple of elements  $(x, y, z)$  with product 1 of prescribed orders (see also [\[5,](#page-13-3) [12\]](#page-14-3)).

<span id="page-1-0"></span>**Theorem 2.** Let  $G = \text{PSL}_2(q)$  where  $q > 2$  is even.

Let  $C$  be the G-conjugacy class of an element  $x$ .

- (1) *If* x *is a semisimple element whose order divides*  $q 1$  *then*  $C^2 = G$ .
- (2) If x is a semisimple element whose order divides  $q + 1$  then  $C^2 = G \setminus \{unipotents\}$ .
- (3) If x is a unipotent element then  $C^2 = G$ .

*In addition, only a semisimple element in* G *can be written as a product of two* G*-conjugate (semisimple) elements that generate* G*.*

<span id="page-1-1"></span>**Theorem 3.** Let  $G = \text{PSL}_2(q)$  where  $q > 3$  is odd.

Let  $C$  be the  $G$ -conjugacy class of an element  $x$ .

(1) If x is a semisimple element whose order is greater than 2 then  $C^2 = G$ .

(2) If x is an element of order 2 then 
$$
\mathcal{C}^2 = \begin{cases} G & \text{if } q \equiv 1 \bmod 4 \\ G \setminus \{unipotents\} & \text{if } q \equiv 3 \bmod 4 \end{cases}
$$

.

(3) If 
$$
x
$$
 is a unipotent element then

$$
\mathcal{C}^2 = \begin{cases} \{unipotents\} \cup \{semisimples \ of \ q - good \ orders\} \cup \{1\} & if \ q \equiv 1 \mod 4 \\ \{unipotents\} \cup \{semisimples \ of \ q - good \ orders\} & if \ q \equiv 3 \mod 4 \end{cases}.
$$

*In addition, any non-trivial element in* G *can be written as a product of two* G*-conjugate semisimple elements that generate* G*. And moreover, a semisimple element can be written as a product of two* G*-conjugate unipotents that generate* G *if and only if its order is* q-minimal *and* q-good, where  $q \neq 9$ .

<span id="page-1-3"></span>**Definition 2.** Let  $q = p^e$  be a prime power and let  $n > 1$  be an integer. Then *n* is called a q*-good* order if one of the following holds:

- *n* is odd and divides either  $q 1$  or  $q + 1$ ;
- *n* is even and 4*n* divides either  $q 1$  or  $q + 1$ .

<span id="page-1-2"></span>**Corollary 4.** Let  $G = \text{PSL}_2(q)$  and let C be the G-conjugacy class of an element x.

(1) *If* q *is even then*

$$
\frac{|C|}{|G|^{2/3}} \to 1 \text{ and } \frac{|C^2|}{|G|} \to 1 \text{ as } q \to \infty.
$$

(2) *If* q *is odd and* x *is a semisimple element whose order is greater than* 2 *then*

$$
\frac{|\mathcal{C}|}{|G|^{2/3}} \to \sqrt[3]{4} \text{ and } \frac{|\mathcal{C}^2|}{|G|} \to 1 \text{ as } q \to \infty.
$$

(3) *If* q *is odd and* x *is an element of order* 2 *then*

$$
\frac{|\mathcal{C}|}{|G|^{2/3}} \to \frac{1}{\sqrt[3]{2}} \text{ and } \frac{|\mathcal{C}^2|}{|G|} \to 1 \text{ as } q \to \infty.
$$

(4) *If* q *is odd and* x *is a unipotent element then*

$$
\frac{|C|}{|G|^{2/3}} \to \frac{1}{\sqrt[3]{2}} \text{ and } \frac{|C^2|}{|G|} \to \frac{3}{4} \text{ as } q \to \infty.
$$

Example 5. For any prime power q < 30 the following table presents *all* the q*-minimal* orders, divided according to whether they are q*-good* or not.

<span id="page-2-0"></span>TABLE 1. Orders of elements in  $\overline{PSL}_2(q)$ 

## 2. PRELIMINARIES – BASIC PROPERTIES OF  $PSL<sub>2</sub>(q)$

2.1. Elements and conjugacy classes. (see [\[2,](#page-13-4) [3,](#page-13-5) [6,](#page-13-6) [14\]](#page-14-4)). Let  $q = p^e$ , where p is a prime number and  $e \geq 1$ . Recall that the order of  $G = \mathrm{PSL}_2(q)$  is  $q(q^2 - 1)/d$ , where

$$
d = \gcd(2, q - 1) = \begin{cases} 1 & \text{if } q \text{ is even} \\ 2 & \text{if } q \text{ is odd} \end{cases}.
$$

One can classify the elements of  $PSL<sub>2</sub>(q)$  according to the Jordan form of their pre-image in  $SL_2(q)$ . The following Table [2](#page-3-0) lists the three types of elements, according to whether the characteristic polynomial  $P(\lambda) := \lambda^2 - \alpha \lambda + 1$  of the matrix  $A \in SL_2(q)$  (where  $\alpha = \text{tr}(A)$ ) has 0, 1 or 2 distinct roots in  $\mathbb{F}_q$ .

We denote  $\kappa(\alpha) = \begin{cases} 1 & \text{if } \alpha \neq 0 \\ 0 & \text{if } \alpha \neq 0 \end{cases}$ 2 if  $\alpha = 0$ .

2.2. Subgroups. Table [3](#page-3-1) specifies all the subgroups of  $G = \text{PSL}_2(q)$  up to isomorphism following [\[14,](#page-14-4) Theorems 6.25 and 6.26].

These subgroups can be divided into the following three classes, following Macbeath [\[11\]](#page-14-2). The subgroups isomorphic to  $PSL_2(q_1)$  or  $PGL_2(q_1)$  are usually called *subfield* subgroups (since  $\mathbb{F}_{q_1}$  is a subfield of  $\mathbb{F}_q$ ). Since  $A_4$ ,  $S_4$ ,  $A_5$  and dihedral groups correspond to the finite triangle groups, that is, triangle groups  $T_{r,s,t}$  such that  $1/r+1/s+1/t > 1$ , we will call them

$A_5\,$	60	$p = 5$ or $q^2 \equiv 1 \mod 5$

<span id="page-3-1"></span>TABLE 3. Subgroups of  $PSL<sub>2</sub>(q)$ 

*small* subgroups. For convenience we will refer to the other subgroups, namely subgroups of the Borel and cyclic subgroups, as *structural* subgroups.

Macbeath [\[11\]](#page-14-2) classified the pairs of elements in  $PSL<sub>2</sub>(q)$  in a way which makes it easy to decide what kind of subgroup they generate.

<span id="page-3-2"></span>**Theorem 6.** [\[11,](#page-14-2) Theorem 1]*. For every*  $\alpha, \beta, \gamma \in \mathbb{F}_q$  there exist three matrices  $A, B, C \in$  $SL_2(q)$  *satisfying*  $tr(A) = \alpha$ ,  $tr(B) = \beta$ ,  $tr(C) = \gamma$  *and*  $ABC = I$ .

**Definition 3.** A triple  $(\alpha, \beta, \gamma) \in \mathbb{F}_q^3$  is called *singular* if  $\alpha^2 + \beta^2 + \gamma^2 - \alpha\beta\gamma - 4 = 0$ .

<span id="page-3-3"></span>**Theorem 7.** [\[11,](#page-14-2) Theorem 2]. Let  $(A, B, C) \in SL_2(q)^3$  be a triple of matrices satisfying  $tr(A) = \alpha$ ,  $tr(B) = \beta$ ,  $tr(C) = \gamma$  *and*  $ABC = I$ . Then  $(\alpha, \beta, \gamma) \in \mathbb{F}_q^3$  is singular *if and only if the group generated by the images of* A *and* B *is a* structural *subgroup of*  $PSL_2(q)$ *.* 

2.3. Orders and traces. For an integer  $n > 1$  we denote

(1) 
$$
\mathcal{T}_q(n) = \{ \alpha \in \mathbb{F}_q : \alpha = \text{tr}(A), A \in \text{SL}_2(q), |\bar{A}| = n \}.
$$

It is easy to see from Table [2](#page-3-0) that for any prime power  $q, \mathcal{T}_q(2) = \{0\}, \mathcal{T}_q(3) = \{\pm 1\}$ , and for any odd  $q = p^e$ ,  $\mathcal{T}_q(p) = {\pm 2}$ . Moreover, when q is odd, then  $\alpha \in \mathcal{T}_q(n)$  if and only if  $-\alpha \in \mathcal{T}_q(n)$ . In fact, for any prime power q and integer  $n > 1$ ,  $\mathcal{T}_q(n)$  can be effectively computed as follows.

<span id="page-4-0"></span>**Proposition 8.** Denote by  $P_q(n)$  the set of primitive roots of unity of order n in  $\mathbb{F}_q$ .

• Let  $q = 2^e$  for some positive integer e and let  $n > 1$  be an integer, then

(2) 
$$
\mathcal{T}_q(n) = \begin{cases} \{0\} & \text{if } n = 2 \\ \{a + a^{-1} : a \in \mathcal{P}_q(n)\} & \text{if } n \text{ divides } q - 1 \\ \{b + b^q : b \in \mathcal{P}_{q^2}(n)\} & \text{if } n \text{ divides } q + 1 \\ \emptyset & \text{otherwise} \end{cases}
$$

• Let  $q = p^e$  for some odd prime p and some positive integer e and let  $n > 1$  be an *integer, then*

(3) 
$$
\mathcal{T}_q(n) = \begin{cases} \{\pm 2\} & \text{if } n = p \\ \{\pm (a + a^{-1}) : a \in \mathcal{P}_q(2n)\} & \text{if } n \text{ divides } \frac{q-1}{2} \\ \{\pm (b + b^q) : b \in \mathcal{P}_{q^2}(2n)\} & \text{if } n \text{ divides } \frac{q+1}{2} \\ \emptyset & \text{otherwise} \end{cases}
$$

*Proof.* We prove the case where q is odd and n divides  $(q-1)/2$ . The other cases are similar.

Assume first that n is even. Let a be a primitive root of unity of order 2n. Then  $-a$  is also a primitive root of unity of order  $2n$ , and  $(-a)^n = a^n = -1$ . Thus the matrices

$$
A = \begin{pmatrix} a & 0 \\ 0 & a^{-1} \end{pmatrix} \quad \text{and} \quad -A = \begin{pmatrix} -a & 0 \\ 0 & -a^{-1} \end{pmatrix}
$$

both reduce to the same element  $\bar{A} \in G$  of order n. Hence,  $a + a^{-1}$  and  $-(a + a^{-1})$  both belong to  $\mathcal{T}_q(n)$ .  $\mathcal{T}_q(n)$  contains only the elements of the claimed form, since it suffices to consider only the conjugacy classes of elements of G, described in Table [2.](#page-3-0)

Now assume that n is odd. Then a is a primitive root of unity of order n if and only if  $-a$  is a primitive root of unity of order 2n. In this case,  $(-a)^n = -a^n = -1$ . Thus the matrices

$$
A = \begin{pmatrix} a & 0 \\ 0 & a^{-1} \end{pmatrix} \quad \text{and} \quad -A = \begin{pmatrix} -a & 0 \\ 0 & -a^{-1} \end{pmatrix}
$$

both reduce to the same element  $\overline{A} \in G$  of order n. Hence,  $a + a^{-1}$  and  $-(a + a^{-1})$  both belong to  $\mathcal{T}_q(n)$ . Again, considering the conjugacy classes appearing in Table [2](#page-3-0) shows that  $\mathcal{T}_r(n)$  contains only the elements of the claimed form  $\mathcal{T}_q(n)$  contains only the elements of the claimed form.

<span id="page-4-1"></span>**Proposition 9.** Assume that  $q = p^e$  is odd. Let  $C \in SL_2(q)$ , and denote  $\gamma = \text{tr}(C)$  and  $t = |\bar{C}|$ *. Assume that*  $\gamma \neq \pm 2$  *(or equivalently,*  $t \neq p$ *). Then* t *is a* q-good *order if and only if one of*  $2 + \gamma$ ,  $2 - \gamma$  *is a square in*  $\mathbb{F}_q$ .

*Proof.* As  $t \neq p$  then t divides either  $(q - 1)/2$  or  $(q + 1)/2$ .

If t divides  $(q-1)/2$  then  $\gamma = a + a^{-1}$  or  $\gamma = -(a + a^{-1})$ , for some primitive root of unity a of order 2t in  $\mathbb{F}_q$  (see Proposition [8\)](#page-4-0). Hence,

$$
\{2+\gamma, 2-\gamma\} = \{a+2+a^{-1}, (-a)+2+(-a)^{-1}\}.
$$

Therefore,  $2 + \gamma$  or  $2 - \gamma$  is a square in  $\mathbb{F}_q$  if and only if  $a = c^2$  or  $-a = c^2$  for some  $c \in \mathbb{F}_q$ . Indeed,  $a + 2 + a^{-1}$  is a square if and only if  $(a + 1)^2/a$  is a square if and only if a is a square in  $\mathbb{F}_q$ , and similarly for  $(-a) + 2 + (-a)^{-1}$ .

Now, one the following necessarily holds:

- If t is even then  $-a$  is also a primitive root of unity of order 2t. Hence, a is a square in  $\mathbb{F}_q$  if and only if  $-a$  is a square is  $\mathbb{F}_q$ . In addition, a is a square in  $\mathbb{F}_q$  if and only if  $\mathbb{F}_q$  contains a primitive root of unity of order 4t, namely, if and only if 4t divides  $q-1$ .
- If t is odd and  $q \equiv 1 \mod 4$  then 4t divides  $q-1$ , and so  $\mathbb{F}_q$  contains a primitive root of unity of order 4t. Thus  $a$ , which is a primitive root of unity of order  $2t$ , is a square in  $\mathbb{F}_q$ , as required.
- If t is odd and  $q \equiv 3 \mod 4$  then  $\mathbb{F}_q$  contains a primitive root of unity of order  $2t$ but does not contain a primitive root of unity of order  $4t$ , and so,  $a$  is a non-square in  $\mathbb{F}_q$ . However,  $-a$  is a primitive root of unity of order t, and so, it is necessarily a square in  $\mathbb{F}_q$ , as required.

In conclusion,  $a = c^2$  or  $-a = c^2$  for some  $c \in \mathbb{F}_q$  if and only if either t is odd and divides  $q-1$  or t is even and 4t divides  $q-1$ .

If t divides  $(q+1)/2$  then  $\gamma = a + a^q$  or  $\gamma = -(a + a^q)$ , for some primitive root of unity a of order 2t in  $\mathbb{F}_{q^2}$  (see Proposition [8\)](#page-4-0). Hence,

$$
\{2+\gamma, 2-\gamma\} = \{a+2+a^q, (-a)+2+(-a)^q\}.
$$

Therefore,  $2 + \gamma$  or  $2 - \gamma$  is a square in  $\mathbb{F}_q$  if and only if  $a = c^2$  or  $-a = c^2$  for some  $c \in \mathbb{F}_{q^2}$ satisfying  $c^{q+1} = 1$ .

Now, one the following necessarily holds:

- If t is even then  $-a$  is also a primitive root of unity of order 2t. Hence,  $a = c^2$  for some  $c \in \mathbb{F}_{q^2}$  satisfying  $c^{q+1} = 1$  if and only if  $-a = b^2$  for some  $b \in \mathbb{F}_{q^2}$  satisfying  $b^{q+1} = 1$ . This is equivalent to the condition that 4t divides  $q + 1$ .
- If t is odd and  $q \equiv 3 \mod 4$  then  $\mathbb{F}_{q^2}$  contains a primitive root of unity b of order 4t satisfying  $b^{q+1} = 1$ . Hence,  $a = c^2$  for some  $c \in \mathbb{F}_{q^2}$  satisfying  $c^{q+1} = 1$ , as required.
- If t is odd and  $q \equiv 1 \mod 4$  then  $\mathbb{F}_{q^2}$  does not contain a primitive root of unity c of order 4t satisfying  $c^{q+1} = 1$ . However, in this case,  $-a = b^2$  for some  $b \in \mathbb{F}_{q^2}$ satisfying  $b^{q+1} = 1$ , as required.

In conclusion,  $a = c^2$  or  $-a = c^2$  for some  $c \in \mathbb{F}_{q^2}$  satisfying  $c^{q+1} = 1$  if and only if either t is odd and divides  $q + 1$  or t is even and 4t divides  $q + 1$ .

## <span id="page-5-0"></span>2.4. Number of elements.

**Definition 4.** Let q be a prime power and let  $\alpha \in \mathbb{F}_q$ .

If  $\alpha = \pm 2$  we say that  $\alpha$  is a *unipotent* trace. If  $\alpha$  is a trace of a semisimple split (respectively, non-split) matrix in  $SL_2(q)$  we say that  $\alpha$  is *split* (respectively, *non-split*).

Assume that q is odd and  $\alpha \neq \pm 2$ . If at least one of  $2 + \alpha$ ,  $2 - \alpha$  is a square in  $\mathbb{F}_q$  we say that  $\alpha$  is a *good* trace. If none of  $2 + \alpha$ ,  $2 - \alpha$  is a square in  $\mathbb{F}_q$  we say that  $\alpha$  is a *bad* trace.

## <span id="page-6-0"></span>Lemma 10.

- (1) *If* q *is even then*  $\mathbb{F}_q$  *contains one unipotent,*  $(q-2)/2$  *split and*  $q/2$  *non-split traces.*
- (2) *If* q *is odd then*  $\mathbb{F}_q$  *contains* 2 *unipotent,*  $(q-3)/2$  *split and*  $(q-1)/2$  *non-split traces.*
- (3) *If*  $q \equiv 1 \mod 4$  *then*  $\mathbb{F}_q$  *contains*  $(q-1)/4$  *bad traces.*
- (4) If  $q \equiv 3 \mod 4$  then  $\mathbb{F}_q$  contains  $(q+1)/4$  bad traces.

*Proof.* (1) and (2) are due to [\[11,](#page-14-2) Lemma 2].

(3) If  $q \equiv 1 \mod 4$  then  $(q-1)/2$  is even, and so all the bad traces are necessarily split. Hence, there are  $\frac{1}{2}(\frac{1}{2})$  $\frac{1}{2}(q-3)+1$ ) bad traces.

(4) If  $q \equiv 3 \mod 4$  then  $(q + 1)/2$  is even, and so all the bad traces are non-split. Hence, ere are  $\frac{1}{6}(\frac{1}{6}(q-1)+1)$  bad traces. there are  $\frac{1}{2}(\frac{1}{2})$  $\frac{1}{2}(q-1)+1$ ) bad traces.

Now, the following corollaries easily follow from Table [2,](#page-3-0) Proposition [9](#page-4-1) and Lemma [10.](#page-6-0)

**Corollary 11.** *If* q *is even then*  $G = \text{PSL}_2(q)$  *contains:* 

- q <sup>2</sup> <sup>−</sup> <sup>1</sup> *unipotent elements,*
- $\bullet$   $\frac{1}{2}$  $\frac{1}{2}q(q+1)(q-2)$  semisimple split elements,
- $\bullet$   $\frac{1}{2}$  $\frac{1}{2}q^2(q-1)$  *semisimple non-split elements.*

<span id="page-6-1"></span>**Corollary 12.** *If* q *is even then*  $G = \text{PSL}_2(q)$  *contains:* 

- q <sup>2</sup> <sup>−</sup> <sup>1</sup> *unipotent elements,*
- $\bullet$   $\frac{1}{4}$  $\frac{1}{4}q(q+1)(q-3)$  semisimple split elements,
- $\bullet$   $\frac{1}{4}$  $\frac{1}{4}q(q-1)^2$  semisimple non-split elements.
- $\bullet$   $\frac{1}{8}$  $\frac{1}{8}q(q^2-1) = \frac{|G|}{4}$  semisimple elements whose order is not q-good.

<span id="page-6-2"></span>2.5. Unipotent elements when q is odd. Consider the following matrices in  $G_0 = SL_2(q)$ (where  $q$  is odd):

$$
U_1 = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}, \quad U_{-1} = \begin{pmatrix} -1 & 1 \\ 0 & -1 \end{pmatrix} = -U_1^{-1},
$$

$$
U_1' = XU_1X^{-1} = \begin{pmatrix} 1 & x^2 \\ 0 & 1 \end{pmatrix} \in G_0, \quad U_{-1}' = XU_{-1}X^{-1} = \begin{pmatrix} -1 & x^2 \\ 0 & -1 \end{pmatrix} \in G_0,
$$

where  $x \in \mathbb{F}_{q^2} \setminus \mathbb{F}_q$  satisfies that  $x^2 \in \mathbb{F}_q$  and  $X = \begin{pmatrix} x & 0 \\ 0 & x \end{pmatrix}$  $0 \t x^{-1}$  $\Big) \in \mathrm{SL}_2(q^2).$ 

<span id="page-6-3"></span>**Proposition 13.** Let  $G_0 = SL_2(q)$  when q is odd. Then, for any  $A \in G_0$ ,  $XAX^{-1} \in G_0$ . *Moreover,*

- If  $A \neq I$  and  $tr(A) = 2$  then A is  $G_0$ -conjugate to either  $U_1$  or  $U'_1$ .
- If  $A \neq -I$  and  $tr(A) = -2$  then A is  $G_0$ -conjugate to either  $U_{-1}$  or  $U'_{-1}$ .

*Proof.* Indeed, if  $A = \begin{pmatrix} a & b \\ c & d \end{pmatrix} \in G_0$  then  $XAX^{-1} = \begin{pmatrix} a & bx^2 \\ cx^{-2} & d \end{pmatrix}$  $cx^{-2}$  d  $\Big) \in G_0$ . Moreover,  $U_1$  is not  $G_0$ -conjugate to  $U'_1 = XU_1X^{-1}$ , since  $x^2$  is not a square of some element in  $\mathbb{F}_q$ . Hence, any  $I \neq A \in G_0$  with  $tr(A) = 2$  is  $G_0$ -conjugate to either  $U_1$  or  $U'_1$  (see Table [2\)](#page-3-0).

<span id="page-7-0"></span>**Corollary 14.** Let  $G = \text{PSL}_2(q)$  when q is odd. Then, for any  $\overline{A} \in G$ ,  $\overline{X} \overline{A} \overline{X}^{-1} \in G$ . *If moreover,*  $\bar{A}$  *is unipotent then it is G-conjugate to either*  $\bar{U}_1$  *or*  $\bar{U'}_1 = \bar{X}\bar{U}_1\bar{X}^{-1}$ *. In addition,*

- *If*  $q \equiv 1 \mod 4$  *then*  $\overline{U}_1$  *and*  $\overline{U}_{-1}$  *are G*-*conjugate.*
- If  $q \equiv 3 \mod 4$  then  $\overline{U}_1$  and  $\overline{U'}_{-1}$  are *G*-conjugate.

## 3. Proof of the main results

Proof of Theorem [1.](#page-0-0) The proof follows from the following Proposition [15,](#page-8-0) Proposition [17,](#page-8-1) Proposition [18,](#page-9-0) Remark [19,](#page-9-1) Proposition [32](#page-13-7) and Remark [33.](#page-13-8)

Proof of Theorem [2.](#page-1-0) The proof follows from the following Proposition [16,](#page-8-2) Proposition [22,](#page-10-0) Proposition [23,](#page-10-1) Proposition [24](#page-11-0) and Proposition [28.](#page-11-1)

Proof of Theorem [3.](#page-1-1) The proof follows from the following Proposition [16,](#page-8-2) Proposition [21,](#page-10-2) Proposition [22,](#page-10-0) Proposition [24,](#page-11-0) Proposition [25,](#page-11-2) Corollary [27,](#page-11-3) Corollary [31](#page-13-9) and Proposition [32.](#page-13-7)

Proof of Corollary [4.](#page-1-2) The proof follows from Theorem [2,](#page-1-0) Theorem [3,](#page-1-1) Table [2](#page-3-0) and §[2.4.](#page-5-0)

- (1) Let  $G = \text{PSL}_2(q)$  when q is even, then  $|G| = q(q^2 1)$ .
	- If  $\mathcal C$  is a conjugacy class of a semisimple split element then

$$
|\mathcal{C}| = q(q+1) \text{ and } |\mathcal{C}^2| = q(q^2 - 1).
$$

• If  $\mathcal C$  is a conjugacy class of a semisimple non-split element then

$$
|\mathcal{C}| = q(q-1) \text{ and } |\mathcal{C}^2| = q(q^2 - 1) - (q^2 - 1) = (q-1)(q^2 - 1).
$$

• If  $\mathcal C$  is a conjugacy class of a unipotent element then

$$
|\mathcal{C}| = q^2 - 1 \text{ and } |\mathcal{C}^2| = q(q^2 - 1).
$$

Now let  $G = \text{PSL}_2(q)$  when q is odd, then  $|G| = q(q^2 - 1)/2$ .

(2) If  $\mathcal C$  is a conjugacy class of semisimple element whose order is greater than 2 then

$$
|\mathcal{C}| = q(q \pm 1) \text{ and } |\mathcal{C}^2| = q(q^2 - 1)/2.
$$

- (3) If  $\mathcal C$  is a conjugacy class of semisimple element x of order 2 then
	- If  $q \equiv 1 \mod 4$  then x is split and so

$$
|\mathcal{C}| = q(q+1)/2 \text{ and } |\mathcal{C}^2| = q(q^2-1)/2.
$$

• If  $q \equiv 3 \mod 4$  then x is non-split and so

$$
|\mathcal{C}| = q(q-1)/2 \text{ and } |\mathcal{C}^2| = q(q^2-1)/2 - (q^2-1) = (q-2)(q^2-1)/2.
$$

(4) If  $\mathcal C$  is a conjugacy class of a unipotent element, then by Corollary [12,](#page-6-1)

$$
|\mathcal{C}| = (q^2 - 1)/2 \text{ and } |\mathcal{C}^2| = q(q^2 - 1)/2 - q(q^2 - 1)/8 - \epsilon = 3q(q^2 - 1)/8 - \epsilon,
$$
  
where  $\epsilon = \begin{cases} 1 & \text{if } q \equiv 1 \text{ mod } 4 \\ 0 & \text{if } q \equiv 3 \text{ mod } 4. \end{cases}$ 

### 3.1. Generation properties of  $\mathcal{C}$ .

<span id="page-8-0"></span>**Proposition 15.** Let  $G = \text{PSL}_2(q)$  when  $q > 3$  and let C be a conjugacy class of a semisim*ple element* s *of order greater than* 2*. Then* C *contains two elements* x, y *that generate* G*.*

*Proof.* Let  $s \in G$  be a semisimple element and let C be the conjugacy class of s. Let  $S \in G_0 = SL_2(q)$  be the preimage of s. Denote the order of s by n and  $\alpha = \text{tr}(S)$ , thus  $\alpha \notin \{0, \pm 2\}$ . Recall that  $d = \gcd(2, q - 1)$ .

If  $q \neq 5, 7$  take some  $\gamma \in \mathcal{T}_q((q+1)/d)$ . If  $(\alpha, \alpha, \gamma)$  is *singular* then  $(2-\gamma)(\alpha^2 - \gamma - 2) = 0$ and so  $\gamma = \alpha^2 - 2$ . Thus, we may replace  $\gamma$  by  $-\gamma$  (or by another  $\gamma \in \mathcal{T}_q((q+1)/d))$  to obtain a non-singular triple  $(\alpha, \alpha, \gamma)$ . When  $q = 9$  one can moreover make sure that  $(\alpha, \alpha, \gamma)$ does not correspond to a triple of matrices  $(A, B, C)$  with  $ABC = I$  satisfying  $\langle \overline{A}, \overline{B} \rangle \cong A_5$ (see [\[10\]](#page-14-1)). When  $q = 5$  or 7 take  $\gamma = -2$ , and then the triple  $(\alpha, \alpha, -2)$  is also not singular.

By Theorem [6,](#page-3-2) there exists a triple of matrices  $(A, B, C)$  such that  $ABC = I$ ,  $tr(A) =$  $tr(B) = \alpha$  and  $tr(C) = \gamma$ . Moreover, by Theorem [7,](#page-3-3)  $\langle \overline{A}, \overline{B} \rangle$  is not a structural subgroup of G. By considering the possible subgroups of G detailed in Table [3](#page-3-1) we see that the only non-structural subgroup containing  $\overline{C}$  is G itself, and hence  $\langle \overline{A}, \overline{B} \rangle = G$ .

<span id="page-8-2"></span>**Proposition 16.** Let  $G = \text{PSL}_2(q)$  when  $q > 3$ .

- *If* q *is odd then any non-trivial element in* G *can be written as a product of two* G*-conjugate semisimple elements that generate* G*;*
- *If* q *is even then only a semisimple element in* G *can be written as a product of two* G*-conjugate (semisimple) elements that generate* G*.*

*Proof.* Assume that q is even. Let  $Z \in G$  and denote  $\gamma = \text{tr}(Z)$ . Assume that  $Z = XY$ where X is G-conjugate to Y, and let  $\alpha = \text{tr}(X) = \text{tr}(Y)$ . If Z is unipotent then  $\gamma = 0$ . Since  $(\alpha, \alpha, 0)$  is *singular* then by Theorem [7](#page-3-3) the subgroup  $\langle X, Y \rangle$  is a structural subgroup of G, and so X and Y cannot generate G. If Z is semisimple then  $\gamma \neq 0$ , and we can choose some  $\alpha \in \mathcal{T}_q(q+1)$  such that  $\gamma \neq \alpha^2$  and then  $(\alpha, \alpha, \gamma)$  is not singular.

Assume that q is odd. Let  $1 \neq z \in G$  and let  $Z \in G_0 = SL_2(q)$  be the preimage of z. Denote  $\gamma = \text{tr}(Z)$ . If  $q \neq 5, 7$  take some  $\alpha \in \mathcal{T}_q((q+1)/2)$ . If  $(\alpha, \alpha, \gamma)$  is *singular* then  $(2 - \gamma)(\alpha^2 - \gamma - 2) = 0$  and so  $\gamma = -2$  or  $\gamma = \alpha^2 - 2$ . Thus, we may replace  $\gamma$  by  $-\gamma$ to obtain a non-singular triple  $(\alpha, \alpha, \gamma)$ . When  $q = 9$  one can moreover make sure that  $(\alpha, \alpha, \gamma)$  does not correspond to a triple of matrices  $(A, B, C)$  with  $ABC = I$  satisfying  $\langle \bar{A}, \bar{B} \rangle \cong A_5$  (see [\[10\]](#page-14-1)). When  $q = 5$  or 7 take  $\alpha = -2$  (and  $\gamma \neq 2$ ) and then the triple  $(-2, -2, \gamma)$  is also not singular.

By Theorem [6,](#page-3-2) there exists a triple of matrices  $(A, B, C)$  such that  $ABC = I$ ,  $tr(A) =$  $tr(B) = \alpha$  and  $tr(C) = \gamma$ . Moreover, by Theorem [7,](#page-3-3)  $\langle A, B \rangle$  is not a structural subgroup of G. By considering the possible subgroups of G detailed in Table [3](#page-3-1) we see that the only non-structural subgroup containing  $\overline{A}$  is G itself, and hence  $\langle \overline{A}, \overline{B} \rangle = G$ .

<span id="page-8-1"></span>**Proposition 17.** Let  $G = \text{PSL}_2(q)$  when  $q > 3$  and let C be a conjugacy class of a semisim*ple element* s. Then C contains three elements x, y, z such that  $xyz = 1$  and  $\langle x, y \rangle = G$  if *and only if the order of* s *is* q-minimal *and greater than* 3*.*

*Proof.* Let  $s \in G$  be a semisimple element and let C be the conjugacy class of s. Let  $S \in G_0 = SL_2(q)$  be the preimage of s. Denote the order of s by n and  $\alpha = \text{tr}(S)$ .

If x, y, z are three elements of order 2 (respectively, 3) such that  $xyz = 1$ , then any finite group generated by x and y is necessarily abelian (respectively, solvable) and so x and y cannot generate  $G$  (see Remark [19\)](#page-9-1).

If n is not q-minimal then  $\alpha$  belongs to some proper subfield  $\mathbb{F}_{q_1}$  of  $\mathbb{F}_{q}$ . In this case, for any three elements  $x, y, z \in \mathcal{C}$  satisfying  $xyz = 1$ , the subgroup  $\langle x, y \rangle$  is necessarily contained in a proper subgroup of G isomorphic to  $PSL_2(q_1)$  (see [\[11\]](#page-14-2) and [\[9\]](#page-13-2)).

If  $n > 3$  is q-minimal then  $\alpha \notin \{0, \pm 1, \pm 2\}$  and hence  $(\alpha - 2)^2(\alpha + 1) \neq 0$  implying that the triple  $(\alpha, \alpha, \alpha)$  is non-singular. If  $q > 5$  and  $n = 5$  one can moreover make sure that the triple  $(\alpha, \alpha, \alpha)$  does not correspond to a triple of matrices  $(A, B, C)$  with  $ABC = I$ satisfying  $\langle A, B \rangle \cong A_5$  (see [\[10\]](#page-14-1)).

Therefore, by Theorems [6](#page-3-2) and [7,](#page-3-3) there exists a triple of matrices  $(A, B, C)$  such that  $ABC = I$ ,  $tr(A) = tr(B) = tr(C) = \alpha$  and  $\langle A, B \rangle$  is a subfield subgroup of G. By the q-minimality of n, s does not belong to any subgroup isomorphic to  $PSL<sub>2</sub>(q<sub>1</sub>)$  for some proper subfield  $\mathbb{F}_{q_1} \subset \mathbb{F}_q$ . In addition, if  $\langle x, y \rangle = \text{PGL}_2(q_1)$  and  $xyz = 1$  then exactly two of  $x, y, z$  belong to  $PGL_2(q_1) \setminus PSL_2(q_1)$  and the third one belongs to  $PSL_2(q_1)$ , so  $x, y, z$ cannot all have the same order *n*. Therefore,  $\langle \overline{A}, \overline{B} \rangle$  cannot generate a subgroup isomorphic to PGL<sub>2</sub>( $a_1$ ), hence  $\langle \overline{A}, \overline{B} \rangle = G$  as needed. to  $\text{PGL}_2(q_1)$ , hence  $\langle \overline{A}, \overline{B} \rangle = G$  as needed.

<span id="page-9-0"></span>**Proposition 18.** Let  $G = \text{PSL}_2(q)$  where q is a prime power. Then there exist three G*conjugate unipotent elements* A, B and C *such that*  $ABC = 1$  *and*  $\langle A, B \rangle = G$  *if and only*  $q > 3$  *is prime.* 

*Proof.* If  $A, B, C \in G$  are three elements of prime order p such that  $ABC = 1$  then  $\langle A, B \rangle$ is contained in a subgroup isomorphic to  $PSL_2(p)$ , implying that necessarily  $q = p > 3$  is prime (see [\[11\]](#page-14-2) and [\[9\]](#page-13-2)).

Now, choose some  $a \in \mathbb{F}_p \setminus \{0, \pm 2\}$  and consider the following matrices in  $SL_2(p)$ :

$$
M = \begin{pmatrix} a+1 & -a/2-1 \\ 2 & -1 \end{pmatrix}, \quad K = \begin{pmatrix} a & -1/2 \\ 2 & 0 \end{pmatrix}.
$$

Let  $A = U_{-1} \in G_0$  be as in §[2.5,](#page-6-2)  $B = MU_{-1}M^{-1}$  and  $C = KU_{-1}K^{-1}$ , then  $ABC = I$ .

As  $tr(U_{-1}) = -2$  and  $(-2, -2, -2)$  is a *non-singular* triple, then by Theorem [7,](#page-3-3) the subgroup generated by the images of  $A$  and  $B$  is not a structural subgroup of  $G$ . By considering the possible subgroups of G detailed in Table [3](#page-3-1) we conclude that  $\langle A, B \rangle = G$ , as needed as needed  $\Box$ 

<span id="page-9-1"></span>Remark 19. Recall that any finite group generated by two non-commuting involutions is dihedral. In addition, the group presented by  $\langle x, y | x^3 = y^3 = (xy)^3 \rangle$  is an infinite solvable group (see e.g.  $[1]$ ).

# 3.2. Basic properties of  $\mathcal{C}^2$ .

<span id="page-9-2"></span>**Lemma 20.** Let  $A, B \in G_0 = SL_2(q)$  be two non-central matrices such that  $tr(A) = tr(B)$  $\lim_{\epsilon \to 0} \text{tr}(A) = -\text{tr}(B)$ . Let C be some conjugacy class in  $G = \text{PSL}_2(q)$ . If  $\overline{A} \in \mathcal{C}^2$  then also  $\bar{B} \in \mathcal{C}^2$ .

*Proof.* If  $\overline{A} \in C^2$  then  $\overline{A} = z(gzg^{-1})$  for some  $z \in C$ ,  $g \in G$ .

If q is even, or if q is odd and  $tr(A) \neq \pm 2$ , then necessarily  $\bar{B} = h\bar{A}h^{-1}$  for some  $h \in G$ (see Table [2\)](#page-3-0), and so  $\bar{B} = (hzh^{-1})(hgzg^{-1}h^{-1}) \in C^2$ .

Assume that q is odd, z is semisimple and  $\overline{A}$  is unipotent. Let  $Z \in G_0$  be the preimage of z. Then by Corollary [14,](#page-7-0) either  $\overline{B} = h\overline{A}h^{-1}$  or  $\overline{B} = h\overline{X}A\overline{X}^{-1}h^{-1}$  for some  $h \in G$  and a matrix  $X \in SL_2(q^2)$  as in §[2.5.](#page-6-2) Moreover by Proposition [13,](#page-6-3)  $XZX^{-1} \in G_0$ , and since  $\text{tr}(XZX^{-1}) = \text{tr}(Z)$  then  $\bar{X}z\bar{X}^{-1} \in \mathcal{C}$  (see Table [2\)](#page-3-0). Similarly,  $\bar{X}gzg^{-1}\bar{X}^{-1} \in \mathcal{C}$ .

Hence, either

$$
\bar{B} = h\bar{A}h^{-1} = (hzh^{-1})(hgzg^{-1}h^{-1}) \in \mathcal{C}^2
$$

or

$$
\bar{B} = h\bar{X}\bar{A}\bar{X}^{-1}h^{-1} = (h\bar{X}z\bar{X}^{-1}h^{-1})(h\bar{X}gzg^{-1}\bar{X}^{-1}h^{-1}) \in \mathcal{C}^2.
$$

If q is odd and z is unipotent, then the following Proposition [21](#page-10-2) shows that  $\mathcal{C}^2$  contains all the unipotent elements in  $G$ , as needed.  $\square$ 

<span id="page-10-2"></span>**Proposition 21.** Let  $G = \text{PSL}_2(q)$  when q is odd and let C be the G-conjugacy class of a unipotent element x. Then  $\mathcal{C}^2$  contains all the unipotent elements in G. *Moreover,*  $1 \in \mathcal{C}^2$  *if and only if*  $q \equiv 1 \text{ mod } 4$ *.* 

*Proof.* For  $q = 5$  this claim can be easily verified. When  $q > 5$  there exist elements  $a, b \in \mathbb{F}_q$ such that  $a, b$  and  $a + 1$  are squares in  $\mathbb{F}_q$  but  $b + 1$  is a non-square in  $\mathbb{F}_q$ . Let  $U_1$  be as in §[2.5,](#page-6-2) let  $A = \begin{pmatrix} 1 & a \\ 0 & 1 \end{pmatrix}$ ,  $B = \begin{pmatrix} 1 & b \\ 0 & 1 \end{pmatrix}$ , then  $U_1 A = \begin{pmatrix} 1 & a+1 \\ 0 & 1 \end{pmatrix}$  and  $U_1 B = \begin{pmatrix} 1 & b+1 \\ 0 & 1 \end{pmatrix}$ . Moreover, A,B and  $U_1A$  are conjugate to  $U_1$  in  $SL_2(q)$ , while  $U_1B$  is conjugate to  $U_1'$  in  $SL<sub>2</sub>(q)$  (see Proposition [13\)](#page-6-3). By Corollary [14,](#page-7-0) any unipotent element in G is G-conjugate to either  $\bar{U}_1$  or to  $\bar{U}'_1$ , as needed.

In addition, by Corollary [14,](#page-7-0)  $\bar{U}_1$  is *G*-conjugate to  $\bar{U}_1^{-1}$  if and if  $q \equiv 1 \mod 4$ .

<span id="page-10-0"></span>**Proposition 22.** Let  $G = \text{PSL}_2(q)$  and let C be the G-conjugacy class of a semisimple *element* x. Then  $C^2$  contains all the semisimple elements in G. Moreover  $1 \in C^2$ .

*Proof.* Let  $z \in G$  be some semisimple element. Let  $X, Z \in SL_2(q)$  be the pre-images of x, z respectively. Denote  $\alpha = \text{tr}(X), \gamma = \text{tr}(Z)$ . By Theorem [6,](#page-3-2) there exist matrices  $X', Y', Z' \in SL_2(q)$  such that  $tr(X') = tr(Y') = \alpha$  and  $tr(Z') = \gamma$ . By Table [2,](#page-3-0)  $\bar{X}', \bar{Y}' \in \mathcal{C}$ and so  $\bar{Z}' \in \mathcal{C}^2$ . Hence by Lemma [20,](#page-9-2)  $z \in \mathcal{C}^2$  as needed.

Moreover, since  $tr(X) = tr(X^{-1})$  then according to Table [2,](#page-3-0)  $x^{-1} \in C$  as well, and so  $xx^{-1} = 1 \in \mathcal{C}^2$ . .

Note that the previous proposition is a specific case of a more general result of Gow [\[7\]](#page-13-11).

<span id="page-10-1"></span>**Proposition 23.** Let  $G = \text{PSL}_2(q)$  when q is even and let C be the G-conjugacy class of a *unipotent element x. Then*  $C^2 = G$ *.* 

*Proof.* Let  $z \in G$  be any semisimple element and denote  $\gamma = \text{tr}(z)$ . By Theorem [6,](#page-3-2) there exist matrices  $x', y', z' \in G$  such that  $tr(x') = tr(y') = 0$  and  $tr(z') = \gamma$ . Thus  $x', y' \in C$  and so  $z' \in \mathcal{C}^2$ . Hence by Lemma [20,](#page-9-2)  $z \in \mathcal{C}^2$  as needed.

Moreover, since x has order 2 then  $x^2 = 1 \in C^2$ . Without loss of generality we may assume that  $x = \begin{pmatrix} 0 & 1 \\ 1 & 0 \end{pmatrix}$  and take  $y = \begin{pmatrix} a+1 & a \\ a & a+1 \end{pmatrix} \in SL_2(q)$  (where  $a \neq 0, 1$ ). Then  $xy = yx = \begin{pmatrix} a & a+1 \\ a & a \end{pmatrix}$  $a+1$  a ). Since  $tr(x) = tr(y) = tr(xy) = 0$  then  $x, y, xy$  are unipotents. Hence by Lemma [20,](#page-9-2)  $\mathcal{C}^2$  contains all the unipotent elements.

# 3.3. Unipotent elements contained in  $\mathcal{C}^2$ .

<span id="page-11-0"></span>**Proposition 24.** Let  $G = \text{PSL}_2(q)$  and let C be the G-conjugacy class of a semisimple split *element* x. Then  $C^2$  contains all the unipotent elements in G.

*Proof.* By Table [2,](#page-3-0) we may assume x is an image of a matrix  $X = \begin{pmatrix} a & 1 \\ 0 & a \end{pmatrix}$ 0  $a^{-1}$  $\Big) \in SL_2(q)$ (where  $a \neq 0, \pm 1$ ). Let  $Y = \begin{pmatrix} a^{-1} & a^{-1}(1-a) \\ 0 & a \end{pmatrix}$  $\begin{array}{ccc} 0 & a \end{array}$ ), then its image in  $G = \text{PSL}_2(q)$  is  $G$ -

conjugate to x, and  $XY = \begin{pmatrix} 1 & 1 \\ 0 & 1 \end{pmatrix}$ . Hence  $\mathcal{C}^2$  contains a unipotent element, and the result now follows from Lemma [20.](#page-9-2)

<span id="page-11-2"></span>**Proposition 25.** Let  $G = \text{PSL}_2(q)$  when q is odd and let C be the G-conjugacy class of a *semisimple non-split element* x *of order greater than* 2*. Then* C 2 *contains all the unipotent elements in* G*.*

*Proof.* By Table [2,](#page-3-0) we may assume that x is an image of a matrix  $X = \begin{pmatrix} a & -1 \\ 1 & 0 \end{pmatrix} \in SL_2(q)$ 

(where  $a \neq 0$ ). Let  $Y = \begin{pmatrix} 0 & 1 \\ -1 & -a \end{pmatrix}$  $-1$   $-a$ ), then its image in  $G = \text{PSL}_2(q)$  is G-conjugate to x, and  $XY = \begin{pmatrix} 1 & 2a \\ 0 & 1 \end{pmatrix}$ . Hence  $\mathcal{C}^2$  contains a unipotent element, and the result now follows from Lemma [20.](#page-9-2)  $\Box$ 

<span id="page-11-4"></span>**Proposition 26.** Let  $G = \text{PSL}_2(q)$  when q is odd and let C be the G-conjugacy class of a *semisimple non-split element* x *of order* 2*. Then* C <sup>2</sup> *does not contain any unipotent element of* G*.*

*Proof.* Assume that  $\mathcal{C}^2$  contains a unipotent element  $z \in G$ . Then  $z = xy$  for some non-split elements x, y of order 2. Let  $X, Y, Z \in SL_2(q)$  be the pre-images of x, y, z respectively. Then  $tr(X) = tr(Y) = 0$  and  $tr(Z) = \pm 2$ . Observe that  $(0, 0, \pm 2)$  is a *singular* triple. Therefore, by Theorem [7,](#page-3-3) the subgroup  $H = \langle x, y \rangle$  is a *structural* subgroup of G. By observing the possible subgroups of  $G$  detailed in Table [3,](#page-3-1)  $H$  cannot be a subgroup of the Borel subgroup since it contains a non-split element, and hence cannot contain the unipotent element  $z$ , yielding a contradiction.

<span id="page-11-3"></span>Corollary 27. Let  $G = \text{PSL}_2(q)$  when q is odd and let C be the G-conjugacy class of a *semisimple element* x *of order* 2*. Then*

- *If*  $q \equiv 1 \mod 4$  *then*  $C^2$  *contains all the unipotent elements in G.*
- If  $q \equiv 3 \mod 4$  then  $\mathcal{C}^2$  does not contain any unipotent element of G.

*Proof.* If  $q \equiv 1 \text{ mod } 4$  then an element of order 2 is split and the result follows from Propo-sition [24.](#page-11-0) If  $q \equiv 3 \mod 4$  then an element of order 2 is non-split and the result follows from Proposition 26. Proposition [26.](#page-11-4)

<span id="page-11-1"></span>**Proposition 28.** Let  $G = \text{PSL}_2(q)$  when q is even and let C be the G-conjugacy class of a *semisimple non-split element*  $x$ *. Then*  $C^2$  *does not contain any unipotent element of*  $G$ *.* 

*Proof.* Assume that  $\mathcal{C}^2$  contains a unipotent element  $z \in G$ . Then  $z = xy$  for some non-split matrices x, y. Then tr(x) = tr(y) =  $\alpha \neq 0$  and tr(z) = 0. Observe that  $(\alpha, \alpha, 0)$  is a *singular*  triple. Therefore, by Theorem [7,](#page-3-3) the subgroup  $H = \langle x, y \rangle$  is a *structural* subgroup of G. By observing the possible subgroups of  $G$  detailed in Table [3,](#page-3-1)  $H$  cannot be a subgroup of the Borel subgroup since it contains a non-split element, and hence cannot contain the unipotent element z, yielding a contradiction.  $\square$ 

# 3.4. Unipotent conjugacy classes  $\mathcal C$  when  $q$  is odd.

<span id="page-12-0"></span>**Proposition 29.** Let  $G_0 = SL_2(q)$  when  $q = p^e$  is odd, and let  $A, B \in G_0$ ,  $A, B \neq \pm I$ *satisfy*  $\text{tr}(A), \text{tr}(B) \in \{\pm 2\}$ *. Denote*  $C = AB$  *and*  $\gamma = \text{tr}(C)$ *.* 

- (1) *If*  $tr(A) = tr(B)$ *, then* A *is*  $G_0$ -conjugate to B *if* and only if  $2 \gamma$  *is a square in*  $\mathbb{F}_q$ *.*
- (2) *If*  $tr(A) = -tr(B)$ *, then* A *is*  $G_0$ -conjugate to −B *if* and only if  $2 + \gamma$  *is a square in*  $\mathbb{F}_q$ .

*Proof.* Without loss of generality we may assume that  $A = U_1$ .

(1) If 
$$
B = MU_1M^{-1}
$$
 for some matrix  $M = \begin{pmatrix} a & b \ c & d \end{pmatrix} \in G_0$ , then  
\n
$$
\gamma = \text{tr}(C) = \text{tr}(AB) = \text{tr}(U_1MU_1M^{-1}) = \text{tr}\begin{pmatrix} 1 - ac - c^2 & 1 + ac + a^2 \ -c^2 & 1 + ac \end{pmatrix} = 2 - c^2,
$$

and so  $2 - \gamma$  is a square in  $\mathbb{F}_q$ .

If 
$$
B = MU_1'M^{-1}
$$
 for some matrix  $M \in G_0$ , then

$$
\gamma = \text{tr}(C) = \text{tr}(AB) = \text{tr}(U_1 M U_1' M^{-1}) = 2 - x^2 c^2,
$$

and since  $x \in \mathbb{F}_{q^2} \setminus \mathbb{F}_q$  then  $2 - \gamma$  is a non-square in  $\mathbb{F}_q$ .

(2) Similarly, if  $B = M(-U_1)M^{-1}$  for some matrix  $M \in G_0$ , then

$$
\gamma = \text{tr}(C) = \text{tr}(AB) = \text{tr}(U_1M(-U_1)M^{-1}) = -2 + c^2,
$$

and so  $2 + \gamma$  is a square in  $\mathbb{F}_q$ .

If  $B = M(-U_1')M^{-1}$  for some matrix  $M \in G_0$ , then

$$
\gamma = \text{tr}(C) = \text{tr}(AB) = \text{tr}(U_1M(-U_1')M^{-1}) = -2 + x^2c^2,
$$

and so  $2 + \gamma$  is a non-square in  $\mathbb{F}_q$ .

Therefore, in order to decide whether  $C = AB$ , where  $A, B \in G$  are G-conjugate unipotent elements and C is of order  $t \neq p$ , one needs to determine whether for  $\gamma \in \mathcal{T}_q(t)$ ,  $2 - \gamma$ or  $2 + \gamma$  is a square in  $\mathbb{F}_q$ . In Proposition [9](#page-4-1) we showed that this is equivalent to decide whether t is a q-good order or not (see Definition [2\)](#page-1-3).

<span id="page-12-1"></span>**Corollary 30.** Let  $G = \text{PSL}_2(q)$  when  $q = p^e$  is odd. Let  $A, B \in G$  be two elements of *order* p and assume that the order of  $C = AB$  is  $t \neq p$ . Then A is G-conjugate to B if and *only if* t *is a* q-good *order.*

*Proof.* Let  $A, B \in G_0 = SL_2(q)$  and  $C = AB$  and assume that their images  $\overline{A}, \overline{B}, \overline{C} \in$  $G = \text{PSL}_2(q)$  have respective orders  $(p, p, t)$ ,  $t \neq p$ . Denote  $\gamma = \text{tr}(C)$ . Then  $\overline{A}$  and  $\bar{B}$  are unipotent if and only if  $A, B \neq \pm I$  and  $tr(A), tr(B) \in {\pm 2}$ . Moreover,  $\bar{A}$  and  $\bar{B}$  are G-conjugate if and only if either  $tr(A) = tr(B)$  and A and B are G<sub>0</sub>-conjugate or  $tr(A) = -tr(B)$  and A and  $-B$  are  $G_0$ -conjugate. From Proposition [29](#page-12-0) we deduce that  $\overline{A}$ 

 $\Box$ 

and  $\overline{B}$  are G-conjugate if and only if  $2 - \gamma$  or  $2 + \gamma$  is a square in  $\mathbb{F}_q$ . By Proposition [9,](#page-4-1) the latter is equivalent to the proposition a q-qood order latter is equivalent to t being a q*-good* order.

<span id="page-13-9"></span>**Corollary 31.** Let  $G = \text{PSL}_2(q)$  when q is odd and let C be the G-conjugacy class of a  $unipotent$  *element* x. Let z be a semisimple element in G. Then  $C^2$  contains z if and only *if the order of* z *is* q-good*.*

*Proof.* Follows from Corollary [30](#page-12-1) and Lemma [20.](#page-9-2) □

<span id="page-13-7"></span>**Proposition 32.** Assume that  $q = p^e$  where p is odd and  $5 \le q \ne 9$  and let  $G = \mathrm{PSL}_2(q)$ . *Then there exist two G-conjugate unipotent elements* A and B *such that*  $\langle A, B \rangle = G$ .

*Moreover, if*  $C = AB$  *is semisimple then the order of*  $C$  *is q*-minimal *and* q-good.

*Proof.* Let  $(A, B, C) \in G^3$  be a triple of respective orders  $(p, p, t)$  such that  $t \neq p$ . If t is not  $q$ -good then by Corollary [30,](#page-12-1) A and B are not G-conjugate. If t is not  $q$ -minimal then the subgroup  $\langle A, B \rangle$  is contained in a subfield subgroup isomorphic to  $PSL_2(q_1)$  for some proper subfield  $\mathbb{F}_{q_1} \subset \mathbb{F}_q$  (see [\[11\]](#page-14-2) and [\[9\]](#page-13-2)).

Now, let t be a q-minimal order which is also a q-good order. By Theorem [6,](#page-3-2) there exist a triple  $(A, B, C) \in G^3$  of respective orders  $(p, p, t)$  such that  $ABC = 1$ . By Corollary [30,](#page-12-1) A is G-conjugate to B.

Let  $\gamma \in \overline{\mathcal{T}}_q(t)$ , as  $t \neq p$  then  $\gamma \neq \pm 2$  and so  $(\gamma \pm 2)^2 \neq 0$  implying that  $(2, 2, \gamma)$  is *non-singular*, hence by Theorem [7,](#page-3-3)  $\langle A, B \rangle$  is not a structural subgroup of G. Since t is q-minimal, then  $\langle A, B \rangle$  is not isomorphic neither to  $PSL_2(q_1)$  nor to  $PGL_2(q_1)$ , for some proper subfield  $\mathbb{F}_{q_1}$  of  $\mathbb{F}_{q}$ . Moreover, if  $5 < q \neq 9$  then either  $p > 5$ ; or  $p = 5$  and  $e > 1$ implying that  $t \neq 2, 3, 5$ ; or  $p = 3$  and  $e > 2$  implying that  $t > 5$  (see Table [1\)](#page-2-0). Therefore,  $\langle A, B \rangle$  cannot be a small subgroup, hence  $\langle A, B \rangle = G$ .  $\langle A, B \rangle$  cannot be a small subgroup, hence  $\langle A, B \rangle = G$ .

<span id="page-13-8"></span>Remark 33. Let  $G = \text{PSL}_2(9) \cong A_6$ , let A, B be two unipotent elements (of order 3) and  $C = (AB)^{-1}$ . Denote the order of C by t, then  $t \in \{2, 3, 4, 5\}$ .

- Clearly if  $t = 2$  or  $t = 3$  then  $\langle A, B \rangle \neq G$  (see Table [1\)](#page-2-0).
- $t = 4$  is not 9-good and so A and B are not G-conjugate, by Corollary [30.](#page-12-1)
- $t = 5$  is 9-good, however if A is G-conjugate to B, then one can verify that  $\langle A, B \rangle \cong$  $A_5$  is a small subgroup of G (see e.g. [\[6,](#page-13-6) §2, Theorem 8.4]).
