

Monte-Carlo Simulation of J1 League Postseason System from the 2015 Season

Takeshi Izumi¹ and Eiji Konaka^{1**}

January 4, 2019

Abstract

In this paper, the new postseason system of J1 League, the top division of professional football in Japan, is simulated. Official regulation defines that the new postseason from the 2015 season consists of five teams selected by different principles the top three teams by total season points, and the winning teams of the 1st and 2nd half of the season.

This paper clarifies that there are some overlaps within these five teams and the average number of teams reaching the postseason is about 3.5. Further, a postseason with five teams will be held only once every 10 to 30 years.

1 Introduction

J1 League, the top professional division of football in Japan, will adopt a new two-stage system with a postseason system from the 2015 season. The postseason system consists of two different stages. The (tentative) names are “Super Stage” and “J League Championship”[1].

Since its opening in 1993 till 2004, the J1 League has had a system of two stages along with a championship game. From the 2005 season, the J1 League has adopted a simple double round-robin system like European major football leagues such as Premier League (England), Bundesliga (Germany), Serie A (Italy), Liga Española (Spain), and so on. Some European football leagues such as Jupiler Pro League (Belgium) and Scottish Premiership (Scotland) have a postseason system called the “split system”[2][3], but these are considered exceptional cases in UEFA¹.

The double round-robin principle is the most simple and fair system, however, J1 League has decided to change the system due to decreased sales and profit[4].

¹Union des Associations Europeennes de Football

Kazumi Daito, the Chairman of J League, said: “It is obvious that football in Japan has shown big progress and has been dramatically growing as a major sport in the last two decades. Japanese players also have shown big progress. Some Japanese play in top-level clubs in the world. This is an amazing fact.”

“However, money and good players are attracted to the five major European football leagues (England, Spain, Italy, Germany, and France). This is called the straw effect, and it refers to football leagues in other countries declining as players and money move to the major leagues; This is now occurring all over the world.”

“J League income peaked at 12.8 billion yen in 2008, but decreased by 0.93 billion yen to 11.9 billion yen by 2012. If this continues, income is expected to decline by another 1 billion yen by 2014.”
(translated by the authors)

Most professional sports league in the USA, such as NFL², MLB³, NBA⁴, and NHL⁵, have adopted postseason system. These postseason systems are designed to get much attention, and these postseason games produce much profit. NPB⁶, the top professional baseball league in Japan, has adopted a postseason system since 2007, which has seen some commercial success. Following these successful examples, J1 League aims to increase its income by introducing the new postseason system.

The most fundamental difference between the new postseason system of J1 League and that of others is that there is possibly an overlap in the teams which have the right to reach the postseason. No substitution teams are selected even if there is any overlap, and therefore, the number of teams and games in the postseason may be different every year, although the number of games is an important factor for income from box office sales and broadcast rights sales.

The objective of this paper is to simulate the new postseason system using a Monte-Carlo simulation to calculate the possibility of overlap.

2 J1 League’s new postseason system

This section introduces the new postseason system. The following explanation is based on the official press release in 2014/2/25[1].

- Regular season
 - Regular season consists of two stages by 18 clubs. Each stage is named as “1st stage” and “2nd stage.”

²National Football League

³Major League Baseball

⁴National Basketball Association

⁵National Hockey League

⁶Nippon Professional Baseball

- Each stage is single round-robin competition. Home and away games are placed on either stage. As a result, each team has 17 matches in one stage with 8 or 9 home games.
- Standings for each stage are based on the sum in points of each game. The point system is the usual 3-1-0 (Win-Draw-Lose) system.
- Super Stage (tentative name)
 - The Super Stage is a knockout tournament of four teams. The following four teams reach the Super Stage.
 - * Winning teams of the 1st and 2nd stages.
 - * The teams ranked 2nd and 3rd in terms of total points over the two stages.

The stage winning teams are denoted by W1 and W2 based on **their total points over both stages**, not based on the stage number. Similarly, the latter teams are denoted by Y2 and Y3.
 - Without any overlaps (defined below), match-ups in the first round are W1 and Y3, and W2 and Y2. The game is held in the hometown of the stage-winning team.
 - The winners of the first round reach the second round, and the winner of the second round (a single-game contest) is the winner of the Super Stage. This team reaches the Championship.
 - Overlap resolution
 - * If Y1 (defined below) overlaps with W1, Y1 reaches the Championship and does not play in the Super Stage. There is no substitution for W1. In this case, the match-up of the first stage is between Y2 and Y3. W2 is seeded and clears the first round.
 - * If either of W1 or W2 overlaps with Y2 or Y3, the team is seeded and clears the first round.
 - * If both W1 and W2 overlap Y2 and Y3, no first round is held and only the second-round match between W1(Y2) and W2(Y3) is held.
- J League Championship (tentative name)
 - The team ranked 1st in terms of total points over the two stages, that is, over 34 matches, reaches the J League Championship. This team is denoted as Y1.
 - Y1 and the winner of the Super Stage play for the Championship. The Championship consists of two games, one each in the hometowns of both teams.

Figure 1 shows the postseason tournament if five teams reach the postseason. There are 8 possible cases of overlap (listed in Table 1), and the number of teams reaching the postseason may vary from three to five. Figure 2 shows an example case where Y2 overlaps W1 (case #3).

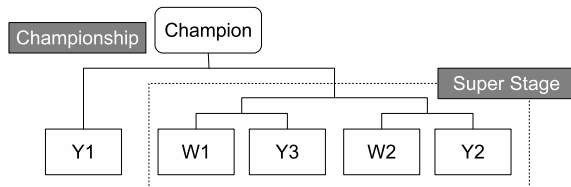

Figure 1: Postseason tournament of J1 League from the 2015 season

Table 1: Overlap cases

case #	overlap(s)	teams
1	null	5
2	(Y3, W1)	4
3	(Y2, W1)	4
4	(Y2, W1), (Y3, W2)	3
5	(Y1, W1)	4
6	(Y1, W1), (Y3, W2)	3
7	(Y1, W1), (Y2, W2)	3
8	(Y1, W1), (Y1, W2)	3

3 Simulation Results

Intuitively, the stage-winning teams would rank high in terms of total points, and vice versa. The objective of this paper is to simulate the new postseason decision system using Monte-Carlo simulation to calculate the possibility of an overlap.

3.1 Notations

The notations used in this paper are summarized below.

- i and j denote the i -th and j -th teams, respectively.
- λ_{ALL} denotes the average number of goals per game.
- $\lambda_{i,GF}$ denotes the average number of goals per game by team i .
- $\lambda_{i,GA}$ denotes the average number of goals per game against team i .
- $\lambda_{i,GF,H}$ and $\lambda_{i,GF,A}$ denote the number average of goals per game by team i in home and away games, respectively. $\lambda_{i,GA,H}$ and $\lambda_{i,GA,A}$ are similarly defined.
- X_i is a random variable that shows the number of goals by team i in one game.

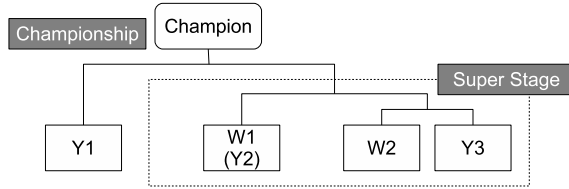

Figure 2: Example: Y2 overlaps W1 (case #3)

- $Po(\lambda)$ is a Poisson distribution with mean λ .

3.2 Game model

It is well known that the number of goals in one football game follows a Poisson distribution[5]. Figure 3 shows the histogram of goals per game in the 2013 J1 League and the probability function of a Poisson distribution with the actual average as the mean.

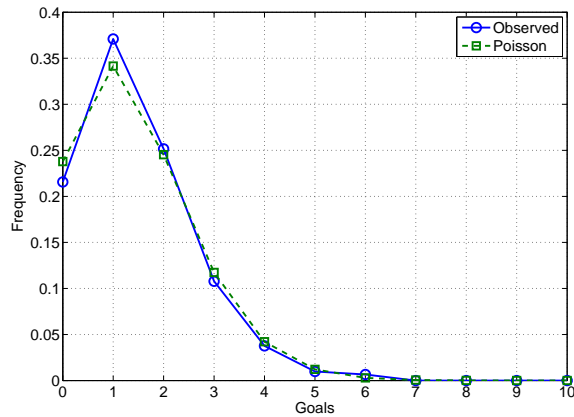

Figure 3: Distribution of goals per game

In this paper, the following models of the game are used.

- M1: X_i is determined by $Po(\lambda_{ALL})$ in all games. In other words,

$$p(x) = e^{-\lambda_{ALL}} \frac{\lambda_{ALL}^x}{x!}, x = 0, 1, \dots \quad (1)$$

Further, suppose that the number of goals by the home and away teams are independent of each other:

$$P(X_i = x, X_j = y) = p(x)p(y). \quad (2)$$

In other words, every team has the same offensive and defensive skills.

- M2: X_i is determined by $Po(\lambda_{i,GF})$ for all opponents. In other words,

$$p_i(x) = e^{-\lambda_{i,GF}} \frac{\lambda_{i,GF}^x}{x!}, x = 0, 1, \dots \quad (3)$$

Further, suppose that the number of goals by the home and away teams are independent of each other:

$$P(X_i = x, X_j = y) = p_i(x)p_j(y). \quad (4)$$

In other words, every team has different offensive skills, but the same defensive skills.

- M3: When i plays against j , X_i is determined by $Po\left(\frac{\lambda_{i,GF} + \lambda_{j,GA}}{2}\right)$.

$$p_{i,j}(x) = e^{-\mu_{i,j}} \frac{\mu_{i,j}^x}{x!}, x = 0, 1, \dots \quad (5)$$

$$\mu_{i,j} = \frac{\lambda_{i,GF} + \lambda_{j,GA}}{2}. \quad (6)$$

Further, suppose that the number of goals by the home and away teams are independent of each other:

$$P(X_i = x, X_j = y) = p_{i,j}(x)p_{j,i}(y). \quad (7)$$

In this model, the offense and the defense skills are reflected.

- M4: When i plays against j in i 's hometown, X_i is determined by $Po\left(\frac{\lambda_{i,GF,H} + \lambda_{j,GA,A}}{2}\right)$.

$$p_{i,j}(x) = e^{-\mu_{i,j}} \frac{\mu_{i,j}^x}{x!}, x = 0, 1, \dots \quad (8)$$

$$\mu_{i,j} = \frac{\lambda_{i,GF,H} + \lambda_{j,GA,A}}{2}. \quad (9)$$

Further, suppose that the number of goals by the home and away teams are independent of each other:

$$P(X_i = x, X_j = y) = p_{i,j}(x)p_{j,i}(y). \quad (10)$$

In this model, not only the offense and the defense skills but also the home and away status are reflected.

The parameters $\lambda_{i,GF}$, $\lambda_{i,GA}$, and so on are taken from J1 League statistics.

Table 2: Number of teams reaching postseason

Teams	M1	M2	M3	M4	case #
3	0.4320	0.5912	0.5195	0.5676	4, 6, 7, 8
4	0.4876	0.3740	0.4282	0.3916	2, 3, 5
5	0.0804	0.0348	0.0522	0.0408	1
mean	3.6485	3.4466	3.5327	3.4372	

Table 3: Probability of each overlap case

Teams	M1	M2	M3	M4	case #
5	0.0804	0.0348	0.0522	0.0408	1
4	0.0754	0.0496	0.0606	0.0527	2
4	0.1205	0.0865	0.1016	0.0898	3
3	0.0530	0.0549	0.0539	0.0513	4
4	0.2917	0.2379	0.2660	0.2491	5
3	0.1168	0.1399	0.1328	0.1353	6
3	0.2063	0.2766	0.2445	0.2639	7
3	0.0559	0.1198	0.0873	0.1172	8

3.3 Simulation result

For each model, 10^5 seasons are simulated and the number of overlap cases is counted. Tables 2 and 3 show the results.

3.4 Discussion

Table 2 shows that a postseason with the maximum of five teams will be held only once about every 10 to 30 years.

For every model, the simulated total points are

- less than the real values for the teams ranked high, and
- more than the real values for the teams ranked low.

For instance, Figure 4 shows the simulated points obtained by models M2 to M4 for the winning team in the 2013 season with 63 points. The averages are 48.705, 54.686, and 48.797 by each model, respectively: these are less than the actual score by 10 to 15 points. This is a straightforward result expected from the calculation rule of average goals for (and goals against) in each model. It can and should be modified in the future. These models, however, lead the points distribution in a narrow range. Therefore, a model close to the real dynamics may lead more overlaps.

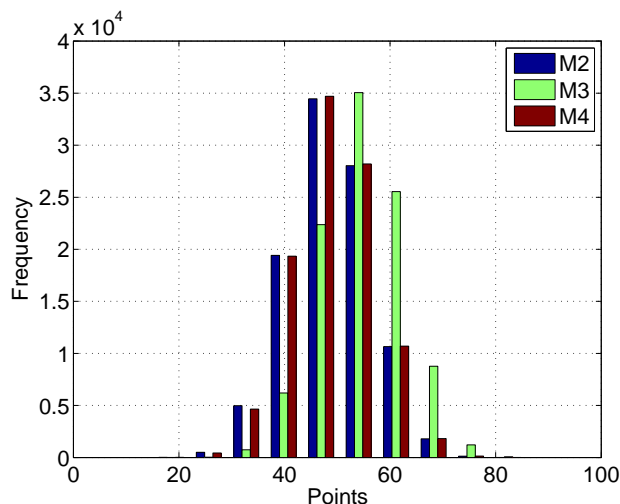

Figure 4: Distribution of points per season

The authors insist that the following definition and explanation in the regulation leads to misunderstanding.

The following four teams reach the Super Stage.

- * Winning teams of the 1st and 2nd stages.
- * The teams ranked in 2nd and 3rd in terms of total points over the two stages.

Unlike in the explanation, this postseason system is basically a tournament of the top three teams in terms of total points, Y1, Y2, and Y3. If W1 and W2 do not rank in the top three, they have reached the postseason stage as a repechage team. Therefore, the new two stages + postseason system is basically a one-stage + postseason system with repechage.

4 Conclusion

From these results, it can be concluded that the new J1 postseason system from the 2015 season has inherent overlaps. In addition, it is clarified that the new system is basically a one-stage system with the postseason stage and it lowers the prestige of winning the 1st and 2nd stages because these teams would appear in the postseason as repechage teams. Given the above, it would be interesting to see whether the new league competition setup succeeds in attracting increasing attention thereby raising sales and profits.

In the future, we intend to develop a more accurate game model and calculate the overlap probability.
