SAÏD ASSERDA

ABSTRACT. For a smooth strictly plurisubharmonic function u on a open set $\Omega \subset \mathbb{C}^n$ and F a C^1 nondecreasing function on \mathbb{R}^*_+ , we investigate the complex partial differential equations

 $\Delta_g \log \det(u_{i\bar{j}}) = F(\det(u_{i\bar{j}})) \|\nabla_g \log \det(u_{i\bar{j}})\|_g^2,$

where Δ_q , $\|.\|_q$ and ∇_q are the Laplacian, tensor norm and the Levi-Civita connexion, respectively, with respect to the Kähler metric $g = \partial \overline{\partial} u$. We show that the above PDE's has a Bernstein property, i.e $\det(u_{i\bar{j}}) = \text{constant}$ on Ω , provided that g is complete, the Ricci curvature of g is bounded below and F satisfies $\inf_{t\in\mathbf{R}^+}(2tF^{'}(t)+\frac{F(t)^2}{n})$ $\frac{(t)^2}{n}$ > $\frac{1}{4}$ and $F(\max_{B(R)} \det u_{i\bar{j}}) = o(R)$.

1. INTRODUCTION

In this note, we investigate a class of fourth order complex nonlinear partial differential equations for a strictly plurisubharmonic function u on a open set $\Omega \subset \mathbb{C}^n$:

$$
\Delta_g \log \det(u_{i\bar{j}}) = F(\det(u_{i\bar{j}})) \|\nabla_g \log \det(u_{i\bar{j}})\|_g^2 \tag{1.1}
$$

where Δ_q , $\|.\|_q$ and ∇_q are the Laplacian, tensor norm and the Levi-Civita connexion, respectively, with respect to the Kähler metric $g = \partial \overline{\partial} u$. For $n \geq 2$, the equation (1.1) is the Euler-Lagrange equation of the variational problem of the functional

$$
\mathcal{V}_{\Phi}(u) = \int_{\Omega} \Phi(\det(u_{i\bar{j}}))dV_e
$$
\n(1.2)

for some $\Phi \in C^4(\mathbf{R}_+^*)$. If $\Phi(t) = t^{1-\beta}, \ \beta \neq 1$, the Euler-Lagrange equation of \mathcal{V}_{Φ} is

$$
\Delta_g \log \det(u_{i\bar{j}}) = \beta \|\nabla_g \log \det(u_{i\bar{j}})\|_g^2 \tag{1.3}
$$

In [1], Chen and Li showed the following Bernstein property of the solution of (3)

Theorem 1.1. Let $\Omega \subset \mathbb{C}^n$ and $u \in C^2(\Omega)$ a strictly plurisubharmonic solution of (3). Assume that

(i) (Ω, g) is complete,

(*ii*) $Ric(g) \geq -C_1$ ($K \geq 0$),

 $(ii) det(u_{i\bar{j}}) < C_2$

where $C_1, C_2 > 0$ are real constants. If $\beta > \frac{\sqrt{9n^2 + 4n} + 3n}{4}$ $\frac{4n+3n}{4}$ then

 $\det(u_{i\bar{j}}) = const \text{ on } \Omega.$

2010 Mathematics Subject Classification. Primary 58E20, Secondary 53C21. Key words and phrases. Ricci curvature, Bernstein property.

For more details about Bernstein property, one can see the paper [1] and references therein. In this note, we will show a Bernstein property of the solutions of (1.1). Our main result is the following.

Theorem 1.2. Let $\Omega \subset \mathbb{C}^n$ be an open set and $u \in C^2(\Omega)$ a strictly plurisubharmonic solution of (1) . Assume that

(i) (Ω, g) is complete,

(ii) $Ric(g) \geq -K$ $(K \geq 0)$,

(ii) $F \in C^1(]0, +\infty[)$ nondecreasing satisfying

$$
\inf_{t>0} \left(2t F'(t) + \frac{F(t)^2}{n} \right) > \frac{1}{4} \quad \text{and} \quad F(\max_{B(R)} \det(u_{i\bar{j}})) = o(R) \tag{1.4}
$$

where $B(R) = \{z \in \Omega, d_g(z, z_0) < R\}$. Then $\det(u_{i\overline{j}})$ is constant on Ω .

If $F(t) = \beta$, the following corollary extends theorem (1.1).

Corollary 1.3. Let $\Omega \subset \mathbb{C}^n$ be an open set and $u \in C^2(\Omega)$ a strictly plurisubharmonic solution of (3). Assume that (Ω, g) is complete and $Ric(g) \geq -K (K \geq 0)$. If $|\beta| > \frac{\sqrt{n}}{2}$ $\frac{\sqrt{n}}{2}$ then $\det(u_{i\bar{j}})$ is constant on Ω .

Example. Example of function F which satisfies conditions of Theorem 1.2 : 1- $F(t) = \log^{2\alpha} t$ where $\alpha \in]\alpha_0(n), \frac{1}{2}$ $\frac{1}{2}$, $\alpha_0(n) > 0$. 2- $F(t) = (\log t) \log(\alpha + (\log t)^2)$ where $\alpha > e^{\frac{1}{4}}$. 3- $F(t) = f(\log t)$ where f is a solution of the Riccati equation $2y' + \frac{y^2}{n} = \alpha$, $\alpha > \frac{1}{4}$.

2. Proof of theorem 1.2

Proof. We denote $\Psi = |\nabla U|^2$ where $U = \log \det(u_{i\bar{j}})$ and $f(t) = F(e^t)$. By Bochner formulae

$$
\Delta_g \Psi = 2f'(U)\Psi^2 + f(U)(<\nabla_g \Psi, \nabla_g U> + <\nabla_g U, \nabla_g \Psi>) \n+ \sum u^{i\bar{j}} u^{k\bar{l}} U_{i\bar{l}} U_{\bar{j}\bar{l}} + \sum u^{i\bar{j}} u^{k\bar{l}} U_{i\bar{l}} U_{\bar{j}k} + \sum u^{i\bar{j}} u^{m\bar{s}} U_{i\bar{l}} U_m U_{\bar{j}} R_{i\bar{s}} \qquad (2.1)
$$

where $(u^{i\bar{j}})$ is the inverse matrix of $(u_{i\bar{j}})$ and $R_{i\bar{s}}$ is the Ricci curvature of g

$$
R_{i\bar{s}} = -\frac{\partial^2 \log \det(u_{k\bar{l}})}{\partial z_i \partial \bar{z}_s} = \frac{\partial^2 \log U}{\partial z_i \partial \bar{z}_s}
$$

Let $z \in \Omega$ fixed, we can choose a normal coordinates (z_1, \dots, z_n) at z such that

$$
u_{i\bar{j}} = \delta_{ij}, \quad U_1 = U_{\bar{1}}, \quad U_i = U_{\bar{i}} = 0, \quad \forall i > 1
$$

At z the formulae (2.1) become

$$
\frac{\Delta_g \Psi}{\Psi} = 2f'(U)\Psi + (f(U) - \frac{1}{2})(\frac{\Psi_1}{\Psi}U_{\bar{1}} + U_1\frac{\Psi_{\bar{1}}}{\Psi}) + \frac{1}{2}(\frac{\Psi_1}{\Psi}U_{\bar{1}} + U_1\frac{\Psi_{\bar{1}}}{\Psi}) + \frac{\sum U_{ik}U_{\bar{j}\bar{k}}}{\Psi} + \frac{\sum U_{i\bar{k}}U_{\bar{i}k}}{\Psi} - \frac{U_{1\bar{1}}U_1U_{\bar{1}}}{\Psi} \qquad (2.2)
$$

Since $\sum U_{ik}U_{\bar{i}\bar{k}} \ge U_{11}U_{\bar{1}\bar{1}}$ and

$$
\frac{1}{2}(\frac{\Psi_1}{\Psi}U_{\bar{1}} + U_1 \frac{\Psi_{\bar{1}}}{\Psi}) - \frac{U_{1\bar{1}}U_1U_{\bar{1}}}{\Psi} = \frac{1}{2\Psi}2\Re(U_{11}U_{\bar{1}}U_{\bar{1}}\n\geq \frac{U_{11}U_{\bar{1}\bar{1}}}{\Psi} - \frac{1}{4}\Psi
$$

we obtain

$$
\frac{1}{2}(\frac{\Psi_1}{\Psi}U_{\bar{1}} + U_1\frac{\Psi_{\bar{1}}}{\Psi}) - \frac{U_{1\bar{1}}U_1U_{\bar{1}}}{\Psi} + \frac{\sum U_{ik}U_{\bar{i}\bar{k}}}{\Psi} \ge -\frac{1}{4}\Psi
$$
\n(2.3)

Let G be the function defined on $B(R) = B_g(z₀, R)$ by

$$
G(z) = (R^2 - r(z)^2)^2 \Psi
$$

where $r(z) = d_g(z, z_0)$. Since G vanishes at the boundary $\partial B(R)$, the maximum of G is attained on $w \in B(R)$. By maximum principle

$$
\nabla_g G(w) = 0
$$

$$
\Delta_g G(w) \leq 0
$$

A computation at w gives

$$
\frac{\Psi_i}{\Psi} = \frac{4rr_i}{R^2 - r^2} \tag{2.4}
$$
\n
$$
\Delta_g G = 2\Psi \|\nabla_g (R^2 - r^2)\|^2 + 2(R^2 - r^2)\Psi \Delta_g (R^2 - r^2) \tag{2.4}
$$
\n
$$
+ 2(R^2 - r^2) \sum (R^2 - r^2)_i \Psi_i + (R^2 - r^2)^2 \Delta_g \Psi
$$
\n
$$
= 2\Psi r^2 \|\nabla_g r\|^2 - 2\Psi (R^2 - r^2) \Delta_g r^2 + (R^2 - r^2)^2 \Delta_g \Psi
$$
\n
$$
-4r(R^2 - r^2) \sum_i r_i \Psi_i \le 0 \tag{2.5}
$$

Since $\|\nabla_g r\|_g = 1$, (2.4) and (2.5) implies

$$
\frac{\Delta_g \Psi}{\Psi} \le \frac{2\Delta_g r^2}{R^2 - r^2} + \frac{14r^2}{(R^2 - r^2)^2} \tag{2.6}
$$

Let η > fixed such that $\inf_{t \in \mathbb{R}} (2f'(t) + \frac{f(t)^2}{n})$ $\frac{(t)^2}{n}) > 2\eta + \frac{1}{4}$ $\frac{1}{4}$. By Shwarz inequality

$$
(f(U) - \frac{1}{2})(\frac{\Psi_1}{\Psi}U_1 + U_1\frac{\Psi_1}{\Psi}) = 2\Re(U_1\frac{4rr_1(f(U) - \frac{1}{2})}{R^2 - r^2})
$$

$$
\geq -\eta\Psi - \frac{16(f(U) - \frac{1}{2})^2r^2}{\eta(2-r^2)^2}
$$
 (2.7)

Since $\Delta U = f(U)$ we have

$$
\frac{\sum U_{i\bar{k}} U_{\bar{i}k}}{\Psi} \ge \frac{\sum (U_{i\bar{i}})^2}{\Psi} \ge \frac{(\sum U_{i\bar{i}})^2}{n\Psi} = \frac{(\Delta U)^2}{n\Psi} = \frac{f(U))^2}{n}\Psi
$$
 (2.8)

The inequalities (2.2) , (2.7) and (2.8) give

$$
\frac{\Delta_g \Psi}{\Psi} \ge \eta \Psi - \frac{16(f(U) - \frac{1}{2})^2 r^2}{\eta (R^2 - r^2)^2}
$$
\n(2.9)

By Laplacian comparison theorem $[3]$: $\Delta_g r^2 \leq 2n + 2(n-1)\sqrt{Kr}$. Since $|f(U) - f(U)|$ 1 $\frac{1}{2}$ |² $\leq 2f(U)^2 + \frac{1}{2}$ $\frac{1}{2}$ and f is nondecreasing, the inequalities (2.6) and (2.9) give on $B(R)$

$$
(R^2 - r^2)^2 \Psi \le G(w) \le C_1 (1 + R) R^2 + C_2 (f(\max_{B(R)} U))^2 R^2
$$

Hence if $z \in B(R/2)$, we have

$$
\Psi(z) \le C_1 \frac{1+R}{R^2} + C_2 \left(\frac{f(\max_{B(R)} U)}{R} \right)^2
$$

Since (Ω, g) is complete, letting R to infinity, we obtain $\Psi(z) = \|\nabla_g U(z)\|^2 = 0$ i.e $\det(u_{i\overline{j}}) = C$ on Ω .
