Stability and instability of the standing waves for the Klein-Gordon-Zakharov system in one space dimension

Silu Yin*

Abstract

The orbital instability of standing waves for the Klein-Gordon-Zakharov system has been established in two and three space dimensions under radially symmetric condition, see Ohta-Todorova (SIAM J. Math. Anal. 2007). In the one space dimensional case, for the non-degenerate situation, we first check that the Klein-Gordon-Zakharov system satisfies Grillakis-Shatah-Strauss' assumptions on the stability and instability theorems for abstract Hamiltonian systems, see Grillakis-Shatah-Strauss (J. Funct. Anal. 1987). As to the degenerate case that the frequency $|\omega| = 1/\sqrt{2}$, we follow Wu (ArXiv: 1705.04216, 2017) to describe the instability of the standing waves for the Klein-Gordon-Zakharov system, by using the modulation argument combining with the virial identity. For this purpose, we establish a modified virial identity to overcome several troublesome terms left in the traditional virial identity.

1 Introduction

We study the Klein-Gordon-Zakharov (KGZ) system:

$$\partial_t^2 u - \partial_x^2 u + u + nu = 0, \qquad (t, x) \in \mathbb{R} \times \mathbb{R}, \qquad (1.1)$$

$$c_0^{-2}\partial_t^2 n - \partial_x^2 n = \partial_x^2 (|u|^2), \qquad (t,x) \in \mathbb{R} \times \mathbb{R}, \qquad (1.2)$$

with the initial data

5

$$u(0,x) = u_0(x), \quad u_t(0,x) = v_0(x), \quad n(0,x) = n_0(x), \quad n_t(0,x) = \nu_0(x).$$
 (1.3)

It describes the nonlinear interaction between the quantum Langmuir and ion-acoustic waves in a plasma. Here u is a complex valued function which represents the fast time scale component of an electric field raised by electrons, and n is a real valued function which denotes the deviation of ion density from its equilibrium. For more physical backgrounds, the reader can refer to [5, 31].

The existence of the local smooth solutions to the Cauchy problem of the KGZ system can be proved by the standard Galerkin method (see, e.g., [32]). Moreover, the global well-posedness was established in [12, 15, 16, 21, 26]. Let $m := -(-\Delta)^{-1}n_t$ with $m|_{t=0} := -(-\Delta)^{-1}\nu_0$, where $\Delta = \partial_x^2$ in one space dimension. The solution $\vec{u} := (u, u_t, n, n_t)^T = (u, v, n, \nu)^T$ of system (1.1)-(1.2) formally obeys the following energy, charge and momentum conservation identities:

$$E(\vec{u}) = \frac{1}{2} \|v\|^2 + \frac{1}{4c_0^2} \|m_x\|^2 + \frac{1}{2} \|u_x\|^2 + \frac{1}{2} \|u\|^2 + \frac{1}{4} \|n\|^2 + \frac{1}{2} \int n|u|^2 dx$$

= $E(\vec{u}_0),$ (1.4)

$$Q(\vec{u}) = \operatorname{Im} \int \bar{u}v dx = Q(\vec{u}_0), \qquad (1.5)$$

^{*}yins11@shu.edu.cn, Department of Mathematics, Shanghai University, Shanghai 200444, P.R. China

$$P(\vec{u}) = 2\text{Re} \int u_t \bar{u}_x dx + \frac{1}{c_0^2} \int n m_x dx = P(\vec{u}_0), \qquad (1.6)$$

where $\vec{u}_0 := (u_0, v_0, n_0, \nu_0)^T$ and we denote

$$||f|| := ||f(x)||_{L^2(\mathbb{R})}$$

for notational simplicity. Without misunderstanding, we will use X to represent the energy space $H^1(\mathbb{R}) \times L^2(\mathbb{R}) \times \dot{H}^{-1}(\mathbb{R})$ in this paper.

System (1.1)-(1.2) has the standing waves

$$(u_{\omega}(t,x), n_{\omega}(t,x)) = (e^{i\omega t}\phi_{\omega}(x), -|\phi_{\omega}(x)|^2),$$

where ϕ_{ω} is the ground state solution to the following equation

$$-\partial_x^2 \phi + (1 - \omega^2)\phi - \phi^3 = 0.$$
 (1.7)

When the parameter $|\omega| < 1$, equation (1.7) exists solution, see Strauss [27]. In particular, the solution to (1.7) is unique.

In the present work, we are first interested in the stability and instability for the standing waves of the KGZ system with non-degenerate frequency $\omega \in (-1, 1)$. We introduce the following notation for $\vec{f} = (f, g, h, k)^T \in X$:

$$T(\theta)\vec{f} = (e^{i\theta}f, e^{i\theta}g, h, k)^T.$$

Let

15

$$\vec{\Phi}_{\omega} = (\phi_{\omega}, i\omega\phi_{\omega}, -|\phi_{\omega}|^2, 0)^T,$$

and denote

$$U_{\varepsilon}(\vec{\Phi}_{\omega}) = \{ \vec{u} \in X : \inf_{(\theta, y) \in \mathbb{R} \times \mathbb{R}} \| \vec{u} - T(\theta) \vec{\Phi}_{\omega}(\cdot - y) \|_{X} < \varepsilon \}.$$

Definition 1.1. The standing wave solution (u_{ω}, n_{ω}) of the KGZ system (1.1)-(1.2) is said to be orbitally stable if for any given $\varepsilon > 0$, there exists $\delta > 0$, such that when $\vec{u}_0 \in U_{\delta}(\vec{\Phi}_{\omega})$, the solution $\vec{u}(t)$ of system (1.1)-(1.2) with the initial data \vec{u}_0 exists for all t > 0, and $\vec{u}(t) \in U_{\varepsilon}(\vec{\Phi}_{\omega})$ for all t > 0. Otherwise, (u_{ω}, n_{ω}) is said to be orbitally unstable.

It is worthy to mention that Grillakis-Shatah-Strauss [10, 11] established the sability and instability theory for abstract Hamiltonian systems. Consider the KGZ system (1.1)-(1.2) in the Hamiltonian case

$$\frac{d\vec{u}}{dt} = JE'(\vec{u}),\tag{1.8}$$

where E' is the Fréchet derivative of E, and define the functional

$$S_{\omega}(\vec{u}) = E(\vec{u}) - \omega Q(\vec{u}).$$

We can verify that $\overline{\Phi}_{\omega}$ is a critical point of $S_{\omega}(\vec{u})$. Via analyzing the spectrum, we can obtain the orbital stability according to the framework of Grillakis-Shatah-Strauss [10] in the nondegenerate case. In other words, if $S''_{\omega}(\vec{u})$ has exactly one negative eigenvalue, then it is orbitally stable if and only if $S_{\omega}(\vec{u})$ is strictly convex at ω . Specifically, by checking the assumptions of the stability and instability theorems in [10], we can get directly the following consequence.

Proposition 1.1. The standing wave $(e^{i\omega t}\phi_{\omega}, -|\phi_{\omega}|^2)$ of the KGZ system (1.1)-(1.2) is orbitally unstable for $|\omega| < \frac{1}{\sqrt{2}}$ and stable for $\frac{1}{\sqrt{2}} < |\omega| < 1$. For the case $|\omega| = \frac{1}{\sqrt{2}}$, which is degenerate based on [10, 11], Comech-Pelinovsky [3] showed the instability by a careful analysis of the linearized system. Ohta gave a different and shorter proof in [24] by the Lyapunov functional method. Maeda [18] extended the previously mentioned researches to subtler assumptions of S_{ω} based on a purely variational argument. Here, we will

- ³⁰ use the modulation argument combining with the virial identity to obtain the instability result. This method is inspired by the work of Wu [30], in which he established the orbital instability of the nonlinear Klein-Gordon equation in the critical frequency case in one space dimension. The modulation argument was introduced by Weinstein [29] for nonlinear Schrödinger equations, developed and widely applied by Martel-Merle [19], Martel-Merle-Tsai [20], Merle [22], Merle-
- Raphaël [23], Stuart [28], Bellazzini-Ghimenti-Le Coz [2], Le Coz-Wu [4]. The local version of the virial type identity is crucial in the proof of our main result. For the KGZ system, there will be several troublesome terms left in the original virial identity, so we need a modified virial identity, see Section 3. Our main result is

Theorem 1.1. When $|\omega| = \frac{1}{\sqrt{2}}$, the standing wave $(e^{i\omega t}\phi_{\omega}, -|\phi_{\omega}|^2)$ of the KGZ system (1.1)-(1.2) is orbitally unstable.

Before ending this introduction, let us mention some related work in several space dimensions. Ohta-Todorova [25] showed that the radially symmetric standing wave $(e^{i\omega t}\phi_{\omega}(x), -|\phi_{\omega}(x)|^2)$ of the KGZ system is strongly unstable in two and three space dimensions when $\omega \in (-1, 1)$. One key step in their proof is that the decay estimate for radially symmetric functions in $H^1(\mathbb{R}^d)$,

$$||u(x)|| \le C|x|^{(1-d)/2} ||u||_{H^1(\mathbb{R}^d)}, \text{ for } |x| \ge 1$$

is valid when $d \ge 2$ but failed when d = 1, see [27]. The case of standing wave with the ground state ($\omega = 0$) was discussed by Gan-Zhang [6] in three space dimensions. For more related works in two and higher space dimensions, one can see [7, 9, 13, 14] and the references therein.

The plan of this paper is as follows. In Section 2, we give some preliminaries, in which we present several basic properties and the coercivity of the Hessian. In Section 3, we introduce the modified virial type identity. In Section 4, we explain the modulation theory in a neighborhood of the standing wave, and control the terms of the modified virial identity. Finally, we prove the main theorem in Section 5.

2 Basic properties

⁵⁰ We first infer that from the definition of $E(\vec{u})$, we have

$$E'(\vec{u}) = \begin{pmatrix} -\partial_x^2 u + u + nu \\ v \\ \frac{1}{2}n + \frac{1}{2}|u|^2 \\ \frac{1}{2c_0^2}(-\Delta)^{-1}\nu \end{pmatrix}.$$
 (2.1)

Let

$$J = \begin{pmatrix} 0 & 1 & 0 & 0 \\ -1 & 0 & 0 & 0 \\ 0 & 0 & 0 & -2c_0^2 \partial_x^2 \\ 0 & 0 & 2c_0^2 \partial_x^2 & 0 \end{pmatrix},$$

which is a skew symmetric linear operator. We can rewrite the KGZ system in the form of

$$\frac{d\vec{u}}{dt} = JE'(\vec{u}). \tag{2.2}$$

Define the inner product

$$\langle \vec{f}, \vec{g} \rangle = \operatorname{Re} \int_{\mathbb{R}} \vec{f}(x)^T \cdot \overline{\vec{g}(x)} dx.$$

In what follows, we write $A \gtrsim B$ (or $A \leq B$) to express $A \geq kB$ (or $A \leq kB$) for certain positive constant k > 0. We have the following basic properties.

Lemma 2.1. For the KGZ system (1.1)-(1.2), we have

$$\frac{d}{dw}Q(\vec{\Phi}_{\omega}) = \frac{1-2\omega^2}{\sqrt{1-\omega^2}} \|\phi_0\|^2$$
(2.3)

55 and

$$3E(\vec{\Phi}_{\omega}) - 4\omega Q(\vec{\Phi}_{\omega}) = (1 - 2\omega^2) \|\phi_{\omega}\|^2 = (1 - 2\omega^2) \sqrt{1 - \omega^2} \|\phi_0\|^2.$$
(2.4)

Proof. From the definition of the charge and rescaling, we have

$$\phi_{\omega}(x) = \sqrt{1 - \omega^2} \phi_0(\sqrt{1 - \omega^2} x),$$

in which $\phi_0(x)$ is the solution of

$$-\partial_x^2 \phi + \phi - \phi^3 = 0. \tag{2.5}$$

Then we get

$$Q(\vec{\Phi}_{\omega}) = \omega \|\phi_{\omega}\|^2 = \omega \sqrt{1 - \omega^2} \|\phi_0\|^2,$$
(2.6)

then (2.3) can be obtained by taking the derivative of (2.6) with respect to ω .

Let ϕ_{ω} and $x\partial_x\phi_{\omega}$ be the multipliers of (1.7), respectively. We have

$$\|\partial_x \phi_\omega\|^2 + (1 - \omega^2) \|\phi_\omega\|^2 - \|\phi_\omega\|_{L^4}^4 = 0$$

and

$$\|\partial_x \phi_\omega\|^2 - (1 - \omega^2) \|\phi_\omega\|^2 + \frac{1}{2} \|\phi_\omega\|_{L^4}^4 = 0.$$

Solving the above equations, we get

$$\|\partial_x \phi_\omega\|^2 = \frac{1-\omega^2}{3} \|\phi_\omega\|^2, \quad \|\phi_\omega\|_{L^4}^4 = \frac{4(1-\omega^2)}{3} \|\phi_\omega\|^2,$$

 \mathbf{SO}

$$3E(\vec{\Phi}_{\omega}) - 4\omega Q(\vec{\Phi}_{\omega}) = \frac{3}{2} \|\partial_x \phi_{\omega}\|^2 + \frac{3(1+\omega^2)}{2} \|\phi_{\omega}\|^2 - \frac{3}{4} \|\phi_{\omega}\|_{L^4}^4 - 4\omega^2 \|\phi_{\omega}\|^2$$
$$= (1-2\omega^2) \|\phi_{\omega}\|^2 = (1-2\omega^2)(1-\omega^2)^{\frac{1}{2}} \|\phi_0\|^2.$$

This proves (2.4).

Define the functional

$$S_{\omega}(\vec{u}) = E(\vec{u}) - \omega Q(\vec{u}). \tag{2.7}$$

We write its derivative as $\langle S'_{\omega}(\vec{u}), \vec{g} \rangle$, where S'_{ω} is a functional from X to its dual, and its second derivative as $\langle S''_{\omega}(\vec{u})\vec{f}, \vec{g} \rangle$, for $\vec{g} \in X$.

Let

$$\vec{\Upsilon}_{\omega} = (i\phi_{\omega}, -\omega\phi_{\omega}, 0, 0)^T, \tag{2.8}$$

$$\partial_x \vec{\Phi}_\omega = (\partial_x \phi_\omega, i\omega \partial_x \phi_\omega, -2\phi_\omega \partial_x \phi_\omega, 0)^T,$$
(2.9)

$$\vec{\Psi}_{\omega} = (2\omega\phi_{\omega}, 0, 0, 0)^T.$$
(2.10)

We will give the coercivity property in Lemma 2.4 below. Before reaching this, we show some preliminaries.

Lemma 2.2. For the KGZ system (1.1)-(1.2), we have

$$S'_{\omega}(\vec{\Phi}_{\omega}) = 0 \tag{2.11}$$

and

$$\operatorname{Ker}(S''_{\omega}(\vec{\Phi}_{\omega})) = \operatorname{Span}\{\vec{\Upsilon}_{\omega}, \partial_x \vec{\Phi}_{\omega}\}, \qquad (2.12)$$

⁶⁵ where S_{ω} is defined by (2.7).

Proof. By definitions of the energy and charge, we have

$$S'_{\omega}(\vec{u}) = E'(\vec{u}) - \omega Q'(\vec{u}) = \begin{pmatrix} -u_{xx} + u + nu \\ v \\ \frac{1}{2}n + \frac{1}{2}|u|^2 \\ \frac{1}{2c_0^2}(-\Delta)^{-1}\nu \end{pmatrix} + i\omega \begin{pmatrix} v \\ -u \\ 0 \\ 0 \end{pmatrix}$$
(2.13)

and

$$S_{\omega}^{\prime\prime}(\vec{\Phi}_{\omega})\vec{f} = \begin{pmatrix} -f_{xx} + f - \phi_{\omega}^{2}f + \phi_{\omega}h \\ g \\ \frac{1}{2}h + \phi_{\omega}\text{Re}f \\ \frac{1}{2c_{0}^{2}}(-\Delta)^{-1}k \end{pmatrix} + i\omega \begin{pmatrix} g \\ -f \\ 0 \\ 0 \end{pmatrix}.$$
 (2.14)

Then we have

$$S'_{\omega}(\vec{\Phi}_{\omega}) = E'(\vec{\Phi}_{\omega}) - \omega Q'(\vec{\Phi}_{\omega}) = 0$$

and

$$S''_{\omega}(\vec{\Phi}_{\omega})\vec{\Upsilon}_{\omega} = S''_{\omega}(\vec{\Phi}_{\omega})\partial_x\vec{\Phi}_{\omega} = 0.$$
(2.15)

It follows from (2.15) that

$$\operatorname{Span}\{\vec{\Upsilon}_{\omega},\partial_x\vec{\Phi}_{\omega}\}\subset\operatorname{Ker}(S_{\omega}''(\vec{\Phi}_{\omega})).$$
(2.16)

Next we show that for any given $\vec{f} = (f, g, h, k) \in \operatorname{Ker}(S''_{\omega}(\vec{\Phi}_{\omega}))$ with $\vec{f} \in X$, we have $\vec{f} \in \operatorname{Span}\{\vec{\Upsilon}_{\omega}, \partial_x \vec{\Phi}_{\omega}\}$. In fact, from (2.14), if $\vec{f} = (f, g, h, k) \in \operatorname{Ker}(S''_{\omega}(\vec{\Phi}_{\omega}))$ and $\vec{f} \neq 0$, we have

$$\begin{cases} -f_{xx} + f - \phi_{\omega}^{2} f + \phi_{\omega} h + i\omega g = 0, \\ g - i\omega f = 0, \\ \frac{1}{2}h + \phi_{\omega} \operatorname{Re} f = 0, \\ \frac{1}{2c_{0}^{2}} (-\Delta)^{-1} k = 0. \end{cases}$$
(2.17)

Thus, $\vec{f} = (f, i\omega f, -2\phi_{\omega} \text{Re}f, 0)$, and f solves the equation

$$-f_{xx} + (1 - \omega^2)f - \phi_{\omega}^2 f - 2\phi_{\omega}^2 \operatorname{Re} f = 0.$$
(2.18)

Let

$$f = f_1 + if_2, \quad f_1 = \operatorname{Re} f, \quad f_2 = \operatorname{Im} f$$

 $\quad \text{and} \quad$

$$L_{+} = -\partial_{x}^{2} + (1 - \omega^{2}) - 3\phi_{\omega}^{2}, \qquad (2.19)$$

$$L_{-} = -\partial_x^2 + (1 - \omega^2) - \phi_{\omega}^2.$$
(2.20)

Equation (2.18) implies that

$$f_1 \in \operatorname{Ker}(L_+), \quad f_2 \in \operatorname{Ker}(L_-).$$

In order to show that f_1 has a linear correlation with $\partial_x \phi_\omega$, we consider their Wronskian determinant:

$$W_{+} = \begin{vmatrix} f_{1} & \partial_{x}\phi_{\omega} \\ \partial_{x}f_{1} & \partial_{x}^{2}\phi_{\omega} \end{vmatrix} = f_{1}\partial_{x}^{2}\phi_{\omega} - \partial_{x}f_{1}\partial_{x}\phi_{\omega}.$$
 (2.21)

Since $\partial_x \phi_\omega, f_1 \in \operatorname{Ker}(L_+)$, we have

$$\partial_x^3 \phi_\omega = (1 - \omega^2) \partial_x \phi_\omega - 3\phi_\omega^2 \partial_x \phi_\omega, \partial_x^2 f_1 = (1 - \omega^2) f_1 - 3\phi_\omega^2 f_1.$$

Therefore

$$W'_{+} = f_{1}\partial_{x}^{3}\phi_{\omega} - \partial_{x}^{2}f_{1}\partial_{x}\phi_{\omega}$$

= $f_{1}(1-\omega^{2})\partial_{x}\phi_{\omega} - 3f_{1}\phi_{\omega}^{2}\partial_{x}\phi_{\omega} - (1-\omega^{2})f_{1}\partial_{x}\phi_{\omega} + 3\phi_{\omega}^{2}f_{1}\partial_{x}\phi_{\omega}$ (2.22)
= 0.

By the exponential decay of ϕ_{ω} , which is well-known (see [8, 17]), we have

$$\lim_{x \to \pm \infty} W_{+} = \lim_{x \to \pm \infty} (f_1 \partial_x^2 \phi_\omega - \partial_x f_1 \partial_x \phi_\omega) = 0.$$
(2.23)

So we get that $W_+ = 0$ with (2.22). Thus we have

$$f_1 \in \operatorname{Span}\{\partial_x \phi_\omega\}. \tag{2.24}$$

For L_{-} , we analogously consider the Wronskian determinant of f_{2} and ϕ_{ω} :

$$W_{-} = \begin{vmatrix} f_2 & \phi_{\omega} \\ \partial_x f_2 & \partial_x \phi_{\omega} \end{vmatrix} = f_2 \partial_x \phi_{\omega} - \partial_x f_2 \phi_{\omega}, \qquad (2.25)$$

and then

$$W'_{-} = f_{2}\partial_{x}^{2}\phi_{\omega} - \partial_{x}^{2}f_{2}\phi_{\omega}$$

= $f_{2}[(1-\omega^{2})\phi_{\omega} - \phi_{\omega}^{3}] - [(1-\omega^{2})f_{2} - \phi_{\omega}^{2}f_{2}]\phi_{\omega}$
= 0. (2.26)

So we have $W_{-} = 0$, which implies

$$f_2 \in \operatorname{Span}\{\phi_\omega\}.\tag{2.27}$$

It follows from (2.24) and (2.27) that $f \in \text{Span}\{\partial_x \phi_\omega, i\phi_\omega\}$. This implies that

$$\operatorname{Ker}(S''_{\omega}(\vec{\Phi}_{\omega})) \subset \operatorname{Span}\{\vec{\Upsilon}_{\omega}, \partial_x \vec{\Phi}_{\omega}\},$$
(2.28)

which combined with (2.16) gives (2.12).

The following lemma tells us that $S''_{\omega}(\vec{\Phi}_{\omega})$ has a negative direction.

Lemma 2.3. Let $\vec{F}_{\omega} = (\partial_{\omega}\phi_{\omega}, i\omega\partial_{\omega}\phi_{\omega}, -2\phi_{\omega}\partial_{\omega}\phi_{\omega}, 0)^T$. We have

$$S''_{\omega}(\vec{\Phi}_{\omega})\vec{F}_{\omega} = \vec{\Psi}_{\omega}.$$
(2.29)

Then, if $\omega \neq 0$, we have

$$\langle S_{\omega}^{\prime\prime}(\vec{\Phi}_{\omega})\vec{F}_{\omega},\vec{F}_{\omega}\rangle < 0.$$
(2.30)

Proof. Since

$$-\partial_x^2 \phi_\omega + (1-\omega^2)\phi_\omega - \phi_\omega^3 = 0,$$

we get

$$-\partial_x^2 \partial_\omega \phi_\omega + (1-\omega^2) \partial_\omega \phi_\omega - 3\phi_\omega^2 \partial_\omega \phi_\omega = 2\omega \phi_\omega.$$
(2.31)

75 Thus

$$S_{\omega}^{\prime\prime}(\vec{\Phi}_{\omega})\vec{F}_{\omega} = \begin{pmatrix} -\partial_x^2 \partial_{\omega}\phi_{\omega} + \partial_{\omega}\phi_{\omega} - \phi_{\omega}^2 \partial_{\omega}\phi_{\omega} - 2\phi_{\omega}^2 \partial_{\omega}\phi_{\omega} - \omega^2 \partial_{\omega}\phi_{\omega} \\ i\omega \partial_{\omega}\phi_{\omega} - i\omega \partial_{\omega}\phi_{\omega} \\ -\phi_{\omega}\partial_{\omega}\phi_{\omega} + \phi_{\omega}\partial_{\omega}\phi_{\omega} \\ 0 \end{pmatrix} = \begin{pmatrix} 2\omega\phi_{\omega} \\ 0 \\ 0 \\ 0 \\ 0 \end{pmatrix}. \quad (2.32)$$

By rescaling, we have

$$\langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{F}_{\omega},\vec{F}_{\omega}\rangle = \omega\partial_{\omega}(\|\phi_{\omega}\|^{2}) = \omega\partial_{\omega}[(1-\omega^{2})^{\frac{1}{2}}\|\phi_{0}\|^{2}] = -\frac{\omega^{2}}{\sqrt{1-\omega^{2}}}\|\phi_{0}\|^{2} < 0$$
(2.33)

for $\omega \neq 0$.

Let

Now we are ready to present the following coercivity property. Similar argument can be found in [2] for Klein-Gordon equation and in [4] for nonlinear Schrödinger equation.

Lemma 2.4 (Coercivity). Assume $\omega \neq 0$, for any given $\vec{\xi} = (\xi, \eta, \zeta, \iota)^T \in X$ satisfying

$$\langle \vec{\xi}, \vec{\Upsilon}_{\omega} \rangle = \langle \vec{\xi}, \partial_x \vec{\Phi}_{\omega} \rangle = \langle \vec{\xi}, \vec{\Psi}_{\omega} \rangle = 0, \qquad (2.34)$$

there exists a positive constant δ such that

$$\langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{\xi},\vec{\xi}\rangle \ge \delta \|\vec{\xi}\|_X^2.$$
(2.35)

Proof. Step 1: Spectral analysis.

80

$$\mathcal{L} := \begin{pmatrix} -\partial_x^2 + 1 & i\omega & 0 & 0 \\ -i\omega & 1 & 0 & 0 \\ 0 & 0 & \frac{1}{2} & 0 \\ 0 & 0 & 0 & \frac{1}{2c_0^2}(-\Delta)^{-1} \end{pmatrix}.$$
(2.36)

For $\vec{f} = (f, g, h, k) \in X$, we have

$$\langle \mathcal{L}f, f \rangle = \|f_x\|^2 + \|f\|^2 + \|g\|^2 + \frac{1}{2}\|h\|^2 + \frac{1}{2c_0^2}\|(-\Delta)^{-1}k_x\|^2 \ge \delta \|\vec{f}\|_X^2, \qquad (2.37)$$

where

$$\delta = \min\{\frac{1}{2}, \frac{1}{2c_0^2}\} > 0.$$
(2.38)

This means that the essential spectrum of \mathcal{L} is positive and away from zero. Since $S''_{\omega}(\vec{\Phi}_{\omega})$ is a compact perturbation of \mathcal{L} , the essential spectrum of $S''_{\omega}(\vec{\Phi}_{\omega})$ is also positive and away from zero by Weyl's Theorem. The rest of its spectrum consists of isolated eigenvalues. By the variational characterization of $\vec{\Phi}_{\omega}$, see e.g. [1], the Morse Index of S_{ω} is 1 at most. Then combined with Lemma 2.3, we infer that $S''_{\omega}(\vec{\Phi}_{\omega})$ admits only one negative eigenvalue $-\gamma < 0$ satisfying

$$S''_{\omega}(\vec{\Phi}_{\omega})\Gamma = -\gamma\Gamma \tag{2.39}$$

with $\|\Gamma\|_X = 1$.

Step 2: Positivity analysis.

We claim that if $\vec{\xi}$ satisfies the orthogonality condition (2.34), then

$$\langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{\xi},\vec{\xi}\rangle > 0.$$
(2.40)

In fact, by Lemma 2.2 and (2.34), we can write the orthogonal decomposition of $\vec{\xi}$ along the spectrum of $S''_{\omega}(\vec{\Phi}_{\omega})$ as follows:

$$\vec{\xi} = \alpha \vec{\Gamma} + \vec{\Theta},\tag{2.41}$$

where α is a real number and $\vec{\Theta}$ is in the positive eigenspace of $S''_{\omega}(\vec{\Phi}_{\omega})$. If $\alpha = 0$, the desired conclusion is trivial.

For $\alpha \neq 0$, We decompose \vec{F}_{ω} orthogonally along the spectrum of $S''_{\omega}(\vec{\Phi}_{\omega})$:

$$\vec{F}_{\omega} = \beta \vec{\Gamma} + \vec{\Omega} + \vec{\Pi}, \qquad (2.42)$$

where $\beta \neq 0$, $\vec{\Omega}$ is in the positive eigenspace of $S''_{\omega}(\vec{\Phi}_{\omega})$ and $\vec{\Pi} \in \text{Ker}(S''_{\omega}(\vec{\Phi}_{\omega}))$. In particular, we have

$$\langle S''_{\omega}(\vec{\Phi}_{\omega})\Omega,\Omega\rangle \gtrsim \|\Omega\|_X.$$
 (2.43)

Because of (2.34), we have

$$0 = \langle \vec{\Psi}_{\omega}, \vec{\xi} \rangle$$

= $\langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{F}_{\omega}, \vec{\xi} \rangle$
= $\langle S''_{\omega}(\vec{\Phi}_{\omega})(\beta\vec{\Gamma} + \vec{\Omega} + \vec{\Pi}), \alpha\vec{\Gamma} + \vec{\Theta} \rangle$
= $-\gamma\alpha\beta + \langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{\Omega}, \vec{\Theta} \rangle.$ (2.44)

Noting that both $\vec{\Omega}$ and $\vec{\Theta}$ are in the positive eigenspace of $S''_{\omega}(\vec{\Phi}_{\omega})$, by Cauchy-Schwarz inequality and the fact that $\langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{\Omega},\vec{\Theta}\rangle = \langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{\Theta},\vec{\Omega}\rangle$, we have

$$\gamma^{2} \alpha^{2} \beta^{2} = \langle S_{\omega}^{\prime\prime}(\vec{\Phi}_{\omega})\vec{\Omega},\vec{\Theta}\rangle^{2} \le \langle S_{\omega}^{\prime\prime}(\vec{\Phi}_{\omega})\vec{\Omega},\vec{\Omega}\rangle\langle S_{\omega}^{\prime\prime}(\vec{\Phi}_{\omega})\vec{\Theta},\vec{\Theta}\rangle.$$
(2.45)

Moreover, (2.30) tells us that

$$\langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{F}_{\omega},\vec{F}_{\omega}\rangle = \langle S''_{\omega}(\vec{\Phi}_{\omega})(\beta\vec{\Gamma}+\vec{\Omega}+\vec{\Pi}),\beta\vec{\Gamma}+\vec{\Omega}+\vec{\Pi}\rangle = -\gamma\beta^{2} + \langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{\Omega},\vec{\Omega}\rangle < 0,$$
 (2.46)

Therefore,

$$\langle S_{\omega}''(\vec{\Phi}_{\omega})\vec{\xi},\vec{\xi} \rangle = \langle S_{\omega}''(\vec{\Phi}_{\omega})(\alpha\vec{\Gamma} + \vec{\Theta}), \alpha\vec{\Gamma} + \vec{\Theta} \rangle$$

$$= -\gamma\alpha^{2} + \langle S_{\omega}''(\vec{\Phi}_{\omega})\vec{\Theta},\vec{\Theta} \rangle$$

$$\geq -\gamma\alpha^{2} + \frac{\gamma^{2}\alpha^{2}\beta^{2}}{\langle S_{\omega}''(\vec{\Phi}_{\omega})\vec{\Omega},\vec{\Omega} \rangle }$$

$$> -\gamma\alpha^{2} + \frac{\gamma^{2}\alpha^{2}\beta^{2}}{\gamma\beta^{2}} = 0.$$

$$(2.47)$$

Step 3: Coercivity analysis. We prove the coercivity by contradiction. Assume that $\vec{\xi}_n \ (n \in \mathbb{N}^+)$ satisfy

$$\langle \vec{\xi_n}, \vec{\Upsilon}_\omega \rangle = \langle \vec{\xi_n}, \partial_x \vec{\Phi}_\omega \rangle = \langle \vec{\xi_n}, \vec{\Psi}_\omega \rangle = 0$$
(2.48)

with $\|\vec{\xi}_n\|_X = 1$ and

$$\lim_{n \to \infty} \langle S_{\omega}^{\prime\prime}(\vec{\Phi}_{\omega})\vec{\xi}_n, \vec{\xi}_n \rangle = 0, \qquad (2.49)$$

then there exists $\vec{\xi}_{\infty} \in X$, such that $\{\vec{\xi}_n\}$ converges to $\vec{\xi}_{\infty}$ weakly and $\vec{\xi}_{\infty}$ verifies

$$\langle \vec{\xi}_{\infty}, \vec{\Upsilon}_{\omega} \rangle = \langle \vec{\xi}_{\infty}, \partial_x \vec{\Phi}_{\omega} \rangle = \langle \vec{\xi}_{\infty}, \vec{\Psi}_{\omega} \rangle = 0.$$
 (2.50)

We first prove that

$$\vec{\xi}_{\infty} = 0. \tag{2.51}$$

Otherwise, from the positivity analysis in Step 2, we have

$$\langle S_{\omega}''(\vec{\Phi}_{\omega})\vec{\xi}_{\infty},\vec{\xi}_{\infty}\rangle > 0.$$
(2.52)

Moreover, by the weak convergence and exponential decay of Φ_{ω} , we infer that

$$\langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{\xi}_{\infty},\vec{\xi}_{\infty}\rangle \leq \lim_{n \to \infty} \langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{\xi}_{n},\vec{\xi}_{n}\rangle = 0.$$
(2.53)

So we have (2.51).

On the other hand, it follows from (2.14) and $\|\vec{\xi}_n\|_X = 1$ that

$$\langle S_{\omega}^{\prime\prime}(\vec{\Phi}_{\omega})\vec{\xi}_{n},\vec{\xi}_{n}\rangle = \|\partial_{x}\xi_{n}\|^{2} + \|\xi_{n}\|^{2} + \|\eta_{n}\|^{2} + \frac{1}{2}\|\zeta_{n}\|^{2} + \frac{1}{2c_{0}^{2}}\|(-\Delta)^{-1}\partial_{x}\iota\|^{2} - \|\phi_{\omega}\xi_{n}\|^{2} + 2\langle\phi_{\omega}\zeta_{n},\xi_{n}\rangle - 2\langle i\omega\xi_{n},\zeta_{n}\rangle \geq \delta - \|\phi_{\omega}\xi_{n}\|^{2} + 2\langle\phi_{\omega}\zeta_{n},\xi_{n}\rangle - 2\langle i\omega\xi_{n},\zeta_{n}\rangle,$$

$$(2.54)$$

where δ is defined by (2.38). Taking $n \to \infty$ in (2.54), it follows from (2.49) that

 $-\|\phi_{\omega}\xi_{\infty}\|^{2} + 2\langle\phi_{\omega}\zeta_{\infty},\xi_{\infty}\rangle - 2\langle i\omega\xi_{\infty},\zeta_{\infty}\rangle \le -\delta < 0.$ (2.55)

This gives a contradiction with (2.51). Hence, for any given $\vec{\xi}$ satisfying (2.34), $\langle S''_{\omega}(\vec{\Phi}_{\omega})\vec{\xi},\vec{\xi}\rangle$ is not only positive, but also strictly bigger than a positive constant. This proves the coercivity property.

- Remark 2.1. When ω ≠ 0, Lemma 2.3 and Lemma 2.4 imply that S["]_ω has exactly one negative eigenvalue and its essential spectrum is positive and bounded away from zero. From Lemma 2.1-Lemma 2.4, we infer that the KGZ system obeys Grillakis-Shatah-Strauss's assumptions for abstract Hamiltonian systems. When ω = 0, (φ₀, -|φ₀|²) is a stationary solution of the KGZ system. Grillakis-Shatah-Strauss gave the sharp conditions for the stability and instability of solitary waves in [10] as follows:
 - If $-\frac{d}{d\omega}Q(\phi_{\omega}) < 0$, then the ϕ -orbit is unstable;
 - The fact that ϕ -orbit is stable if and only if $-\frac{d}{d\omega}Q(\phi_{\omega}) > 0$.

Hence, the standing wave of the KGZ system is unstable for $|\omega| < \frac{1}{\sqrt{2}}$ and stable for $\frac{1}{\sqrt{2}} < |\omega| < 1$.

¹⁰⁵ **3** Modified Virial Type Identity

In the degenerate case $|\omega| = \frac{1}{\sqrt{2}}$, the proof of Theorem 1.1 is based on the local versions of the virial type identity. We first define a cutoff function $\varphi_R \in C^{\infty}(\mathbb{R})$ by

$$\varphi_R(x) = \begin{cases} x, & |x| \le R, \\ 0, & |x| \ge 2R. \end{cases}$$
(3.1)

Lemma 3.1. Let the traditional virial type quantity I(t) be defined by

$$I(t) = \operatorname{Re} \int_{\mathbb{R}} u\bar{u}_t dx + 2\operatorname{Re} \int_{\mathbb{R}} \varphi_R(x - y(t))u_x\bar{u}_t dx + \frac{1}{c_0^2} \int_{\mathbb{R}} \varphi_R(x - y(t))nm_x dx.$$
(3.2)

Then for the KGZ system, we have

$$I'(t) = -\dot{y}P(\vec{u}_0) + \dot{y} \int_{\mathbb{R}} [1 - \varphi'_R(x - y(t))] [2\operatorname{Re}(u_x \bar{u}_t) + \frac{1}{c_0^2} n m_x] dx$$

$$- 2 \|u_x\|^2 - \frac{1}{2} \|n\|^2 - \frac{1}{2c_0^2} \|m_x\|^2 - \int_{\mathbb{R}} n|u|^2 dx$$

$$+ \int_{\mathbb{R}} [1 - \varphi'_R(x - y(t))] [|u_t|^2 + |u_x|^2 - |u|^2 + \frac{1}{2c_0^2} |m_x|^2 + \frac{1}{2} |n|^2] dx.$$
(3.3)

Proof. By elementary calculation, we have

$$\frac{d}{dt} \operatorname{Re} \int_{\mathbb{R}} u\bar{u}_t dx = \|u_t\|^2 - \|u_x\|^2 - \|u\|^2 - \int_{\mathbb{R}} n|u|^2 dx,$$
(3.4)

$$2\operatorname{Re}\int_{\mathbb{R}}\varphi_{R}\frac{d}{dt}(u_{x}\bar{u}_{t})dx = -\int_{\mathbb{R}}\varphi_{R}'|u_{t}|^{2}dx - \int_{\mathbb{R}}\varphi_{R}'|u_{x}|^{2}dx + \int_{\mathbb{R}}\varphi_{R}'|u|^{2}dx + \int_{\mathbb{R}}(\varphi_{R}n)_{x}|u|^{2}dx$$
(3.5)

and

$$\frac{1}{c_0^2} \int_{\mathbb{R}} \varphi_R \frac{d}{dt} (nm_x) dx = -\frac{1}{2c_0^2} \int_{\mathbb{R}} \varphi_R' |m_x|^2 dx - \frac{1}{2} \int_{\mathbb{R}} \varphi_R' |n|^2 dx - \int_{\mathbb{R}} (\varphi_R n)_x |u|^2 dx.$$
(3.6)

Then

$$2\frac{d}{dt}\operatorname{Re}\int_{\mathbb{R}}\varphi_{R}(x-y(t))u_{x}\bar{u}_{t}dx = -2\dot{y}\operatorname{Re}\int_{\mathbb{R}}\varphi_{R}'(x-y(t))u_{x}\bar{u}_{t}dx + \int_{\mathbb{R}}(\varphi_{R}n)_{x}|u|^{2}dx$$
$$-\int_{\mathbb{R}}\varphi_{R}'(x-y(t))(|u_{t}|^{2}+|u_{x}|^{2}-|u|^{2})dx$$
(3.7)

110 and

$$\frac{1}{c_0^2} \frac{d}{dt} \int_{\mathbb{R}} \varphi_R(x - y(t)) nm_x dx = -\frac{1}{c_0^2} \dot{y} \int_{\mathbb{R}} \varphi_R'(x - y(t)) nm_x dx - \int_{\mathbb{R}} (\varphi_R n)_x |u|^2 dx - \frac{1}{2c_0^2} \int_{\mathbb{R}} \varphi_R'(x - y(t)) |m_x|^2 dx - \frac{1}{2} \int_{\mathbb{R}} \varphi_R'(x - y(t)) |n|^2 dx.$$
(3.8)

Adding (3.4)-(3.8) up, we get (3.3).

From Lemma 3.1, since the traditional virial identity loses positivity, we should search a modified virial quantity to overcome it. The following lemma is the key observation in the proof of the instability for the critical frequency $|\omega| = \frac{1}{\sqrt{2}}$.

Lemma 3.2. Let

$$\tilde{I}(t) = I(t) + \operatorname{Re} \int_{\mathbb{R}} u \bar{u}_t dx - \frac{1}{c_0^2} \int_{\mathbb{R}} nm dx, \qquad (3.9)$$

satisfying

$$\int_{\mathbb{R}} n_t dx = 0, \qquad \int_{\mathbb{R}} x n_t dx = 0. \tag{3.10}$$

115 If $|\omega| = \frac{1}{\sqrt{2}}$, then

$$\tilde{I}'(t) = -\dot{y}P(\vec{u}_0) + \dot{y} \int_{\mathbb{R}} [1 - \varphi_R'(x - y(t))] [2\operatorname{Re}(u_x \bar{u}_t) + \frac{1}{c_0^2} nm_x] dx + \int_{\mathbb{R}} [1 - \varphi_R'(x - y(t))] [|u_t|^2 + |u_x|^2 - |u|^2 + \frac{1}{2c_0^2} |m_x|^2 + \frac{1}{2} |n|^2] dx$$
(3.11)
$$- 6E(\vec{u}_0) + 8\omega Q(\vec{u}_0) + 4 ||u_t - i\omega u||^2 + \frac{2}{c_0^2} ||m_x||^2.$$

Proof. Condition (3.10) ensures the last integral term of $\tilde{I}(t)$ is well-defined in the energy space X. In fact, from the properties of Fourier transform, (3.10) implies

$$\int n_t dx = \int \delta(\hat{x}) \hat{n}_t d\hat{x} = \hat{n}_t |_{\hat{x}=0} = 0$$

and

$$\int x n_t dx = i \int \delta(\hat{x}) \partial_{\hat{x}} \hat{n}_t d\hat{x} = i \partial_{\hat{x}} \hat{n}_t |_{\hat{x}=0} = 0.$$

So the integral

$$\int nmdx = \int \hat{n}\hat{m}d\hat{x} = \int \frac{\hat{n}\hat{n}_t}{|\hat{x}|^2}d\hat{x}$$

has no singularity at $\hat{x} = 0$. Here we have used the Parseval identity.

By equation (1.2), we discover that

$$\|n\|^{2} + \int_{\mathbb{R}} n|u|^{2} dx = \int_{\mathbb{R}} n(n+|u|^{2}) dx$$

$$= \frac{1}{c_{0}^{2}} \int_{\mathbb{R}} n\partial_{t} m dx$$

$$= \frac{1}{c_{0}^{2}} \frac{d}{dt} \int_{\mathbb{R}} nm dx - \frac{1}{c_{0}^{2}} \int_{\mathbb{R}} \partial_{x}^{2} mm dx$$

$$= \frac{1}{c_{0}^{2}} \frac{d}{dt} \int_{\mathbb{R}} nm dx + \frac{1}{c_{0}^{2}} ||m_{x}||^{2}$$

(3.12)

and

$$\|u_t\|^2 - 3\|u_x\|^2 + (4\omega^2 - 3)\|u\|^2 - \frac{3}{2}\|n\|^2 - \frac{3}{2c_0^2}\|m_x\|^2 - 3\int_{\mathbb{R}} n|u|^2 dx$$

=4\|u_t - i\omega u\|^2 - 6E(\vec{u}_0) + 8\omega Q(\vec{u}_0). (3.13)

Thus, it follows from (3.3) and (3.4) that

$$\begin{split} \tilde{I}'(t) &= -\dot{y}P(\vec{u}_0) + \dot{y} \int_{\mathbb{R}} [1 - \varphi_R'(x - y(t))] [2\text{Re}(u_x \bar{u}_t) + \frac{1}{c_0^2} nm_x] dx \\ &+ \int_{\mathbb{R}} [1 - \varphi_R'(x - y(t))] [|u_t|^2 + |u_x|^2 - |u|^2 + \frac{1}{2c_0^2} ||m_x||^2 + \frac{1}{2} |n|^2] dx \\ &+ ||u_t||^2 - 3||u_x||^2 - ||u||^2 - \frac{3}{2} ||n||^2 + \frac{1}{2c_0^2} ||m_x||^2 - 3 \int_{\mathbb{R}} n|u|^2 dx \\ &= -\dot{y}P(\vec{u}_0) + \dot{y} \int_{\mathbb{R}} [1 - \varphi_R'(x - y(t))] [2\text{Re}(u_x \bar{u}_t) + \frac{1}{c_0^2} nm_x] dx \\ &+ \int_{\mathbb{R}} [1 - \varphi_R'(x - y(t))] [|u_t|^2 + |u_x|^2 - |u|^2 + \frac{1}{2c_0^2} ||m_x||^2 + \frac{1}{2} |n|^2] dx \\ &+ ||u_t||^2 - 3||u_x||^2 + (4\omega^2 - 3)||u||^2 - \frac{3}{2} ||n||^2 - \frac{3}{2c_0^2} ||m_x||^2 - 3 \int_{\mathbb{R}} n|u|^2 dx \\ &+ (2 - 4\omega^2)||u||^2 + \frac{2}{c_0^2} ||m_x||^2 \\ &= -\dot{y}P(\vec{u}_0) + \dot{y} \int_{\mathbb{R}} [1 - \varphi_R'(x - y(t))] [2\text{Re}(u_x \bar{u}_t) + \frac{1}{c_0^2} nm_x] dx \\ &+ \int_{\mathbb{R}} [1 - \varphi_R'(x - y(t))] [|u_t|^2 + |u_x|^2 - |u|^2 + \frac{1}{2c_0^2} ||m_x||^2 + \frac{1}{2} |n|^2] dx \\ &- 6E(\vec{u}_0) + 8\omega Q(\vec{u}_0) + 4||u_t - i\omega u||^2 + (2 - 4\omega^2)||u||^2 + \frac{2}{c_0^2} ||m_x||^2. \end{split}$$

In particular, if $|\omega| = \frac{1}{\sqrt{2}}$, we get (3.11).

¹²⁰ 4 Modulation and Some Estimates

To prove the main theorem by a contradiction argument, we suppose that the standing wave (u_{ω}, n_{ω}) of the KGZ system is stable. The contradiction will be derived from the control of the terms in the modified virial identity. In the process of control, the use of the coercivity property would require to deal with the orthogonality conditions. The following modulation lemma shows that if the standing wave solution is stable, then the orthogonality conditions can be obtained.

Lemma 4.1 (Modulation). There exists $\varepsilon_0 > 0$ such that for any given $\varepsilon \in (0, \varepsilon_0)$, if $\vec{u} \in U_{\varepsilon}(\vec{\Phi}_{\omega})$, then there exist C^1 -functions

$$\theta(t):[0,t^*]\to\mathbb{R},\quad\lambda(t):[0,t^*]\to(0,\infty),\quad y(t):[0,t^*]\to\mathbb{R},$$

such that if we define $\vec{\xi} = (\xi, \eta, \zeta, \iota)$ satisfying

$$\vec{\xi}(t) = \vec{u}(t, \cdot - y(t)) - T(\theta(t))\vec{\Phi}_{\lambda\omega}(\cdot - y(t)) := \vec{u} - \vec{R},$$

$$(4.1)$$

then for any given $t \in [0, t^*]$, $\vec{\xi}$ satisfies the following orthogonality conditions,

$$\langle \vec{\xi}, T(\theta(t)) \vec{\Upsilon}_{\lambda(t)\omega} \rangle = \langle \vec{\xi}, T(\theta(t)) \partial_x \vec{\Phi}_{\lambda(t)\omega} \rangle = \langle \vec{\xi}, T(\theta(t)) \vec{\Psi}_{\lambda(t)\omega} \rangle = 0,$$
(4.2)

where

125

$$T(\theta(t))\vec{\Upsilon}_{\lambda\omega} = \left(ie^{i\theta(t)}\phi_{\lambda\omega}(\cdot - y(t)), -\lambda\omega e^{i\theta(t)}\phi_{\lambda\omega}(\cdot - y(t)), 0, 0\right)^{T},$$

$$T(\theta(t))\partial_x \vec{\Phi}_{\lambda\omega} = \left(e^{i\theta(t)}\partial_x \phi_{\lambda\omega}(\cdot - y(t)), i\lambda\omega e^{i\theta(t)}\partial_x \phi_{\lambda\omega}(\cdot - y(t)), -2\phi_{\lambda\omega}\partial_x \phi_{\lambda\omega}(\cdot - y(t)), 0\right)^T,$$

$$T(\theta(t))\vec{\Psi}_{\lambda\omega} = \left(2\lambda\omega e^{i\theta(t)}\phi_{\lambda\omega}(\cdot - y(t)), 0, 0, 0\right)^T.$$

Here $\vec{R} = T(\theta(t))\vec{\Phi}_{\lambda\omega}(\cdot - y(t))$ is called the modulated soliton. Moreover, we have estimates

$$\|\vec{\xi}\|_X + |\lambda - 1| \lesssim \varepsilon \tag{4.3}$$

and

$$|\dot{\theta}(t) - \lambda(t)\omega| + |\dot{y}| + |\dot{\lambda}| = O(||\vec{\xi}||_X).$$

$$(4.4)$$

Proof. We first show the existence of θ , λ and y by the Implicit Function Theorem. Denoting

$$\begin{split} F_1(\theta, y, \lambda; \vec{u}) &= \langle \vec{\xi}, T(\theta) \Upsilon_{\lambda \omega} \rangle, \\ F_2(\theta, y, \lambda; \vec{u}) &= \langle \vec{\xi}, T(\theta) \partial_x \vec{\Phi}_{\lambda \omega} \rangle, \\ F_3(\theta, y, \lambda; \vec{u}) &= \langle \vec{\xi}, T(\theta) \vec{\Psi}_{\lambda \omega} \rangle, \end{split}$$

we have

$$\begin{split} F_{1}(\theta, y, \lambda; \vec{u}) = & \left\langle u - e^{i\theta} \phi_{\lambda\omega}(\cdot - y), ie^{i\theta} \phi_{\lambda\omega}(\cdot - y) \right\rangle + \left\langle v - i\lambda\omega e^{i\theta} \phi_{\lambda\omega}(\cdot - y), -\lambda\omega e^{i\theta} \phi_{\lambda\omega}(\cdot - y) \right\rangle, \\ F_{2}(\theta, y, \lambda; \vec{u}) = & \left\langle u - e^{i\theta} \phi_{\lambda\omega}(\cdot - y), e^{i\theta} \partial_{x} \phi_{\lambda\omega}(\cdot - y) \right\rangle + \left\langle v - i\lambda\omega e^{i\theta} \phi_{\lambda\omega}(\cdot - y), i\lambda\omega e^{i\theta} \partial_{x} \phi_{\lambda\omega}(\cdot - y) \right\rangle \\ & + \left\langle n + |\phi_{\lambda\omega}(\cdot - y)|^{2}, -2\phi_{\lambda\omega}\partial_{x}\phi_{\lambda\omega}(\cdot - y) \right\rangle, \\ F_{3}(\theta, y, \lambda; \vec{u}) = & \left\langle u - e^{i\theta} \phi_{\lambda\omega}(\cdot - y), 2\lambda\omega e^{i\theta} \phi_{\lambda\omega}(\cdot - y) \right\rangle, \end{split}$$

then

$$\frac{\partial(F_1, F_2, F_3)}{\partial(\theta, y, \lambda)}\Big|_{(0,0,1; \vec{\Phi}_{\omega})} = \begin{pmatrix} a_{11} & 0 & 0\\ 0 & a_{22} & a_{23}\\ 0 & 0 & a_{33} \end{pmatrix},$$

where

$$\begin{aligned} a_{11} &= \partial_{\theta} F_1 \big|_{(0,0,1;\vec{\Phi}_{\omega})} = -(1+\omega^2) \|\phi_{\omega}\|^2, \\ a_{22} &= \partial_y F_2 \big|_{(0,0,1;\vec{\Phi}_{\omega})} = (1+\omega^2) \|\partial_x \phi_{\omega}\|^2 + \|\partial_x |\phi_{\omega}|^2 \|^2, \\ a_{23} &= \partial_{\lambda} F_2 \big|_{(0,0,1;\vec{\Phi}_{\omega})} = \frac{\omega^2}{1-\omega^2} [(1+\omega^2) \|x^{\frac{1}{2}} \partial_x \phi_{\omega}\|^2 + \|x^{\frac{1}{2}} \partial_x |\phi_{\omega}|^2 \|^2], \\ a_{33} &= \partial_{\lambda} F_3 \big|_{(0,0,1;\vec{\Phi}_{\omega})} = \frac{\omega^3}{1-\omega^2} \|\phi_{\omega}\|^2. \end{aligned}$$

This means that the Jacobian matrix of the derivative of $(\theta, y, \lambda) \to (F_1, F_2, F_3)$ is nondegenerate at $(\theta, y, \lambda) = (0, 0, 1)$. Hence, by the Implicit Function Theorem, we obtain the existence of (θ, y, λ) in a neighborhood of (0, 0, 1) satisfying

$$(F_1, F_2, F_3)(\theta(t), y(t), \lambda(t); \vec{u}(t)) = 0.$$

To verify the modulation parameters (θ, y, λ) are C^1 , we can use the equation of $\vec{\xi}$ and regularization arguments, similar to the method in [19].

We now want to verify (4.4). From (4.1) and (2.2), we have

$$\partial_t \vec{\xi} + i\dot{\theta}\vec{R} - \dot{y}\partial_x \vec{R} + \dot{\lambda}\partial_\lambda \vec{R} = JE'(\vec{R} + \vec{\xi}).$$
(4.5)

Moreover, from Taylor's expansion, we have

$$E'(\vec{R} + \vec{\xi}) = E'(\vec{R}) + E''(\vec{R})\vec{\xi} + O(\|\vec{\xi}\|_X^2).$$
(4.6)

Noting the fact that $\phi_{\lambda\omega}$ is a solution of

$$-\partial_x^2 \phi_{\lambda\omega} + (1 - \lambda^2 \omega^2) \phi_{\lambda\omega} - \phi_{\lambda\omega}^3 = 0, \qquad (4.7)$$

we have

$$\partial_t \vec{\xi} + i(\dot{\theta} - \lambda\omega)A\vec{R} - \dot{y}\partial_x \vec{R} + \dot{\lambda}\partial_\lambda \vec{R} = JE''(\vec{R})\vec{\xi} + O(\|\vec{\xi}\|_X^2), \tag{4.8}$$

where

We differentiate $\langle \vec{\xi}, T(\theta) \vec{\Psi}_{\lambda(t)\omega} \rangle = 0$ in (4.2) with respect to time t to get

$$\langle \partial_t \vec{\xi}, T(\theta) \vec{\Psi}_{\lambda(t)\omega} \rangle = -\langle \vec{\xi}, \partial_t \left(T(\theta) \vec{\Psi}_{\lambda(t)\omega} \right) \rangle.$$
(4.9)

Denoting

$$Mod(t) = (\dot{\theta}(t) - \lambda(t)\omega, \dot{y}(t), \dot{\lambda})^{T},$$

we have

$$\langle \vec{\xi}, \partial_t(T(\theta)\vec{\Psi}_{\lambda(t)\omega}) \rangle = O\big((1 + |\mathrm{Mod}(t)|) \|\vec{\xi}\|_X\big).$$
(4.10)

Because of the orthogonality condition and taking the inner product of (4.8) with $T(\theta)\vec{\Psi}_{\lambda(t)\omega}$, we get

$$\begin{aligned} \langle \partial_t \vec{\xi}, T(\theta) \vec{\Psi}_{\lambda(t)\omega} \rangle \\ &= - (\dot{\theta} - \lambda\omega) \langle iA\vec{R}, T(\theta) \vec{\Psi}_{\lambda(t)\omega} \rangle + \dot{y} \langle \partial_x \vec{R}, T(\theta) \vec{\Psi}_{\lambda(t)\omega} \rangle - \dot{\lambda} \langle \partial_\lambda \vec{R}, T(\theta) \vec{\Psi}_{\lambda(t)\omega} \rangle + O(\|\vec{\xi}\|_X^2) \\ &= - \dot{\lambda} \langle \partial_\lambda \phi_{\lambda\omega}, 2\lambda\omega \phi_{\lambda\omega} \rangle + O(\|\vec{\xi}\|_X^2). \end{aligned}$$

$$(4.11)$$

(4.10) and (4.11) imply that

$$\lambda \omega \partial_{\lambda} \|\phi_{\lambda \omega}\|^2 \dot{\lambda} = O\big((1 + |\operatorname{Mod}(t)|)\|\vec{\xi}\|_X\big) + O(\|\vec{\xi}\|_X^2).$$
(4.12)

Taking the inner product of (4.8) with $T(\theta) \vec{\Upsilon}_{\lambda\omega}$ and $T(\theta) \partial_x \vec{\Phi}_{\lambda\omega}$, respectively, by similar arguments we get

$$(1 + \lambda^2 \omega^2) \|\phi_{\lambda\omega}\|^2 (\dot{\theta} - \lambda\omega) = O((1 + |\text{Mod}(t)|) \|\vec{\xi}\|_X) + O(\|\vec{\xi}\|_X^2),$$
(4.13)

$$[(1+\lambda^{2}\omega^{2})\|\partial_{x}\phi_{\lambda\omega}\|^{2}+\|\partial_{x}|\phi_{\lambda\omega}|^{2}\|^{2}]\dot{y}+C_{\star}\dot{\lambda}=O((1+|\mathrm{Mod}(t)|)\|\vec{\xi}\|_{X})+O(\|\vec{\xi}\|_{X}^{2}).$$
(4.14)

Indeed, we have

$$M \text{Mod}(t) = O((1 + |\text{Mod}(t)|) \|\vec{\xi}\|_X) + O(\|\vec{\xi}\|_X^2),$$
(4.15)

where

$$M = \begin{pmatrix} (1+\lambda^2\omega^2) \|\phi_{\lambda\omega}\|^2 & 0 & 0\\ 0 & (1+\lambda^2\omega^2) \|\partial_x\phi_{\lambda\omega}\|^2 + \|\partial_x|\phi_{\lambda\omega}|^2\|^2 & C_{\star}\\ 0 & 0 & \lambda\omega\partial_{\lambda}\|\phi_{\lambda\omega}\|^2 \end{pmatrix}$$

is an invertible matrix. Therefore,

$$|\mathrm{Mod}(t)| \le C \|\vec{\xi}\|_X + O(\|\vec{\xi}\|_X^2), \tag{4.16}$$

which concludes the proof of (4.4).

In what follows, we want to scale the terms on the righthand side of the modified virial identity (3.11). For this purpose, we first choose the initial data as

$$\vec{u}_0 = (1+a)\vec{\Phi}_\omega \tag{4.17}$$

and get the following properties.

Lemma 4.2. Let \vec{u}_0 be defined by (4.17). For the KGZ system, we have

$$P(\vec{u}_0) = 0, \tag{4.18}$$

$$Q(\vec{u}_0) - Q(\vec{\Phi}_\omega) = 2a\omega \|\phi_\omega\|^2 + O(a^2),$$
(4.19)

$$Q(T(\theta)\vec{\Phi}_{\omega}) - Q(\vec{\Phi}_{\omega}) = 0 \tag{4.20}$$

and

$$-6E(\vec{u}_0) + 8\omega Q((\vec{u}_0)) = (4a\omega^2 + 4\omega^2 - 2)\|\phi_\omega\|^2 + O(a^2),$$
(4.21)

where $O(a^2)$ denotes the equivalent infinitesimal of a^2 .

Proof. To be specific,

$$\vec{u}_0 = \left((1+a)\phi_\omega, i(1+a)\omega\phi_\omega, -(1+a)\phi_\omega^2, 0 \right),$$

then

$$P(\vec{u}_0) = 2\text{Re}\int i(1+a)^2\omega\phi_\omega\partial_x\phi_\omega dx + 0 = 0,$$

which gives (4.18).

For getting (4.19), we have

$$Q(\vec{u}_0) - Q(\vec{\Phi}_\omega) = \langle Q'(\vec{\Phi}_\omega), \vec{u}_0 - \vec{\Phi}_\omega \rangle + O(\|\vec{u}_0 - \vec{\Phi}_\omega\|_X^2)$$
$$= \langle \omega \phi_\omega, a \phi_\omega \rangle + \langle i \phi_\omega, i a \omega \phi_\omega \rangle + O(a^2)$$
$$= 2a \omega \|\phi_\omega\|^2 + O(a^2).$$

Property (4.20) is a direct consequence from the definition of the charge. As to (4.21), we write

$$-6E(\vec{u}_{0}) + 8\omega Q((\vec{u}_{0})) = -6(E(\vec{u}_{0}) - E(\vec{\Phi}_{\omega})) + 8\omega (Q(\vec{u}_{0}) - Q(\vec{\Phi}_{\omega})) - 6E(\vec{\Phi}_{\omega}) + 8\omega Q((\vec{\Phi}_{\omega})) = -6(S_{\omega}(\vec{u}_{0}) - S_{\omega}(\vec{\Phi}_{\omega})) + 2\omega (Q(\vec{u}_{0}) - Q(\vec{\Phi}_{\omega})) - 6E(\vec{\Phi}_{\omega}) + 8\omega Q((\vec{\Phi}_{\omega})).$$

According to Taylor's expansion and (2.11), we have

$$S_{\omega}(\vec{u}_0) - S_{\omega}(\vec{\Phi}_{\omega}) = O(\|\vec{u}_0 - \vec{\Phi}_{\omega}\|_X^2) = O(a^2).$$

Thus, combined with (2.4) in Lemma 2.1, we get (4.21).

¹⁴⁵ Moreover, we have the following properties.

Lemma 4.3. Let $\vec{u_0}$ be defined by (4.17), $\lambda \in \mathbb{R}^+$ and $\lambda \lesssim 1$. For the KGZ system, we have

$$S_{\lambda\omega}(\vec{u}_0) - S_{\lambda\omega}(\vec{\Phi}_{\omega}) = -2a(\lambda - 1)\omega^2 \|\phi_{\omega}\|^2 + O(a^2),$$
(4.22)

$$S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\omega}) - S_{\lambda\omega}(\vec{\Phi}_{\omega}) = 0 \tag{4.23}$$

and

$$S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\lambda\omega}) - S_{\lambda\omega}(\vec{\Phi}_{\omega}) = -\frac{(\lambda-1)^2(1-2\omega^2)(2-\omega)\omega^2}{2(1-\omega^2)} \|\phi_{\omega}\|^2 + o(|\lambda-1|^2).$$
(4.24)

Proof. From Lemma 4.2, we have

$$S_{\lambda\omega}(\vec{u}_0) - S_{\lambda\omega}(\vec{\Phi}_{\omega}) = E(\vec{u}_0) - E(\vec{\Phi}_{\omega}) - \lambda\omega Q(\vec{u}_0) + \lambda\omega Q(\vec{\Phi}_{\omega})$$
$$= S_{\omega}(\vec{u}_0) - S_{\omega}(\vec{\Phi}_{\omega}) - (\lambda - 1)\omega[Q(\vec{u}_0) - Q(\vec{\Phi}_{\omega})]$$
$$= O(a^2) - 2a(\lambda - 1)\omega^2 \|\phi_{\omega}\|^2,$$

which gives (4.22).

Since

$$S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\omega}) - S_{\lambda\omega}(\vec{\Phi}_{\omega}) = E(T(\theta)\vec{\Phi}_{\omega}) - E(\vec{\Phi}_{\omega}) - \lambda\omega[Q(T(\theta)\vec{\Phi}_{\omega}) - Q(\vec{\Phi}_{\omega})],$$

(4.23) can be checked by the definition of the energy and (4.20).

From the definition of S_{ω} , Taylor's expansion, (2.11) and (4.23), we have

$$S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\lambda\omega}) - S_{\lambda\omega}(\vec{\Phi}_{\omega})$$

$$=S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\lambda\omega}) - S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\omega}) + S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\omega}) - S_{\lambda\omega}(\vec{\Phi}_{\omega})$$

$$=S_{\omega}(T(\theta)\vec{\Phi}_{\lambda\omega}) - S_{\omega}(T(\theta)\vec{\Phi}_{\omega}) + (\lambda - 1)\omega[Q(T(\theta)\vec{\Phi}_{\lambda\omega}) - Q(T(\theta)\vec{\Phi}_{\omega})]$$

$$=\frac{1}{2}\langle S_{\omega}''(\vec{\Phi}_{\omega}) (T(\theta)\vec{\Phi}_{\lambda\omega} - T(\theta)\vec{\Phi}_{\omega}), (T(\theta)\vec{\Phi}_{\lambda\omega} - T(\theta)\vec{\Phi}_{\omega})\rangle + o(|\lambda - 1|^{2})$$

$$+ (\lambda - 1)\omega[Q(T(\theta)\vec{\Phi}_{\lambda\omega}) - Q(T(\theta)\vec{\Phi}_{\omega})].$$
(4.25)

Since

$$\begin{split} \langle S_{\omega}''(\vec{\Phi}_{\omega}) \left(T(\theta) \vec{\Phi}_{\lambda\omega} - T(\theta) \vec{\Phi}_{\omega} \right), \left(T(\theta) \vec{\Phi}_{\lambda\omega} - T(\theta) \vec{\Phi}_{\omega} \right) \rangle \\ = & (\lambda - 1)^2 \omega^2 \langle S_{\omega}''(T(\theta) \vec{\Phi}_{\omega}) \partial_{\omega} (T(\theta) \vec{\Phi}_{\omega}), \partial_{\omega} (T(\theta) \vec{\Phi}_{\omega}) \rangle + o(|\lambda - 1|^2) \\ = & - (\lambda - 1)^2 \omega^2 \frac{d}{d\lambda} Q(T(\theta) \vec{\Phi}_{\lambda\omega}) \big|_{\lambda = 1} + o(|\lambda - 1|^2) \end{split}$$

and

$$\frac{d}{d\lambda}Q(T(\theta)\vec{\Phi}_{\lambda\omega})\big|_{\lambda=1} = \omega \frac{d}{d\omega}Q(\vec{\Phi}_{\omega}) = -\frac{(1-2\omega^2)\omega}{1-\omega^2}\|\phi_{\omega}\|^2,$$

we have

$$\langle S_{\omega}''(\vec{\Phi}_{\omega}) (T(\theta)\vec{\Phi}_{\lambda\omega} - T(\theta)\vec{\Phi}_{\omega}), (T(\theta)\vec{\Phi}_{\lambda\omega} - T(\theta)\vec{\Phi}_{\omega}) \rangle$$

= $\frac{(\lambda - 1)^2(1 - 2\omega^2)\omega^3}{1 - \omega^2} \|\phi_{\omega}\|^2 + o(|\lambda - 1|^2).$

Due to

$$\begin{aligned} Q(T(\theta)\vec{\Phi}_{\lambda\omega}) - Q(T(\theta)\vec{\Phi}_{\omega}) = &(\lambda - 1)\omega \langle Q'(T(\theta)\vec{\Phi}_{\omega}), \partial_{\omega}(T(\theta)\vec{\Phi}_{\omega}) \rangle + o(|\lambda - 1|) \\ = &(\lambda - 1)\omega \frac{d}{d\omega}Q(\vec{\Phi}_{\omega}) + o(|\lambda - 1|) \\ = &-\frac{(\lambda - 1)(1 - 2\omega^2)\omega}{1 - \omega^2} \|\phi_{\omega}\|^2 + o(|\lambda - 1|), \end{aligned}$$

we get (4.24) immediately.

Now we are ready to control $||u_t - i\omega u||$.

Lemma 4.4. Suppose that $\vec{\xi} = (\xi, \eta, \zeta, 0)$ is defined by (4.1). If $|\omega| = \frac{1}{\sqrt{2}}$, then

$$\|u_t - i\omega u\|^2 = (\lambda - 1)^2 \omega^2 \|\phi_\omega\|^2 + \|\eta - i\omega\xi\|^2 + O(a|\lambda - 1| + |\lambda - 1|^3 + |\lambda - 1| \|\vec{\xi}\|_X^2).$$
(4.26)

Proof. By (4.1), we have

$$\begin{split} \|u_t - i\omega u\|^2 &= \|ie^{i\theta}\lambda\omega\phi_{\lambda\omega} + \eta - i\omega e^{i\theta}\phi_{\lambda\omega} - i\omega\xi\|^2 \\ &= \|ie^{i\theta}(\lambda - 1)\omega\phi_{\lambda\omega} + \eta - i\omega\xi\|^2 \\ &= (\lambda - 1)^2\omega^2\|\phi_{\lambda\omega}\|^2 + \|\eta - i\omega\xi\|^2 + 2(\lambda - 1)\omega\langle ie^{i\theta}\phi_{\lambda\omega}, \eta - i\omega\xi\rangle. \end{split}$$

Since the third orthogonality condition $\langle \vec{\xi}, 2\lambda\omega e^{i\theta}\phi_{\lambda\omega}\rangle = 0$ in (4.2) and

$$\|\phi_{\lambda\omega}\|^2 = \|\phi_{\omega}\|^2 + O(|\lambda - 1|),$$

we get

$$\|u_t - i\omega u\|^2 = (\lambda - 1)^2 \omega^2 \|\phi_\omega\|^2 + \|\eta - i\omega\xi\|^2 + 2(\lambda - 1)\omega \langle ie^{i\theta}\phi_{\lambda\omega}, \eta \rangle + O(|\lambda - 1|^3).$$

To estimate $\langle ie^{i\theta}\phi_{\lambda\omega},\eta\rangle$, from (4.19), (4.20) and the charge conservation law we have

$$Q(\vec{u}_0) - Q(\vec{\Phi}_\omega) + [Q(\vec{\Phi}_\omega) - Q(T(\theta)\vec{\Phi}_\omega)] + [Q(T(\theta)\vec{\Phi}_\omega) - Q(T(\theta)\vec{\Phi}_{\lambda\omega})]$$

= $Q(\vec{u}) - Q(T(\theta)\vec{\Phi}_{\lambda\omega})$
= $-\langle \xi, \lambda \omega e^{i\theta} \phi_{\lambda\omega} \rangle + \langle \eta, i e^{i\theta} \phi_{\lambda\omega} \rangle + O(\|\vec{\xi}\|_X^2).$

Recalling $\frac{d}{dw}Q(\vec{\Phi}_{\omega}) = 0$ when $|\omega| = \frac{1}{\sqrt{2}}$ in (2.3), we have

$$\begin{aligned} \langle \eta, ie^{i\theta}\phi_{\lambda\omega} \rangle =& Q(\vec{u}_0) - Q(\vec{\Phi}_{\omega}) + [Q(T(\theta)\vec{\Phi}_{\omega}) - Q(T(\theta)\vec{\Phi}_{\lambda\omega})] + O(\|\vec{\xi}\|_X^2) \\ =& O(a + |\lambda - 1|^2 + \|\vec{\xi}\|_X^2). \end{aligned}$$

Thus, (4.26) is obtained.

We then scale $\|\vec{\xi}\|_X$.

Lemma 4.5. Let $\vec{\xi}$ be defined by (4.1). If $|\omega| = \frac{1}{\sqrt{2}}$, then

$$\|\vec{\xi}\|_X^2 = O(a^2 + a|\lambda - 1|) + o(|\lambda - 1|^2).$$
(4.27)

Proof. By (2.11) and Lemma 2.4, combined with the energy and charge conservation laws, we have

$$\begin{split} \|\vec{\xi}\|_X^2 &\lesssim \langle S_{\lambda\omega}''(\vec{\Phi}_{\lambda\omega})\vec{\xi},\vec{\xi} \rangle \\ &= S_{\lambda\omega}(\vec{u}) - S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\lambda\omega}) + o(\|\vec{\xi}\|_X^2) \\ &= [S_{\lambda\omega}(\vec{u}_0) - S_{\lambda\omega}(\vec{\Phi}_\omega)] - [S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\lambda\omega}) - S_{\lambda\omega}(\vec{\Phi}_\omega)] + o(\|\vec{\xi}\|_X^2). \end{split}$$

When $|\omega| = \frac{1}{\sqrt{2}}$, from (4.24) we have

$$S_{\lambda\omega}(T(\theta)\vec{\Phi}_{\lambda\omega}) - S_{\lambda\omega}(\vec{\Phi}_{\omega}) = o(|\lambda - 1|^2), \qquad (4.28)$$

then, thanks to (4.22), we get (4.27) immediately.

5 Proof of Theorem 1.1

Suppose that $\vec{u} \in U_{\varepsilon}(\vec{\Phi}_{\omega})$ defined by (4.1), we have $|\lambda - 1| \leq \varepsilon << 1$. We will prove Theorem 1.1 by a contradiction argument. The initial data satisfies (4.17) in which a > 0 will be determined later. Assume that $\vec{\xi}(t, x) = (\xi, \eta, \zeta, \iota)^T$ satisfies

$$\int_{\mathbb{R}} \iota dx = 0, \qquad \int_{\mathbb{R}} x \cdot \iota dx = 0, \tag{5.1}$$

by the definition of $\tilde{I}(t)$ and the proof of Lemma 3.2, we have the time uniform boundedness

$$\tilde{I}(t) \lesssim R(\|\vec{\Phi}_{\omega}\|_X^2 + 1).$$

However, we will claim that

$$\lim_{t \to \infty} \tilde{I}(t) \to \infty, \tag{5.2}$$

which gives a contradiction. Since the solution to (1.7) is exponentially decaying at infinity, we have

$$\begin{split} &\int_{|x-y(t)|\geq R} [|u_t|^2 + |u_x|^2 - |u|^2 + \frac{1}{2c_0^2} |m_x|^2 + \frac{1}{2} |n|^2 + 2\operatorname{Re}(u_x \bar{u}_t) + \frac{1}{c_0^2} nm_x] dx \\ &\lesssim \int_{|x|\geq R} (|\phi_{\lambda\omega}|^2 + |\partial_x \phi_{\lambda\omega}|^2 + |\xi|^2 + |\xi_x|^2 + |\eta|^2 + |(-\Delta)^{-1} \iota_x|^2 + |\zeta|^2) dx \\ &= O(\|\vec{\xi}\|_X^2 + \frac{1}{R}). \end{split}$$

When $|\dot{y}| \lesssim 1$, from Lemma 4.2 we have

$$\begin{split} \tilde{I}'(t) \gtrsim &(4a\omega^2 + 4\omega^2 - 2) \|\phi_{\omega}\|^2 + O(a^2) + 4(\lambda - 1)^2 \omega^2 \|\phi_{\lambda\omega}\|^2 + 4\|\eta - i\omega\xi\|^2 \\ &+ O(a|\lambda - 1| + |\lambda - 1|^3 + |\lambda - 1| \|\vec{\xi}\|_X^2) + O(\|\vec{\xi}\|_X^2 + \frac{1}{R}) \\ \gtrsim &(4a\omega^2 + 4\omega^2 - 2) \|\phi_{\omega}\|^2 + O(a^2 + a|\lambda - 1| + |\lambda - 1|^3 + \|\vec{\xi}\|_X^2 + \frac{1}{R}). \end{split}$$

Let R be sufficiently large and $\frac{1}{R} = O(a^2)$. According to Lemma 4.5, we have

$$\tilde{I}'(t) \gtrsim (4a\omega^2 + 4\omega^2 - 2) \|\phi_{\omega}\|^2 + O(a^2 + a|\lambda - 1|) + o(|\lambda - 1|^2).$$

Since $|\omega| = \frac{1}{\sqrt{2}}$, $4a\omega^2$ is absolutely positive. Choosing ε and a_0 small enough, for any given $a \in (0, a_0)$, we have

$$\tilde{I}'(t) \gtrsim 2a\omega^2 \|\phi_\omega\|^2 > 0,$$

which means (5.2). Thus, we have completed the instability of the standing wave at frequency $|\omega| = \frac{1}{\sqrt{2}}$ for the KGZ system.
