Abstract. We enlarge the spectral problem of a generalized D-Kaup-Newell (D-KN) spectral problem. Solving the enlarged zero-curvature equations, we produce integrable couplings. A reduction of the spectral matrix leads to a second integrable coupling system. Next, bilinear forms that are symmetric, ad-invariant, and non-degenerate on the given non-semisimple matrix Lie algebra are computed to employ the variational identity. The variational identity is then applied to the original enlarged spectral problem of a generalized D-KN hierarchy and the reduced problem. Hamiltonian structures are presented, as well as a bi-Hamiltonian formulation of the reduced problem. Both hierarchies have infinitely many commuting symmetries and conserved densities, i.e., are Liouville integrable.

Keywords: Integrable coupling, Matrix spectral problem, Liouville integrable, Hamiltonian structure

1. Introduction

The finding of new integrable couplings has become an important area of research in mathematical physics [1]-[14]. Originally, integrable couplings were found in the study of centerless Virasoro symmetry algebras of integrable systems [1, 2]. Given an integrable system $u_t = K(u)$, an integrable coupling of the system is a triangular system of the form:

$$\bar{u}_t = [u_t, v_t]^T = \bar{K}(\bar{u}) = [K(u), S(u, v)]^T$$
(1)

where potentials u and v are scalar functions or vector functions with dependent variables $\bar{x} = (t, x_1, x_2, ...), \bar{u} = [u, v]^T$. It is important that the new differential equations in the bigger system (1) involve the dependent variables u and all of its derivatives, i.e., $\frac{\partial S}{\partial u} \neq 0$. Integrable couplings were first constructed through perturbations [1, 2, 3], then the spectral matrices were enlarged [4, 5, 6], and in 2006, the connection between integrable couplings and semi-direct sums of Lie algebras was realized [7, 8]. Very recently, a novel kind of AKNS integrable couplings was analyzed [14] and other new integrable couplings have been presented [15, 16]. This paper has the enlarge spectral matrix with all submatrices depending on λ . This technique has only be seen recently.

A generalized D-KN hierarchy is derived from the following isospectral problem:

$$\phi_x = U(\lambda, u)\phi = \begin{bmatrix} \lambda^2 - r_1 & \lambda p_1 + s_1 \\ \lambda q_1 + v_1 & -\lambda^2 + r_1 \end{bmatrix} \phi,$$
(2)

where $u = [p_1, q_1, r_1, s_1, v_1]^T$ are potentials, $\phi = [\phi_1, \phi_2]^T$ and $U \in sl(2, \mathbb{R})$. A hierarchy starting from this spectral problem was analyzed and found to be integrable in the Liouville sense [17]. A reduction to the spectral problem 2 is bi-Hamiltonian [17]. In this paper, we enlarge both the spectral problem 2 and its reduction and show their integrability which is a new finding.

Recall, the D-KN spectral problem is known [18, 21] to be

$$\phi_x = U(\lambda, u)\phi = \begin{bmatrix} \lambda^2 + r_1 & \lambda p_1 \\ \lambda q_1 & -\lambda^2 - r_1 \end{bmatrix} \phi,$$
(3)

which depends on three potentials $u = [p_1, q_1, r_1]^T$ and ϕ is the same as (2) with $U \in sl(2, \mathbb{R})$. The new spectral problem (2) is a generalization of the D-KN spectral problem adding two new potentials s_1 and v_1 . Previously, the cases where $r_1 = \alpha$ and $r_1 = \alpha pq$ have been shown to generate integrable hierarchies [19, 20] for the D-KN spectral problem (3). It is clear that (2) is a generalization of the Kaup-Newell [25] spectral matrix, as well. We will note that AKNS hierarchy [26] may be found from (2) by letting $p_1 = q_1 = r_1 = 0$ and choosing a suitable Laurent expansion.

Two sections complete this paper: integrable couplings and Hamiltonian structures. In the integrable couplings section, an enlarged the spectral matrix (2) is presented. Solving the zero-curvature equation, we find a system of recursive relation and prove they are local. We use this to present the hierarchy of integrable couplings. Next, a reduction of the enlarged spectral matrix leads to a second integrable coupling system. The section of Hamiltonian structures follows where a non-degenerate, ad-invariant, symmetric bilinear forms are found. The bilinear forms along with the variational identity produce Hamiltonian structures of a generalized D-KN integrable couplings and its reduced integrable coupling system. A bi-Hamiltonian structure is found for the reduced integrable couplings. We discover infinitely many commuting symmetries and conserved functionals for both hierarchies and, thus, their Liouville integrability.

2. Integrable couplings

In order to simplify notation, we define a triangular block matrix as follows:

$$M(A_1, A_2) = \begin{bmatrix} A_1 & A_2 \\ 0 & A_1 \end{bmatrix}.$$
 (4)

It can easily be shown that matrices of this form are closed under matrix multiplication, i.e., constitute a Lie algebra. The associated matrix loop algebra $\tilde{\mathfrak{g}}(\lambda)$ is formed by all block matrices of the type:

$$\tilde{\mathfrak{g}}(\lambda) = \{M(A_1, A_2) \mid M \text{ defined by } (4), \text{ entries of } A_i \text{ are Laurent series in } \lambda\}.$$
 (5)

We will use this notation throughout this paper.

2.1. Generalized D-KN integrable couplings

A spectral matrix is chosen from $\tilde{\mathfrak{g}}(\lambda)$ as

$$\bar{U} = \bar{U}(\bar{u}, \lambda) = M(U(\lambda, u), U_1(\lambda, v)),$$
(6)

where $\bar{u} = [u, v]^T$, $u = [p_1, q_1, r_1, s_1, v_1]^T$, $v = [p_2, q_2, r_2, s_2, v_2]^T$ are potentials. U is from the generalized D-KN spectral problem (2) and

$$U_{1} = U(\lambda, v) = \begin{bmatrix} \lambda^{2} - r_{2} & \lambda p_{2} + s_{2} \\ \lambda q_{2} + v_{2} & -\lambda^{2} + r_{2} \end{bmatrix}.$$
 (7)

The isospectral problem is

$$\bar{\phi}_x = \bar{U}\bar{\phi},\tag{8}$$

where $\bar{\phi} = [\psi, \phi]^T, \psi = [\psi_1, \psi_2]^T$ and $\phi = [\phi_1, \phi_2]^T$. Note that U is the same matrix as (2).

Assume that the solution to the stationary zero-curvature equation, $\bar{W}_x = [\bar{U}, \bar{W}]$, is of the form

$$\bar{W} = \begin{bmatrix} W & W_1 \\ 0 & W \end{bmatrix} \in \tilde{\mathfrak{g}}(\lambda), W = \begin{bmatrix} a & b \\ c & -a \end{bmatrix}, W_1 = \begin{bmatrix} e & f \\ g & -e \end{bmatrix}$$
(9)

then we get the following matrix formulas:

$$\begin{cases} W_x = UW - WU, \\ W_{1,x} = U_1W - WU_1 + UW_1 - W_1U. \end{cases}$$
(10)

Solving these two formulas, we get the differential equations:

$$\begin{cases} a_x = -q_1b\lambda + p_1c\lambda - v_1b + s_1c, \\ b_x = -2p_1a\lambda + 2b\lambda^2 - 2s_1a - 2r_1b, \\ c_x = 2q_1a\lambda - 2c\lambda^2 + 2v_1a + 2r_1c, \\ e_x = p_1g\lambda + p_2c\lambda - q_2b\lambda - q_1f\lambda + s_1g + s_2c - v_1f - v_2b, \\ f_x = 2b\lambda^2 + 2f\lambda^2 - 2p_1e\lambda - 2p_2a\lambda - 2r_1f - 2r_2b - 2s_1e - 2s_2a, \\ g_x = -2c\lambda^2 - 2g\lambda^2 + 2q_1e\lambda + 2q_2a\lambda + 2r_1g + 2r_2c + 2v_1e + 2v_2a. \end{cases}$$
(11)

By assuming a, b, c, e, f, g, have the following Laurent series expansions:

$$a = \sum_{i=0}^{\infty} a_i \lambda^{-i}, \qquad b = \sum_{i=0}^{\infty} b_i \lambda^{-i}, \qquad c = \sum_{i=0}^{\infty} c_i \lambda^{-i}, e = \sum_{i=0}^{\infty} e_i \lambda^{-i}, \qquad f = \sum_{i=0}^{\infty} f_i \lambda^{-i}, \qquad g = \sum_{i=0}^{\infty} g_i \lambda^{-i},$$
(12)

and substituting (12) into (11), we have the recursion relations

$$\begin{cases} b_{i+1} = \frac{b_{i-1,x}}{2} + p_1 a_i + s_1 a_{i-1} + r_1 b_{i-1}, \\ c_{i+1} = -\frac{c_{i-1,x}}{2} + q_1 a_i + v_1 a_{i-1} + r_1 c_{i-1}, \\ a_{i+1,x} = -q_1 \frac{b_{i,x}}{2} - p_1 \frac{c_{i,x}}{2} + (p_1 v_1 - q_1 s_1) a_i - q_1 r_1 b_i + p_1 r_1 c_i + s_1 c_{i+1} \\ -v_1 b_{i+1}, \\ f_{i+1} = \frac{f_{i-1,x}}{2} - b_{i+1} + p_2 a_i + p_1 e_i + s_2 a_{i-1} + s_1 e_{i-1} + r_2 b_{i-1} + r_1 f_{i-1}, \\ g_{i+1} = -\frac{g_{i-1,x}}{2} - c_{i+1} + q_2 a_i + q_1 e_i + v_2 a_{i-1} + v_1 e_{i-1} + r_2 c_{i-1} + r_1 g_{i-1}, \\ e_{i+1,x} = -\frac{g_{i,x}}{2} p_1 - \frac{f_{i,x}}{2} q_1 + (p_2 - p_1) [-\frac{c_{m,x}}{2} + v_1 a_m + r_1 c_m] \\ + (q_1 - q_2) [\frac{b_{m,x}}{2} + s_1 a_m + r_1 b_m] + s_1 g_{i+1} + s_2 c_{i+1} - v_1 f_{i+1} - v_2 b_{i+1} \\ + (p_1 v_2 - q_1 s_2) a_i + (p_1 v_1 - q_1 s_1) e_i + p_1 r_2 c_i - q_1 r_2 b_i \\ + p_1 r_1 g_i - q_1 r_1 f_i, \end{cases}$$
(13)

for all $i \ge 1$ with initial values

$$a_{0} = \alpha, \quad b_{0} = c_{0} = 0, \quad a_{1} = 0, \qquad b_{1} = \alpha p_{1}, \qquad c_{1} = \alpha q_{1}, \\ e_{0} = \beta, \quad f_{0} = g_{0} = 0, \quad e_{1} = 0, \quad f_{1} = (\beta - \alpha)p_{1} + p_{2}\alpha, \quad g_{1} = (\beta - \alpha)q_{1} + q_{2}\alpha,$$
(14)

and the conditions for integration

$$\begin{cases} a_i|_{u=0} = b_i|_{u=0} = c_i|_{u=0} = 0, & i \ge 1, \\ e_i|_{u=0} = f_i|_{u=0} = g_i|_{u=0} = 0, & i \ge 1, \end{cases}$$
(15)

which determine the sequence of $\{a_i, b_i, c_i, e_i, f_i, g_i | i \ge 0\}$ uniquely. For i = 2, 3, we have the following:

$$\begin{split} b_2 &= \alpha s_1, \qquad c_2 = \alpha v_1, \qquad a_2 = -\alpha \frac{1}{2} p_1 q_1, \\ f_2 &= (\beta - \alpha) s_1 + \alpha s_2, \qquad e_2 = (\alpha q_1 + \frac{1}{2} \beta q_1 - \frac{1}{2} q_2) p_1 - \frac{1}{2} \alpha p_2 q_1, \\ g_2 &= (\beta - \alpha) v_1 + \alpha v_2; \\ b_3 &= \alpha \frac{1}{2} (-p_1^2 q_1 + 2 p_1 r_1 + p_{1,x}), \qquad c_3 = -\alpha \frac{1}{2} (q_1^2 p_1 - 2 q_1 r_1 + q_{1,x}), \\ a_3 &= -\alpha \frac{1}{2} (p_1 v_1 + q_1 s_1), \\ f_3 &= \frac{1}{2} [(\beta - 2\alpha) p_{1,x} + \alpha p_{2,x} + ((\beta + 3\alpha) p_1^2 q_1 + (2\beta - 4\alpha) r_1 p_1 \\ -\alpha (p_2 q_1 p_1 - 2 r_2 p_1 + q_2 p_1^2) + 2\alpha p_2 r_1], \\ g_3 &= -\frac{1}{2} [(\beta - 2\alpha) q_{1,x} + \alpha q_{2,x} - (-\beta + 3\alpha) q_1^2 p_1 \alpha - (2\beta - 4\alpha) r_1 q_1 \\ + \alpha (q_2 p_1 q_1 - 2 r_2 q_1 + p_2 q_1^2) - 2\alpha q_2 r_1], \\ e_3 &= (v_1 \alpha - \frac{1}{2} v_1 \beta - \frac{1}{2} v_2 \alpha) p_1 + (s_1 \alpha - \frac{1}{2} s_1 \beta - \frac{1}{2} s_2 \alpha) q_1 - \frac{1}{2} p_2 v_1 \alpha - \frac{1}{2} q_2 s_1 \alpha. \end{split}$$

All $\{a_i, b_i, c_i, e_i, f_i, g_i | i \ge 0\}$ can be proven as differential polynomials of \bar{u} with respect to x.

Proposition 2.1. Let $\{a_i, b_i, c_i, e_i, f_i, g_i | i = 0, 1\}$ be given by equations (14). Then all functions $\{a_i, b_i, c_i, e_i, f_i, g_i | i \ge 0\}$ determined by equation (13) with the conditions (15) are differential polynomials in \bar{u} with respect to x, and thus, are local.

Proof. We compute from the enlarged stationary zero-curvature equation, $\bar{W}_x = [\bar{U}, \bar{W}]$,

$$\frac{d}{dx}\operatorname{tr}(\bar{W}^2) = 2\operatorname{tr}(\bar{W}\bar{W}_x) = 2\operatorname{tr}(\bar{W}[\bar{U},\bar{W}]) = 2(\operatorname{tr}(\bar{W}^2\bar{U}) - \operatorname{tr}(\bar{W}^2\bar{U})) = 0, \quad (16)$$

and seeing that the $tr(\bar{W}^2) = 4(a^2 + bc)$, we have

$$a^{2} + bc = (a^{2} + bc)|_{u=0} = \alpha^{2}, \qquad (17)$$

following from the initial data (14). Now, we use (12), the Laurent expansions of a, b, c, to give

$$a_{i} = \frac{\alpha}{2} - \frac{1}{2\alpha} \sum_{k+l=i,k,l\geq 1} a_{k}a_{l} - \frac{1}{2\alpha} \sum_{k+l=i,k,l\geq 0} b_{k}c_{l}, i\geq 1.$$
(18)

Based on the recursion relation above (18) and the previous (13), we use mathematical induction to see that all functions $\{a_i, b_i, c_i, i \ge 0\}$ are differential polynomials in u with respect to x, and therefore, are local.

Now, we have

$$\frac{d}{dx}(2ae + fc + gb) = 2a_xe + 2ae_x + f_xc + fc_x + g_xb + gb_x$$

=2e(-q₁b\lambda + p₁c\lambda - v_1b + s_1c) + 2a(p₁g\lambda + p₂c\lambda
- q₂b\lambda - q_1f\lambda + s_1g + s_2c - v_1f - v_2b) + c(2b\lambda^2
+ 2f\lambda^2 - 2p_1e\lambda - p_2a\lambda - 2r_1f - 2r_2b - 2s_1e - 2s_2a)
+ f(2q_1a\lambda - 2c\lambda^2 + 2v_1a + 2r_1c) + b(-2c\lambda^2 - 2g\lambda^2
+ 2q_1e\lambda + q_2a\lambda + 2r_1g + 2r_2c + 2v_1e + 2v_2a)
+ g(-2p_1a\lambda + 2b\lambda^2 - 2s_1a - 2r_1b) = 0.

Similarly, we get

$$2ae + fc + gb = (2ae + fc + gb)|_{\bar{u}=0} = \alpha\beta.$$

Therefore, using the Laurent expansions of a, b, c, e, f, and g in (12), we have

$$e_{i} = \beta - \frac{\beta}{\alpha}a_{i} - \frac{1}{2\alpha}\sum_{k+l=i,k,l\geq 0}f_{k}c_{l} - \frac{1}{2\alpha}\sum_{k+l=i,k,l\geq 0}g_{k}b_{l} - \frac{1}{\alpha}\sum_{k+l=i,k,l\geq 1}a_{k}e_{l},$$
(19)

for all $i \ge 1$. Using the localness of $\{a_i, b_i, c_i | i \ge 0\}$ and the recursive relations (13) and (19), we may see through mathematical induction that all functions $\{e_i, f_i, g_i | i \ge 0\}$ are differential polynomials in \bar{u} with respect to x. This completes the proof.

Now, we need to solve the zero-curvature equations,

$$\bar{U}_{t_m} - \bar{V}_x^{[m]} + [\bar{U}, \bar{V}^{[m]}] = 0, \quad m \ge 0,$$
(20)

which are the compatibility conditions between (8) and the temporal problems,

$$\bar{\phi}_{t_m} = \bar{V}^{[m]} \bar{\phi} = \bar{V}^{[m]} (\bar{u}, \lambda) \bar{\phi}, \quad m \ge 0.$$

$$(21)$$

In order to do this, we introduce a series of Lax operators

$$\bar{V}^{[m]}(\bar{u},\lambda) = (\lambda^m \bar{W})_+. \tag{22}$$

After solving (20), we generate a hierarchy of soliton equations, for all $m \ge 0$,

$$\bar{u}_{t_m} = \bar{K}_m = \begin{bmatrix} 2b_{m+1} \\ -2c_{m+1} \\ q_1b_{m+1} - p_1c_{m+1} \\ -2p_1a_{m+1} + 2b_{m+2} \\ 2q_1a_{m+1} - 2c_{m+2} \\ 2f_{m+1} + 2b_{m+1} \\ -2g_{m+1} - 2c_{m+1} \\ q_1f_{m+1} + q_2b_{m+1} - p_1g_{m+1} - p_2c_{m+1} \\ -2p_1e_{m+1} - 2p_2a_{m+1} + 2b_{m+2} + 2f_{m+2} \\ 2q_1e_{m+1} + 2q_2a_{m+1} - 2c_{m+2} - 2g_{m+2} \end{bmatrix}.$$
(23)

We have

$$\bar{K}_m = \bar{\Phi}\bar{K}_{m-1} = \bar{\Phi}^m\bar{K}_0, \quad m \ge 0,$$
 (24)

where

$$\bar{\Phi} = \begin{bmatrix} \Phi & 0\\ \Phi_1 - \Phi & \Phi \end{bmatrix}.$$
(25)

where Φ is the recursion operator of the original system $u_t = K(u)$ equal to

$$\begin{bmatrix} -p_{1}\partial^{-1}v_{1} & -p_{1}\partial^{-1}s_{1} & 2s_{1}\partial^{-1} & 1-p_{1}\partial^{-1}q_{1} & -p_{1}\partial^{-1}p_{1} \\ -s_{1}\partial^{-1}q_{1} & q_{1}\partial^{-1}s_{1} & -2v_{1}\partial^{-1} & q_{1}\partial^{-1}q_{1} & 1+q_{1}\partial^{-1}p_{1} \\ q_{1}\partial^{-1}v_{1} & q_{1}\partial^{-1}p_{1} & -2v_{1}\partial^{-1} & q_{1}\partial^{-1}q_{1} & 1+q_{1}\partial^{-1}p_{1} \\ p_{1}v_{1}\partial^{-1}\frac{q_{1}}{2} & p_{1}v_{1}\partial^{-1}\frac{p_{1}}{2} & -p_{1}v_{1}\partial^{-1} & \frac{q_{1}}{2} & \frac{p_{1}}{2} \\ -q_{1}s_{1}\partial^{-1}\frac{q_{1}}{2} & -q_{1}s_{1}\partial^{-1}\frac{p_{1}}{2} & +q_{1}s_{1}\partial^{-1} \\ \frac{1}{2}\partial + r_{1} - s_{1}\partial^{-1}v_{1} & -s_{1}\partial^{-1}s_{1} & 2p_{1}r_{1}\partial^{-1} & -s_{1}\partial^{-1}q_{1} & -s_{1}\partial^{-1}p_{1} \\ -p_{1}r_{1}\partial^{-1}q_{1} & -\partial p_{1}\partial^{-1}\frac{p_{1}}{2} & +\partial p_{1}\partial^{-1} \\ -\partial p_{1}\partial^{-1}\frac{q_{1}}{2} & -p_{1}r_{1}\partial^{-1}s_{1} & -2q_{1}r_{1}\partial^{-1} & v_{1}\partial^{-1}q_{1} & v_{1}\partial^{-1}p_{1} \\ +\partial q_{1}\partial^{-1}\frac{q_{1}}{2} & +q_{1}r_{1}\partial^{-1}p_{1} & -\partial q_{1}\partial^{-1} \\ +q_{1}r_{1}\partial^{-1}q_{1} & +\partial q_{1}\partial^{-1}\frac{p_{1}}{2} \end{bmatrix}$$

$$(26)$$

and Φ_1 is the supplemental matrix differential operator with entries

$$\begin{split} & \left[\Phi_{1} \right]_{11} = -p_{1} \partial^{-1} v_{2} - p_{2} \partial^{-1} v_{1} - s_{2} \partial^{-1} q_{1} - s_{1} \partial^{-1} q_{2}, \\ & \left[\Phi_{1} \right]_{12} = -p_{1} \partial^{-1} s_{2} - p_{2} \partial^{-1} s_{1} - s_{2} \partial^{-1} p_{1} - s_{1} \partial^{-1} p_{2} \\ & \left[\Phi_{1} \right]_{13} = 2s_{2} \partial^{-1} + 2s_{1} \partial^{-1} \left[\Phi_{1} \right]_{14} = 1 - p_{1} \partial^{-1} q_{2} - p_{2} \partial^{-1} q_{1}, \\ & \left[\Phi_{1} \right]_{21} = q_{1} \partial^{-1} v_{2} + q_{2} \partial^{-1} v_{1} + v_{1} \partial^{-1} q_{2} + v_{2} \partial^{-1} q_{1}, \\ & \left[\Phi_{1} \right]_{22} = q_{1} \partial^{-1} s_{2} + q_{2} \partial^{-1} s_{1} + v_{1} \partial^{-1} q_{2} + v_{2} \partial^{-1} q_{1}, \\ & \left[\Phi_{1} \right]_{23} = -2v_{1} \partial^{-1} - 2v_{2} \partial^{-1}, \\ & \left[\Phi_{1} \right]_{24} = q_{1} \partial^{-1} q_{2} + q_{2} \partial^{-1} q_{1} + \left(\frac{p_{1} v_{2} - q_{1} s_{2}}{2} \right) \partial^{-1} q_{1} - \left(\frac{p_{1} v_{1} - q_{1} s_{1}}{2} \right) \partial^{-1} q_{1} \\ & + \frac{(p_{1} v_{1} - q_{1} s_{1})}{2} \partial^{-1} q_{2} \\ & \left[\Phi_{1} \right]_{32} = \frac{(v_{1} p_{2} - q_{2} s_{1})}{2} \partial^{-1} p_{1} + \frac{(p_{1} v_{2} - q_{1} s_{2})}{2} \partial^{-1} p_{1} - \frac{(p_{1} v_{1} - q_{1} s_{1})}{2} \partial^{-1} p_{1} \\ & + \frac{(p_{1} v_{1} - q_{1} s_{1})}{2} \partial^{-1} p_{2} \\ & \left[\Phi_{1} \right]_{33} = -(p_{1} v_{2} - q_{1} s_{2}) \partial^{-1} v_{1} - (p_{2} v_{1} - q_{2} s_{1}) \partial^{-1} q_{1} \\ & + \frac{(p_{1} v_{1} - q_{1} s_{1})}{2} \partial^{-1} p_{2} \\ & \left[\Phi_{1} \right]_{34} = \frac{q_{2}}{2}, \left[\Phi_{1} \right]_{35} = \frac{p_{2}}{2} \\ & (27) \\ & \left[\Phi_{1} \right]_{44} = r_{2} - s_{1} \partial^{-1} v_{2} - s_{2} \partial^{-1} v_{1} - \partial \frac{(p_{2} - p_{1})}{2} \partial^{-1} q_{1} - (r_{1} p_{2} + p_{1} r_{2}) \partial^{-1} q_{1} \\ & + p_{1} r_{1} \partial^{-1} q_{1} - r_{1} p_{1} \partial^{-1} q_{2} - \partial \frac{p_{1}}{2} \partial^{-1} q_{2}, \\ & \left[\Phi_{1} \right]_{42} = -s_{1} \partial^{-1} s_{2} - s_{2} \partial^{-1} s_{1} - \partial (p_{2} - p_{1}) \partial^{-1} \partial^{-1} p_{1} - (r_{1} p_{2} + p_{1} r_{2}) \partial^{-1} p_{1} \\ & + p_{1} r_{1} \partial^{-1} q_{1} - r_{1} p_{1} \partial^{-1} q_{2} - \partial \frac{p_{1}}{2} \partial^{-1} p_{2}, \\ & \left[\Phi_{1} \right]_{43} = \partial(p_{2} - p_{1}) \partial^{-1} + 2(r_{1} p_{2} - p_{1} \partial^{-1} p_{2} - \beta \partial^{-1} p_{1} - (r_{1} p_{2} + q_{1} r_{2}) \partial^{-1} q_{1} \\ & + p_{1} r_{1} \partial^{-1} q_{2} - s_{2} \partial^{-1} q_{1} + \left(\frac{p_{1} q_{2} - s_{2} \partial^{-1} p_{1} - (r_{1} p_{2} + q_{1} r_{2}) \partial^{-1} q_{1} \\ & - q_{1}$$

with $\partial = \frac{\partial}{\partial x}$ and ∂^{-1} as the inverse operator of ∂ .

2.2. A specific reduction with two less potentials

A spectral matrix, U, chosen from $\tilde{\mathfrak{g}}(\lambda)$, is of the form:

$$\bar{U} = M(U(\lambda, u), U_1(\lambda, v))$$
(28)

where r_1, r_2 from (6) are replaced with $\tilde{r}_1 = \frac{1}{2}p_1q_1, \tilde{r}_2 = \frac{1}{2}(p_1q_2 + p_2q_1 - p_1q_1)$, and $\bar{u} = (u, v)^T$, $u = [p_1, q_1, s_1, v_1]^T$, $v = [p_2, q_2, s_2, v_2]^T$ are potentials. The corresponding spacial spectral problem is

$$\bar{\phi}_x = \bar{U}(\bar{u}, \lambda)\bar{\phi},\tag{29}$$

where $\bar{\phi} = [\psi, \phi]^T, \psi = [\psi_1, \psi_2]^T$ and $\phi = [\phi_1, \phi_2]^T$.

Again, we assume that the solution to the stationary zero-curvature equation, $\bar{W}_x = [\bar{U}, \bar{W}]$, is of the form as (9). Solving the stationary zero-curvature equation (20), we have the following differential equations as (11) with $r_1 = \tilde{r_1}$ and $r_2 = \tilde{r_2}$. By assuming a, b, c, e, f, g, have the Laurent expansions (12), we have the recursion relations

$$\begin{cases} b_{i+1} = \frac{b_{i-1,x}}{2} + p_1a_i + s_1a_{i-1} + \frac{1}{2}p_1q_1b_{i-1}, \\ c_{i+1} = -\frac{c_{i-1,x}}{2} + q_1a_i + v_1a_{i-1} + \frac{1}{2}p_1q_1c_{i-1}, \\ a_{i+1,x} = -q_1\frac{b_{i,x}}{2} - p_1\frac{c_{i,x}}{2} + (p_1v_1 - q_1s_1)a_i - \frac{1}{2}p_1q_1^2b_i \\ + \frac{1}{2}p_1^2q_1c_i + s_1c_{i+1} - v_1b_{i+1}, \\ f_{i+1} = \frac{f_{i-1,x}}{2} - b_{i+1} + p_2a_i + p_1e_i + s_2a_{i-1} + s_1e_{i-1} \\ + \frac{1}{2}(p_1q_2 + p_2q_1 - p_1q_1)b_{i-1} + \frac{1}{2}p_1q_1f_{i-1}, \\ g_{i+1} = -\frac{g_{i-1,x}}{2} - c_{i+1} + q_2a_i + q_1e_i + v_2a_{i-1} + v_1e_{i-1} \\ + \frac{1}{2}(p_1q_2 + p_2q_1 - p_1q_1)c_{i-1} + \frac{1}{2}p_1q_1g_{i-1}, \\ e_{i+1,x} = -\frac{p_1g_{i,x}}{2} - \frac{q_1f_{i,x}}{2} + (p_2 - p_1)[-\frac{c_{m,x}}{2} + v_1a_m + \frac{1}{2}p_1q_1c_m] \\ + (q_1 - q_2))[\frac{b_{m,x}}{2} + s_1a_m + \frac{1}{2}p_1q_1b_m] \\ + s_1g_{i+1} + s_2c_{i+1} - v_1f_{i+1} - v_2b_{i+1} + (p_1v_2 - q_1s_2)a_i \\ + (p_1v_1 - q_1s_1)e_i + \frac{1}{2}p_1(p_1q_2 + p_2q_1 - p_1q_1)c_i \\ - \frac{1}{2}q_1(p_1q_2 + p_2q_1 - p_1q_1)b_i + \frac{1}{2}p_1^2q_1g_i - \frac{1}{2}p_1q_1^2f_i, \end{cases}$$

for all $i \ge 1$ with the same initial values (14) and conditions for integration (15) which determine the sequence of $\{a_i, b_i, c_i, e_i, f_i, g_i | i \ge 0\}$ uniquely. All $\{a_i, b_i, c_i, e_i, f_i, g_i\}$ can be proven as differential polynomials of \bar{u} with respect to x.

Proposition 2.2. Let $\{a_i, b_i, c_i, e_i, f_i, g_i | i = 0, 1\}$ be given by equation (14). Then all functions $\{a_i, b_i, c_i, e_i, f_i, g_i | i \ge 0\}$ determined by equations (30) with the conditions (15) are differential polynomials in \bar{u} with respect to x, and thus, are local.

Proof. For brevity, we leave the proof out. It is similar to Proposition 2.1.

We solve the zero-curvature equations (20) with the Lax matrices (22) to generate a hierarchy of soliton equations for all $m \ge 0$,

$$\bar{u}_{t_m} = \bar{K}_m = \begin{bmatrix} 2b_{m+1} \\ -2c_{m+1} \\ -2p_1a_{m+1} + 2b_{m+2} \\ 2q_1a_{m+1} - 2c_{m+2} \\ 2f_{m+1} + 2b_{m+1} \\ -2g_{m+1} - 2c_{m+1} \\ -2p_1e_{m+1} - 2p_2a_{m+1} + 2b_{m+2} + 2f_{m+2} \\ 2q_1e_{m+1} + 2q_2a_{m+1} - 2c_{m+2} - 2g_{m+2} \end{bmatrix}.$$
(31)

We have

$$\bar{K}_m = \bar{\Phi}\bar{K}_{m-1} = \bar{\Phi}^m\bar{K}_0, \quad m \ge 0,$$
 (32)

where $\bar{\Phi}$ is a recursion operator determined from (30) and given by

$$\bar{\Phi} = \begin{bmatrix} \Phi & 0\\ \Phi_1 - \Phi & \Phi \end{bmatrix}.$$
(33)

The matrix blocks of $\overline{\Phi}$ are defined by

$$\Phi = \begin{bmatrix} -p_1 \partial^{-1} v_1 & -p_1 \partial^{-1} s_1 & 1 - p_1 \partial^{-1} q_1 & -p_1 \partial^{-1} p_1 \\ q_1 \partial^{-1} v_1 & q_1 \partial^{-1} s_1 & q_1 \partial^{-1} q_1 & 1 + q_1 \partial^{-1} p_1 \\ \frac{1}{2} \partial + \widetilde{r_1} - s_1 \partial^{-1} v_1 & -s_1 \partial^{-1} s_1 & -s_1 \partial^{-1} q_1 & -s_1 \partial^{-1} p_1 \\ v_1 \partial^{-1} v_1 & -\frac{1}{2} \partial + \widetilde{r_1} + v_1 \partial^{-1} s_1 & v_1 \partial^{-1} q_1 & v_1 \partial^{-1} p_1 \end{bmatrix}$$
(34)

and

$$\Phi_{1} = \begin{bmatrix} -p_{1}\partial^{-1}v_{2} & -p_{1}\partial^{-1}s_{2} & 1-p_{1}\partial^{-1}q_{2} & -p_{1}\partial^{-1}p_{2} \\ -p_{2}\partial^{-1}v_{1} & -p_{2}\partial^{-1}s_{1} & -p_{2}\partial^{-1}q_{1} & -p_{2}\partial^{-1}p_{1} \\ q_{1}\partial^{-1}v_{2} & q_{1}\partial^{-1}s_{2} & q_{1}\partial^{-1}q_{2} & 1+q_{1}\partial^{-1}p_{2} \\ +q_{2}\partial^{-1}v_{1} & +q_{2}\partial^{-1}s_{1} & +q_{2}\partial^{-1}q_{1} & +q_{2}\partial^{-1}p_{1} \\ & & & \\ \widetilde{r}_{2} - s_{1}\partial^{-1}v_{2} & -s_{1}\partial^{-1}s_{2} & -s_{1}\partial^{-1}q_{2} & -s_{1}\partial^{-1}p_{2} \\ -s_{2}\partial^{-1}v_{1} & -s_{2}\partial^{-1}s_{1} & -s_{2}\partial^{-1}q_{1} & -s_{2}\partial^{-1}p_{1} \\ & & \\ v_{1}\partial^{-1}v_{2} & \widetilde{r}_{2} + v_{2}\partial^{-1}s_{1} & v_{1}\partial^{-1}q_{2} & v_{1}\partial^{-1}p_{2} \\ +v_{2}\partial^{-1}v_{1} & +v_{1}\partial^{-1}s_{2} & +v_{2}\partial^{-1}q_{1} & +v_{2}\partial^{-1}p_{1} \end{bmatrix}$$

$$(35)$$

where $\tilde{r}_1 = \frac{1}{2}p_1q_1$ and $\tilde{r}_2 = \frac{1}{2}(p_1q_2 + p_2q_1 - p_1q_1)$.

A specific example can be found from the reduced hierarchy of integrable couplings (31) when m = 6 by setting the eight potentials and α and β to be the following: $\{p_1 = q_1 = 0, s_1 = u, v_1 = -u, p_2 = q_2 = v, s_2 = w, v_2 = r, \alpha = -4, \beta = -8\}$. We find a

coupled mKdV [10, 11] system of equations:

$$\begin{cases}
 u_t = -u_{xxx} - 6u^2 u_x, \\
 v_t = -v_{xxx} - 4uvu_x - 2u^2 v_x + (4r - 4w)u^2, \\
 w_t = -w_{xxx} + u_{xxx} + (6u^2 + (4v - 4w)u)u_x - 4u^2 v_x - 2u^2 w_x, \\
 r_t = -r_{xxx} - u_{xxx} + (-6u^2 + (-4r + 4v)u)u_x - 2u^2 r_x - 2u^2 v_x.
\end{cases}$$
(36)

3. Hamiltonian structures

3.1. Constructing bilinear forms over a non-semisimple Lie algebra

For generating Hamiltonian structures for the integrable couplings in (23) and (31), we use the variational identity over the non-semisimple Lie algebra $\tilde{\mathfrak{g}}(\lambda)$ [9, 12, 13]. The variational identity is a generalization of the trace identity [9, 24]. The variational identity may be applied to non-semisimple Lie algebras where the trace identity works for semsimple. The idea is to use non-degenerate, symmetric, and ad-invariant bilinear forms on the Lie algebra. We begin with a construction of non-degenerate, symmetric, and ad-invariant bilinear forms on $\tilde{\mathfrak{g}}(\lambda)$ by rewriting $\tilde{\mathfrak{g}}(\lambda)$ into a vector form.

The isomorphism

$$\sigma: \tilde{\mathfrak{g}}(\lambda) \to \mathbb{R}^6, A \mapsto (a_1, ..., a_6)^T,$$
(37)

where

$$A = M(A_1, A_2) \in \tilde{\mathfrak{g}}(\lambda), \quad A_i = \begin{bmatrix} a_{3i-2} & a_{3i-1} \\ a_{3i} & -a_{3i-2} \end{bmatrix}, i = 1, 2,$$
(38)

and a constant symmetric matrix,

$$F = F_1 \otimes \begin{bmatrix} 1 & 0 \\ 0 & 0 \end{bmatrix} + F_2 \otimes \begin{bmatrix} 0 & 1 \\ 1 & 0 \end{bmatrix}, F_i = \begin{bmatrix} 2\eta_i & 0 & 0 \\ 0 & 0 & \eta_i \\ 0 & \eta_1 i & 0 \end{bmatrix}, i = 1, 2,$$
(39)

where \otimes is the Kronecker prodect, with arbitrary constants η_1 and η_2 furnish the bilinear forms on $\tilde{\mathfrak{g}}(\lambda)$ defined as

$$\langle A, B \rangle_{\tilde{\mathfrak{g}}(\lambda)} = \langle \sigma(A), \sigma(B) \rangle_{\mathbb{R}^{6}} = (a_{1}, ..., a_{6}) F(b_{1}, ..., b_{6})^{T} = (2a_{1}b_{1} + a_{2}b_{3} + a_{3}b_{2})\eta_{1} + (2a_{1}b_{4} + a_{2}b_{6} + a_{3}b_{5} + 2a_{4}b_{1} + a_{5}b_{3} + a_{6}b_{2})\eta_{2}.$$

$$(40)$$

The bilinear forms (40) are symmetric and ad-invariant due to the isomorphism σ . The bilinear forms, defined by (40), are non-degenerate iff the determinant of F is not zero, i.e.,

$$det(F) = -4\eta_2^6 \neq 0.$$
(41)

Therefore, we choose $\eta_2 \neq 0$ to obtain the required non-degenerate, symmetric, and ad-invariant bilinear forms over the enlarged matrix loop algebra $\tilde{\mathfrak{g}}(\lambda)$. For simplicity, we choose $\eta_1 = 0$ and $\eta_2 = 1$.

3.2. Hamiltonian structures of generalized D-KN integrable couplings

Now, we begin with the enlarged spectral matrix of a generalized D-KN hierarchy (8) and compute

$$\langle \bar{W}, \bar{U}_{\lambda} \rangle_{\tilde{\mathfrak{g}}(\lambda)} = (4a+4e)\lambda + fq_1 + bq_2 + cp_2 + gp_1 \tag{42}$$

and

$$\langle \bar{W}, \bar{U}_{\bar{u}} \rangle_{\tilde{\mathfrak{g}}(\lambda)} = [g\lambda, f\lambda, -2e, g, f, c\lambda, b\lambda, -2a, c, b]^T.$$
 (43)

Substituting the Laurent series and comparing powers of λ , we have

$$\frac{\delta}{\delta \bar{u}} \int \frac{(4a_{m+2} + 4e_{m+2}) + f_{m+1}q_1 + b_{m+1}q_2 + c_{m+1}p_2 + g_{m+1}p_1}{m} dx =$$

$$[g_{m+1}, f_{m+1}, -2e_m, g_m, f_m, c_{m+1}, b_{m+1}, -2a_m, c_m, b_m]^T, \ m \ge 1.$$
(44)

A long calculation involving the recursion relations (13) shows that

$$\frac{\delta\bar{\mathcal{H}}_{m+1}}{\delta\bar{u}} = \bar{\Psi}\frac{\delta\bar{\mathcal{H}}_m}{\delta\bar{u}},\tag{45}$$

where

$$\bar{\Psi} = \bar{\Phi}^{\dagger} = \begin{bmatrix} \Phi^{\dagger} & (\Phi_1 - \Phi)^{\dagger} \\ 0 & \Phi^{\dagger} \end{bmatrix},$$
(46)

with Φ and Φ_1 from (25), (26) and (27), respectively. We consequently obtain Hamiltonian structures for the hierarchy of integrable couplings (23), i.e.,

$$\bar{u}_{t_m} = \bar{J} \frac{\delta \bar{\mathcal{H}}_m}{\delta \bar{u}}, \quad m \ge 0, \tag{47}$$

with the Hamiltonian functionals,

$$\bar{\mathcal{H}}_m = \int \frac{(4a_{m+2} + 4e_{m+2}) + f_{m+1}q_1 + b_{m+1}q_2 + c_{m+1}p_2 + g_{m+1}p_1}{m} dx, \qquad (48)$$

for $m \geq 1$, and

$$\bar{\mathcal{H}}_0 = \int [(\beta - \alpha)p_1q_1 + \alpha(p_1q_2 + p_2q_1) - 2\beta r_1 - 2\alpha r_2]dx$$
(49)

calculated directly from $[g_1, f_1, -2e_0, g_0, f_0, c_1, b_1, -2a_0, c_0, b_0]^T$. The Hamiltonian operator in (47) is the block matrix of the form:

$$\bar{J} = \begin{bmatrix} 0 & J_1 \\ J_1 & J_2 \end{bmatrix},\tag{50}$$

where

$$J_{1} = \begin{bmatrix} 0 & 2 & 0 & 0 & 0 \\ -2 & 0 & 0 & 0 & 0 \\ 0 & 0 & \frac{1}{2}\partial & s_{1} & -v_{1} \\ 0 & 0 & -s_{1} & 0 & \partial + 2r_{1} \\ 0 & 0 & v_{1} & \partial - 2r_{1} & 0 \end{bmatrix}, J_{2} = \begin{bmatrix} 0 & 2 & 0 & 0 & 0 \\ -2 & 0 & 0 & 0 & 0 \\ 0 & 0 & 0 & s_{2} & -v_{2} \\ 0 & 0 & -s_{2} & 0 & 2r_{2} \\ 0 & 0 & v_{2} & -2r_{2} & 0 \end{bmatrix}.$$
 (51)

As a direct result of the Hamiltonian structures (47), the recursion structure (24) and (45), and the property $\bar{J}\bar{\Psi} = \bar{\Psi}^{\dagger}\bar{J}$, the hierarchy (23) has the following commutativity of flows:

$$\{\bar{\mathcal{H}}_k, \bar{\mathcal{H}}_l\}_{\bar{J}} = \int \left(\frac{\delta\bar{\mathcal{H}}_k}{\delta\bar{u}}\right)^T \bar{J} \frac{\delta\bar{\mathcal{H}}_l}{\delta\bar{u}} dx = 0.$$
(52)

We also have the commutativity of symmetries for $\{\bar{K}_n\}$, i.e.,

$$[\bar{K}_k, \bar{K}_l] = \bar{K}'_k(\bar{u})[\bar{K}_l] - \bar{K}'_l(\bar{u})[\bar{K}_k] = 0, \quad k, l \ge 0.$$
(53)

Therefore, the hierarchy (23) is Liouville integrable, as expected.

3.3. Bi-Hamiltonian structures of the reduced integrable couplings

Next, we focus on the reduced spectral matrix (29) and compute

$$\langle \bar{W}, \bar{U}_{\lambda} \rangle_{\tilde{\mathfrak{g}}(\lambda)} = (4a+4e)\lambda + fq_1 + bq_2 + cp_2 + gp_1 \tag{54}$$

and

$$\langle \bar{W}, \bar{U}_{\bar{u}} \rangle_{\tilde{\mathfrak{g}}(\lambda)} = [(a-e)q_1 - aq_2 + g\lambda, (a-e)p_1 - ap_2 + f\lambda, g, f, - aq_1 + c\lambda, -ap_1 + b\lambda, c, b]^T.$$

$$(55)$$

Again, we compare powers of λ after substituting the Laurent series for a, b, c, e, f, g to get

$$\frac{\delta}{\delta \bar{u}} \int \frac{(4a_{m+2} + 4e_{m+2}) + f_{m+1}q_1 + b_{m+1}q_2 + c_{m+1}p_2 + g_{m+1}p_1}{m} dx = [(a_m - e_m)q_1 - a_mq_2 + g_{m+1}, (a_m - e_m)p_1 - a_mp_2 + f_{m+1}, g_m, f_m - a_mq_1 + c_{m+1}, -a_mp_1 + b_{m+1}, c_m, b_m]^T, m \ge 1.$$
(56)

Now using the recursion relations (30), we have

$$\frac{\delta \bar{\mathcal{H}}_{m+1}}{\delta \bar{u}} = \bar{\Psi} \frac{\delta \bar{\mathcal{H}}_m}{\delta \bar{u}},\tag{57}$$

where

$$\bar{\Psi} = \bar{\Phi}^{\dagger} = \begin{bmatrix} \Phi^{\dagger} & (\Phi_1 - \Phi)^{\dagger} \\ 0 & \Phi^{\dagger} \end{bmatrix},$$
(58)

with Φ and Φ_1 from (34) and (35), respectively.

We finally obtain the bi-Hamiltonian structure for the hierarchy of integrable couplings (31),

$$\bar{u}_{t_m} = \bar{J} \frac{\delta \bar{\mathcal{H}}_{m+1}}{\delta \bar{u}} = \bar{M} \frac{\delta \bar{\mathcal{H}}_m}{\delta \bar{u}}, \ m \ge 0,$$
(59)

with the Hamiltonian functionals

$$\bar{\mathcal{H}}_m = \int \frac{(4a_{m+2} + 4e_{m+2}) + f_{m+1}q_1 + b_{m+1}q_2 + c_{m+1}p_2 + g_{m+1}p_1}{m} dx, \qquad (60)$$

for $m \geq 1$, and the block Hamiltonian operators \bar{J} given by

$$\bar{J} = \begin{bmatrix} 0 & J \\ J & J \end{bmatrix}, J = \begin{bmatrix} 0 & 0 & 0 & 2 \\ 0 & 0 & -2 & 0 \\ 0 & 2 & 0 & 0 \\ -2 & 0 & 0 & 0 \end{bmatrix},$$
(61)

and $\overline{M} = \overline{\Phi}\overline{J}$ where \overline{J} is above (61) and $\overline{\Phi}$ is the recursion operator (33) for the reduced integrable couplings (31). Recall, a bi-Hamiltonian property means that \overline{J} and \overline{M} constitute a Hamiltonian pair, or, $\overline{N} = \alpha \overline{J} + \beta \overline{M}$, for any $\alpha, \beta \in \mathbb{R}$, is a Hamiltonian operator. As a direct result of the bi-Hamiltonian structure (59), we can say that the soliton hierarchy (31) is integrable in the Liouville sense:

$$\begin{cases} \{\bar{\mathcal{H}}_{k}, \bar{\mathcal{H}}_{l}\}_{\bar{J}} = \int \left(\frac{\delta\bar{\mathcal{H}}_{k}}{\delta\bar{u}}\right)^{T} \bar{J} \frac{\delta\bar{\mathcal{H}}_{l}}{\delta\bar{u}} dx = 0, \\ \{\bar{\mathcal{H}}_{k}, \bar{\mathcal{H}}_{l}\}_{\bar{M}} = \int \left(\frac{\delta\bar{\mathcal{H}}_{k}}{\delta\bar{u}}\right)^{T} \bar{M} \frac{\delta\bar{\mathcal{H}}_{l}}{\delta\bar{u}} dx = 0, \end{cases}$$
(62)

and

$$[\bar{K}_k, \bar{K}_l] = \bar{K}'_k(\bar{u})[\bar{K}_l] - \bar{K}'_l(\bar{u})[\bar{K}_k] = 0, \quad k, l \ge 0.$$
(63)

4. Concluding remarks

We have introduced a new spectral matrix that is a generalization of the D-Kaup-Newell and Kaup-Newell spectral problems. Integrable couplings were a result of solving zerocurvature equations on the enlarged zero-curvature equation and its reduction. The Hamiltonian structures of the integrable couplings were constructed and presented. The reduced hierarchy of integrable couplings was found to be bi-Hamiltonian and both hierarchies are Liouville integrable. These hierarchies are both new and different. Many new systems of equations have been found to be integrable like the coupled mKdV 36.

This paper uses a relatively new idea of having $\frac{\partial U_1}{\partial \lambda} \neq 0$ in the enlarged spectral matrix \bar{U} where most integrable couplings are generated through perturbations and $\frac{\partial U_1}{\partial \lambda} = 0$. Although the calculations are more difficult and tedious, many new applications may arise from integrable couplings starting from enlarged spectral matrices of this form. One application is the Darboux transformation method for the construction of solutions to integrable couplings [28, 29]. This construction creates new integrable systems associated with non-semisimple Lie algebras and brings us new insightful thoughts to classify integrable systems from an algebraic point of view.
