REFINEMENTS OF SOME NUMERICAL RADIUS INEQUALITIES FOR HILBERT SPACE OPERATORS

MOHAMMAD .W. ALOMARI

Abstract. In this work, some generalizations and refinements inequalities for the numerical radius of the product of Hilbert space operators are proved. New inequalities for the numerical radius of block matrices of Hilbert space operators are also established.

1. INTRODUCTION

Let $\mathscr{B}(\mathscr{H})$ be the Banach algebra of all bounded linear operators defined on a complex Hilbert space $(\mathscr{H}; \langle \cdot, \cdot \rangle)$ with the identity operator $1_{\mathscr{H}}$ in $\mathscr{B}(\mathscr{H})$.

For a bounded linear operator T on a Hilbert space \mathscr{H} , the numerical range $W(T)$ is the image of the unit sphere of $\mathscr H$ under the quadratic form $x \to \langle Tx, x \rangle$ associated with the operator. More precisely,

 $W(T) = \{ \langle Tx, x \rangle : x \in \mathcal{H}, ||x|| = 1 \}.$

Also, the numerical radius is defined to be

$$
w(T) = \sup \{ |\lambda| : \lambda \in W(T) \} = \sup_{\|x\|=1} |\langle Tx, x \rangle|.
$$

The spectral radius of an operator T is defined to be

$$
r(T) = \sup \{ |\lambda| : \lambda \in \text{sp}(T) \}.
$$

We recall that, the usual operator norm of an operator T is defined to be

$$
||T|| = \sup \{ ||Tx|| : x \in H, ||x|| = 1 \},\
$$

and

$$
\ell(T) := \inf \{ ||Tx|| : x \in \mathcal{H}, ||x|| = 1 \}
$$

=
$$
\inf \{ |\langle Tx, y \rangle| : x, y \in \mathcal{H}, ||x|| = ||y|| = 1 \}.
$$

Key words and phrases. Numerical radius, Operator norm, mixed Schwarz inequality.

2 M.W. ALOMARI

It's well known that the numerical radius is not submultiplicative, but it is satisfies $w(TS) \leq 4w(T)w(S)$ for all $T, S \in \mathscr{B}(\mathscr{H})$. In particular if T, S are commute, then $w(TS) \leq 2w(T)w(S)$. Moreover, if T, S are normal then $w(\cdot)$ is submultiplicative $w(TS) \leq w(T)w(S)$. Denote $|T| = (T^*T)^{1/2}$ the absolute value of the operator T. Then we have $w(|T|) = ||T||$. It's convenient to mention that, the numerical radius norm is weakly unitarily invariant; i.e., $w(U^*TU) = w(T)$ for all unitary U . Also, let us not miss the chance to mention the important property that $w(T) = w(T^*)$ and $w(T^*T) = w(T^*)$ for every $T \in \mathscr{B}(\mathscr{H})$.

A popular problem is the following: does the numerical radius of the product of operators commute, i.e., $w(TS) = w(ST)$ for any operators $T, S \in \mathcal{B}(\mathcal{H})$?

This problem has been given serious attention by many authors and in several resources (see $[14]$, for example). Fortunately, it has been shown recently that, for one of such operators must be a multiple of a unitary operator, and we need only to check $w(TS) = w(ST)$ for all rank one operators $S \in \mathcal{B}(\mathcal{H})$ to arrive at the conclusion. This fact was proved by Chien et al. in [\[6\]](#page-16-1). For other related problems involving numerical ranges and radius see $\lceil 6 \rceil$ and $\lceil 7 \rceil$ as well as the elegant work of Li [\[27\]](#page-17-0) and the references therein. For more classical and recent properties of numerical range and radius, see [\[6\]](#page-16-1) [\[7\]](#page-16-2), [\[27\]](#page-17-0) and the comprehensive books [\[4\]](#page-15-0), [\[16\]](#page-16-3) and [\[17\]](#page-16-4).

On the other hand, it is well known that $w(\cdot)$ defines an operator norm on $\mathscr{B}(\mathscr{H})$ which is equivalent to operator norm $\|\cdot\|$. Moreover, we have

$$
\frac{1}{2}||T|| \le w(T) \le ||T|| \tag{1.1}
$$

for any $T \in \mathcal{B}(\mathcal{H})$. The inequality is sharp.

In 2003, Kittaneh $[21]$ refined the right-hand side of (1.1) , where he proved that

$$
w(T) \le \frac{1}{2} \left(\|T\| + \|T^2\|^{1/2} \right) \tag{1.2}
$$

for any $T \in \mathcal{B}(\mathcal{H})$.

After that in 2005, the same author in [\[19\]](#page-16-6) proved that

$$
\frac{1}{4}||A^*A + AA^*|| \le w^2(A) \le \frac{1}{2}||A^*A + AA^*||. \tag{1.3}
$$

The inequality is sharp. This inequality was also reformulated and generalized in [\[13\]](#page-16-7) but in terms of Cartesian decomposition.

In 2007, Yamazaki $[30]$ improved (1.1) by proving that

$$
w(T) \le \frac{1}{2} (||T|| + w(\tilde{T})) \le \frac{1}{2} (||T|| + ||T^2||^{1/2}), \qquad (1.4)
$$

where $T = |T|^{1/2}U|T|^{1/2}$ with unitary U.

In 2008, Dragomir [\[11\]](#page-16-8) used Buzano inequality to improve [\(1.1\)](#page-1-0), where he proved that

$$
w^{2}(T) \le \frac{1}{2} (||T|| + w(T^{2})). \tag{1.5}
$$

This result was also recently generalized by Sattari et al. in [\[29\]](#page-17-2).

This work, is divided into four sections, after this introduction, in Section [2,](#page-2-0) we recall some well-known inequalities for bounded linear operators. In Section [3,](#page-4-0) some generalizations and refinements of the numerical radius inequalities are proved. In Section [4,](#page-11-0) new refinement inequalities for the numerical radius of $n \times n$ Hilbert space operator matrices are established.

2. Lemmas

In order to prove our results we need a sequence of lemmas.

Lemma 1. We have

(1) The Power-Mean inequality

$$
a^{\alpha}b^{1-\alpha} \leq \alpha a + (1 - \alpha) b \leq (\alpha a^{p} + (1 - \alpha) b^{p})^{\frac{1}{p}}, \qquad (2.1)
$$

for all $\alpha \in [0, 1]$, $a, b \ge 0$ and $p \ge 1$.

(2) The Power-Young inequality

$$
ab \le \frac{a^{\alpha}}{\alpha} + \frac{b^{\beta}}{\beta} \le \left(\frac{a^{p\alpha}}{\alpha} + \frac{b^{p\beta}}{\beta}\right)^{\frac{1}{p}}
$$
(2.2)

for all $a, b \ge 0$ and $\alpha, \beta > 1$ with $\frac{1}{\alpha} + \frac{1}{\beta} = 1$ and all $p \ge 1$.

Lemma 2. (The McCarty inequality). Let $A \in \mathcal{B}(\mathcal{H})^+$, then

$$
\langle Ax, x \rangle^p \le \langle A^p x, x \rangle \,, \qquad p \ge 1,\tag{2.3}
$$

for any unit vector $x \in \mathcal{H}$

The mixed Schwarz inequality was introduced in [\[25\]](#page-16-9), as follows:

Lemma 3. Let $A \in \mathcal{B}(\mathcal{H})^+$, then

$$
|\langle Ax, y \rangle|^2 \le \langle |A|^{2\alpha} x, x \rangle \langle |A^*|^{2(1-\alpha)} y, y \rangle, \qquad 0 \le \alpha \le 1. \tag{2.4}
$$

for any vectors $x, y \in \mathscr{H}$

In order to generalize (2.4) , Kittaneh in [\[24\]](#page-16-10) used the following key lemma to prove a generalization of Kato's inequality [\(2.4\)](#page-2-1).

Lemma 4. Let $A, B \in \mathcal{B}(\mathcal{H})^+$. Then $\begin{bmatrix} A & C^* \\ C & B \end{bmatrix}$ is positive in $\mathscr{B}(\mathscr{H}\oplus\mathscr{H})$ if and only if $|\langle Cx, y\rangle|^2 \leq \langle Ax, x\rangle \langle By, y\rangle$ for every vectors $x, y \in \mathcal{H}$.

Indeed, in [\[24\]](#page-16-10) we find that

Lemma 5. Let $A, B \in \mathcal{B}(\mathcal{H})$ such that $|A|B = B^*|A|$. If f and g are nonnegative continuous functions on $[0,\infty)$ satisfying $f(t)g(t) = t$ $(t \geq 0)$, then

$$
|\langle ABx, y \rangle| \le r(B) \|f(|A|)x\| \|g(|A^*|)y\|
$$
 (2.5)

for any vectors $x, y \in \mathcal{H}$.

Clearly, by setting $B = 1_{\mathscr{H}}$ and choosing $f(t) = t^{\alpha}$, $g(t) = t^{1-\alpha}$, then the inequality (2.5) reduces to (2.4) .

The following useful estimate of a spectral radius was also obtained by Kittaneh in [\[20\]](#page-16-11).

Lemma 6. If $A, B \in \mathcal{B}(\mathcal{H})$. Then

$$
r(AB)
$$

\n
$$
\leq \frac{1}{4} \left(\|AB\| + \|BA\| + \sqrt{\left(\|AB\| - \|BA\|\right)^2 + 4m(A,B)} \right), (2.6)
$$

where $m(A, B) := \min \{||A|| ||BAB||, ||B|| ||ABA||\}.$

In some of our results we need the following two fundamental norm estimates, which are:

$$
||A + B||
$$

\n
$$
\leq \frac{1}{2} \left(||A|| + ||B|| + \sqrt{(||A|| - ||B||)^2 + 4 ||A^{1/2} B^{1/2}||^2} \right), (2.7)
$$

and

$$
||A^{1/2}B^{1/2}|| \le ||AB||^{1/2}.
$$
 (2.8)

Both estimates are valid for all positive operators $A, B \in \mathcal{B}(\mathcal{H})$. Also, it should be noted that (2.7) is sharper than the triangle inequality as pointed out by Kittaneh in [\[23\]](#page-16-12).

A new refinement of Cauchy-Schwarz inequality was recently obtained in [\[3\]](#page-15-1), as follows:

Lemma 7. Let $A \in \mathcal{B}(\mathcal{H})^+$, then

$$
|\langle Ax, y \rangle|^{2p} \le [\langle A^p x, x \rangle - \langle |A - \langle Ax, x \rangle 1_{\mathcal{H}}|^p x, x \rangle] \times [\langle A^p y, y \rangle - \langle |A - \langle Ay, y \rangle 1_{\mathcal{H}}|^p y, y \rangle] \le \langle A^p x, x \rangle \langle A^p y, y \rangle
$$
\n(2.9)

for all $p \geq 2$ and every $x, y \in \mathcal{H}$.

3. Numerical Radius Inequalities

Let us begin with the following result.

Theorem 1. Let $A, B \in \mathcal{B}(\mathcal{H})$ such that $|A|B = B^*|A|$. If f, g be nonnegative continuous functions on $[0, \infty)$ satisfying $f(t)g(t) = t$, $(t \geq 0)$. Then

$$
w(AB) \leq \frac{1}{2}r(B) w ((f^2(|A|) + g^2(|A^*|)))
$$

\n
$$
\leq \frac{1}{8} (||B|| + ||B^2||^{1/2}) \{ ||f^2(|A|)|| + ||g^2(|A^*|) ||
$$
\n
$$
+ \sqrt{(||f^2(|A|)|| - ||g^2(|A^*|) ||)^2 + 4 ||f(|A|) g(|A^*|) ||^2} \}.
$$
\n(3.1)

In particular, we have

$$
w(A) \leq \frac{1}{2}w((f^2(|A|) + g^2(|A^*|))).
$$

Proof. Setting $y = x$ in (2.5) , we get

$$
|\langle ABx, x \rangle| \le r (B) \|f (|A|) x\| \|g (|A^*|) x\|
$$

= $r (B) \langle f^2 (|A|) x, x \rangle^{1/2} \langle g^2 (|A^*|) x, x \rangle^{1/2}$
 $\le \frac{1}{2} r (B) (\langle f^2 (|A|) x, x \rangle + \langle g^2 (|A^*|) x, x \rangle)$ by (2.1)
 $= \frac{1}{2} r (B) \langle (f^2 (|A|) + g^2 (|A^*|)) x, x \rangle$

Thus, by taking the supremum over $x \in \mathcal{H}$ we get that

$$
\sup_{\|x\|=1} |\langle ABx, x \rangle| \leq \frac{1}{2} r(B) \sup_{\|x\|=1} \langle (f^2(|A|) + g^2(|A^*|)) x, x \rangle
$$

= $\frac{1}{2} r(B) w ((f^2(|A|) + g^2(|A^*|)))$
 $\left(\leq \frac{1}{2} r(B) ||(f^2(|A|) + g^2(|A^*|)) || \right)$ by (1.1).

which proves the first inequality in (3.1) .

$$
\sup_{\|x\|=1} |\langle ABx, x \rangle| \le \frac{1}{2} r(B) w \left((f^2 (|A|) + g^2 (|A^*|)) \right)
$$

$$
\le \frac{1}{2} r(B) ||(f^2 (|A|) + g^2 (|A^*|))||
$$

The second inequality follows by employing the [\(2.7\)](#page-3-1) on the last inequality above i.e.,

$$
\left\| \left(f^{2}(|A|) + g^{2}(|A^{*}|) \right) \right\| \leq \frac{1}{2} r(B) \left\{ \left\| f^{2}(|A|) \right\| + \left\| g^{2}(|A^{*}|) \right\| + \sqrt{\left(\left\| f^{2}(|A|) \right\| - \left\| g^{2}(|A^{*}|) \right\| \right)^{2} + 4 \left\| f(|A|) g(|A^{*}|) \right\|^2} \right\}
$$

also, by using (2.6) with $A = 1_{\mathscr{H}}$, we get

$$
\sup_{\|x\|=1} |\langle ABx, x \rangle| \le \frac{1}{8} \left(\|B\| + \|B^2\|^{1/2} \right) \{ \|f^2(|A|)\| + \|g^2(|A^*|) \| + \sqrt{\left(\|f^2(|A|)\| - \|g^2(|A^*|) \|\right)^2 + 4 \|f(|A|) g(|A^*|) \|^2} \right\}
$$

and this proves the second inequality in [\(3.1\)](#page-4-1).

 \Box

Corollary 1. Let $A, B \in \mathcal{B}(\mathcal{H})$ such that $|A|B = B^*|A|$. Then,

$$
w(AB) \leq \frac{1}{2}r(B) w \left(\left(|A|^{2\alpha} + |A^*|^{2(1-\alpha)} \right) \right)
$$

\n
$$
\leq \frac{1}{8} \left(\|B\| + \|B^2\|^{1/2} \right) \left\{ \| |A|^{2\alpha} \| + \| |A^*|^{2(1-\alpha)} \| \right\}
$$

\n
$$
+ \sqrt{\left(\| |A|^{2\alpha} \| - \| |A^*|^{2(1-\alpha)} \| \right)^2 + 4 \| |A|^\alpha |A^*|^{1-\alpha} \|^2} \right\}.
$$
\n(3.2)

for all $0 \leq \alpha \leq 1$.

Proof. Setting $f(t) = t^{\alpha}$ and $g(t) = t^{1-\alpha}$, $0 \le \alpha \le 1$, $t \ge 0$ in Theorem [1.](#page-4-2)

Corollary 2. Let $A, B \in \mathcal{B}(\mathcal{H})$ such that $|A|B = B^*|A|$. In particular, we have

$$
w(AB) \le \frac{1}{4} (||B|| + ||B^2||^{1/2}) \cdot (||A|| + ||A^2||^{1/2}) \tag{3.3}
$$

Proof. Setting $\alpha = \frac{1}{2}$ $\frac{1}{2}$ in [\(3.2\)](#page-5-0) we get

$$
w(AB) \leq \frac{1}{2}r(B) w \left(\left(|A|^{2\alpha} + |A^*|^{2(1-\alpha)} \right) \right)
$$

\n
$$
\leq \frac{1}{8} \left(\|B\| + \|B^2\|^{1/2} \right) \{ \|A\| + \|A^*\| \} \qquad \text{(by (2.6) with } A = 1_{\mathcal{H}}\right)
$$

\n
$$
+ \sqrt{\left(\|A\| - \|A^*\| \right)^2 + 4 \left| |A|^{1/2} |A^*|^{1/2} \right|^2}
$$

\n
$$
= \frac{1}{4} \left(\|B\| + \|B^2\|^{1/2} \right) \cdot \left(\|A\| + \|A^2\|^{1/2} \right)
$$

where the last inequality follows from (2.8) and using the fact that $|||A||| = ||A^*|| = ||A||$ and this proves the desired result.

A generalization of Theorem [1](#page-4-2) is given as follows:

Theorem 2. Let $A, B \in \mathcal{B}(\mathcal{H})$ such that $|A|B = B^*|A|$. If f, g be nonnegative continuous functions on $[0, \infty)$ satisfying $f(t)g(t) = t$, $(t \geq 0)$. Then,

$$
w^{p}(AB) \le r^{p}(B) \cdot w\left(\frac{1}{\alpha}f^{\alpha p}(|A|) + \frac{1}{\beta}g^{\beta p}(|A^{*}|)\right)
$$

$$
\le r^{p}(B) \cdot \left\|\frac{1}{\alpha}f^{\alpha p}(|A|) + \frac{1}{\beta}g^{\beta p}(|A^{*}|)\right\|
$$
(3.4)

for all $p \geq 1$, $\alpha \geq \beta > 1$ with $\frac{1}{\alpha} + \frac{1}{\beta} = 1$ and $\beta p \geq 2$. Moreover we have

$$
w^{p}(AB) \leq \frac{1}{2^{p+1}} \cdot \gamma \cdot \left(\|B\| + \|B^{2}\|^{1/2} \right)^{p} \times \left\{ \|f^{\alpha p}(|A|)\| + \|g^{\beta p}(|A^{*}|)\| + \Phi(f, g; A) \right\},
$$
\n(3.5)

where $\Phi(f, g; A) := \sqrt{||f^{\alpha p} (||A||) - ||g^{\beta p} (||A^*||) ||^2 + 4 ||f^{\rho\alpha} (||A||) g^{\rho\beta} (||A^*||) ||^2}$ and $\gamma = \max\{\frac{1}{\alpha}\}$ $\frac{1}{\alpha}$, $\frac{1}{\beta}$ $\frac{1}{\beta}\}$.

Proof. Using the mixed Schwarz inequality (2.5) , we have

$$
\begin{split}\n&\left|\langle ABx, x\rangle\right|^{p} \\
&\leq r^{p}(B) \left\|f\left(|A|\right)x\right\|^{p} \left\|g\left(|A^{*}|\right)x\right\|^{p} \\
&= r^{p}(B) \left\langle f^{2}\left(|A|\right)x, x\right\rangle^{\frac{p}{2}} \left\langle g^{2}\left(|A^{*}|\right)x, x\right\rangle^{\frac{p}{2}} \\
&\leq r^{p}(B) \left[\frac{1}{\alpha} \left\langle f^{2}\left(|A|\right)x, x\right\rangle^{\frac{\alpha p}{2}} + \frac{1}{\beta} \left\langle g^{2}\left(|A^{*}|\right)x, x\right\rangle^{\frac{\beta p}{2}}\right] \qquad \text{(by (2.2))} \\
&\leq r^{p}(B) \left[\frac{1}{\alpha} \left\langle f^{\alpha p}\left(|A|\right)x, x\right\rangle + \frac{1}{\beta} \left\langle g^{\beta p}\left(|A^{*}|\right)x, x\right\rangle\right] \qquad \text{(by (2.3))} \\
&= r^{p}(B) \left\langle \left[\frac{1}{\alpha} f^{\alpha p}\left(|A|\right) + \frac{1}{\beta} g^{\beta p}\left(|A^{*}|\right)\right] x, x\right\rangle.\n\end{split}
$$

Taking the supremum over $x \in \mathcal{H}$, we obtain the first inequality in (3.4) . To obtain the second inequality, by utilizing (1.1) on the first inequality in (3.4) we have

$$
w\left(\frac{1}{\alpha}f^{\alpha p}(|A|) + \frac{1}{\beta}g^{\beta p}(|A^*|)\right)
$$

\n
$$
\leq \left\|\frac{1}{\alpha}f^{\alpha p}(|A|) + \frac{1}{\beta}g^{\beta p}(|A^*|)\right\|
$$

\n
$$
\leq \max\{\frac{1}{\alpha}, \frac{1}{\beta}\}\cdot \|f^{\alpha p}(|A|) + g^{\beta p}(|A^*|)\|
$$

\n
$$
\leq \frac{1}{2}\gamma\left(\|f^{\alpha p}(|A|)\| + \|g^{\beta p}(|A^*|\right)\| \qquad \text{(by (2.7))}
$$

\n
$$
+ \sqrt{\|f^{\alpha p}(|A|)\| - \|g^{\beta p}(|A^*|\)\|^2 + 4\|f^{\beta p/2}(|A|)g^{\beta/2}(|A^*|\)|^2\right)}
$$

\n
$$
\leq \frac{1}{2}\gamma\left(\|f^{\alpha p}(|A|)\| + \|g^{\beta p}(|A^*|\right)\| \qquad \text{(by (2.8))}
$$

\n
$$
+ \sqrt{\|f^{\alpha p}(|A|)\| - \|g^{\beta p}(|A^*|\)|^2 + 4\|f^{\beta \alpha}(|A|)g^{\beta \beta}(|A^*|\)|}\right).
$$

Hence, by substituting all in [\(3.4\)](#page-6-0) we get

$$
w^{p}(AB) \le r^{p}(B) \cdot w\left(\frac{1}{\alpha}f^{\alpha p}(|A|) + \frac{1}{\beta}g^{\beta p}(|A^{*}|)\right)
$$

\n
$$
\le r^{p}(B) \cdot \left\|\frac{1}{\alpha}f^{\alpha p}(|A|) + \frac{1}{\beta}g^{\beta p}(|A^{*}|)\right\|
$$

\n
$$
\le \frac{1}{2^{p+1}} \cdot \gamma \cdot \left(||B|| + ||B^{2}||^{1/2}\right)^{p}
$$

\n
$$
\times \left\{||f^{\alpha p}(|A|)|| + ||g^{\beta p}(|A^{*}|)|| + \Phi(f, g; A)\right\},
$$

where the last inequality follows from (2.6) with $A = 1_{\mathcal{H}}$ and this is yield the required result, where $\Phi(f, g; A)$ is defined above. \Box

A generalization of Sattari et al. inequality which was obtained in [\[29\]](#page-17-2) is given as follows:

Theorem 3. Let $A, B \in \mathcal{B}(\mathcal{H})$ such that

 (1) $AB = BA$, and (2) | $A^2|B^2 = (B^2)^*|A^2|.$

If f, g be nonnegative continuous functions on $[0, \infty)$ satisfying $f(t)g(t) =$ $t, (t \geq 0)$. Then,

$$
w^{2p} (AB) \le \frac{1}{2} ||AB||^{2p} + \frac{\gamma}{2^{p+2}} \left(||B^2|| + ||B^4||^{1/2} \right)^p
$$

$$
\times \left\{ ||f^{\alpha p} (|A|) || + ||g^{\beta p} (|A^*|) || + \Phi (f, g; A) \right\} (3.6)
$$

where $\Phi(f, g; A)$ is defined in Theorem [2,](#page-6-1) and $\gamma = \max\{\frac{1}{\alpha}\}$ $\frac{1}{\alpha}, \frac{1}{\beta}$ $\frac{1}{\beta}\},$ for all $p \ge 1, \ \alpha \ge \beta > 1$ with $\frac{1}{\alpha} + \frac{1}{\beta} = 1$ and $\beta p \ge 2$.

Proof. Let us first note that the Dragomir refinement of Cauchy-Schwarz inequality reads that [\[12\]](#page-16-13):

$$
|\langle x, y \rangle| \le |\langle x, e \rangle \langle e, y \rangle| + |\langle x, y \rangle - \langle x, e \rangle \langle e, y \rangle| \le ||x|| ||y||
$$

for all $x, y, e \in \mathcal{H}$ with $||e|| = 1$.

It's easy to deduce the inequality

$$
|\langle x, e \rangle \langle e, y \rangle| \le \frac{1}{2} (|\langle x, y \rangle| + ||x|| ||y||).
$$
 (3.7)

Setting $e = u$, $x = ABu$, $y = B^*A^*u$ in [\(3.7\)](#page-8-0) and using the Power-Mean inequality (2.1) we get

$$
|\langle ABu, u \rangle \langle u, B^*A^*u \rangle| \le \frac{1}{2} \left(|\langle ABu, B^*A^*u \rangle| + ||Au|| \, ||B^*A^*u|| \right)
$$

$$
\le \left(\frac{|\langle (AB)^2u, u \rangle|^p + ||Au||^p \, ||A^*u||^p}{2^p} \right)^{\frac{1}{p}},
$$

since A, B are commutative so that $(AB)^2 = A^2B^2$. Equivalently, we may write

$$
|\langle ABu, u \rangle|^{2p} \le \frac{1}{2} \left(\left| \langle (AB)^2u, u \rangle \right|^p + \|ABu\|^p \, \|B^*A^*u\|^p \right). \tag{3.8}
$$

Now, using the mixed Schwarz inequality (2.5) by replacing A, B by A^2, B^2 ; respectively, then we have

$$
\left| \langle (AB)^2 x, x \rangle \right|^p
$$

\n
$$
\leq r^p (B^2) \| f (|A^2|) x \| ^p \| g (| (A^2)^*|) x \| ^p
$$

\n
$$
= r^p (B^2) \langle f^2 (|A^2|) x, x \rangle^{\frac{p}{2}} \langle g^2 (|(A^2)^*|) x, x \rangle^{\frac{p}{2}}
$$

\n
$$
\leq r^p (B^2) \left[\frac{1}{\alpha} \langle f^2 (|A^2|) x, x \rangle^{\frac{\alpha_p}{2}} + \frac{1}{\beta} \langle g^2 (|(A^2)^*|) x, x \rangle^{\frac{\beta_p}{2}} \right] \qquad \text{(by (2.2))}
$$

\n
$$
\leq r^p (B^2) \left[\frac{1}{\alpha} \langle f^{\alpha p} (|A^2|) x, x \rangle + \frac{1}{\beta} \langle g^{\beta p} (|(A^2)^*|) x, x \rangle \right] \qquad \text{(by (2.3))}
$$

\n
$$
= r^p (B^2) \left\langle \left[\frac{1}{\alpha} f^{\alpha p} (|A^2|) + \frac{1}{\beta} g^{\beta p} (|(A^2)^*|) \right] x, x. \right\rangle.
$$

Substituting in [\(3.8\)](#page-8-1) and taking the supremum over $x \in \mathcal{H}$, and finally proceed as in the proof of Theorem [2](#page-6-1) we get the desired inequality. We shall omit the details. \Box

Corollary 3. Under the assumptions of Theorem [3,](#page-8-2) we have

$$
w^{2}(AB) \le \frac{1}{2} ||AB||^{2} + \frac{1}{8} (||B^{2}|| + ||B^{4}||^{1/2}) (||A|| + ||A^{2}||^{1/2})
$$

Theorem 4. Let $A, B \in \mathcal{B}(\mathcal{H})^+$ such that AB is contraction. Then

$$
w^{2p}(AB) \le |||A^p|| - \ell (|||(A - ||A||)|^p||)|
$$

$$
\times [||B^p|| - \ell (|||(B - ||B||)|^p||)] \quad (3.9)
$$

for all $p \geq 2$. In particular, we have

$$
w^{2p}(A) \le ||A^p|| - \ell (|||(A - ||A||)|^p||)
$$

for every positive contraction A.

Proof. Let us first prove that $T =$ $\begin{bmatrix} A & B^*A^* \\ AB & B \end{bmatrix} \in \mathcal{B}(\mathcal{H} \oplus \mathcal{H})$ is positive. Since AB is contraction, then by Proposition I.3.5 ([\[4\]](#page-15-0), p. 10), $\begin{bmatrix} I & B^*A^* \\ AB & I \end{bmatrix}$ is positive. Thus, $T =$ $\left[\begin{array}{cc} A & B^*A^* \\ AB & B \end{array} \right] =$ $A \quad 0$ $0 \quad B$ 1 $+$ $\begin{bmatrix} 0 & B^*A^* \end{bmatrix}$ AB 0 1

is positive since $A, B \geq 0$.

Now, let
$$
\mathbf{x} = \begin{pmatrix} x_1 \\ x_2 \end{pmatrix}
$$
 in $\mathcal{H} \oplus \mathcal{H}$, such that $||x_1||^2 + ||x_2||^2 = 1$.

Since AB is contraction then $\begin{bmatrix} A & B^*A^* \\ AB & B \end{bmatrix}$ is positive. Therefore, by setting $C = AB$ in Lemma [4,](#page-3-4) and this implies that

$$
|\langle ABx_1, x_2\rangle|^{2p} \le \langle Ax_1, x_1\rangle^p \langle Bx_2, x_2\rangle^p
$$
\n(3.10)

If we wish setting $x_1 = x_2$ and employing the first inequality in Lemma [7,](#page-4-3) we get

$$
|\langle ABx_1, x_2 \rangle|^{2p} \le \langle Ax_1, x_1 \rangle^p \langle Bx_2, x_2 \rangle^p
$$

\n
$$
\le (\langle A^p x_1, x_1 \rangle - \langle |A - \langle Ax_1, x_1 \rangle 1_{\mathcal{H}}|^p x_1, x_1 \rangle)
$$

\n
$$
\times (\langle B^p x_2, x_2 \rangle - \langle |B - \langle Bx_2, x_2 \rangle 1_{\mathcal{H}}|^p x_2, x_2 \rangle)
$$

\n
$$
\le \left(\langle A^p x_1, x_1 \rangle - \langle |A - \sup_{\|x_1\| = 1} \langle Ax_1, x_1 \rangle 1_{\mathcal{H}}|^p x_1, x_1 \rangle \right)
$$

\n
$$
\times \left(\langle B^p x_2, x_2 \rangle - \langle |B - \sup_{\|x_2\| = 1} \langle Bx_2, x_2 \rangle 1_{\mathcal{H}}|^p x_2, x_2 \rangle \right)
$$

Taking the supremum over $x_1, x_2 \in \mathcal{H}$, we observe that

$$
\sup_{\|x_1\|=\|x_2\|=1} |\langle ABx_1, x_2\rangle|^{2p}
$$
\n
$$
\leq \sup_{\|x_1\|=\|x_2\|=1} \left\{ \left[\langle A^p x_1, x_1 \rangle - \langle \left| A - \sup_{\|x_1\|=1} \langle Ax_1, x_1 \rangle 1_{\mathcal{H}} \right|^p x_1, x_1 \rangle \right] \right\}
$$
\n
$$
\times \left[\langle B^p x_2, x_2 \rangle - \langle \left| B - \sup_{\|x_2\|=1} \langle Bx_2, x_2 \rangle 1_{\mathcal{H}} \right|^p x_2, x_2 \rangle \right] \right\}
$$
\n
$$
\leq \sup_{\|x_1\|=1} \langle A^p x_1, x_1 \rangle - \inf_{\|x_1\|=1} \langle \left| A - \sup_{\|x_1\|=1} \langle Ax_1, x_1 \rangle 1_{\mathcal{H}} \right|^p x_1, x_1 \rangle
$$
\n
$$
\times \sup_{\|x_1\|=1} \langle B^p x_2, x_2 \rangle - \inf_{\|x_2\|=1} \langle \left| B - \sup_{\|x_2\|=1} \langle Bx_2, x_2 \rangle 1_{\mathcal{H}} \right|^p x_2, x_2 \rangle
$$
\n
$$
= [\|A^p\| - \ell \left(\| |(A - \|A\|) \|^p \|\right)] \times [\|B^p\| - \ell \left(\| |(B - \|B\|) \|^p \|\right)]
$$
\nwhich completes the proof.

As we have seen, the positivity assumption of $T =$ $\left[\begin{array}{cc} A & B^*A^* \\ AB & B \end{array} \right]$ in Theorem [4](#page-9-0) is essential. A more general case could be obtained for general operators A, B without any contractivity assumptions.

Corollary 4. Let $A, B \in \mathcal{B}(\mathcal{H})^+$ such that $T =$ $\left[\begin{array}{cc} A & C^* \\ C & B \end{array}\right]$ is positive. Then

$$
w^{2p}(C)
$$

\n
$$
\leq [||A^p|| - \ell (|||(A - ||A||)|^p||)] \times [||B^p|| - \ell (|||(B - ||B||)|^p||)]
$$
 (3.11)

for all $p \geq 2$. In particular, we have

$$
w^{2p}(C) \le ||A^p|| - \ell (|||(A - ||A||)|^p||).
$$

Moreover, in special case for $C = A$, we have

$$
w^{2p}(A) \le |||A^p|| - \ell (|||(A - ||A||)|^p||).
$$

Proof. The proof follows from Lemma [5](#page-3-5) and Theorem [4.](#page-9-0) \Box

Corollary 5. Let $T \in \mathcal{B}(\mathcal{H})$ be any operator. Then

$$
w^{2p}(T) \le |||T^p|| - \ell(|||(T - ||T||)|^p||)|
$$

$$
\times [||(T^*)^p|| - \ell(|||(T^* - ||T||)|^p||)] \quad (3.12)
$$

for all $p \geq 2$.

Proof. Since $\begin{bmatrix} |T| & T^* \\ T & |T^* \end{bmatrix}$ T | T^* | $\Big] \in \mathscr{B}(\mathscr{H} \oplus \mathscr{H})$ is positive (see[\[24\]](#page-16-10)), then the result follows from Corollary [4.](#page-11-1) \Box

4. REFINEMENTS OF NUMERICAL RADIUS INEQUALITIES FOR $n \times n$ matrix Operators

Several numerical radius type inequalities improving and refining the inequality [\(1.1\)](#page-1-0) have been recently obtained by many other authors see for example $[2]$, $[9]$, $[10]$, $[21]$ – $[23]$, $[28]$. Among others, three important facts concerning the Numerical radius inequalities of $n \times n$ Operator matrices are obtained by different authors which are grouped together, as follows:

Let
$$
A = [A_{ij}] \in \mathcal{B}(\bigoplus_{i=1}^{n} \mathcal{H}_i)
$$
 such that $A_{ij} \in \mathcal{B}(\mathcal{H}_j, \mathcal{H}_i)$. Then
\n
$$
w(A) \leq \begin{cases} \omega\left(\begin{bmatrix} t_{ij}^{(1)} \end{bmatrix}\right), & \text{Hou & \text{Du in [18]} \\ \omega\left(\begin{bmatrix} t_{ij}^{(2)} \end{bmatrix}\right), & \text{BaniDomi & \text{Kittaneh in [5]} ; \quad (4.1) \\ \omega\left(\begin{bmatrix} t_{ij}^{(3)} \end{bmatrix}\right), & \text{AbuOmar & \text{Kittaneh in [1]} \end{cases}
$$

where

$$
t_{ij}^{(1)} = \omega \left(\left[\|T_{ij}\| \right] \right), \qquad t_{ij}^{(2)} = \begin{cases} \frac{1}{2} \left(\|T_{ii}\| + \|T_{ii}^2\|^{1/2} \right), & i = j \\ \|T_{ij}\|, & i \neq j \end{cases}
$$

and

$$
t_{ij}^{(3)} = \begin{cases} \omega(T_{ii}), & i = j \\ \|T_{ij}\|, & i \neq j \end{cases}
$$

In the next result we refine the latest bound $t_{ij}^{(3)}$ by adding a third part; which is the numerical range of the sub-operators on the opposite diagonal.

Theorem 5. Let $A = [A_{ij}] \in \mathcal{B}(\bigoplus_{i=1}^n \mathcal{H}_i)$ such that $A_{ij} \in \mathcal{B}(\mathcal{H}_j, \mathcal{H}_i)$, and f, g be as in Lemma $5.$ Then

$$
w(A) \le w([a_{ij}]), \tag{4.2}
$$

.

where

$$
a_{ij} = \begin{cases} w(A_{ij}), & j = i \text{ and } j \neq n-i+1 \\ w(A_{ij}), & j = n-i+1 \text{ and } j \neq i \\ ||A_{ij}||, & j \neq n-i+1 \text{ and } j \neq i \end{cases}.
$$

Proof. Let $x = \begin{bmatrix} x_1 & x_2 & \cdots & x_n \end{bmatrix}^T \in \bigoplus_{i=1}^n \mathcal{H}_i$ with $||x|| = 1$. For simplicity setting $k_i = n - i + 1$, then we have

$$
|\langle Ax, x \rangle| = \left| \sum_{i,j=1}^{n} \langle A_{ij}x_j, x_i \rangle \right|
$$

\n
$$
\leq \sum_{i,j=1}^{n} |\langle A_{ij}x_j, x_i \rangle|
$$

\n
$$
\leq \sum_{i=1}^{n} |\langle A_{ii}x_i, x_i \rangle| + \sum_{i=1}^{n} |\langle A_{k_ik_i}x_{k_i}, x_{k_i} \rangle| + \sum_{j \neq i, k_i}^{n} |\langle A_{ij}x_j, x_i \rangle|
$$

\n
$$
\leq \sum_{i=1}^{n} \omega(A_{ii}) ||x_i||^2 + \sum_{i=1}^{n} \omega(A_{k_ik_i}) ||x_{k_i}||^2 + \sum_{j \neq i}^{n} ||A_{ij}|| ||x_i|| ||x_j||
$$

\n
$$
\leq \sum_{i=1}^{n} a_{ij} ||x_i|| ||x_j||
$$

\n
$$
= \langle [a_{ij}] y, y \rangle
$$

where $y = (||x_1|| ||x_2|| \cdots ||x_n||)^T$. Taking the supremum over $x \in \bigoplus \mathscr{H}_i$, we obtain the desired result. 14 M.W. ALOMARI

Corollary 6. If
$$
\mathbf{A} = \begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}
$$
 in $\mathcal{B}(\mathcal{H}_1 + \mathcal{H}_2)$, then
\n
$$
w\left(\begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix} \right) \leq \frac{1}{2} (w(A_{11}) + w(A_{22}) + \sqrt{(w(A_{11}) - w(A_{22}))^2 + (w(A_{12}) + w(A_{21}))^2})
$$

Proof. From Theorem [5,](#page-12-0) we have

$$
w\left(\begin{bmatrix} A_{11} & A_{12} \\ A_{21} & A_{22} \end{bmatrix}\right) \leq w\left(\begin{bmatrix} w(A_{11}) & w(A_{12}) \\ w(A_{21}) & w(A_{22}) \end{bmatrix}\right)
$$

= $\frac{1}{2}r\left(\begin{bmatrix} w(A_{11}) & w(A_{12}) + w(A_{21}) \\ w(A_{21}) + w(A_{12}) & w(A_{22}) \end{bmatrix}\right)$
= $\frac{1}{2}(w(A_{11}) + w(A_{22}) + \sqrt{(w(A_{11}) - w(A_{22}))^2 + (w(A_{12}) + w(A_{21}))^2})$

which proves the result. \Box

Using the fact that for any $n \times n$ matrix $A = [A_{ij}]$ such that $A_{ij} \geq 0$. Then $w(A) \leq r \left(\frac{[A_{ij}] + [A_{ji}]}{2} \right)$ 2), we may state Theorem 5 as follows:

Corollary 7. Let $A = [A_{ij}] \in \mathscr{B}(\bigoplus_{i=1}^n \mathscr{H}_i)$ and f, g be as in Lemma [5.](#page-3-5) Then

$$
w(A) \le r([b_{ij}]) \tag{4.4}
$$

where

$$
b_{ij} = \begin{cases} w(A_{ij}), & j = i \text{ and } j \neq n - i + 1 \\ \frac{1}{2} (w(A_{ij}) + w(A_{ji})), & j = n - i + 1 \text{ and } j \neq i \\ \frac{1}{2} (\|A_{ij}\| + \|A_{ji}\|), & j \neq i, n - i + 1 \end{cases}
$$

Theorem 6. Let $A = [A_{ij}] \in \mathscr{B}(\bigoplus_{i=1}^n \mathscr{H}_i)$ and f, g be as in Lemma [5.](#page-3-5) Then

$$
w(A) \le w([c_{ij}]), \tag{4.5}
$$

where

$$
c_{ij} = \begin{cases} \frac{1}{2} ||f^2 (|A_{ii}|) + g^2 (|A_{ii}^*|) ||, & j = i \text{ and } j \neq n - i + 1 \\ \frac{1}{2} ||f^2 (|A_{ij}|) + g^2 (|A_{ij}^*|) ||, & j = n - i + 1 \text{ and } j \neq i \\ ||A_{ij}||, & j \neq i, n - i + 1 \end{cases}
$$

Proof. Let $x = \begin{bmatrix} x_1 & x_2 & \cdots & x_n \end{bmatrix}^T \in \bigoplus_{i=1}^n \mathcal{H}_i$ with $||x|| = 1$. For simplicity setting $k_i = n - i + 1$, then we have

$$
\begin{split}\n\langle Ax, x \rangle &= \left| \sum_{i,j=1}^{n} \langle A_{ij} x_{j}, x_{i} \rangle \right| \\
&\leq \sum_{i,j=1}^{n} |\langle A_{ij} x_{j}, x_{i} \rangle| \\
&\leq \sum_{i=1}^{n} |\langle A_{ii} x_{i}, x_{i} \rangle| + \sum_{i=1}^{n} |\langle A_{k_{i}k_{i}} x_{k_{i}}, x_{k_{i}} \rangle| + \sum_{j \neq i}^{n} |\langle A_{ij} x_{j}, x_{i} \rangle| \\
&\leq \sum_{i=1}^{n} \langle f^{2} (|A_{ii}|) x_{i}, x_{i} \rangle^{1/2} \langle g^{2} (|A_{ii}^{*}|) x_{i}, x_{i} \rangle^{1/2} \\
&\quad + \sum_{i=1}^{n} \langle f^{2} (|A_{k_{i}k_{i}}|) x_{k_{i}}, x_{k_{i}} \rangle^{1/2} \langle g^{2} (|A_{k_{i}k_{i}}^{*}|) x_{k_{i}}, x_{k_{i}} \rangle^{1/2} \\
&\quad + \sum_{j \neq i}^{n} |\langle A_{ij} x_{j}, x_{i} \rangle| \\
&\leq \frac{1}{2} \left[\sum_{i=1}^{n} \langle f^{2} (|A_{ii}|) x_{i}, x_{i} \rangle + \langle g^{2} (|A_{ii}^{*}|) x_{i}, x_{i} \rangle \right] \\
&\quad + \frac{1}{2} \left[\sum_{i=1}^{n} \langle f^{2} (|A_{k_{i}k_{i}}|) x_{k_{i}}, x_{k_{i}} \rangle + \langle g^{2} (|A_{k_{i}k_{i}}^{*}|) x_{k_{i}}, x_{k_{i}} \rangle \right] \\
&\quad + \sum_{j \neq i}^{n} |\langle A_{ij} x_{j}, x_{i} \rangle| \\
&\quad + \sum_{j \neq i}^{n} |\langle A_{ij} x_{j}, x_{i} \rangle| \\
\end{split}
$$

$$
\leq \frac{1}{2} \sum_{i=1}^{n} \left\langle \left[f^{2} \left(|A_{ii}| \right) + g^{2} \left(|A_{ii}^{*}| \right) \right] x_{i}, x_{i} \right\rangle
$$

+
$$
\frac{1}{2} \sum_{i=1}^{n} \left\langle \left[f^{2} \left(|A_{k_{i}k_{i}}| \right) + g^{2} \left(|A_{k_{i}k_{i}}^{*}| \right) \right] x_{k_{i}}, x_{k_{i}} \right\rangle
$$

+
$$
\sum_{j \neq i}^{n} \left| \left\langle A_{ij} x_{j}, x_{i} \right\rangle \right|
$$

=
$$
\left\langle [c_{ij}] y, y \right\rangle
$$

where $y = (||x_1|| ||x_2|| \cdots ||x_n||)^T$. Taking the supremum over $x \in \bigoplus \mathscr{H}_i$, we obtain the desired result.

As we did in Corollary [7](#page-13-0) we may restate Theorem [6](#page-13-1) in terms of spectral radius as follows:

Corollary 8. Let $A = [A_{ij}] \in \mathscr{B}(\bigoplus_{i=1}^n \mathscr{H}_i)$ and f, g be as in Lemma [5.](#page-3-5) Then

$$
w(A) \le r([d_{ij}]), \tag{4.6}
$$

where

$$
d_{ij} = \begin{cases} \frac{1}{2} || f^{2} (|A_{ij}|) + g^{2} (|A_{ij}^{*}|) ||, & j = i \text{ and } j \neq n - i + 1 \\ \frac{1}{4} [|| f^{2} (|A_{ij}|) + g^{2} (|A_{ij}^{*}|) || \\ & + || f^{2} (|A_{ji}|) + g^{2} (|A_{ji}^{*}|) ||], & j = n - i + 1 \text{ and } j \neq i \\ \frac{1}{2} (||A_{ij}|| + ||A_{ji}||), & j \neq i, n - i + 1 \end{cases}
$$

Acknowledgment: The author wish to thank the referee for his fruitful comments and careful reading of the original manuscript of this work that have implemented the final version of this work.
