# An application of Baker's method to the Jeśmanowicz' conjecture on primitive Pythagorean triples 

Maohua Le

17 October 2018

#### Abstract

Let $m, n$ be positive integers such that $m>n, \operatorname{gcd}(m, n)=1$ and $m \not \equiv n \bmod 2$. In 1956, L. Jeśmanowicz [6] conjectured that the equation $\left(m^{2}-n^{2}\right)^{x}+(2 m n)^{y}=\left(m^{2}+n^{2}\right)^{z}$ has only the positive integer solution $(x, y, z)=(2,2,2)$. This problem is not yet solved. In this paper, combining a lower bound for linear forms in two logarithms due to M. Laurent $[7$ with some elementary methods, we prove that if $m n \equiv 2 \bmod 4$ and $m>30.8 n$, then Jeśmanowicz' conjecture is true.

## 1 Introduction

Let $\mathbb{N}$ be the set of positive integers. Let $m, n$ be positive integers such that $m>n, \operatorname{gcd}(m, n)=1$ and $m \not \equiv n \bmod 2$. It is well known that the triple $\left(m^{2}-n^{2}, 2 m n, m^{2}+n^{2}\right)$ is a primitive Pythagorean triple with $\left(m^{2}-n^{2}\right)^{2}+(2 m n)^{2}=\left(m^{2}+n^{2}\right)^{2}$. In 1956 L. Jeśmanowicz [6] conjectured that the equation

$$
\begin{equation*}
\left(m^{2}-n^{2}\right)^{x}+(2 m n)^{y}=\left(m^{2}+n^{2}\right)^{z}, x, y, z \in \mathbb{N} \tag{1.1}
\end{equation*}
$$

has only the solution $(x, y, z)=(2,2,2)$. This problem is not solved yet.
For over twenty years, many papers have investigated Jeśmanowicz' conjecture for the case that $m n \equiv$ $2 \bmod 4$. In this respect, Jeśmanowicz' conjecture is true in the following cases:
(i) (M.-H. Le [8]) $m n \equiv 2 \bmod 4$ and $m^{2}+n^{2}$ is an odd prime power.
(ii) (Z.-F. Cao [1]) $(m, n) \equiv(5,2) \bmod 8$.
(iii) (M.-J. Deng and D.-M. Huang [3]) $m n \equiv(2,3) \bmod 4$ and either $m+n \not \equiv 1 \bmod 16$ or $y>1$.
(iv) (M.-M. Ma and Y.-G. Chen [10]) $m n \equiv 2 \bmod 4$ and $y>1$.
(v) (K. Takakuwa and Y. Asaeda [14]) $m \equiv 2 \bmod 4, n=3$ and $m$ satisfies some conditions.
(vi) (Y.-D. Guo and M.-H. Le [4]) $m \equiv 2 \bmod 4, n=3$ and $m>6000$.
(vii) (K. Takakuwa [13]) $m \equiv 2 \bmod 4$ and $n \in\{3,7,11,15\}$.
(viii) (N. Terai [15]) $n=2$.
(ix) (M.-J. Deng and J. Guo [2]) $n \equiv 2 \bmod 4$ and $n<600$.
(x) (M.-H. Le [9]) $(m, n) \equiv(2,3) \bmod 4$ and $m>81 n$.
(xi) (T. Miyazaki and N. Terai [11) $n \equiv 2 \bmod 4, m>72 n$ and the divisors of $n$ satisfy some conditions.
(xii) (P.-Z. Yuan and Q. Han [16) $m n \equiv 2 \bmod 4, m>72 n$ and the divisors of $m, n$ satisfy some conditions.

In this paper, combining a lower bound for linear forms in two logarithms due to M. Laurent [7] with some elementary methods, we improve the results of [9, [11 and [16] as follows:

Theorem 1.1. If $m n \equiv 2 \bmod 4$ and $m>30.8 n$, then Jeśmanowicz' conjecture is true.

## 2 Preliminaries

Lemma 2.1 ([2]). If $n \equiv 2 \bmod 4$ and $n<600$ then Jeśmanowicz' conjecture is true.
Lemma 2.2 (Corollary 1.1 of [16]). If $m \equiv 2 \bmod 4, n \not \equiv 1 \bmod 8$ and $n<85$, then Jeśmanowicz' conjecture is true.

Lemma 2.3 ( $\mathbf{5}$ ). If $m n \equiv 2 \bmod 4$ and $m+n$ has a prime divisor $p$ with $p \not \equiv 1 \bmod 16$, then Jeśmanowicz' conjecture is true.

Lemma 2.4. If $m n \equiv 2 \bmod 4, m>30.8 n$ and (1.1) has a solution $(x, y, z) \neq(2,2,2)$, then $m^{2}+n^{2}>$ $m^{2}-n^{2} \geq 2704$.

Proof. By Lemma 2.3, if $m n \equiv 2 \bmod 4$ and (1.1) has a solution $(x, y, z)$ with $(x, y, z) \neq(2,2,2)$, then every prime divisor $p$ of $m+n$ satisfies $p \equiv 1 \bmod 16$. This implies that $m+n \equiv 1 \bmod 16$. Hence, we have $m+n \equiv 1 \bmod 4$ and $(m, n) \equiv(2,3)$ or $(3,2) \bmod 4$. Therefore, if $m \equiv 2 \bmod 4$, then $n \equiv 3 \bmod 4$ and

$$
\begin{equation*}
n \geq 85 . \tag{2.1}
\end{equation*}
$$

Similarly, by Lemma 2.1, (2.1) holds if $n \equiv 2 \bmod 4$. Thus, since $m>30.8 n$, we get from (2.1) that

$$
\begin{equation*}
m^{2}+n^{2}>m^{2}-n^{2} \geq m+n>31.8 n \geq 31.8 \times 85=2703 . \tag{2.2}
\end{equation*}
$$

Lemma 2.5 ([15]). If $m^{2}+n^{2} \equiv 1 \bmod 2 m n$, then Jeśmanowicz' conjecture is true.
Lemma 2.6 (10]). If $m n \equiv 2 \bmod 4$ and (1.1) has a solution $(x, y, z)$ with $(x, y, z) \neq(2,2,2)$, then the solution satisfies $x \equiv 0 \bmod 2, y=1$ and $z \equiv 1 \bmod 2$.

Lemma 2.7. Let $a_{1}, a_{2}, b_{1}, b_{2}$ be positive integers such that $\min \left\{a_{1}, a_{2}\right\}>1$ and $\operatorname{gcd}\left(a_{1}, a_{2}\right)=1$. Further let $\Lambda=b_{1} \log \left(a_{1}\right)-b_{2} \log \left(a_{2}\right)$. Let $\rho$ and $\mu$ be real numbers with $\rho>1$ and $1 / 3 \leq \mu \leq 1$. Further let

$$
\begin{equation*}
\delta=\frac{1}{2}\left(1+2 \mu-\mu^{2}\right), \lambda=\delta \log (\rho) . \tag{2.3}
\end{equation*}
$$

Then

$$
\begin{equation*}
\log |\Lambda| \geq-C A_{1} A_{2} B^{2}-\sqrt{\omega \theta} B-\log \left(C^{\prime} A_{1} A_{2} B^{2}\right) \tag{2.4}
\end{equation*}
$$

where

$$
\begin{gather*}
A_{j} \geq \max \left\{1,(\rho+1) \log \left(a_{j}\right)\right\}, A_{1} A_{2} \geq \lambda^{2}, j=1,2  \tag{2.5}\\
B \geq \log (\rho)+\max \left\{\frac{\log (2)}{2}, \lambda, 1.81+\log (\lambda)+\log \left(\frac{b_{1}}{A_{2}}+\frac{b_{2}}{A_{1}}\right)\right\}  \tag{2.6}\\
\omega=2+2\left(1+\frac{1}{4 H^{2}}\right)^{1 / 2}, \theta=\frac{1}{2 H}+\left(1+\frac{1}{4 H^{2}}\right)^{1 / 2}, H=\frac{B}{\lambda}  \tag{2.7}\\
C=\frac{C_{0} \mu}{\lambda^{3} \delta}, C^{\prime}=\frac{\sqrt{C_{0} \omega \theta}}{\lambda^{3}}  \tag{2.8}\\
C_{0}=\left(\frac{\omega}{6}+\frac{1}{2}\left(\frac{\omega^{2}}{9}+\frac{8 \lambda \omega^{5 / 4} \theta^{1 / 4}}{3 \sqrt{A_{1} A_{2} H}}+\frac{4}{3}\left(\frac{1}{A_{1}}+\frac{1}{A_{2}}\right) \frac{\lambda \omega}{H}\right)^{1 / 2}\right)^{2} \tag{2.9}
\end{gather*}
$$

Proof. This lemma is the special case of Theorem 2 of [7] for $\gamma_{1}$ and $\gamma_{2}$ coprime positive integers.
Lemma 2.8. Under the assumptions of Lemma 2.7, if $\min \left\{a_{1}, a_{2}\right\} \geq 2704$ and $b_{1} / A_{2}>b_{2} / A_{1}>240$, then

$$
\begin{equation*}
\log |\Lambda|>-14.8365 \log \left(a_{1}\right) \log \left(a_{2}\right)\left(1.8248+\log \left(\frac{b_{1}}{\log \left(a_{2}\right)}+\frac{b_{2}}{\log \left(a_{1}\right)}\right)\right)^{2} \tag{2,.10}
\end{equation*}
$$

Proof. By Lemma 2.7, we may choose parameters

$$
\begin{equation*}
\rho=e^{1.575}, \mu=\frac{1}{3} \tag{2.11}
\end{equation*}
$$

By (2.3) and (2.11), we have

$$
\begin{equation*}
\delta=\frac{7}{9}, \lambda=1.225 \tag{2.12}
\end{equation*}
$$

Since $\min \left\{a_{1}, a_{2}\right\}>2703$, by (2.5), (2.11) and (2.12), we can set

$$
\begin{equation*}
A_{j}=5.8314 \log \left(a_{j}\right), j=1,2 \tag{2.13}
\end{equation*}
$$

Hence, by (2.13), we have

$$
\begin{equation*}
A_{j}>46.0803, j=1,2 \tag{2.14}
\end{equation*}
$$

By (2.6), (2.11) and (2.12), we can set

$$
\begin{equation*}
B=3.5880+\log \left(\frac{b_{1}}{A_{2}}+\frac{b_{2}}{A_{1}}\right) . \tag{2.15}
\end{equation*}
$$

Since $b_{1} / A_{2}>b_{2} / A_{1}>240$, by (2.15) and (2.7), we have

$$
\begin{equation*}
B>9.7617 \tag{2.16}
\end{equation*}
$$

and

$$
\begin{equation*}
H>7.9688 \tag{2.17}
\end{equation*}
$$

Therefore, by (2.7) and (2.17), we get

$$
\begin{equation*}
\omega<4.0040, \theta<1.0648 \tag{2.18}
\end{equation*}
$$

Further, by $(2.9),(2.12),(2.14),(2.17)$ and (2.18), we have

$$
\begin{equation*}
C_{0}<1.8706 \tag{2.19}
\end{equation*}
$$

and by (2.8), we get

$$
\begin{equation*}
C<0.4361, C^{\prime}<2.0829 \tag{2.20}
\end{equation*}
$$

From (2.4) and (2.20), we have

$$
\begin{equation*}
\log |\Lambda|>-\left(0.4361+\frac{\sqrt{\omega \theta}}{A_{1} A_{2} B}+\frac{\log \left(2.0829 A_{1} A_{2} B^{2}\right)}{A_{1} A_{2} B^{2}}\right) A_{1} A_{2} B^{2} \tag{2.21}
\end{equation*}
$$

By (2.14), (2.16) and (2.18), we get

$$
\begin{equation*}
\frac{\sqrt{\omega \theta}}{A_{1} A_{2} B}<1.0026 \times 10^{-4} \tag{2.22}
\end{equation*}
$$

Since $f(t)=\log (t) / t$ is a decreasing function for $t>e$, by (2.14) and (2.16), we have

$$
\begin{equation*}
\frac{\log \left(2.0829 A_{1} A_{2} B^{2}\right)}{A_{1} A_{2} B^{2}}<\frac{\log \left(2.0829 \times 46.0803^{2} \times 9.7617^{2}\right)}{46.0803^{2} \times 9.7617^{2}}<0.6401 \times 10^{-4} \tag{2.23}
\end{equation*}
$$

Thus, by (2.13), (2.15), (2.21), (2.22) and (2.23), we obtain

$$
\begin{equation*}
\log |\Lambda|>-0.4363 A_{1} A_{2} B^{2}>-14.8365 \log \left(a_{1}\right) \log \left(a_{2}\right)\left(1.8248+\log \left(\frac{b_{1}}{\log \left(a_{2}\right)}+\frac{b_{2}}{\log \left(a_{1}\right)}\right)\right)^{2} \tag{2.24}
\end{equation*}
$$

The lemma is proved.

## 3 Proof of Theorem

We mow assume that $m n \equiv 2 \bmod 4, m>30.8 n$ and (1.1) has a solution $(x, y, z)$ with $(x, y, z) \neq(2,2,2)$. By Lemma 2.6, the solution $(x, y, z)$ satisfies

$$
\begin{equation*}
\left(m^{2}-n^{2}\right)^{x}+2 m n=\left(m^{2}+n^{2}\right)^{z}, x, z \in \mathbb{N}, x \equiv 0 \bmod 2, z \equiv 1 \bmod 2 . \tag{3.1}
\end{equation*}
$$

By Lemma 2.4, $m^{2}+n^{2}$ and $m^{2}-n^{2}$ satisfy (2.2). Since $x \equiv 0 \bmod 2$, if $x \leq z$ then from (3.1) we get $2 m n=\left(m^{2}+n^{2}\right)^{z}-\left(m^{2}-n^{2}\right)^{x} \geq\left(m^{2}+n^{2}\right)^{x}-\left(m^{2}-n^{2}\right)^{x} \geq\left(m^{2}+n^{2}\right)^{2}-\left(m^{2}-n^{2}\right)^{2}=(2 m n)^{2}>2 m n$, a contradiction. Therefore, we have

$$
\begin{equation*}
x>z \tag{3.2}
\end{equation*}
$$

and $x-z$ an odd integer.
Since $x \equiv 0 \bmod 2$ and $\left(m^{2}-n^{2}\right)^{2} \equiv\left(m^{2}+n^{2}\right)^{2} \bmod (2 m n)$, we have $\left(m^{2}-n^{2}\right)^{x} \equiv\left(m^{2}+n^{2}\right)^{x} \bmod (2 m n)$. Further, since $\operatorname{gcd}\left(2 m n, m^{2}+n^{2}\right)=1$, by (3.1) and (3.2), we get

$$
\begin{equation*}
\left(m^{2}+n^{2}\right)^{x-z} \equiv 1 \bmod (2 m n) \tag{3.3}
\end{equation*}
$$

Hence, by Lemma 2.5, we see from (3.3) that the case $x-z=1$ can be removed. So we have

$$
\begin{equation*}
x-z \geq 3 \tag{3.4}
\end{equation*}
$$

Let $k=m / n$. By (3.1) and (3.4), we have

$$
\begin{equation*}
\left(m^{2}-n^{2}\right)^{3} \leq\left(m^{2}-n^{2}\right)^{x-z}<\left(\frac{m^{2}+n^{2}}{m^{2}-n^{2}}\right)^{z}=\left(1+\frac{2}{k^{2}-1}\right)^{z} \tag{3.5}
\end{equation*}
$$

Notice that $\log (1+t)<t$ for any $t>0$. By (3.5), we get

$$
\begin{equation*}
3 \log \left(m^{2}-n^{2}\right)<\frac{2 z}{k^{2}-1} \tag{3.6}
\end{equation*}
$$

Since $k>30.8$, we see from (3.6) that

$$
\begin{equation*}
\frac{z}{\log \left(m^{2}-n^{2}\right)}>\frac{3}{2}\left(k^{2}-1\right)>1421.46 . \tag{3.7}
\end{equation*}
$$

On the other hand, by (3.1), we have

$$
\begin{align*}
z \log \left(m^{2}+n^{2}\right)= & \log \left(\left(m^{2}-n^{2}\right)^{x}+2 m n\right)=\log \left(\left(m^{2}-n^{2}\right)^{x}\right)+ \\
& \log \left(1+\frac{2 m n}{\left(m^{2}-n^{2}\right)^{x}}\right)<x \log \left(m^{2}-n^{2}\right)+\frac{2 m n}{\left(m^{2}-n^{2}\right)^{x}} \tag{3.8}
\end{align*}
$$

Let $\left(a_{1}, a_{2}, b_{1}, b_{2}\right)=\left(m^{2}+n^{2}, m^{2}-n^{2}, z, x\right)$ and $\Lambda=z \log \left(m^{2}+n^{2}\right)-x \log \left(m^{2}-n^{2}\right)$. By (3.8), we have

$$
\begin{equation*}
0<\Lambda<\frac{2 m n}{\left(m^{2}-n^{2}\right)^{x}} \tag{3.9}
\end{equation*}
$$

Further, since $\left(m^{2}-n^{2}\right)^{x}>\left(m^{2}-n^{2}\right)^{2} \geq(m+n)^{2}>2 m n$, we see from (3.1) that $2\left(m^{2}-n^{2}\right)^{x}>\left(m^{2}+n^{2}\right)^{z}$. Hence, by (3.9), we get

$$
\begin{equation*}
0<\Lambda<\frac{4 m n}{\left(m^{2}+n^{2}\right)^{z}} \tag{3.10}
\end{equation*}
$$

whence we obtain

$$
\begin{equation*}
\log (4 m n)-\log |\Lambda|>z \log \left(m^{2}+n^{2}\right) \tag{3.11}
\end{equation*}
$$

Since $x \geq 4$, by (2.2), (3.7) and (3.8), we have

$$
\begin{array}{r}
\frac{z}{\log \left(m^{2}-n^{2}\right)}>\frac{x}{\log \left(m^{2}+n^{2}\right)}>\frac{z}{\log \left(m^{2}-n^{2}\right)}-\frac{2 m n}{\left(m^{2}-n^{2}\right)^{x} \log \left(m^{2}+n^{2}\right)} \frac{1}{\log \left(m^{2}-n^{2}\right)} \\
>\frac{z}{\log \left(m^{2}-n^{2}\right)}-\frac{1}{(m+n)^{2}(\log (m+n))^{2}}>1421.46-5 \times 10^{-8} \tag{3.12}
\end{array}
$$

whence we get

$$
\begin{equation*}
\frac{z}{5.8314 \log \left(m^{2}-n^{2}\right)}>\frac{x}{5.8314 \log \left(m^{2}+n^{2}\right)}>240 \tag{3.13}
\end{equation*}
$$

Therefore, by Lemma 2.8, we see from (2.2) and (3.13) that

$$
\begin{equation*}
\log |\Lambda|>-14.8365 \log \left(m^{2}+n^{2}\right) \log \left(m^{2}-n^{2}\right)\left(1.8248+\log \left(\frac{z}{\log \left(m^{2}-n^{2}\right)}+\frac{x}{\log \left(m^{2}+n^{2}\right)}\right)\right)^{2} \tag{3.14}
\end{equation*}
$$

Substituting (3.14) into (3.11), by (3.13), we have

$$
\begin{equation*}
\frac{\log (4 m n)}{\log \left(m^{2}+n^{2}\right) \log \left(m^{2}-n^{2}\right)}+14.8365\left(1.8248+\log \left(\frac{2 z}{\log \left(m^{2}-n^{2}\right)}\right)\right)^{2}>\frac{z}{\log \left(m^{2}-n^{2}\right)} . \tag{3.15}
\end{equation*}
$$

Since $m^{2}+n^{2}>2 m n$ and $m^{2}-n^{2} \geq m+n$, by (2.2), we have

$$
\begin{equation*}
\frac{\log (4 m n)}{\log \left(m^{2}+n^{2}\right) \log \left(m^{2}-n^{2}\right)}<\frac{1}{\log (m+n)}\left(\frac{\log (2)}{\log (m+n)}+1\right)<0.1266 \tag{3.16}
\end{equation*}
$$

Hence, by (3.15) and (3.16), we get

$$
\begin{equation*}
0.1266+14.8365\left(1.8248+\log \left(\frac{2 z}{\log \left(m^{2}-n^{2}\right)}\right)\right)^{2}>\frac{z}{\log \left(m^{2}-n^{2}\right)} \tag{3.17}
\end{equation*}
$$

Let $f(t)=t-0.1266-14.8365(1.8248+\log (2 t))^{2}$. We see from (3.17) that

$$
\begin{equation*}
f\left(\frac{z}{\log \left(m^{2}-n^{2}\right)}\right)<0 \tag{3.18}
\end{equation*}
$$

Since $f^{\prime}(t)=1-29.6730(1.8248+\log (2 t)) / t$ and $f^{\prime}(t)>0$ for $t>250$, where $f^{\prime}(t)$ is the derivative of $f(t)$, we have $f(t)>f(1420)>0$ for $t>1420$. Therefore, by (3.18), we get $z / \log \left(m^{2}-n^{2}\right)<1420$, which contradicts (3.7). Thus, if $m n \equiv 2 \bmod 4$ and $m>30.8 n$, then (1.1) has only the solution $(x, y, z)=(2,2,2)$. The theorem is proved.
