# ON $C^{1, \alpha}$-REGULARITY FOR CRITICAL POINTS OF A GEOMETRIC OBSTACLE-TYPE PROBLEM 

SUJIN KHOMRUTAI AND ARMIN SCHIKORRA

#### Abstract

We consider critical points of the geometric obstacle problem on vectorial maps $u: \mathbb{B}^{2} \subset \mathbb{R}^{2} \rightarrow \mathbb{R}^{N}$ $$
\int_{\mathbb{B}^{2}}|\nabla u|^{2} \quad \text { subject to } u \in \mathbb{R}^{N} \backslash \mathbb{B}^{N}(0) .
$$

Our main result is $C^{1, \alpha}$-regularity for any $\alpha<1$. Technically, we split the map $u=\lambda v$, where $v: \mathbb{B}^{2} \rightarrow \mathbb{S}^{N-1}$ is the vectorial component and $\lambda=|u|$ the scalar component measuring the distance to the origin. While $v$ satisfies a weighted harmonic map equation with weight $\lambda^{2}, \lambda$ solves the obstacle problem for $$
\int_{\mathbb{B}^{2}}|\nabla \lambda|^{2}+\lambda^{2}|\nabla v|^{2}, \quad \text { subject to } \lambda \geq 1 \text {. }
$$ where $|\nabla v|^{2} \in L^{1}\left(\mathbb{B}^{2}\right)$. We then play ping-pong between the increases in the regularity of $\lambda$ and $v$ to obtain finally the $C^{1, \alpha}$-result.

## 1. Introduction

Denote by

$$
D(u):=\int_{\mathbb{B}^{2}}|\nabla u|^{2} .
$$

the Dirichlet energy for maps defined on the two-dimensional disk $\mathbb{B}^{2} \subset \mathbb{R}^{2}$.
The classical obstacle problem for a given obstacle function $\omega: \mathbb{B}^{2} \rightarrow \mathbb{R}$ analyzes the minimizer

$$
\inf _{f \geq \omega} \int_{B^{2}}|\nabla f|^{2}
$$

One can reformulate the obstacle problems for graphs $u=(x, f(x))$ as analyzing the minimizer of the problem

$$
\inf _{X_{\Omega}} \int_{B^{2}}|\nabla u|^{2},
$$

where

$$
\Omega=\left\{(x, t) \in \mathbb{B}^{2} \times \mathbb{R}: t<\varphi(x)\right\}
$$

and the infimum is taken over the set of maps not touching $\Omega$.

$$
\begin{equation*}
X_{\Omega}:=\left\{u \in H^{1}\left(\mathbb{B}^{2}, \mathbb{R}^{3}\right): u \notin \Omega\right\} \tag{1.1}
\end{equation*}
$$

It is a natural to consider this situation for sets $\Omega$ whose boundary is smooth and compact, but which may not be a graph. In this case, $u$ can be thought of as a soap film in threedimensional space which lives outside of a solid ball. Where the soap film intersects with the solid ball, a free boundary appears.

Geometric obstacle problems have been considered, e.g. [11] but this is quite different from our case. Much closer to our situation, considering minimizers, is the setup as in $[10,5]$. Since the obstacle problem is not convex anymore, it is natural to consider not only minimizers but also critical points, which we shall do in this work.

A first observation is that the geometric setting immediately leads to regularity issues: while in the classical obstacle theory, basic $C^{1, \alpha}$-regularity is quite easy to obtain, already for the simplest case of round obstacles $\Omega=\mathbb{B}^{N-1}$, any harmonic function into $\partial \mathbb{B}^{N-1}=$ $\mathbb{S}^{N-1}$ is necessarily a critical point of the obstacle problem. Indeed we have,
Proposition 1.1. Let $\bar{v}$ be a minimizing harmonic map from $\mathbb{B}^{n} \rightarrow \mathbb{S}^{N-1}$ with respect to its own boundary values, then $u:=\bar{v}$ minimizes the Dirichlet energy in the class $X_{\mathbb{B}^{N-1}}$ with respect to its own boundary values.

If $\bar{v}$ is a critical (possibly non-minimizing) harmonic map from $\mathbb{B}^{2} \rightarrow \mathbb{S}^{N-1}$, then $\bar{v}$ is a critical map for the Dirichlet energy with respect tot he class $X_{\mathbb{B}^{N-1}}$.

Proof. We split $u=\lambda v$, where $\lambda=|u| \geq 1$ and $v=\frac{u}{|u|} \in H^{1}\left(\mathbb{B}^{2}, \mathbb{S}^{2}\right)$. Since $v \cdot \nabla v \equiv 0$, we have

$$
|\nabla u|^{2}=|\nabla \lambda v+\lambda \nabla v|^{2}=|\nabla \lambda|^{2}+|\lambda|^{2}|\nabla v|^{2}
$$

In particular,

$$
\int_{\mathbb{B}^{n}}|\nabla u|^{2} \geq \int|\nabla v|^{2}
$$

with equality if and only if $\lambda \equiv 1$. The conclusion now follows.
In particular, for $n \geq 3$ there is no hope of obtaining even mere continuity at the free boundary for the solutions of the obstacle problem: harmonic maps may only be smooth for $n \geq 3$ on a large set (not everywhere), see $[20,5]$, and if we consider critical harmonic maps may be everywhere discontinuous, see [15].

This is why, for now, we shall restrict our attention to $n=2$. The main result of this work is the basic regularity theory for spherical obstacles.

Theorem 1.2. Let $\Omega=\mathbb{B}^{N-1} \subset \mathbb{R}^{N}$ be the solid unit ball. Denote the obstacle class $X_{\Omega}$ as in (1.1). Then any map of which is critical in $X_{\Omega}$ with respect to $D(\cdot)$ is $C^{1, \alpha}$-smooth, for any $\alpha<1$.

In future works we plan to analyze the free boundary, where $u$ intersects with $\partial \Omega$, as well as more general obstacles.

Let us also state that as a by-product of our arguments we obtain the following regularity result for harmonic maps into the (non-compact) manifold of conformal transformations.
Theorem 1.3. Denote the group of conformal transformations with conformal factor bounded from below by $\lambda_{0}$ as

$$
C O_{\lambda_{0}}(N)=\left\{\lambda Q \in \mathbb{R}^{N \times N}: Q \in S O(N), \lambda>\lambda_{0}\right\}
$$

Then for $\lambda_{0}>0$, any map $P \in H^{1}\left(\mathbb{B}^{2}, C O_{\lambda_{0}}(N)\right)$ which is a critical point of the Dirichlet energy $D(\cdot)$ in the class of maps into $C O_{\lambda_{0}}(N)$ belongs to $C^{1, \alpha}$ for any $\alpha<1$.

The proof is almost verbatim to the one of Theorem 1.2, we point out the differences in Section 8.
1.1. A reformulation of Theorem 1.2. In order to prove Theorem 1.2 we represent any point $u$ in $\mathbb{R}^{N} \backslash \mathbb{B}^{N}$ uniquely as

$$
u=\lambda v
$$

where $v=\frac{u}{|u|} \in \mathbb{S}^{N-1}$ and $\lambda=|u|>0$.
If $u \in H^{1}\left(\mathbb{B}^{2}, \mathbb{R}^{n} \backslash \mathbb{B}_{1}^{N}\right)$ then $\lambda \in H^{1}\left(\mathbb{B}^{2}\right)$ is a scalar function and $v \in H^{1}\left(\mathbb{B}^{2}, \mathbb{S}^{N-1}\right)$. In particular we have $\langle v, \nabla v\rangle=0$, which leads to

$$
|\nabla u|^{2}=|\nabla \lambda v+\lambda \nabla v|^{2}=|\nabla \lambda|^{2}+\lambda^{2}|\nabla v|^{2} .
$$

Consequently, Theorem 1.2 can be reformulated as

Theorem 1.4. Let $(\lambda, v) \in H^{1}\left(\mathbb{B}^{2}\right) \times H^{1}\left(\mathbb{B}^{2}, \mathbb{S}^{N-1}\right)$ be a critical map with respect to the energy

$$
E(\lambda, v):=\int|\nabla \lambda|^{2}+\int \lambda^{2}|\nabla v|^{2}
$$

and subject to $\lambda \geq \lambda_{0}$. That is,

- assume that

$$
\left.\frac{d}{d \varepsilon}\right|_{\varepsilon=0} E(\lambda+\varepsilon \varphi, v) \geq 0
$$

holds whenever $\varphi \in H_{0}^{1}\left(\mathbb{B}^{2}\right)$, and $\lambda+\varepsilon \varphi \geq \lambda$ almost everywhere in $\mathbb{B}^{2}$ and $(\lambda+$ $\varepsilon \varphi) v \in H^{1}\left(\mathbb{B}^{2}\right)$ for small $\varepsilon$.

- and

$$
\left.\frac{d}{d \varepsilon}\right|_{\varepsilon=0} E\left(\lambda, \frac{v+\varepsilon \psi}{|v+\varepsilon \psi|}\right)=0
$$

holds for any $\psi \in C_{c}^{\infty}\left(\mathbb{B}^{2}, \mathbb{R}^{N}\right)$
Then $u=\lambda v \in C^{1, \alpha}$ for some $\alpha>0$.
Remark 1.5. - By an easy adaptation of the proof one can show that $\lambda \geq 1$ can be replaced by $\lambda \geq \lambda_{0}$ where $\lambda_{0} \in C^{\infty}\left(\overline{\mathbb{B}^{2}},(0, \infty)\right)$ with $\inf _{\mathbb{B}^{2}} \lambda_{0}>0$. Observe that e.g. for starshaped obstacles the approach is much more complicated: Then one would need to assume $\lambda \geq \lambda_{0}(v)$, i.e. have to consider an obstacle depending on $v$, which heavily complicates the variation in $v$.

- Moreover, observe that $E$ as above is convex in $\lambda$, but not in $v$. That is, the only critical points in terms of $\lambda$ are minimizers, but again not necessarily so $v$.
1.2. Outline of the proof. The proof of Theorem 1.4 is split into several parts, since we have to jump between improvements in regularity of $\lambda$ and $v$. First we prove in Section 2 local boundedness of $\lambda$, see Proposition 2.1. Then we compute the Euler-Lagrange equations for $v$, in Section 3. Since by now we have shown that $\lambda$ is locally bounded from above and below the Euler-Lagrange equations are uniformly elliptic equations with $W^{1,2}$-coefficients. We prove a priori $L^{p}$-estimates for such equations in Section 4, which might be interesting in their own right - see Proposition 4.1. In Section 5 we then obtain successively for $v$ Hölder regularity, Proposition 5.1, $W^{1, p}$-regularity for any $p<\infty$, in Proposition 5.3 and finally $W^{2,2-\varepsilon}$-regularity in Corollary 5.5. This is the optimal regularity one can hope for without having better estimates on $\lambda$, see [22]. So in Section 6 we turn to improving the regularity $\lambda$, and the already obtained regularity for $v$ allows us to obtain $W^{2,2}$-estimates for $\lambda$ which in turn lead to $W^{2, p}$-estimate for $v$ for any $p<\infty$, see Corollary 6.5. Lastly, with the regularity already obtained for $\lambda$ and $v$ we show in Section 7 that $\lambda$ solves an elliptic inequality in viscosity sense, and we obtain $C^{1, \alpha}$-regularity of $\lambda$. With this we conclude the promised regularity of $u=\lambda v$.

## 2. Boundedness of $\lambda$

The scalar function $\lambda$ is a solution to a classical (graph-)obstacle problem, however for the energy

$$
\lambda \mapsto \int|\nabla \lambda|^{2}+\int \lambda^{2}|\nabla v|^{2}
$$

But observe that $|\nabla v|^{2} \in L^{1}\left(\mathbb{R}^{n}\right)$, only. In particular, a priori for general $|\nabla v|^{2} \in L^{1}\left(\mathbb{R}^{n}\right)$, we cannot hope that $\lambda$ is very smooth. For now we have to content ourselves with the (local) boundedness of $\lambda$.

Proposition 2.1 (Boundedness of $\lambda)$. Let $\lambda, v$ be as in Theorem 1.4. Then $\lambda \in L_{l o c}^{\infty}\left(\mathbb{B}^{2}\right)$, that is for any compact set $K \subset \mathbb{B}^{2}$ we have that $\lambda \in L^{\infty}(K)$.

Proof. We will show that $\lambda \in L^{\infty}(B(0, r))$ for any $r \in(0,1)$. Fix such an $r$. By Fubini's theorem, there must be $R \in(r, 1)$ such that

$$
\|\lambda\|_{H^{1}(\partial B(0, R))} \precsim \frac{1}{1-r}\|\lambda\|_{H^{1}(B(0,1))} .
$$

Since $\partial B(0, r)$ is one-dimensional we have that $H^{1}(\partial B(0, R))$ embeds in particular into $C^{0}(\partial B(0, R))$. For simplicity of notation we shall pretend that $R=1$ and thus assume w.l.o.g.

$$
K_{1}:=\|\lambda\|_{L^{\infty}(\partial B(0,1))}<\infty .
$$

Let $\eta \in C_{c}^{\infty}\left(\mathbb{B}^{2}, \mathbb{R}_{+}\right)$and let $K>K_{1}$. Then for small $\varepsilon>0$ the following variation of $\lambda$ is admissible

$$
\lambda_{\varepsilon}:=\lambda-\varepsilon \eta(\lambda-K)
$$

Indeed, by convexity, whenever $\varepsilon\|\eta\|_{\infty}<1$,

$$
\lambda_{\varepsilon}=(1-\varepsilon \eta) \lambda+\varepsilon \eta K \geq 1 \quad \text { a.e. in } \mathbb{B}^{2} .
$$

In particular, the Euler-Lagrange inequality for $\lambda$ implies

$$
\left.\frac{d}{d \varepsilon}\right|_{\varepsilon=0^{+}} E\left(\lambda_{\varepsilon}, v\right) \geq 0
$$

that is

$$
\begin{equation*}
\int_{\mathbb{B}^{2}}|\nabla \lambda|^{2} \eta+\int_{\mathbb{B}^{2}}(\lambda-K) \nabla \lambda \cdot \nabla \eta+\int_{\mathbb{B}^{2}} \lambda \eta(\lambda-K)|\nabla v|^{2} \leq 0 . \tag{2.1}
\end{equation*}
$$

We would like to test this inequality with $\eta:=(\lambda-K)_{+}$Then $\eta \in H_{0}^{1}\left(\mathbb{B}^{2}\right)$ - the zero boundary data stems from the choice of $K \geq K_{1}$. Moreover,

$$
\nabla \eta=\chi_{\{\lambda \geq K\}} \nabla \lambda
$$

Cf. [6, Chapter 5, Problem 18, p.308]. However $\eta$ may not be bounded, ant the resulting integrals may not converge. So instead for arbitrary $k>K$ we test with

$$
\eta_{k}:=-(\eta-k)_{-}+k=\min \{\eta-k, 0\}+k \in[0, k]
$$

In other words,

$$
\eta_{k}= \begin{cases}k & \text { in }\{\lambda>K+k\} \\ \lambda-K & \text { in }\{\lambda<K+k\} \cap\{\lambda>K\} \\ 0 & \text { in }\{\lambda<K\}\end{cases}
$$

Now we have $\eta_{k} \in H_{0}^{1} \cap L^{\infty}\left(\mathbb{B}^{2}, \mathbb{R}_{+}\right)$, and consequently, $\eta_{k}$ is admissible as testfunction in (2.1). Moreover,

$$
\begin{equation*}
\nabla \eta_{k}=\chi_{\{\lambda \in(K, K+k)\}} \nabla \lambda \tag{2.2}
\end{equation*}
$$

We observe that $(K-\lambda) \eta_{k} \geq 0$ and thus

$$
\int_{\mathbb{B}^{2}} \lambda \eta(K-\lambda)|\nabla v|^{2} \geq 0
$$

Moreover, in view of (2.2),

$$
\int_{\mathbb{B}^{2}}(\lambda-K) \nabla \lambda \cdot \nabla \eta=\int_{\mathbb{B}^{2}}(\lambda-K) \chi_{\lambda \in(K, k)}|\nabla \lambda|^{2} \geq 0
$$

Consequently, (2.1) implies

$$
\int_{\mathbb{B}^{2}}|\nabla \lambda|^{2} \eta_{k} \leq 0
$$

that is, since $\eta_{k} \geq 0$,

$$
\begin{gathered}
|\nabla \lambda|^{2} \eta_{k} \equiv 0 . \\
\int_{\mathbb{B}^{2}}|\nabla \lambda|^{2}(\lambda-K)_{+} \leq 0
\end{gathered}
$$

This implies

$$
|\nabla \lambda|^{2}(\lambda-K)_{+} \equiv 0
$$

that is

$$
\left|\nabla\left((\lambda-K)_{+}\right)^{2}\right| \equiv 0
$$

But in view of (2.2) this implies

$$
\left|\nabla\left(\eta_{k}\right)^{2}\right| \equiv 0
$$

which in turn gives $\eta_{k} \equiv 0$ (since $\eta_{k} \in H_{0}^{1}\left(\mathbb{B}^{2}\right)$. In particular $\lambda \leq K$ almost everywhere, i.e. $\lambda$ is bounded (recall that $\lambda \geq \lambda_{0} \in L^{\infty}(\mathbb{B})$ was assumed).

## 3. The Euler-Lagrange equations for $v$

Now that $\lambda$ is bounded, we start with computing the Euler-Lagrange equations for $v$, which are a weighted version of the spherical harmonic map equation. In particular we obtain a weighted version of Shatah's conservation law [23], that Hélein used in [9] to obtain regularity for harmonic maps into spheres.

Lemma 3.1 (Euler-Lagrange equations). Let $\lambda$ and $v$ be as in Theorem 1.4. Then,

$$
\begin{equation*}
\operatorname{div}\left(\lambda^{2} \nabla v^{i}\right)=\Omega_{i j} \cdot \lambda^{2} \nabla v^{j} \tag{3.1}
\end{equation*}
$$

with

$$
\Omega_{i j}=v^{j} \nabla v^{i}-v^{i} \nabla v^{j}
$$

Equivalently we also have a weighted version of Shatah's conservation law [23]

$$
\begin{equation*}
\operatorname{div}\left(\lambda^{2} \Omega_{i j}\right)=0 \tag{3.2}
\end{equation*}
$$

Proof. Since $|v| \equiv 1$ we have

$$
\left.\frac{d}{d \varepsilon}\right|_{\varepsilon=0} \frac{v+\varepsilon \psi}{|v+\varepsilon \psi|}=\psi-\langle\psi, v\rangle v
$$

and consequently, the Euler-Lagrange equations with respect to $v$, can be written as

$$
\int_{\mathbb{B}^{2}} \lambda^{2} \nabla v \cdot \nabla \psi=\int_{\mathbb{B}^{2}} \lambda^{2} \nabla v \cdot \nabla(\langle\psi, v\rangle v)
$$

Now, $v \cdot \nabla v \equiv 0$ since $|v| \equiv 1$, so

$$
\nabla v \cdot \nabla(\langle\psi, v\rangle v)=|\nabla v|^{2}\langle\psi, v\rangle
$$

We thus obtain the Euler-Lagrange equation

$$
\operatorname{div}\left(\lambda^{2} \nabla v^{i}\right)=\lambda^{2} v^{i}|\nabla v|^{2}
$$

Now we rewrite this equation (using again $v^{i} \nabla v^{i}=\frac{1}{2} \nabla|v|^{2} \equiv 0$ ), with he following trick

$$
v^{i}|\nabla v|^{2}=v^{i} \nabla v^{j} \cdot \nabla v^{j}=\left(v^{i} \nabla v^{j} \cdot \nabla v^{j}-v^{j} \nabla v^{i}\right) \cdot \nabla v^{j}
$$

This establishes (3.1). The conservation law (3.2) follows now from a direct computation.

## 4. Uniform a priori estimates for critical equations with elliptic $W^{1,2}$-COEFFICIENTS

Proposition 4.1. Let $2<p_{0}<p_{\infty}<\infty$ and $\Lambda>1$. Then there exists a constant $C=C\left(\Lambda, p_{0}, p_{\infty}\right)$, a small $\varepsilon=\varepsilon\left(\Lambda, p_{0}, p_{\infty}\right)>0$ and a small $\alpha=\alpha\left(\Lambda, p_{0}, p_{\infty}\right)>0$ so that the following holds.

Let either $p=2$ or $p \in\left(p_{0}, p_{\infty}\right)$ and $R>0$. Let $v \in W^{1,2}\left(\mathbb{B}^{2}, \mathbb{R}^{N}\right)$ be a solution to

$$
\begin{equation*}
\operatorname{div}\left(\lambda^{2} \nabla v^{i}\right)=\Omega_{i j} \cdot \lambda^{2} \nabla v^{j} \quad \text { in } \mathbb{B}^{2} \tag{4.1}
\end{equation*}
$$

where $\lambda \in L^{\infty} \cap W^{1,2}\left(\mathbb{B}^{2}\right)$ satisfies

$$
\begin{equation*}
\Lambda^{-1} \leq \lambda \leq \Lambda \quad \text { almost everywhere in } \mathbb{B}^{2} \tag{4.2}
\end{equation*}
$$

and $\Omega_{i j} \in L_{l o c}^{2}\left(\mathbb{B}^{2}, \mathbb{R}^{2}\right)$ satisfies

$$
\begin{equation*}
|\Omega| \leq \Lambda|\nabla v| \quad \text { almost everywhere in } \mathbb{B}^{2} . \tag{4.3}
\end{equation*}
$$

If $p=2$ we assume moreover

$$
\begin{equation*}
\operatorname{div}\left(\lambda^{2} \Omega_{i j}\right)=0 \quad \text { in } \mathbb{B}^{2} \tag{4.4}
\end{equation*}
$$

Then, if $\nabla v \in L_{\text {loc }}^{p}\left(\mathbb{B}^{2}\right)$ then for any $r<R$ the estimate

$$
\|\nabla v\|_{L^{p}(B(r))} \leq C\left(\frac{r}{R}\right)^{\frac{\alpha}{p}}\|\nabla v\|_{L^{p}(B(R))}
$$

holds for all balls $B(R) \subset \mathbb{B}^{2}$ on which $v$ and $\lambda$ satisfy

$$
\|\nabla \lambda\|_{L^{2}(B(R))}+\|\nabla v\|_{L^{2}(B(R))} \leq \varepsilon .
$$

An important ingredient for the $p=2$ case is Wente's Lemma see [14, 26, 2, 24, 13, 4, 25].
Lemma 4.2 (Wente Lemma). Let $B \subset \mathbb{R}^{2}$ be a ball, and $a, b \in W^{1,2}(B)$. If $w \in$ $W^{1,2}(B(R))$ is a solution to

$$
\begin{cases}\Delta w=\nabla a \cdot \nabla^{\perp} b & \text { in } B \\ w=0 & \text { on } \partial B\end{cases}
$$

where $\nabla^{\perp}=\left(-\partial_{2}, \partial_{1}\right)^{T}$, then

$$
\|w\|_{L^{\infty}(B)}+\|\nabla w\|_{L^{2}(B)} \leq\|\nabla a\|_{L^{2}(B)}\|\nabla b\|_{L^{2}(B)} .
$$

The proof of Proposition 4.1 is based on the following estimate.
Lemma 4.3. Let $2<p_{0}<p_{\infty}<\infty$ and $\Lambda>1$. Then there exists a constant $C=$ $C\left(\Lambda, p_{0}, p_{\infty}\right)$ so that the following holds.

Let either $p=2$ or $p \in\left(p_{0}, p_{\infty}\right)$ and $R>0$. Let $v \in W^{1,2}\left(B(R), \mathbb{R}^{N}\right)$ be a solution to (4.1) in $B(R)$, where $\lambda \in L^{\infty} \cap W^{1,2}(B(R))$ satisfies (4.2) in $B(R)$ and $\Omega_{i j} \in L_{\text {loc }}^{2}\left(B(R), \mathbb{R}^{2}\right)$ satisfies (4.3). If $p=2$ we assume moreover (4.4) to hold in $B(R)$.

Then, if $\nabla v \in L^{p}(B(R))$ we have the following a priori estimate for any $r \in(0, R]$

$$
\|\nabla v\|_{L^{p}(B(r))} \leq C\left(\left(\frac{r}{R}\right)^{\frac{2}{p}}+\|\nabla \lambda\|_{L^{2}(B(R))}+\|\nabla v\|_{L^{2}(B(R))}\right)\|\nabla v\|_{L^{p}(B(R))}
$$

Proof. We use Hodge decomposition to obtain

$$
\begin{equation*}
\lambda^{2} \nabla v=\nabla a+\nabla^{\perp} b+H \quad \text { in } B(R) \tag{4.5}
\end{equation*}
$$

Here $\nabla^{\perp}=\left(-\partial_{y}, \partial_{x}\right)$. Namely, we choose $a, b \in W_{0}^{1,2}\left(B(R), \mathbb{R}^{N}\right)$, and $H$ harmonic in $B(R)$ so that

$$
\left\{\begin{array}{ll}
\Delta a=\operatorname{div}\left(\lambda^{2} \nabla v\right) & \text { in } B(R) \\
a=0 & \text { on } \partial B(R)
\end{array}, \begin{cases}\Delta b=\operatorname{curl}\left(\lambda^{2} \nabla v\right) & \text { in } B(R) \\
b=0 & \text { on } \partial B(R)\end{cases}\right.
$$

ON $C^{1, \alpha}$-REGULARITY FOR CRITICAL POINTS OF A GEOMETRIC OBSTACLE-TYPE PROBLEM 9
From (4.1) we find that

$$
\begin{cases}\Delta a=\Omega_{i j} \cdot \lambda^{2} \nabla v^{j} & \text { in } B(R) \\ a=0 & \text { on } \partial B(R)\end{cases}
$$

From standard elliptic estimates we then obtain for any $p>2$

$$
\begin{equation*}
\|\nabla a\|_{L^{p}(B(R))} \precsim\|\lambda\|_{\infty}^{2}\|\Omega\|_{L^{2}(B(R))}\|\nabla v\|_{L^{p}(B(R))} \tag{4.6}
\end{equation*}
$$

Of course the constant may depend on $p$ as it blows up for $p \rightarrow \infty$ or as $p \rightarrow 2$. But it is uniform for $p \in\left(p_{0}, p_{\infty}\right)$. For $p=2$, we use that by (4.4) we have a div-curl structure. Then, Wente's Lemma, Lemma 4.2, implies the same estimate (4.6) for $p=2$.
For $b$ we use compute the curl and find

$$
\begin{cases}\Delta b=\nabla^{\perp}\left(\lambda^{2}\right) \nabla v & \text { in } B(R) \\ b=0 & \text { on } \partial B(R)\end{cases}
$$

Again from standard elliptic estimates for $p>2$ and from Wente's Lemma and the div-curl structure for $p=2$ we obtain the estimate

$$
\|\nabla b\|_{L^{p}(B(R))} \precsim\|\lambda\|_{L^{\infty}(B(R))}\|\nabla \lambda\|_{L^{2}(B(R))}\|\nabla v\|_{L^{p}(B(R))}
$$

By the assumptions on $\lambda$ and $\Omega$ we thus get

$$
\|\nabla a\|_{L^{p}(B(R))}+\|\nabla b\|_{L^{p}(B(R))} \leq C\left(\Lambda, p_{0}, p_{\infty}\right)\left(\|\nabla v\|_{L^{2}(B(R))}+\|\nabla \lambda\|_{L^{2}(B(R))}\right)\|\nabla v\|_{L^{p}(B(R))}
$$

In particular we get from (4.5),

$$
\|\nabla v\|_{L^{p}(B(r))} \leq C(\Lambda)\|H\|_{L^{p}(B(r))}+C\left(\Lambda, p_{0}, p_{\infty}\right)\left(\|\nabla v\|_{L^{2}(B(R))}+\|\nabla \lambda\|_{L^{2}(B(R))}\right)\|\nabla v\|_{L^{p}(B(R))}
$$

and
$\|H\|_{L^{p}(B(R))} \leq C(\Lambda)\|\nabla v\|_{L^{p}(B(R))}+C\left(\Lambda, p_{0}, p_{\infty}\right)\left(\|\nabla v\|_{L^{2}(B(R))}+\|\nabla \lambda\|_{L^{2}(B(R))}\right)\|\nabla v\|_{L^{p}(B(R))}$,
The last ingredient is the harmonicity of $H$, which implies for any $r<R$, see, e.g. [8, Theorem 2.1, p.78],

$$
\|H\|_{L^{p}(B(r))} \precsim\left(\frac{r}{R}\right)^{\frac{2}{p}}\|H\|_{L^{p}(B(R))} .
$$

Together, the last three estimates imply the claimed result.
By choosing $r<\theta^{\frac{p}{n}} R$ for $\theta$ small enough we obtain as a corollary
Corollary 4.4. Let $2<p_{0}<p_{\infty}<\infty$ and $\Lambda>1$. Then there exists a constant $C=$ $C\left(\Lambda, p_{0}, p_{\infty}\right)$, a small $\varepsilon=\varepsilon\left(\Lambda, p_{0}, p_{\infty}\right)>0$ and a small $\theta=\theta\left(\Lambda, p_{0}, p_{\infty}\right)$ so that the following holds.

Let either $p=2$ or $p \in\left(p_{0}, p_{\infty}\right)$ and $R>0$. Let $v \in W^{1,2}\left(B(R), \mathbb{R}^{N}\right)$ be a solution to (4.1) in $B(R)$, where $\lambda \in L^{\infty} \cap W^{1,2}(B(R))$ satisfies (4.2) in $B(R)$ and $\Omega_{i j} \in L_{l o c}^{2}\left(B(R), \mathbb{R}^{2}\right)$ satisfies (4.3) in $B(R)$. If $p=2$ we assume moreover (4.4) to hold in $B(R)$.

Then, if $\nabla v \in L^{p}(B(R))$ and if

$$
\|\nabla \lambda\|_{L^{2}(B(R))}+\|\nabla v\|_{L^{2}(B(R))}<\varepsilon
$$

then for $\sigma:=\theta^{\frac{p}{2}}$ we have

$$
\|\nabla v\|_{L^{p}(B(\sigma R))} \leq \frac{1}{2}\|\nabla v\|_{L^{p}(B(R))}
$$

Proof of Proposition 4.1. The proof now follows from Corollary 4.4 by iteration. Pick $r \in\left(\sigma^{k-1} R, \sigma^{k} R\right]$ for some $k \in \mathbb{N}$.

For now let us assume that $k \geq 2$. Repeated application of Corollary 4.4 implies

$$
\|\nabla v\|_{L^{p}(B(r))} \leq 2^{1-k}\|\nabla v\|_{L^{p}(B(R))}
$$

Since for our choice of $r$,

$$
2^{1-k}=\sigma^{(k-1) \frac{\log 2}{-\log \sigma}} \leq\left(\frac{r}{R}\right)^{\frac{\log 2}{-\log \sigma}}
$$

we have found that

$$
\|\nabla v\|_{L^{p}(B(r))} \leq\left(\frac{r}{R}\right)^{\frac{\log 2}{-\log \sigma}}\|\nabla v\|_{L^{p}(B(R))}
$$

Since $\sigma=\theta^{\frac{p}{2}}$ we choose (independently of $p$ )

$$
\alpha:=2 \frac{\log 2}{-\log \theta} .
$$

That is, we have shown

$$
\|\nabla v\|_{L^{p}(B(r))} \leq\left(\frac{r}{R}\right)^{\frac{\alpha}{p}}\|\nabla v\|_{L^{p}(B(R))}
$$

holds for any $r \leq \sigma^{2} R$. For $r \in\left(\sigma^{2} R, R\right)$ we use the trivial estimate

$$
\|\nabla v\|_{L^{p}(B(r))} \leq\|\nabla v\|_{L^{p}(B(R))} \leq \sigma^{-2 \frac{\alpha}{p}}\left(\frac{r}{R}\right)^{\frac{\alpha}{p}}\|\nabla v\|_{L^{p}(B(R))} .
$$

Using again that $\sigma=\theta^{\frac{p}{2}}$ we find for any $r \in\left(\sigma^{2} R, R\right)$

$$
\|\nabla v\|_{L^{p}(B(r))} \leq\|\nabla v\|_{L^{p}(B(R))} \leq \theta^{-2 \alpha}\left(\frac{r}{R}\right)^{\frac{\alpha}{p}}\|\nabla v\|_{L^{p}(B(R))}
$$

5. $W^{2,2-\varepsilon}$-REGULARITY OF V

As a consequence of our analysis in the previous section we obtain Hölder continuity of $v$.

Proposition 5.1 (Initial regularity for $v$ ). Let $v$ and $\lambda$ be as in Theorem 1.4. Then there exists $\alpha>0$ such that for every compact $K \subset \mathbb{B}^{2}$ we have

$$
\begin{equation*}
\sup _{B\left(y_{0}, r\right) \subset K} r^{-\frac{\alpha}{2}}\|\nabla v\|_{L^{2}\left(B\left(y_{0}, r\right)\right)}<\infty . \tag{5.1}
\end{equation*}
$$

In particular, by Sobolev embedding in $\mathbb{R}^{2}, v \in C_{\text {loc }}^{0, \alpha}$.
Remark 5.2. The proof of Hölder continuity can be found in the literature: from Lemma 3.1, more precisely (3.1) we obtain that for $\xi^{i}:=\lambda^{2} \nabla u^{i}$ we have

$$
\operatorname{div}\left(\xi^{i}\right)=\Omega_{i k} \xi^{k}
$$

Hölder regularity now follows from a distorted version of Rivière's celebrated regularity theorem for systems with antisymmetric potential [16]. More precisely, [17, Remark 3.4.] is applicable - since $\lambda \in L_{\text {loc }}^{\infty}$ by Proposition 2.1 and using also that by assumption $\inf _{\mathbb{B}^{2}} \lambda>0$.

In order to obtain later higher regularity, however, we need the estimate (5.1).
Proof of Proposition 5.1. For $0<r<R$ let $B\left(y_{0}, r\right) \subset B\left(y_{0}, R\right) \subset \mathbb{B}^{2}$. Since our result is away from the boundary, by Proposition 2.1 we may assume w.l.o.g. that $\lambda$ is bounded in all of $\mathbb{B}^{2}$.

Observe that since $\lambda, v \in W^{1,2}\left(\mathbb{B}^{2}\right)$, by absolute continuity of the integral, for any $\varepsilon>0$ there exists a radius $R_{0}>0$ such that

$$
\sup _{B\left(y_{0}, \rho\right) \subset \mathbb{B}^{2}, \rho<R_{0}}\|\nabla v\|_{L^{2}\left(B\left(y_{0}, \rho\right)\right)}+\|\nabla \lambda\|_{L^{2}\left(B\left(y_{0}, \rho\right)\right)}<\varepsilon
$$

The claim then follows from the a priori estimates of Proposition 4.1 (for $p=2$ ) and a covering argument.
5.1. Slightly higher integrability of the gradient of $\mathbf{v}$. The next step is higher integrability of the derivative $\nabla v$,
Proposition 5.3 ( $W^{1,2+\varepsilon}$-regularity for $\left.v\right)$. Let $v$ and $\lambda$ be as in Theorem 1.4. Then, there exists $p>2$ such that $v \in W_{\text {loc }}^{1, p}\left(\mathbb{B}^{2}\right)$.

Proof. We apply Hodge decomposition on a ball $B(R)$. Namely we split

$$
\begin{equation*}
\lambda^{2} \nabla v=\nabla a+\nabla^{\perp} b+H \quad \text { in } B(R) \tag{5.2}
\end{equation*}
$$

where $H$ is harmonic in $B(R)$ and $a$ and $b$ are chosen as follows (in view of Lemma 3.1):

$$
\left\{\begin{array}{ll}
\Delta a=\operatorname{div}\left(\lambda^{2} \nabla v\right)=\Omega \lambda^{2} \nabla v & \text { in } B(R) \\
a=0 & \text { on } \partial B(R)
\end{array}, \quad \begin{cases}\Delta b=\operatorname{curl}\left(\lambda^{2} \nabla v\right)=\nabla^{\perp} \lambda^{2} \nabla v & \text { in } B(R) \\
b=0 & \text { on } \partial B(R)\end{cases}\right.
$$

With the $\alpha$ from Proposition 5.1, the structure of $\Omega$, and boundedness of $\lambda$ we obtain

$$
\sup _{B(r) \subset B(R)} r^{-\alpha}\|\Delta a\|_{L^{1}(B(r))}<\infty .
$$

but for $b$, since $\nabla \lambda \in L^{2}$ only, we find

$$
\sup _{B(r) \subset B(R)} r^{-\frac{\alpha}{2}}\|\Delta b\|_{L^{1}(B(r))}<\infty .
$$

By (a localized version of) the Sobolev embedding for Morrey spaces, see [1], we obtain that for any $p \in\left[1, \frac{2-\alpha}{1-\alpha}\right), \nabla a$ and $\nabla b$ belong to $L_{l o c}^{p}(B(R))$. Since $\alpha>0$ we can choose $p>2$, and since $H$ is harmonic on $B(R)$ and $\lambda$ is bounded away from zero, from (5.2) we get $\nabla v \in L_{l o c}^{p}(B(R))$.
5.2. On integrability of the gradient of $\mathbf{v}$ and $W^{2,2-\varepsilon}$-regularity. Now we can (still only assuming that $\lambda \in W^{1,2}$ ) bootstrap the regularity for $v$ all the way to $W_{l o c}^{1, p}, p \in(1, \infty)$. For this we adapt an iteration strategy by Sharp and Topping [22], see also generalizations in $[21,18]$. The main technical ingredient are the uniform a priori estimates in Proposition 4.1.

Proposition 5.4 ( $W^{1, p}$-regularity for $v$ for large $p$ ). Let $v$ and $\lambda$ be as in Theorem 1.4. Then, for any $p \in(1, \infty)$ we have $v \in W_{\text {loc }}^{1, p}\left(\mathbb{B}^{2}, \mathbb{R}^{N}\right)$.

Proof of Proposition 5.4. Fix $p_{\infty} \in(2, \infty)$. We are going to show that $v \in W_{l o c}^{1, p_{\infty}}\left(\mathbb{B}^{2}\right)$.
By Proposition 5.3 we have $v \in W_{l o c}^{1, p_{1}}\left(\mathbb{B}^{2}\right)$. Set $p_{0}:=\frac{2+p_{1}}{2}$, and apply Proposition 4.1, then for some (uniform) $\alpha$,

$$
\begin{equation*}
\sup _{B(r) \subset K} r^{-\frac{\alpha}{p_{1}}}\|\nabla v\|_{L^{p_{1}}(B(r))}<\infty \tag{5.3}
\end{equation*}
$$

As in (5.2) we apply Hodge decomposition on some ball $B(R) \subset \mathbb{B}^{2}$.

$$
\begin{equation*}
\lambda^{2} \nabla v=\nabla a+\nabla^{\perp} b+H \quad \text { in } B(R) \tag{5.4}
\end{equation*}
$$

where $H$ is harmonic in $B(R)$ and in view of Lemma 3.1 we have

$$
\left\{\begin{array}{lll}
\Delta a=\Omega \lambda^{2} \nabla v & \text { in } B(R) \\
a=0 & \text { on } \partial B(R)
\end{array}, \begin{cases}\Delta b=\nabla^{\perp} \lambda^{2} \nabla v & \text { in } B(R) \\
b=0 & \text { on } \partial B(R)\end{cases}\right.
$$

From (5.3) we obtain

$$
\sup _{B(r) \subset B(R)} r^{-2 \frac{\alpha}{p_{1}}}\|\Delta a\|_{L^{\frac{p_{1}}{2}}(B(r))}<\infty
$$

and (recall that we only have $\nabla \lambda \in L^{2}$ ),

$$
\sup _{B(r) \subset B(R)} r^{-\frac{\alpha}{p_{1}}}\|\Delta b\|_{L^{\frac{2 p_{1}}{p_{1}+2}}(B(r))}<\infty
$$

Observe that since $p_{1}>2$ we have $\frac{p_{1}}{2}>q_{1}:=\frac{2 p_{1}}{2 p_{1}+2}>1$. That is we have,

$$
\sup _{B(r) \subset B(R)} r^{-\frac{\alpha}{p_{1}}}\left(\|\Delta a\|_{L^{q_{1}}(B(r))}+\|\Delta b\|_{L^{q_{1}}(B(r))}\right)<\infty
$$

Again we use the Sobolev embedding on Morrey spaces, see [1]. For

$$
\frac{1}{p_{2}}:=\frac{1}{q_{1}}-\frac{1}{2-\frac{\alpha}{p_{1}} q_{1}}=\frac{1}{p_{1}}-\frac{\alpha}{4 p_{1}+4-2 \alpha}
$$

we get

$$
\sup _{B(r) \subset B(R / 2)} r^{-\frac{\frac{\alpha}{p_{1}+1}}{p_{2}}}\left(\|\nabla a\|_{L^{p_{2}}(B(r))}+\|\nabla b\|_{L^{p_{2}}(B(r))}\right)<\infty .
$$

In particular, from (5.4) and harmonicity of $H$ we get $v \in L^{p_{2}}(B(R / 2))$. By a covering argument we conclude that $v \in W_{l o c}^{1, p_{2}}\left(\mathbb{B}^{2}\right)$.

So we define a sequence $\left(p_{i}\right)_{i}$ by

$$
\frac{1}{p_{i+1}}:=\frac{1}{p_{i}}-\frac{\alpha}{4 p_{i}+4-2 \alpha} .
$$

By induction we obtain from Proposition $4.1 v \in W_{\text {loc }}^{1, p_{i+1}, \mathbb{R}^{N}}\left(\mathbb{B}^{2}\right)$ for every $i \in \mathbb{N}$ such that $p_{i}<p_{\infty}$. The important point is that $\alpha$ is uniform and does not depend on each $i$.

Clearly $p_{i+1} \geq p_{i}$ and $\lim _{i \rightarrow \infty} p_{i}=\infty$. That is there exists $i_{0} \in \mathbb{N}$ such that $p_{i}<p_{\infty}$ and $p_{i+1}>p_{\infty}$. That means that $v \in W_{l o c}^{1, p_{\infty}}\left(\mathbb{B}^{2}\right)$.

As a direct corollary from Proposition 5.4 and the Euler-Lagrange equations in Lemma 3.1 we obtain $W_{l o c}^{2,2-\varepsilon}$-regularity for $v$. Observe that in view of the counterexamples in [22] this is the best regularity for $v$ one can hope for without having further improvements on the regularity of $\lambda$.

Corollary 5.5. Let $v$ and $\lambda$ be as in Theorem 1.4. Then, for any $q \in(1,2)$ we have $v \in W_{l o c}^{2, q}$.

Proof. From Proposition 5.4 we have that $v \in W_{l o c}^{1, p}\left(\mathbb{B}^{2}\right)$ for any $p \in(1, \infty)$. From Lemma 3.1 we thus get that for any $q \in(1,2)$ - recall that $\nabla \lambda \in L^{2}\left(\mathbb{B}^{2}\right)-$

$$
\operatorname{div}\left(\lambda^{2} \nabla v\right) \in L_{l o c}^{q}\left(\mathbb{B}^{2}\right)
$$

Now

$$
\Delta v=\operatorname{div}\left(\lambda^{-2} \lambda^{2} \nabla v\right)=\nabla \lambda^{-2} \lambda^{2} \nabla v+L_{l o c}^{q}\left(\mathbb{B}^{2}\right) .
$$

Since $\inf _{\mathbb{B}^{2}} \lambda>0$ we have that $\lambda^{-2} \in H^{1}\left(\mathbb{B}^{2}\right)$ and thus

$$
\Delta v \in L_{l o c}^{q}\left(\mathbb{B}^{2}\right)
$$

Standard elliptic estimates imply now $v \in W_{l o c}^{2, q}\left(\mathbb{B}^{2}, \mathbb{R}^{N}\right)$.

## 6. $W^{2,2}$-REGULARITY FOR $\lambda$

By now, for $\lambda$ and $v$ as in Theorem 1.4 we have shown in Lemma 2.1 that $\lambda \in L_{\text {loc }}^{\infty}\left(\mathbb{B}^{2}\right)$ and in Corollary 5.5 that $v \in W_{\text {loc }}^{2, q}\left(\mathbb{B}^{2}\right)$ for any $q \in(1,2)$.
Recall that we assume that $\lambda \geq 1$. It will be notationally convenient to work with $\mu:=\lambda-1$, which is a critical point of the energy

$$
\int|\nabla \mu|^{2}+\int\left(\mu^{2}-2 \mu\right)|\nabla v|^{2}
$$

So in the following we are going to consider the regularity of critical points $\mu \in$ $L^{\infty}\left(\mathbb{B}^{2},[0, \infty)\right)$

$$
F(\mu):=\int|\nabla \mu|^{2}+\int\left(\mu^{2}-2 \mu\right) g \quad \text { subject to } \mu \geq 0
$$

where $g \in W_{l o c}^{1, q}\left(\mathbb{B}^{2}\right)$ for any $q<2$, in particular $g \in L_{l o c}^{2}\left(\mathbb{B}^{2}\right)$.
First we observe the variational inequality.
Lemma 6.1. Let $\mu$ as above, i.e. a critical point of $F$. Then, for any $\varphi \in C_{c}^{\infty}\left(\mathbb{B}^{2}\right)$ such that $\varphi \geq 0$ we have

$$
\begin{equation*}
\int_{\mathbb{B}^{2}} \nabla \mu \cdot \nabla(\varphi-\mu)+\int_{\mathbb{B}^{2}} \mu(\varphi-\mu) g-\int_{\mathbb{B}^{2}}(\varphi-\mu) g \geq 0 \tag{6.1}
\end{equation*}
$$

Proof. This follows using the variation

$$
\mu_{\varepsilon}:=\mu+\varepsilon(\varphi-\mu) .
$$

The variational inequality (6.1) for $\mu$ is almost of the form of variational inequalities considered e.g. in $[7,(2.6)]$, where Frehse showed how Nirenberg's method of discretely differentiating partial differential equations can be adapted to variational inequalities. Indeed, the only additional term that does not appear in $[7,(2.6)]$ is $\int_{\mathbb{B}^{2}} \mu(\varphi-\mu) g$. So we (slightly) adapt Frehse's argument to obtain
Proposition 6.2. Let $\mu \in W^{1,2}\left(\mathbb{B}^{2}\right) \cap L_{\text {loc }}^{\infty}\left(\mathbb{B}^{2}\right)$ as above, i.e. a critical point of $F$. If $g \in W_{\text {loc }}^{1, q}\left(\mathbb{B}^{2}\right)$ for any $q<2$, then $\mu \in W_{\text {loc }}^{2,2}\left(\mathbb{B}^{2}\right)$.

We now follow closely Frehse's argument in [7], and only prove the differences.
Firstly, we introduce first and second order differential quotients,

$$
\begin{gathered}
\delta_{i ; h} \mu(x):=\frac{\mu\left(x+h e_{i}\right)-\mu(x)}{h}, \\
\delta_{i, j ; h} \mu(x):=\frac{\mu\left(x+h e_{i}\right)+\mu\left(x-h e_{j}\right)-2 \mu(x)}{h^{2}}
\end{gathered}
$$

ON $C^{1, \alpha}$-REGULARITY FOR CRITICAL POINTS OF A GEOMETRIC OBSTACLE-TYPE PROBLEM15
The main first observation in [7, Hilfssatz 1]
Lemma 6.3. Let $\eta \in C_{c}^{\infty}\left(\mathbb{B}^{2}\right), \eta \geq 0$. Then for any $h<\operatorname{dist}\left(\operatorname{supp} \eta, \partial \mathbb{B}^{2}\right)$ we have for $i=1,2$,

$$
\int_{\mathbb{B}^{2}} \nabla \mu \cdot \nabla\left(\eta^{2} \delta_{i, i ; h} \mu\right)+\int_{\mathbb{B}^{2}} \mu\left(\eta^{2} \delta_{i, i ; h} \mu\right) g-\int_{\mathbb{B}^{2}}\left(\eta^{2} \delta_{i, i ; h} \mu\right) g \geq 0
$$

Proof. Observe that for $\varepsilon \ll h$ we have that

$$
\mu_{\varepsilon}:=\mu+\varepsilon \eta^{2} \delta_{i, j ; h} \mu \geq 0
$$

In particular, $\mu_{\varepsilon}$ is a permissible variation of $\mu$, and the claim follows.
The only term that we have to estimate additionally to Frehse's [7] is the following:

## Lemma 6.4.

$$
\int_{\mathbb{B}^{2}} \mu \eta^{2} \delta_{i, i ; h} \mu g \precsim C\left(1+\left\|\nabla \delta_{i, h}(\eta \mu)\right\|_{L^{2}\left(\mathbb{B}^{2}\right)}\right)
$$

where $C$ depends on $\operatorname{supp} \eta,\|\mu\|_{L^{\infty}},\|\nabla \mu\|_{L^{2}},\|\nabla \eta\|_{L^{\infty}},\|g\|_{L^{p}}$, for $p$ sufficiently close to $\infty$ and $\|\nabla g\|_{W^{1, q}}$ for a $q<2$ sufficiently close to 2.

Proof. First, a standard application of the discrete Leibniz rule,

$$
\int_{\mathbb{B}^{2}} \mu \eta^{2} \delta_{i, i ; h} \mu g=-\int_{\mathbb{B}^{2}} \mu \delta_{i,-h} \delta_{i, h}(\eta \mu) g+C
$$

Thus, with the discrete integration by parts rule we obtain for any $q \in(1, \infty)$,

$$
\|\nabla(\eta \mu g)\|_{L^{q}}\left\|\delta_{i, h}(\eta \mu)\right\|_{L^{\frac{q}{q-1}}}
$$

For $q<2$ we have

$$
\|\nabla(\eta \mu g)\|_{L^{q}} \precsim C .
$$

On the other hand, since $\delta_{i, h}(\eta \mu)$ has compact support, by Sobolev-Poincarè-embedding (since we are in two dimensions) for any $q \in(1,2)$,

$$
\left\|\delta_{i, h}(\eta \mu)\right\|_{L^{\frac{q}{q-1}}} \precsim\left\|\nabla \delta_{i, h}(\eta \mu)\right\|_{L^{2}}
$$

Proof of Proposition 6. Following word-by-word the Frehse's argument in [7], using additionally the estimate Lemma 6.4 we obtain, cf. [7, p. 149],

$$
\left\|\nabla\left(\delta_{i, h}(\mu \eta)\right)\right\|_{L^{2}}^{2} \leq C\left(1+\left\|\nabla\left(\delta_{i, h}(\mu \eta)\right)\right\|_{L^{2}}\right)
$$

From Young's inequality we obtain

$$
\left\|\nabla\left(\delta_{i, h}(\mu \eta)\right)\right\|_{L^{2}}^{2} \leq C+4 C^{2}+\frac{1}{2}\left\|\nabla\left(\delta_{i, h}(\mu \eta)\right)\right\|_{L^{2}}^{2}
$$

and thus we obtain a bound on $\left\|\nabla\left(\delta_{i, h}(\mu \eta)\right)\right\|_{L^{2}}^{2}$ independent of $h$. Letting $h \rightarrow 0$ we get that

$$
\nabla \partial_{i}(\mu \eta) \in L^{2}
$$

which readily leads to $u \in W^{2,2}$ in the set where $\eta \equiv 1$. Taking $\eta \in C_{c}^{\infty}\left(\mathbb{B}^{2}\right)$ and $\eta \equiv 1$ on $K \subset \mathbb{B}^{2}, K$ compact, we get that $\mu \in W_{\text {loc }}^{2,2}(K)$. This holds for any compact set $K \subset \mathbb{B}^{2}$, so the claim is proven.

Corollary 6.5. Let $v$ and $\lambda$ be as in Theorem 1.4. Then $\lambda \in W_{\text {loc }}^{2,2}\left(\mathbb{B}^{2}\right), v \in W_{\text {loc }}^{2, p}\left(\mathbb{B}^{2}, \mathbb{R}^{N}\right)$ for any $p<\infty$. In particular $\lambda \in C^{0, \alpha}$ and $v \in C^{1, \alpha}$ for any $\alpha<1$.

Proof. By Corollary 5.5 we have that $|\nabla v|^{2} \in W_{l o c}^{1, q}$ for any $q<2$. Thus Proposition 6 is applicable to $\mu=\lambda-1$, and we get that $\lambda=\mu+1 \in W_{l o c}^{2,2}\left(\mathbb{B}^{2}\right)$.

To obtain $W_{l o c}^{2, p}$-regularity for $v$, we consider again the equations for $v,(3.1)$, and note that

$$
\operatorname{div}\left(\lambda^{2} \nabla v\right) \in L_{l o c}^{p}\left(\mathbb{B}^{2}\right)
$$

Moreover, since $\lambda \geq 1$, we compute

$$
\Delta v=\operatorname{div}\left(\lambda^{-2} \lambda^{2} \nabla v\right)=\lambda^{-} \nabla \lambda \nabla v+\lambda^{-2} \operatorname{div}\left(\lambda^{2} \nabla v\right)
$$

Since $\nabla \lambda \in W_{l o c}^{1,2}$ and $\nabla v \in W_{l o c}^{1, q}$ for any $q<2$, we obtain that $\Delta v \in L_{l o c}^{p}$ and consequently standard Calderon-Zygmund theory implies that $\nabla^{2} v \in L_{l o c}^{p}$.

## 7. On $C^{1, \alpha}$-REGULARITY FOR $\lambda$

At this stage we have that $v \in W_{l o c}^{2, p}\left(\mathbb{B}^{2}, \mathbb{R}^{N}\right)$ for all $p \in(1, \infty)$ and $\lambda \in W_{\text {loc }}^{2,2}\left(\mathbb{B}^{2}\right)$. Observe that this implies in particular that $\lambda$ is continuous. Since the obstacle condition $\lambda \geq 1$ is pointwise, the theory of viscosity solutions (see e.g. [3, 12]) is more suitable now.

Proposition 7.1. There exists a constant $\Lambda>0$ such that $\lambda$ solve in viscosity sense the inequalities

$$
0 \leq \Delta \lambda \leq \Lambda \quad \text { in } \mathbb{B}^{2}
$$

This Proposition is a consequence of Lemma 7.3 and Lemma 7.4 below. The first observation is that $\lambda$ is smooth in the open set $\{\lambda>1\}$.

Lemma 7.2. We have $\lambda, v \in C^{\infty}(\{\lambda>1\})$ and we have

$$
\begin{equation*}
\Delta \lambda=\lambda|\nabla v|^{2} \quad \text { pointwise in }\{\lambda>1\} \tag{7.1}
\end{equation*}
$$

In view of Corollary 6.5 there exists in particular $\Lambda>0$ such that

$$
\Delta \lambda \leq \Lambda \quad \text { in }\{\lambda>1\}
$$

Proof. We revert our attention to $u:=\lambda v$ and show that $u \in C^{\infty}(\{\lambda>1\})$. Let $x_{0} \in\{\lambda>$ $1\}$. Then, since $\lambda$ is continuous, there exists a ball $B:=B\left(x_{0}\right)$ such that $\bar{B} \subset\{\lambda>1\}$. But this implies that for any $\varphi \in C_{c}^{\infty}(B)$ for all suitably small

$$
u_{\varepsilon}:=u+\varepsilon \varphi
$$

is a permissible variation of the Dirichlet energy, setting $\lambda_{\varepsilon}:=\left|u_{\varepsilon}\right|>0$ and $v_{\varepsilon}:=\frac{u_{\varepsilon}}{\left|u_{\varepsilon}\right|^{2}}$. That is,

$$
\left.\frac{d}{d \varepsilon}\right|_{\varepsilon=0} \int\left|\nabla u_{\varepsilon}\right|^{2}=0
$$

But this implies

$$
\Delta u=0 \quad \text { in }\{\lambda>1\}
$$

so in particular $\lambda=|u| \in C^{\infty}(\{\lambda>1\})$ and $v=\frac{u}{|u|} \in C^{\infty}(\{\lambda>1\})$.
The equation (7.1) follows now from the variation $\lambda_{\varepsilon}:=\lambda+\varepsilon \psi$ for arbitrary $\psi \in C_{c}^{\infty}(\{\lambda>$ 1\}).

Lemma 7.3. We have in viscosity sense

$$
\Delta \lambda \geq 0 \quad \text { in } \mathbb{B}^{2}
$$

Proof. Let $x_{0} \in \mathbb{B}^{2}$. If $\lambda\left(x_{0}\right)>1$, then the claim follows immediately from Lemma 7.2 , since smooth solutions are viscosity solutions.

So assume that $\lambda\left(x_{0}\right)=1$. For any test-function $\varphi \geq \lambda$ such that $\varphi\left(x_{0}\right)=1$ we have in particular

$$
\varphi \geq 1, \quad \text { and } \quad \varphi\left(x_{0}\right)=1
$$

That is, $\varphi$ attains its minimum at $x_{0}$ and thus $\Delta \varphi \geq 0$.
Lemma 7.4. For $\lambda$ as above we have in viscosity sense.

$$
\Delta \lambda \leq \Lambda \quad \text { in } \mathbb{B}^{2} .
$$

Proof. By the variation $\lambda_{\varepsilon}:=\lambda+\varepsilon \varphi$ for $\varphi \in C_{c}^{\infty}\left(\mathbb{B}^{2}\right)$ and $\varphi \geq 0$ we get the variational inequality

$$
\int \nabla \lambda \cdot \nabla \varphi+\lambda \varphi|\nabla v|^{2} \geq 0
$$

Let $\eta \in C_{c}^{\infty}(B(0,1))$ be the usual bump function, $\eta \equiv 1$ in $B\left(0, \frac{1}{2}\right), \eta(-x)=\eta(x), \eta \geq 0$ and $\int \eta=1$. We set $\eta_{\varepsilon}:=\varepsilon^{-2} \eta(\cdot / \varepsilon)$. We denote $\lambda_{\varepsilon}:=\eta_{\varepsilon} * \lambda$ and have for any fixed testfunction $\varphi \geq 0$ (if $\varepsilon$ is small enough then $\varphi * \eta_{\varepsilon} \geq 0$ is permissible as a test function)

$$
\begin{aligned}
\int \nabla \lambda_{\varepsilon} \cdot \nabla & \varphi=\int \nabla \lambda \cdot \nabla\left(\varphi * \eta_{\varepsilon}\right) \\
\geq & -\int \lambda\left(\varphi * \eta_{\varepsilon}\right)|\nabla v|^{2} \\
& =-\int \varphi\left(\lambda|\nabla v|^{2}\right) * \eta_{\varepsilon}
\end{aligned}
$$

Since, in view of Corollary 6.5 we have

$$
\left\|\left(\lambda|\nabla v|^{2}\right) * \eta_{\varepsilon}\right\|_{L^{\infty}} \leq\left\|\lambda|\nabla v|^{2}\right\|_{L^{\infty}}=: \Lambda<\infty
$$

we find that

$$
\begin{equation*}
\Delta \lambda_{\varepsilon} \leq \Lambda \quad \text { in } \mathbb{B}_{1-2 \varepsilon} \tag{7.2}
\end{equation*}
$$

This inequality holds in pointwise and viscosity sense, since $\lambda_{\varepsilon}$ is smooth.
On the other hand, since $\lambda$ is Hölder continuous, we have that $\lambda_{\varepsilon}$ converges locally uniformly to $\lambda$ as $\varepsilon \rightarrow 0$. This implies, e.g. as in [19, Lemma 2.4], that also $\lambda$ satisfies (7.2) in viscosity sense.

As a consequence of the regularity theory of viscosity solutions to elliptic partial differential inequalities, see e.g. [19], we obtain

Corollary 7.5. Let be $\lambda$ as above, then $\lambda \in C^{1, \alpha}$ for any $\alpha<1$.

## 8. Adaptations for the proof of Theorem 1.3

For matrices $A, B \in \mathbb{R}^{N \times N}$ we denote the Hilbert-Schmidt scalar product by

$$
A: B:=\sum_{i, j=1}^{\infty} A_{i j} B_{i j}
$$

Now as in the sphere case, where we have $u \cdot \nabla u=0$ if $|u|=1$ almost everywhere, if $P \in S O(N)$ almost everywhere then

$$
\nabla P: P=P^{T} \nabla P: I_{N \times N}=0
$$

since $P^{T} \nabla P$ is antisymmetric and the identity matrix $I_{N \times N}$ is symmetric.
In particular we have for $\lambda \in H^{1}\left(\mathbb{B}^{2}\right)$ and $P \in H^{1}\left(\mathbb{B}^{2}, S O(N)\right)$,

$$
|\nabla(\lambda P)|^{2}=|\nabla \lambda|^{2}+\lambda^{2}|\nabla P|^{2}
$$

We conclude that we have to consider critical points of the energy

$$
E(\lambda, P)=|\nabla \lambda|^{2}+\lambda^{2}|\nabla P|^{2}
$$

So we see that we get the analogue of Lemma 3.1. Now regularity estimates are almost verbatim of what we have here.

Lemma 8.1 (Euler-Lagrange equations). Let $\lambda$ and $P$ be as in Theorem 1.3. Then,

$$
\operatorname{div}\left(\lambda^{2} \nabla P\right)=\lambda^{2} \Omega \nabla P
$$

with

$$
\Omega=-P^{T} \nabla P
$$

Equivalently we also have the conservation law

$$
\operatorname{div}\left(\lambda^{2} P^{T} \nabla P\right)=0
$$

Proof. A permissible variation for $P$ is $P_{\varepsilon}:=P e^{\varepsilon \alpha \varphi}$ where $\alpha \in s o(N)$ is antisymmetric and $\varphi \in C_{c}^{\infty}\left(\mathbb{B}^{2}\right)$. This leads to

$$
\int \lambda^{2} \nabla P: \nabla(P \alpha \varphi)=0
$$

Observe that for antisymmetric $\alpha$ we readily have

$$
\nabla P: \nabla P \alpha=0
$$

Thus, the Euler-Lagrange equations for variations in $P$ are

$$
\operatorname{div}\left(\lambda^{2} P^{T} \nabla P\right): \alpha=0
$$

This holds for any antisymmetric matrix $\alpha \in \operatorname{so}(N)$. Using that $P^{T} \nabla P$ is also antisymmetric, we thus get

$$
\operatorname{div}\left(\lambda^{2} P^{T} \nabla P\right)=0
$$

We can equivalently rewrite this as

$$
\operatorname{div}\left(\lambda^{2} \nabla P\right)=\operatorname{div}\left(\lambda^{2} P P^{T} \nabla P\right)=\lambda^{2} \nabla P P^{T} \nabla P
$$

Using that $\nabla P P^{T}=\nabla\left(P P^{T}\right)-P^{T} \nabla P=-P^{T} \nabla P$ we get the claim.
