# GEOMETRIC HARDY AND HARDY-SOBOLEV INEQUALITIES ON HEISENBERG GROUPS

#### MICHAEL RUZHANSKY, BOLYS SABITBEK, AND DURVUDKHAN SURAGAN

ABSTRACT. In this paper, we present the geometric Hardy inequality for the sub-Laplacian in the half-spaces on the stratified groups. As a consequence, we obtain the following geometric Hardy inequality in a half-space on the Heisenberg group with a sharp constant

$$\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi \ge \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi, \ p > 1,$$

which solves the conjecture in the paper [11]. Also, we obtain a version of the Hardy-Sobolev inequality in a half-space on the Heisenberg group

$$\left(\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi - \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi\right)^{\frac{1}{p}} \ge C \left(\int_{\mathbb{H}^+} |u|^{p^*} d\xi\right)^{\frac{1}{p^*}},$$

where  $dist(\xi, \partial \mathbb{H}^+)$  is the Euclidean distance to the boundary,  $p^* := Qp/(Q-p)$ ,  $2 \le p < Q$ , and

$$\mathcal{W}(\xi) = \left(\sum_{i=1}^{n} \langle X_i(\xi), \nu \rangle^2 + \langle Y_i(\xi), \nu \rangle^2\right)^{\frac{1}{2}},$$

is the angle function. For p = 2, this gives the Hardy-Sobolev-Maz'ya inequality on the Heisenberg group.

## 1. INTRODUCTION

Let us recall the Hardy inequality in the half-space

$$\int_{\mathbb{R}^n_+} |\nabla u|^p dx \ge \left(\frac{p-1}{p}\right)^p \int_{\mathbb{R}^n_+} \frac{|u|^p}{x_n^p} dx, \quad p > 1,$$
(1.1)

for every function  $u \in C_0^{\infty}(\mathbb{R}^n_+)$ , where  $\nabla$  is the usual Euclidean gradient. The halfspace is defined by  $\mathbb{R}^n_+ := \{(x', x_n) | x' := (x_1, \dots, x_{n-1}) \in \mathbb{R}^{n-1}, x_n > 0\}, n \in \mathbb{N}$ . There is a number of studies related to inequality (1.1), see e.g. [1], [2], [5], [12].

No new data was collected or generated during the course of this research.

Filippas, Maz'ya and Tertikas in [7] have established the Hardy-Sobolev inequality in the following form

$$\left(\int_{\mathbb{R}^{n}_{+}} |\nabla u|^{p} dx - \left(\frac{p-1}{p}\right)^{p} \int_{\mathbb{R}^{n}_{+}} \frac{|u|^{p}}{x_{n}^{p}} dx\right)^{\frac{1}{p}} \ge C\left(\int_{\mathbb{R}^{n}_{+}} |u|^{p^{*}} dx\right)^{\frac{1}{p^{*}}}, \qquad (1.2)$$

for all function  $u \in C_0^{\infty}(\mathbb{R}^n_+)$ , where  $p^* = \frac{np}{n-p}$  and  $2 \leq p < n$ . There is a different proof of this inequality by Frank and Loss [6].

The Hardy inequality in the half-space on the Heisenberg group was shown by Luan and Young [21] in the form

$$\int_{\mathbb{H}^+} |\nabla_H u|^2 d\xi \ge \frac{1}{4} \int_{\mathbb{H}^+} \frac{|x|^2 + |y|^2}{t^2} |u|^2 d\xi.$$
(1.3)

An alternative proof of this inequality was given by Larson in [11], where the author generalised it to any half-space of the Heisenberg group,

$$\int_{\mathbb{H}^+} |\nabla_H u|^2 d\xi \ge \frac{1}{4} \int_{\mathbb{H}^+} \frac{\sum_{i=1}^n \langle X_i(\xi), \nu \rangle^2 + \langle Y_i(\xi), \nu \rangle^2}{dist(\xi, \partial \mathbb{H}^+)^2} |u|^2 d\xi,$$

where  $X_i$  and  $Y_i$  (for i = 1, ..., n) are left-invariant vector fields on the Heisenberg group,  $\nu$  is the Riemannian outer unit normal (see [9]) to the boundary. Also, there is the  $L^p$ -generalisation of the above inequality

$$\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi \ge \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\sum_{i=1}^n |\langle X_i(\xi), \nu \rangle|^p + |\langle Y_i(\xi), \nu \rangle|^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi.$$

Note also that the authors in [14] have extended this result to general Carnot groups.

The main aim of this paper is to improve the  $L^p$ -version of the geometric Hardy inequality for the sub-Laplacian in the half-spaces on the stratified groups (the Carnot groups), where the obtained inequality will be a natural extension of the inequality derived by the authors in [11] and [14] on the Heisenberg and the stratified groups, respectively. Note that it proves the inequality conjectured in [11]. Moreover, we obtain a version of the Hardy-Sobolev inequality in the setting of the Heisenberg group.

The main results of this paper are as follows:

• Geometric  $L^p$ -Hardy inequality on  $\mathbb{G}^+$ : Let  $\mathbb{G}^+ := \{x \in \mathbb{G} : \langle x, \nu \rangle > d\}$ be a half-space of a stratified group  $\mathbb{G}$ . Then for all  $u \in C_0^{\infty}(\mathbb{G}^+), \beta \in \mathbb{R}$  and p > 1 we have

$$\begin{split} \int_{\mathbb{G}^+} |\nabla_{\mathbb{G}} u|^p dx &\geq -(p-1)(|\beta|^{\frac{p}{p-1}} + \beta) \int_{\mathbb{G}^+} \frac{\mathcal{W}(x)^p}{dist(x, \partial \mathbb{G}^+)^p} |u|^p dx \\ &+ \beta \int_{\mathbb{G}^+} \frac{\mathcal{L}_p(dist(x, \partial \mathbb{G}^+))}{dist(x, \partial \mathbb{G}^+)^{p-1}} |u|^p dx, \end{split}$$

where  $\mathcal{W}(x) := (\sum_{i=1}^{N} \langle X_i(x), \nu \rangle^2)^{1/2}$ , and  $\mathcal{L}_p$  is the *p*-sub-Laplacian on  $\mathbb{G}$ , see (1.6).

• Geometric  $L^p$ -Hardy inequality on  $\mathbb{H}^+$ : Let  $\mathbb{H}^+ := \{\xi \in \mathbb{H}^n : \langle \xi, \nu \rangle > d\}$ be a half-space of the Heisenberg group. Then for all  $u \in C_0^{\infty}(\mathbb{H}^+)$  and p > 1 we have

$$\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi \ge \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi,\partial\mathbb{H}^+)^p} |u|^p d\xi$$

where  $\mathcal{W}(\xi) := \left(\sum_{i=1}^{n} \langle X_i(\xi), \nu \rangle^2 + \langle Y_i(\xi), \nu \rangle^2\right)^{1/2}$  and the constant is sharp. • Geometric Hardy-Sobolev inequality on  $\mathbb{H}^+$ : Let  $\mathbb{H}^+ := \{\xi \in \mathbb{H}^n :$ 

• Geometric Hardy-Sobolev inequality on  $\mathbb{H}^+$ : Let  $\mathbb{H}^+ := \{\xi \in \mathbb{H}^n : \langle \xi, \nu \rangle > d\}$  be a half-space of the Heisenberg group. Then for all  $u \in C_0^{\infty}(\mathbb{H}^+)$ and  $2 \leq p < Q$  with Q = 2n + 1, there exists some C > 0 such that we have

$$\left(\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi - \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi,\partial\mathbb{H}^+)^p} |u|^p d\xi\right)^{\frac{1}{p}} \ge C \left(\int_{\mathbb{H}^+} |u|^{p^*} d\xi\right)^{\frac{1}{p^*}},$$

where  $dist(\xi, \partial \mathbb{H}^+) := \langle \xi, \nu \rangle - d$  is the distance from  $\xi$  to the boundary and  $p^* := Qp/(Q-p)$ .

1.1. Preliminaries on stratified groups. Let  $\mathbb{G} = (\mathbb{R}^n, \circ, \delta_{\lambda})$  be a stratified Lie group (or a homogeneous Carnot group), with dilation structure  $\delta_{\lambda}$  and Jacobian generators  $X_1, \ldots, X_N$ , so that N is the dimension of the first stratum of  $\mathbb{G}$ . Let us denote by Q the homogeneous dimension of  $\mathbb{G}$ . We refer to the recent books [8] and [17] for extensive discussions of stratified Lie groups and their properties.

The sub-Laplacian on  $\mathbb{G}$  is given by

$$\mathcal{L} = \sum_{k=1}^{N} X_k^2. \tag{1.4}$$

We also recall that the standard Lebesque measure dx on  $\mathbb{R}^n$  is the Haar measure for  $\mathbb{G}$  (see, e.g. [8, Proposition 1.6.6]). Each left invariant vector field  $X_k$  has an explicit form and satisfies the divergence theorem, see e.g. [8] for the derivation of the exact formula: more precisely, we can express

$$X_{k} = \frac{\partial}{\partial x'_{k}} + \sum_{l=2}^{r} \sum_{m=1}^{N_{l}} a_{k,m}^{(l)}(x', ..., x^{(l-1)}) \frac{\partial}{\partial x_{m}^{(l)}},$$
(1.5)

with  $x = (x', x^{(2)}, \ldots, x^{(r)})$ , where r is the step of  $\mathbb{G}$  and  $x^{(l)} = (x_1^{(l)}, \ldots, x_{N_l}^{(l)})$  are the variables in the  $l^{th}$  stratum, see also [8, Section 3.1.5] for a general presentation. The horizontal gradient is given by

$$\nabla_{\mathbb{G}} := (X_1, \ldots, X_N),$$

and the horizontal divergence is defined by

$$\operatorname{div}_{\mathbb{G}} v := \nabla_{\mathbb{G}} \cdot v.$$

The *p*-sub-Laplacian has the following form

$$\mathcal{L}_p v = \nabla_{\mathbb{G}}(|\nabla_{\mathbb{G}} v|^{p-2} \nabla_{\mathbb{G}} v).$$
(1.6)

Let us define the half-space on the stratified group  $\mathbb{G}$  as

$$\mathbb{G}^+ := \{ x \in \mathbb{G} : \langle x, \nu \rangle > d \},\$$

where  $\nu := (\nu_1, \ldots, \nu_r)$  with  $\nu_j \in \mathbb{R}^{N_j}$ ,  $j = 1, \ldots, r$ , is the Riemannian outer unit normal to  $\partial \mathbb{G}^+$  (see [9]) and  $d \in \mathbb{R}$ . Let us define the so-called angle function

$$\mathcal{W}(x) := \sqrt{\sum_{i=1}^{N} \langle X_i(x), \nu \rangle^2};$$

such function was introduced by Garofalo [9] in his investigation of the horizontal Gauss map. The Euclidean distance to the boundary  $\partial \mathbb{G}^+$  is denoted by  $dist(x, \partial \mathbb{G}^+)$  and defined as

$$dist(x, \partial \mathbb{G}^+) = \langle x, \nu \rangle - d.$$

## 2. Geometric Hardy inequalities

**Theorem 2.1.** Let  $\mathbb{G}^+$  be a half-space of a stratified group  $\mathbb{G}$ . Then for all  $\beta \in \mathbb{R}$  and p > 1 we have

$$\int_{\mathbb{G}^+} |\nabla_{\mathbb{G}} u|^p dx \ge -(p-1)(|\beta|^{\frac{p}{p-1}} + \beta) \int_{\mathbb{G}^+} \frac{\mathcal{W}(x)^p}{dist(x,\partial\mathbb{G}^+)^p} |u|^p dx \qquad (2.1)$$
$$+ \beta \int_{\mathbb{G}^+} \frac{\mathcal{L}_p(dist(x,\partial\mathbb{G}^+))}{dist(x,\partial\mathbb{G}^+)^{p-1}} |u|^p dx,$$

for all  $u \in C_0^{\infty}(\mathbb{G}^+)$ .

Proof of Theorem 2.1. Let us begin with the divergence theorem, then we apply the Hölder inequality and the Young inequality, respectively. It follows for a vector field  $V \in C^{\infty}(\mathbb{G}^+)$  that

$$\begin{split} \int_{\mathbb{G}^+} \operatorname{div}_{\mathbb{G}} V |u|^p dx &= -p \int_{\mathbb{G}^+} |u|^{p-1} \langle V, \nabla_{\mathbb{G}} u \rangle dx \\ &\leq p \left( \int_{\mathbb{G}^+} |\nabla_{\mathbb{G}} u|^p dx \right)^{\frac{1}{p}} \left( \int_{\mathbb{G}^+} |V|^{\frac{p}{p-1}} |u|^p dx \right)^{\frac{p-1}{p}} \\ &\leq \int_{\mathbb{G}^+} |\nabla_{\mathbb{G}} u|^p dx + (p-1) \int_{\mathbb{G}^+} |V|^{\frac{p}{p-1}} |u|^p dx. \end{split}$$

By rearranging the above expression, we arrive at

$$\int_{\mathbb{G}^+} |\nabla_{\mathbb{G}} u|^p dx \ge \int_{\mathbb{G}^+} (\operatorname{div}_{\mathbb{G}} V - (p-1)|V|^{\frac{p}{p-1}})|u|^p dx.$$
(2.2)

Now we choose V in the following form

$$V = \beta \frac{|\nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+)|^{p-2}}{dist(x, \partial \mathbb{G}^+)^{p-1}} \nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+),$$
(2.3)

that is

$$|V|^{\frac{p}{p-1}} = |\beta|^{\frac{p}{p-1}} \frac{|\nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+)|^p}{dist(x, \partial \mathbb{G}^+)^p}.$$

Also, we have

$$\begin{aligned} |\nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+)|^p &= \left| \left( X_1 dist(x, \partial \mathbb{G}^+), \dots, X_N dist(x, \partial \mathbb{G}^+) \right) \right|^p \\ &= \left| \left( \langle X_1(x), \nu \rangle, \dots, \langle X_N(x), \nu \rangle \right) \right|^p \\ &= \left( \sum_{i=1}^N \langle X_i(x), \nu \rangle^2 \right)^{\frac{p}{2}} = \mathcal{W}(x)^p. \end{aligned}$$

Indeed, let us show that  $\langle X_i(x), \nu \rangle = X_i \langle x, \nu \rangle$ :

$$X_{i}(x) = (\overbrace{0, \dots, 1}^{i}, \dots, 0, \underbrace{a_{i,1}^{(2)}(x'), \dots, a_{i,N_{2}}^{(2)}(x')}_{N_{2}}, \dots, \underbrace{a_{i,1}^{(r)}(x', x^{(2)}, \dots, x^{(r-1)}), \dots a_{i,N_{r}}^{(r)}(x', x^{(2)}, \dots, x^{(r-1)})}_{N_{r}}), \\ \langle X_{i}(x), \nu \rangle = \nu'_{i} + \sum_{l=2}^{r} \sum_{m=1}^{N_{l}} a_{i,m}^{(l)}(x', x^{(2)}, \dots, x^{(r-1)})\nu_{m}^{(l)},$$

and

$$\langle x, \nu \rangle = \sum_{k=1}^{N} x'_{k} \nu'_{k} + \sum_{l=2}^{r} \sum_{m=1}^{N_{l}} x^{(l)}_{m} \nu^{(l)}_{m},$$
  
$$X_{i} \langle x, \nu \rangle = \nu'_{i} + \sum_{l=2}^{r} \sum_{m=1}^{N_{l}} a^{(l)}_{i,m} (x', x^{(2)}, \dots, x^{(r-1)}) \nu^{(l)}_{m}.$$

A direct calculation shows that

$$\begin{split} \operatorname{div}_{\mathbb{G}} V = & \beta \frac{\nabla_{\mathbb{G}}(|\nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+)|^{p-2} \nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+))}{dist(x, \partial \mathbb{G}^+)^{p-1}} \\ & - \beta(p-1) \frac{|\nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+)|^{p-2} \nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+) dist(x, \partial \mathbb{G}^+)^{p-2} \nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+)}{dist(x, \partial \mathbb{G}^+)^{2(p-1)}} \\ & = & \beta \frac{\mathcal{L}_p(dist(x, \partial \mathbb{G}^+))}{dist(x, \partial \mathbb{G}^+)^{p-1}} - \beta(p-1) \frac{|\nabla_{\mathbb{G}} dist(x, \partial \mathbb{G}^+)|^p}{dist(x, \partial \mathbb{G}^+)^p}. \end{split}$$

So we get

$$\operatorname{div}_{\mathbb{G}}V - (p-1)|V|^{\frac{p}{p-1}} = -(p-1)(|\beta|^{\frac{p}{p-1}} + \beta)\frac{|\nabla_{\mathbb{G}}dist(x,\partial\mathbb{G}^+)|^p}{dist(x,\partial\mathbb{G}^+)^p} + \beta\frac{\mathcal{L}_p(dist(x,\partial\mathbb{G}^+))}{dist(x,\partial\mathbb{G}^+)^{p-1}}.$$

Putting the above expression into inequality (2.2), we arrive at

$$\begin{split} \int_{\mathbb{G}^+} |\nabla_{\mathbb{G}} u|^p dx &\geq -(p-1)(|\beta|^{\frac{p}{p-1}} + \beta) \int_{\mathbb{G}^+} \frac{(\sum_{i=1}^N \langle X_i(x), \nu \rangle^2)^{\frac{p}{2}}}{dist(x, \partial \mathbb{G}^+)^p} |u|^p dx \\ &+ \beta \int_{\mathbb{G}^+} \frac{\mathcal{L}_p(dist(x, \partial \mathbb{G}^+))}{dist(x, \partial \mathbb{G}^+)^{p-1}} |u|^p dx, \end{split}$$

completing the proof.

2.1. Preliminaries on the Heisenberg group. Let us give a brief introduction of the Heisenberg group. Let  $\mathbb{H}^n$  be the Heisenberg group, that is, the set  $\mathbb{R}^{2n+1}$  equipped with the group law

$$\xi \circ \widetilde{\xi} := (x + \widetilde{x}, y + \widetilde{y}, t + \widetilde{t} + 2\sum_{i=1}^{n} (\widetilde{x}_{i}y_{i} - x_{i}\widetilde{y}_{i})),$$

where  $\xi := (x, y, t) \in \mathbb{H}^n$ ,  $x := (x_1, \ldots, x_n)$ ,  $y := (y_1, \ldots, y_n)$ , and  $\xi^{-1} = -\xi$  is the inverse element of  $\xi$  with respect to the group law. The dilation operation of the Heisenberg group with respect to the group law has the following form

$$\delta_{\lambda}(\xi) := (\lambda x, \lambda y, \lambda^2 t) \text{ for } \lambda > 0.$$

The Lie algebra  $\mathfrak{h}$  of the left-invariant vector fields on the Heisenberg group  $\mathbb{H}^n$  is spanned by

$$X_i := \frac{\partial}{\partial x_i} + 2y_i \frac{\partial}{\partial t} \text{ for } 1 \le i \le n,$$
$$Y_i := \frac{\partial}{\partial y_i} - 2x_i \frac{\partial}{\partial t} \text{ for } 1 \le i \le n,$$

and with their (non-zero) commutator

$$[X_i, Y_i] = -4\frac{\partial}{\partial t}$$

The horizontal gradient of  $\mathbb{H}^n$  is given by

$$\nabla_H := (X_1, \ldots, X_n, Y_1, \ldots, Y_n),$$

so the sub-Laplacian on  $\mathbb{H}^n$  is given by

$$\mathcal{L} := \sum_{i=1}^{n} \left( X_i^2 + Y_i^2 \right).$$

Let us define the half-space of the Heisenberg group by

$$\mathbb{H}^+ := \{\xi \in \mathbb{H}^n : \langle \xi, \nu \rangle > d\}_{\xi}$$

where  $\nu := (\nu_x, \nu_y, \nu_t)$  with  $\nu_x, \nu_y \in \mathbb{R}^n$  and  $\nu_t \in \mathbb{R}$  is the Riemannian outer unit normal to  $\partial \mathbb{H}^+$  (see [9]) and  $d \in \mathbb{R}$ . Let us define the so-called angle function

$$\mathcal{W}(\xi) := \sqrt{\sum_{i=1}^{n} \langle X_i(\xi), \nu \rangle^2 + \langle Y_i(\xi), \nu \rangle^2}.$$

The Euclidean distance to the boundary  $\partial \mathbb{H}^+$  is denoted by  $dist(\xi, \partial \mathbb{H}^+)$  and defined by

$$dist(\xi, \partial \mathbb{H}^+) := \langle \xi, \nu \rangle - d.$$

2.2. Consequences on the Heisenberg group. As a consequence of Theorem 2.1 we have the following inequality.

**Corollary 2.2.** Let  $\mathbb{H}^+$  be a half-space of the Heisenberg group  $\mathbb{H}^n$ . Then for all  $u \in C_0^{\infty}(\mathbb{H}^+)$  and p > 1 we have

$$\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi \ge \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi,$$
(2.4)

where the constant is sharp.

**Remark 2.3.** Note that inequality (2.4) was conjectured in [11] which is a natural extension of inequality (1.3) in [21]. Also, the sharpness of inequality (2.4) was proved by choosing  $\nu := (1, 0, ..., 0)$  and d = 0 in the paper [11].

*Proof of Corollary 2.2.* Let us rewrite the inequality in Theorem 2.1 in terms of the Heisenberg group as follows

$$\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi \ge -(p-1)(|\beta|^{\frac{p}{p-1}}+\beta) \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi,\partial\mathbb{H}^+)^p} |u|^p d\xi +\beta \int_{\mathbb{H}^+} \frac{\mathcal{L}_p(dist(\xi,\partial\mathbb{H}^+))}{dist(\xi,\partial\mathbb{H}^+)^{p-1}} |u|^p d\xi.$$

In the case of the Heisenberg group, we need to show that the last term vanishes to prove Corollary 2.2. Indeed, we have

$$\mathcal{L}_p(dist(\xi, \partial \mathbb{H}^+)) = 0,$$

since

$$\begin{aligned} \langle X_i(\xi), \nu \rangle &= \nu_{x,i} + 2y_i\nu_t, & \langle Y_i(\xi), \nu \rangle &= \nu_{y,i} - 2x_i\nu_t, \\ X_i \langle X_i(\xi), \nu \rangle &= 0, & Y_i \langle Y_i(\xi), \nu \rangle &= 0, \\ Y_i \langle X_i(\xi), \nu \rangle &= 2\nu_t, & X_i \langle Y_i(\xi), \nu \rangle &= -2\nu_t, \end{aligned}$$

where  $\xi := (x, y, t)$  with  $x, y \in \mathbb{R}^n$  and  $t \in \mathbb{R}$ ,  $\nu := (\nu_x, \nu_y, \nu_t)$  with  $\nu_x := (\nu_{x,1}, \dots, \nu_{x,n})$ and  $\nu_y := (\nu_{y,1}, \dots, \nu_{y,n})$ . Then we have

$$X_{i}(\xi) = \underbrace{(0, \dots, 1, \dots, 0, 0, \dots, 0, 2y_{i})}_{n},$$
$$Y_{i}(\xi) = \underbrace{(0, \dots, 0, 0, \dots, 1, \dots, 0, 0, -2x_{i})}_{n},$$

So we have

$$\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi \ge -(p-1)(|\beta|^{\frac{p}{p-1}} + \beta) \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi.$$

Now we optimise by differentiating the above inequality with respect to  $\beta$ , so that we have

$$\frac{p}{p-1}|\beta|^{\frac{1}{p-1}} + 1 = 0,$$

which leads to

$$\beta = -\left(\frac{p-1}{p}\right)^{p-1}$$

Using this value of  $\beta$ , we arrive at

$$\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi \ge \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi.$$

We have finished the proof of Corollary 2.2.

## 3. Geometric Hardy-Sobolev inequalities

In this section, we present the geometric Hardy-Sobolev inequality in the half space on the Heisenberg group.

3.1. A lower estimate for the geometric Hardy type inequalities. We start with an estimate for the remainder.

**Lemma 3.1.** Let  $\mathbb{H}^+$  be a half-space of the Heisenberg group  $\mathbb{H}^n$ . Then for  $p \geq 2$ , there exists a constant  $C_p > 0$  such that

$$E_p[u] = \int_{\mathbb{H}^+} |\nabla_H u|^p d\xi - \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{|\nabla_H dist(\xi, \partial \mathbb{H}^+)|^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi$$
$$\geq C_p \int_{\mathbb{H}^+} |dist(\xi, \partial \mathbb{H}^+)|^{p-1} |\nabla_H v|^p d\xi, \qquad (3.1)$$

for all  $u \in C_0^{\infty}(\mathbb{H}^+)$ , where  $dist(\xi, \partial \mathbb{H}^+) := \langle \xi, \nu \rangle - d$  is the distance from  $\xi$  to the boundary,  $C_p = (2^{p-1} - 1)^{-1}$ , and  $u(\xi) = dist(\xi, \partial \mathbb{H}^+)^{\frac{p-1}{p}}v(\xi)$ .

The Euclidean version of such a lower estimate to the Hardy inequality was established by Barbaris, Filippas and Tertikas [3].

*Proof of Lemma 3.1.* Let us begin by recalling once again the angle function, denoted by  $\mathcal{W}$ ,

$$|\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|^{p} = |(X_{1}\langle \xi, \nu \rangle, \dots, X_{n}\langle \xi, \nu \rangle, Y_{1}\langle \xi, \nu \rangle, \dots, Y_{n}\langle \xi, \nu \rangle)|^{p}$$
$$= \left(\sum_{i=1}^{n} \langle X_{i}(\xi), \nu \rangle^{2} + \langle Y_{i}(\xi), \nu \rangle^{2}\right)^{\frac{p}{2}}$$
$$= \mathcal{W}(\xi)^{p}. \tag{3.2}$$

Note that  $X_i(\xi, \nu)$  is equal to  $\langle X_i(\xi), \nu \rangle$ , see the proof of Theorem 2.1. This expression  $|\nabla_H dist(\xi, \partial \mathbb{H}^+)|^p = \mathcal{W}(\xi)^p$  will be used later. For now we will estimate the following form

$$E_p[u] := \int_{\mathbb{H}^+} |\nabla_H u|^p d\xi - \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi.$$
(3.3)

To estimate this, we introduce the following ground transform

$$u(\xi) = dist(\xi, \partial \mathbb{H}^+)^{\frac{p-1}{p}} v(\xi).$$
(3.4)

8

By inserting it into (3.3) and using (3.2), we have

$$\begin{split} E_p[u] &= \int_{\mathbb{H}^+} \left| \frac{p-1}{p} dist(\xi, \partial \mathbb{H}^+)^{-\frac{1}{p}} \nabla_H dist(\xi, \partial \mathbb{H}^+) v + dist(\xi, \partial \mathbb{H}^+)^{\frac{p-1}{p}} \nabla_H v \right|^p d\xi \\ &- \left( \frac{p-1}{p} \right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi, \partial \mathbb{H}^+)^p} |dist(\xi, \partial \mathbb{H}^+)^{\frac{p-1}{p}} v|^p d\xi \\ &\geq \int_{\mathbb{H}^+} \left| \frac{p-1}{p} dist(\xi, \partial \mathbb{H}^+)^{-\frac{1}{p}} v + dist(\xi, \partial \mathbb{H}^+)^{\frac{p-1}{p}} \frac{\nabla_H v}{\nabla_H dist(\xi, \partial \mathbb{H}^+)} \right|^p |\mathcal{W}(\xi)|^p \\ &- \left| \frac{p-1}{p} dist(\xi, \partial \mathbb{H}^+)^{-\frac{1}{p}} v \right|^p |\mathcal{W}(\xi)|^p d\xi. \end{split}$$

Then for  $p \geq 2$  and  $A, B \in \mathbb{R}^n$  we have that

$$|A + B|^p - |A|^p \ge C_p |B|^p + p|A|^{p-2}A \cdot B,$$

where  $C_p = (2^{p-1} - 1)^{-1}$  (see [3, Lemma 3.3]). By taking

$$A := \frac{p-1}{p} dist(\xi, \partial \mathbb{H}^+)^{-\frac{1}{p}} v \text{ and } B := dist(\xi, \partial \mathbb{H}^+)^{\frac{p-1}{p}} \frac{\nabla_H v}{\nabla_H dist(\xi, \partial \mathbb{H}^+)}$$

then we have the following lower estimate

$$\begin{split} E_p[u] &\geq \int_{\mathbb{H}^+} |\mathcal{W}(\xi)|^p (|A+B|^p - |A|^p) d\xi \\ &\geq C_p \int_{\mathbb{H}^+} dist(\xi, \partial \mathbb{H}^+)^{p-1} |\nabla_H v|^p \frac{\mathcal{W}(\xi)^p}{|\nabla_H dist(\xi, \partial \mathbb{H}^+)|^p} d\xi \\ &+ \left(\frac{p-1}{p}\right)^{p-1} \int_{\mathbb{H}^+} |\mathcal{W}(\xi)|^p |\nabla_H dist(\xi, \partial \mathbb{H}^+)|^{p-2} \left(\nabla_H dist(\xi, \partial \mathbb{H}^+) \cdot \nabla_H |v|^p\right) d\xi \\ &\geq C_p \int_{\mathbb{H}^+} dist(\xi, \partial \mathbb{H}^+)^{p-1} |\nabla_H v|^p d\xi. \end{split}$$

In the last line we have used (3.2) and we dropped the last term on the right-hand side. This completes the proof of Lemma 3.1.

3.2. Geometric Hardy-Sobolev inequality in the half-space on  $\mathbb{H}^n$ . Now we are ready to obtain the geometric Hardy-Sobolev inequality in the half-space on the Heisenberg group  $\mathbb{H}^n$ .

**Theorem 3.2.** Let  $\mathbb{H}^+$  be a half-space of the Heisenberg group  $\mathbb{H}^n$ . Then for every function  $u \in C_0^{\infty}(\mathbb{H}^+)$  and  $2 \leq p < Q$  with Q = 2n + 1, there exists some C > 0 such that we have

$$\left(\int_{\mathbb{H}^+} |\nabla_H u|^p d\xi - \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi\right)^{\frac{1}{p}} \ge C \left(\int_{\mathbb{H}^+} |u|^{p^*} d\xi\right)^{\frac{1}{p^*}},$$
(3.5)

where  $p^* := Qp/(Q-p)$  and  $dist(\xi, \partial \mathbb{H}^+) := \langle \xi, \nu \rangle - d$  is the distance from  $\xi$  to the boundary.

**Remark 3.3.** Note that for p = 2 we have the Hardy-Sobolev-Maz'ya inequality in the following form

$$\left(\int_{\mathbb{H}^+} |\nabla_H u|^2 d\xi - \frac{1}{4} \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^2}{dist(\xi, \partial \mathbb{H}^+)^2} |u|^2 d\xi\right)^{\frac{1}{2}} \ge C \left(\int_{\mathbb{H}^+} |u|^{2^*} d\xi\right)^{\frac{1}{2^*}}, \quad (3.6)$$
  
where  $2^* := 2O/(O-2)$ 

where  $2^* := 2Q/(Q-2)$ .

Proof of Theorem 3.2. Our key ingredient of proving the Hardy-Sobolev inequality in the half-space of  $\mathbb{H}^n$  is the  $L^1$ -Sobolev inequality, or the Gagliardo-Nirenberg inequality. It has been established on the Heisenberg group by Baldi, Franchi, Pansu in [4].

The  $L^1$ -Sobolev inequality on the Heisenberg group follows in the form

$$c\left(\int_{\mathbb{H}^n} |g|^{\frac{Q}{Q-1}} d\xi\right)^{\frac{Q-1}{Q}} \leq \int_{\mathbb{H}^n} |\nabla_H g| d\xi,$$

for some c > 0, for every function  $g \in W^{1,1}(\mathbb{H}^n)$ . Now let us set  $g = |u|^{p^*(1-1/Q)}$ , then we obtain

$$c\left(\int_{\mathbb{H}^{+}} |u|^{p^{*}} d\xi\right)^{\frac{Q-1}{Q}} \leq \left|\frac{p(Q-1)}{Q-p}\right| \int_{\mathbb{H}^{+}} |u|^{\frac{Q(p-1)}{Q-p}} |\nabla_{H}|u| |d\xi,$$
  
$$\leq \left|\frac{p(Q-1)}{Q-p}\right| \int_{\mathbb{H}^{+}} |u|^{\frac{Qp}{Q-p}} |\nabla_{H}u| d\xi,$$
  
$$= \left|\frac{p(Q-1)}{Q-p}\right| \int_{\mathbb{H}^{+}} |u|^{p^{*}(1-1/p)} |\nabla_{H}u| d\xi.$$

We have used  $|\nabla_H |u|| \leq |\nabla_H u|$  (see [15, Proof of Theorem 2.1]). Then we arrive at

$$C_1 \left( \int_{\mathbb{H}^+} |u|^{p^*} d\xi \right)^{\frac{Q-1}{Q}} \le \int_{\mathbb{H}^+} |u|^{p^*(1-1/p)} |\nabla_H u| d\xi,$$
(3.7)

where  $C_1 := c \left| \frac{Q-p}{p(Q-1)} \right| > 0$ . Let us estimate the right-hand side of inequality (3.7). Again we use a ground transform  $u(\xi) = dist(\xi, \partial \mathbb{H}^+)^{\frac{p-1}{p}} v(\xi)$  which leads to

$$\begin{split} &\int_{\mathbb{H}^{+}} |u|^{p^{*}(1-1/p)} |\nabla_{H}u| d\xi \\ &= \int_{\mathbb{H}^{+}} |u|^{p^{*}(1-1/p)} \left| dist(\xi, \partial \mathbb{H}^{+})^{\frac{p-1}{p}} \nabla_{H}v + \frac{p-1}{p} dist(\xi, \partial \mathbb{H}^{+})^{-1/p} \nabla_{H} dist(\xi, \partial \mathbb{H}^{+})v \right| d\xi \\ &\leq \int_{\mathbb{H}^{+}} |u|^{p^{*}(1-1/p)} dist(\xi, \partial \mathbb{H}^{+})^{\frac{p-1}{p}} |\nabla_{H}v| d\xi \\ &+ \frac{p-1}{p} \int_{\mathbb{H}^{+}} dist(\xi, \partial \mathbb{H}^{+})^{p^{*}(1-1/p)^{2}-1/p} |\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})||v|^{p^{*}(1-1/p)+1} d\xi \\ &= I_{1} + \frac{p-1}{p} I_{2}. \end{split}$$

In the last line we have denoted two integrals by  $I_1$  and  $I_2$ , respectively. Also, for simplification we denote  $\alpha := p^*(1 - 1/p)^2 + 1 - 1/p$ . First, we estimate  $I_2$  using integrations by parts

$$\begin{split} I_{2} &= \int_{\mathbb{H}^{+}} dist(\xi, \partial \mathbb{H}^{+})^{\alpha-1} |\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})| |v|^{\alpha p/(p-1)} d\xi \\ &= \frac{1}{\alpha} \int_{\mathbb{H}^{+}} \langle \nabla_{H} dist(\xi, \partial \mathbb{H}^{+})^{\alpha}, \nabla_{H} dist(\xi, \partial \mathbb{H}^{+}) \rangle \frac{|v|^{\alpha p/(p-1)}}{|\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|} d\xi \\ &= -\frac{1}{\alpha} \int_{\mathbb{H}^{+}} dist(\xi, \partial \mathbb{H}^{+})^{\alpha} \nabla_{H} \left( \frac{\nabla_{H} dist(\xi, \partial \mathbb{H}^{+}) |v|^{\alpha p/(p-1)}}{|\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|} \right) d\xi \\ &= -\frac{1}{\alpha} \int_{\mathbb{H}^{+}} dist(\xi, \partial \mathbb{H}^{+})^{\alpha} \times \\ \left( \frac{\nabla_{H} dist(\xi, \partial \mathbb{H}^{+}) \nabla_{H} |v|^{\alpha p/(p-1)}}{|\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|} - \frac{\langle \nabla_{H} dist(\xi, \partial \mathbb{H}^{+}), \nabla_{H} |\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})| \rangle |v|^{\alpha p/(p-1)}}{|\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|} \right) d\xi \\ &= -\frac{1}{\alpha} \int_{\mathbb{H}^{+}} dist(\xi, \partial \mathbb{H}^{+})^{\alpha} \frac{\nabla_{H} dist(\xi, \partial \mathbb{H}^{+}) \nabla_{H} |v|^{\alpha p/(p-1)}}{|\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|} d\xi \\ &\leq -\frac{p}{p-1} \int_{\mathbb{H}^{+}} dist(\xi, \partial \mathbb{H}^{+})^{\alpha} |v|^{\alpha p/(p-1)-1} |\nabla_{H} v| d\xi \\ &= -\frac{p}{p-1} \int_{\mathbb{H}^{+}} |u|^{p^{*(1-1/p)}} dist(\xi, \partial \mathbb{H}^{+})^{\frac{p-1}{p}} |\nabla_{H} v| d\xi \\ &\leq \frac{p}{p-1} I_{1}. \end{split}$$

We have used  $|\nabla_H|u|| \leq |\nabla_H u|$ , and

$$\mathcal{L}dist(\xi,\partial\mathbb{H}^+) = \sum_{i=1}^n X_i \langle X_i(\xi), \nu \rangle + Y_i \langle Y_i(\xi), \nu \rangle = 0,$$

since

$$\begin{aligned} \langle X_i(\xi), \nu \rangle &= \nu_{x,i} + 2y_i\nu_t, & \langle Y_i(\xi), \nu \rangle &= \nu_{y,i} - 2x_i\nu_t, \\ X_i\langle X_i(\xi), \nu \rangle &= 0, & Y_i\langle Y_i(\xi), \nu \rangle &= 0, \\ Y_i\langle X_i(\xi), \nu \rangle &= 2\nu_t, & X_i\langle Y_i(\xi), \nu \rangle &= -2\nu_t, \end{aligned}$$

where  $\xi := (x, y, t)$  with  $x, y \in \mathbb{R}^n$  and  $t \in \mathbb{R}$ ,  $\nu := (\nu_x, \nu_y, \nu_t)$  with  $\nu_x := (\nu_{x,1}, \dots, \nu_{x,n})$ and  $\nu_y := (\nu_{y,1}, \dots, \nu_{y,n})$ . Also we have

$$\langle \nabla_{H} dist(\xi, \partial \mathbb{H}^{+}), \nabla_{H} | \nabla_{H} dist(\xi, \partial \mathbb{H}^{+}) | \rangle = \frac{2\nu_{t}}{|\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|}$$

$$\underbrace{((2x_{1}\nu_{t} - \nu_{y,1})(\nu_{x,1} + 2y_{1}\nu_{t}) + \ldots + (2x_{n}\nu_{t} - \nu_{y,n})(\nu_{x,n} + 2y_{n}\nu_{t})}_{n} + \underbrace{(\nu_{y,1} - 2x_{1}\nu_{t})(\nu_{x,1} + 2y_{1}\nu_{t}) + \ldots + (\nu_{y,n} - 2x_{n}\nu_{t})(\nu_{x,n} + 2y_{n}\nu_{t})}_{n} = 0,$$

since

$$\nabla_{H} |\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})| = (X_{1} |\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|, \dots, X_{n} |\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|,$$

$$Y_{1} |\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|, \dots, Y_{n} |\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|)$$

$$= \frac{2\nu_{t}}{|\nabla_{H} dist(\xi, \partial \mathbb{H}^{+})|} (\underbrace{2x_{1}\nu_{t} - \nu_{y,1}, \dots, 2x_{n}\nu_{t} - \nu_{y,n}}_{n}, \underbrace{\nu_{x,1} + 2y_{1}\nu_{t}, \dots, \nu_{x,n} + 2y_{n}\nu_{t}}_{n}),$$

and

$$\nabla_H dist(\xi, \partial \mathbb{H}^+) = (\underbrace{\nu_{x,1} + 2y_1\nu_t, \dots, \nu_{x,n} + 2y_n\nu_t}_n, \underbrace{\nu_{y,1} - 2x_1\nu_t, \dots, \nu_{y,n} - 2x_n\nu_t}_n).$$

As we see that integral  $I_2$  can be estimated by integral  $I_1$ . From this estimation we know that

$$\int_{\mathbb{H}^+} |u|^{p^*(1-1/p)} |\nabla_H u| d\xi \le 2I_1.$$
(3.8)

Now it comes to estimate  $I_1$  by using the Hölder inequality

$$\begin{split} I_{1} &= \int_{\mathbb{H}^{+}} \left\{ |u|^{p^{*}(1-1/p)} \right\} \left\{ dist(\xi, \partial \mathbb{H}^{+})^{(p-1)/p} |\nabla_{H}v| \right\} d\xi \\ &\leq \left( \int_{\mathbb{H}^{+}} |u|^{p^{*}} d\xi \right)^{1-1/p} \left( \int_{\mathbb{H}^{+}} dist(\xi, \partial \mathbb{H}^{+})^{p-1} |\nabla_{H}v|^{p} d\xi \right)^{1/p} \\ &\leq C_{p}^{-1/p} \left( \int_{\mathbb{H}^{+}} |u|^{p^{*}} d\xi \right)^{1-1/p} \left( \int_{\mathbb{H}^{+}} |\nabla_{H}u|^{p} d\xi - \left( \frac{p-1}{p} \right)^{p} \int_{\mathbb{H}^{+}} \frac{\mathcal{W}(\xi)^{p}}{dist(\xi, \partial \mathbb{H}^{+})^{p}} |u|^{p} d\xi \right)^{1/p} \end{split}$$

In the last line we have used Lemma 3.1. Inserting the estimate of  $I_1$  in (3.8), we arrive at

$$\int_{\mathbb{H}^{+}} |u|^{p^{*}(1-1/p)} |\nabla_{H}u| d\xi \leq 2C_{p}^{-1/p} \left( \int_{\mathbb{H}^{+}} |u|^{p^{*}} d\xi \right)^{1-1/p} \left( \int_{\mathbb{H}^{+}} |\nabla_{H}u|^{p} d\xi - \left(\frac{p-1}{p}\right)^{p} \int_{\mathbb{H}^{+}} \frac{\mathcal{W}(\xi)^{p}}{dist(\xi,\partial\mathbb{H}^{+})^{p}} |u|^{p} d\xi \right)^{\frac{1}{p}}.$$

Plugging the above estimate in (3.7), we have

$$C_1 \left( \int_{\mathbb{H}^+} |u|^{p^*} d\xi \right)^{\frac{Q-1}{Q}} \leq 2C_p^{-1/p} \left( \int_{\mathbb{H}^+} |u|^{p^*} d\xi \right)^{\frac{p-1}{p}} \left( \int_{\mathbb{H}^+} |\nabla_H u|^p d\xi - \left(\frac{p-1}{p}\right)^p \int_{\mathbb{H}^+} \frac{\mathcal{W}(\xi)^p}{dist(\xi, \partial \mathbb{H}^+)^p} |u|^p d\xi \right)^{\frac{1}{p}}.$$
  
collecting terms, we finish the proof of Theorem 3.2.

By collecting terms, we finish the proof of Theorem 3.2.

3.3. Consequence of Theorem 3.2. Let us demonstrate our result in a particular case when p = 2:

Corollary 3.4. Let  $\mathbb{H}^+ := \{\xi = (x, y, t) \in \mathbb{H}^n | t > 0\}$  be a half-space of the Heisenberg group  $\mathbb{H}^n$ . Then for every function  $u \in C_0^{\infty}(\mathbb{H}^+)$  taking d = 0 we have

$$\left(\int_{\mathbb{H}^+} |\nabla_H u|^2 d\xi - \int_{\mathbb{H}^+} \frac{|x|^2 + |y|^2}{t^2} |u|^2 d\xi\right)^{\frac{1}{2}} \ge C \left(\int_{\mathbb{H}^+} |u|^{2^*} d\xi\right)^{\frac{1}{2^*}}, \quad (3.9)$$

12

where  $2^* := 2Q/(Q-2)$ , Q = 2n + 2, with C > 0 independent of u. Proof of Corollary 3.4. We have the following left-invariant vector fields

$$X_i = \frac{\partial}{\partial x_i} + 2y_i \frac{\partial}{\partial t}$$
 and  $Y_i = \frac{\partial}{\partial y_i} - 2x_i \frac{\partial}{\partial t}$ ,

with the commutator

$$[X_i, Y_i] = -4\frac{\partial}{\partial t}.$$

Then for  $\xi = (x_1, \dots, x_n, y_1, \dots, y_n, t)$  and  $\nu = (0, \dots, 0, 0, \dots, 0, 1)$ , we get  $\langle X_i(\xi), \nu \rangle = 2y_i$  and  $\langle Y_i(\xi), \nu \rangle = -2x_i$ ,

where

$$X_{i}(\xi) = (\underbrace{0, \dots, 1}^{i}, \dots, 0, \underbrace{0, \dots, 0}^{n}, 2y_{i}),$$
$$Y_{i}(\xi) = (\underbrace{0, \dots, 0}^{n}, \underbrace{0, \dots, 1}^{i}, \dots, 0, , -2x_{i}).$$

Thus, we arrive at

$$\frac{\mathcal{W}(\xi)^2}{dist(\xi,\partial\mathbb{H}^+)^2} = 4\frac{|x|^2 + |y|^2}{t^2}.$$
(3.10)

Plugging the above expression into inequality (3.6) we obtain

$$\left(\int_{\mathbb{H}^+} |\nabla_H u|^2 d\xi - \int_{\mathbb{H}^+} \frac{|x|^2 + |y|^2}{t^2} |u|^2 d\xi\right)^{\frac{1}{2}} \ge C \left(\int_{\mathbb{H}^+} |u|^{2^*} d\xi\right)^{\frac{1}{2^*}},$$
  
3.9).

showing (3.9).
