

# NORM ONE TORI AND HASSE NORM PRINCIPLE, II: DEGREE 12 CASE

AKINARI HOSHI, KAZUKI KANAI, AND AIICHI YAMASAKI

ABSTRACT. Let  $k$  be a field,  $T$  be an algebraic  $k$ -torus,  $X$  be a smooth  $k$ -compactification of  $T$  and  $\text{Pic } \overline{X}$  be the Picard group of  $\overline{X} = X \times_k \overline{k}$ . Hoshi, Kanai and Yamasaki [HKY22] determined  $H^1(k, \text{Pic } \overline{X})$  for norm one tori  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  and gave a necessary and sufficient condition for the Hasse norm principle for extensions  $K/k$  of number fields with  $[K : k] = n \leq 15$  and  $n \neq 12$ . In this paper, we determine 64 cases with  $H^1(k, \text{Pic } \overline{X}) \neq 0$  and give a necessary and sufficient condition for the Hasse norm principle for  $K/k$  with  $[K : k] = 12$ .

## 1. INTRODUCTION

Let  $k$  be a field,  $K/k$  be a separable field extension of degree  $n$  and  $L/k$  be the Galois closure of  $K/k$  with  $\text{Gal}(L/k) \simeq G$ . Let  $S_n$  (resp.  $A_n$ ,  $D_n$ ,  $C_n$ ) be the symmetric (resp. the alternating, the dihedral, the cyclic) group of degree  $n$  of order  $n!$  (resp.  $n!/2$ ,  $2n$ ,  $n$ ). Let  $nTm$  be the  $m$ -th transitive subgroup of the symmetric group  $S_n$  of degree  $n$  up to conjugacy (see Butler and McKay [BM83], [GAP]). We may regard  $G$  as the transitive subgroup  $G = nTm \leq S_n$ . Let  $H = \text{Gal}(L/K) \leq G$  with  $[G : H] = n$ . Then we may assume that  $H$  is the stabilizer of one of the letters in  $G$ , i.e.  $L = k(\theta_1, \dots, \theta_n)$  and  $K = k(\theta_i)$  for some  $1 \leq i \leq n$ .

Voskresenskii [Vos67] proved that all the 2-dimensional algebraic  $k$ -tori are  $k$ -rational. This implies that  $H^1(k, \text{Pic } \overline{X}) \simeq A(T) \simeq \text{III}(T) = 0$  where  $X$  is a smooth  $k$ -compactification of an algebraic  $k$ -torus  $T$ ,  $A(T)$  is the kernel of the weak approximation of  $T$  and  $\text{III}(T)$  is the Shafarevich-Tate group of  $T$  (see Section 3 and also Manin [Man74, §30]). Kunyavskii [Kun84] showed that, among 73 cases of 3-dimensional  $k$ -tori  $T$ , there exist exactly 2 cases with  $H^1(k, \text{Pic } \overline{X}) \neq 0$  which are of special type called norm one tori. Hoshi, Kanai and Yamasaki [HKY22, Theorem 1.18] determined  $H^1(k, \text{Pic } \overline{X})$  for norm one tori  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  with  $[K : k] = n \leq 15$  and  $n \neq 12$ . We determine 64 cases with  $H^1(k, \text{Pic } \overline{X}) \neq 0$  when  $[K : k] = 12$  as follows: (Note that there exist exactly 301 transitive subgroups  $12Tm$  of  $S_{12}$  up to conjugacy (see Royle [Roy87] and [GAP]).)

**Theorem 1.1.** *Let  $k$  be a field,  $K/k$  be a separable field extension of degree 12 and  $L/k$  be the Galois closure of  $K/k$ . Assume that  $G = \text{Gal}(L/k) = 12Tm$  ( $1 \leq m \leq 301$ ) is a transitive subgroup of  $S_{12}$  and  $H = \text{Gal}(L/K)$  with  $[G : H] = 12$ . Let  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  be the norm one torus of  $K/k$  of dimension 11 and  $X$  be a smooth  $k$ -compactification of  $T$ . Then  $H^1(k, \text{Pic } \overline{X}) \neq 0$  if and only if  $G$  is given as in Table 1. In particular, if  $k$  is a number field and  $L/k$  is an unramified extension, then  $A(T) = 0$  and  $H^1(k, \text{Pic } \overline{X}) \simeq \text{III}(T)$ .*

In Table 1,  $V_4 \simeq C_2 \times C_2$  is the Klein four group,  $Q_8$  is the quaternion group of order 8,  $\text{PSL}_2(\mathbb{F}_{11})$  is the projective special linear group of degree 2 over the finite field  $\mathbb{F}_{11}$  of 11 elements, and  $S_n(m)$  and  $A_n(m)$  mean that  $S_n(m) \simeq S_n = mTx \leq S_m$  and  $A_n(m) \simeq A_n = mTx \leq S_m$  respectively.

**Remark 1.2.** Theorem 1.1 enables us to obtain the group  $T(k)/R$  of  $R$ -equivalence classes over a local field  $k$  via  $T(k)/R \simeq H^1(k, \text{Pic } \overline{X}) \simeq H^1(G, [J_{G/H}]^{fl})$  for norm one tori  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  with  $[K : k] = 12$  (see Colliot-Thélène and Sansuc [CTS77, Corollary 5, page 201], Voskresenskii [Vos98, Section 17.2] and Hoshi, Kanai and Yamasaki [HKY22, Section 7, Application 1]).

Kunyavskii [Kun84] gave a necessary and sufficient condition for the Hasse norm principle for  $K/k$  with  $[K : k] = 4$  ( $G = 4Tm$  ( $1 \leq m \leq 5$ )). Drakokhrust and Platonov [DP87] gave a necessary and sufficient condition for the Hasse norm principle for  $K/k$  with  $[K : k] = 6$  ( $G = 6Tm$  ( $1 \leq m \leq 16$ )). Hoshi, Kanai and Yamasaki [HKY22, Theorem 1.18] gave a necessary and sufficient condition for the Hasse norm principle for  $K/k$  with  $[K : k] = n \leq 15$  and  $n \neq 12$  (see also [HKY22, Section 1]).

By Theorem 1.1 and Ono's theorem (see Theorem 3.6) which claims that the Hasse norm principle holds for  $K/k$  if and only if  $\text{III}(T) = 0$  where  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  is the norm one torus of  $K/k$ , the Hasse norm principle holds for  $K/k$  with  $[K : k] = 12$  as in the cases in Theorem 1.1 except for the cases as in Table 1. By using Drakokhrust and Platonov's method (see Section 6 for details) and some new useful functions of GAP [GAP] provided in Section 7, we will prove the following main theorem of this paper which gives a necessary and sufficient condition for the Hasse norm principle for  $K/k$  with  $[K : k] = 12$ :

**Theorem 1.3.** *Let  $k$  be a number field,  $K/k$  be a field extension of degree 12 and  $L/k$  be the Galois closure of  $K/k$ . Let  $G = \text{Gal}(L/k) = 12Tm$  ( $1 \leq m \leq 301$ ) be a transitive subgroup of  $S_{12}$ ,  $H = \text{Gal}(L/K)$  with  $[G : H] = 12$  and  $G_v$  be the decomposition group of  $G$  at a place  $v$  of  $k$ . Let  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  be the norm one torus of  $K/k$  of dimension 11 and  $X$  be a smooth  $k$ -compactification of  $T$ . Then  $A(T) \simeq \text{III}(T) = 0$  except for the 64 cases in Table 1. For the 64 cases in Table 1 except for 3 cases  $G = 12T31, 12T32, 12T57$  as in Tables 2-3, 2-4, 2-5, we have either (a)  $A(T) = 0$  and  $\text{III}(T) \simeq \mathbb{Z}/2\mathbb{Z}$  or (b)  $A(T) \simeq \mathbb{Z}/2\mathbb{Z}$  and  $\text{III}(T) = 0$ . We assume that  $H$  is the stabilizer of one of the letters in  $G$ . Then  $\text{III}(T)$  is given as in Tables 2-1 to 2-5. Moreover, for the cases in Table 2-1 and Table 2-3,  $\text{III}(T)$  is also given for general  $H \leq G$  with  $[G : H] = 12$ .*

In Tables 2-1 to 2-5,  $M_{16} = \langle x, y \mid x^8 = y^2 = 1, yxy^{-1} = x^5 \rangle$  is the modular type 2-group of order 16,  $Z(G)$  is the center of a group  $G$ ,  $D(G)$  is the derived subgroup of  $G$  and  $D^i(G) := D(D^{i-1}(G))$  is the  $i$ -th derived subgroup ( $D^0(G) := G$ ),  $\text{Syl}_p(G)$  is a  $p$ -Sylow subgroup of  $G$  where  $p$  is a prime number,  $N_G(G')$  is the normalizer of a subgroup  $G' \leq G$ ,  $\Phi(G)$  is the Frattini subgroup of  $G$ , i.e. the intersection of all maximal subgroups of  $G$ , and  $\text{Orb}_G(i)$  is the orbit of  $1 \leq i \leq n$  under the action of  $G \leq S_n$ .

Note that a place  $v$  of  $k$  with non-cyclic decomposition group  $G_v$  as in Tables 2-1 to 2-5 must be ramified in  $L$  because if  $v$  is unramified, then  $G_v$  is cyclic.

Table 2-1:  $\text{III}(T) = 0$  for  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  and  $G = \text{Gal}(L/k) = 12Tm$  as in Table 1

| $G$   | $\text{III}(T) \leq \mathbb{Z}/2\mathbb{Z}$ , and<br>$\text{III}(T) = 0$ if and only if there exists a place $v$ of $k$ such that  |

**Remark 1.4.** As a consequence of Theorem 1.3, we obtain the Tamagawa number  $\tau(T)$  of norm one tori  $T = R_{k/k}^{(1)}(\mathbb{G}_m)$  over a number field  $k$  via Ono's formula  $\tau(T) = |H^1(G, J_{G/H})|/|\text{III}(T)|$  where  $H^1(G, J_{G/H})$  is given as in Section 9 (Appendix) of the arXiv version (arXiv:1910.01469) of [HKY22] (see Ono [Ono63, Main theorem, page 68], Voskresenskii [Vos98, Theorem 2, page 146] and Hoshi, Kanai and Yamasaki [HKY22, Section 8, Application 2]).

We organize this paper as follows. In Section 2, we prepare basic definitions and known results about algebraic  $k$ -tori, in particular, norm one tori. In Section 3, we recall some known results about Hasse norm principle. In Section 4, we give some known results about norm one tori and  $k$ -rationality. In particular, we recall a flabby resolution of  $G$ -lattices which is a basic tool to investigate algebraic  $k$ -tori. In Section 5, we give the proof of Theorem 1.1. In Section 6, we recall Drakokhrust and Platonov's method for the Hasse norm principle for  $K/k$  and results in [HKY22, Section 6]. In Section 7, we prove Theorem 1.3 by using Drakokhrust and Platonov's method and some new useful functions of GAP [GAP]. In Section 8, GAP algorithms are given which are also available from <https://www.math.kyoto-u.ac.jp/~yamasaki/Algorithm/Norm1ToriHNP>.

**Acknowledgments.** We would like to thank Ming-chang Kang, Shizuo Endo and Boris Kunyavskii for giving us useful and valuable comments. We also thank the referee for very careful reading of the manuscript.

## 2. ALGEBRAIC TORI AND NORM ONE TORI

Let  $k$  be a field,  $\bar{k}$  be a fixed separable closure of  $k$  and  $\mathcal{G} = \text{Gal}(\bar{k}/k)$  be the absolute Galois group of  $k$ . Let  $T$  be an algebraic  $k$ -torus, i.e. a group  $k$ -scheme with fiber product (base change)  $T \times_k \bar{k} = T \times_{\text{Spec } k} \text{Spec } \bar{k} \simeq (\mathbb{G}_{m, \bar{k}})^n$ ;  $k$ -form of the split torus  $(\mathbb{G}_m)^n$ . Then there exists a finite Galois extension  $K/k$  with Galois group  $G = \text{Gal}(K/k)$  such that  $T$  splits over  $K$ :  $T \times_k K \simeq (\mathbb{G}_{m, K})^n$ . It is also well-known that there is the duality between the category of  $G$ -lattices, i.e. finitely generated  $\mathbb{Z}[G]$ -modules which are  $\mathbb{Z}$ -free as abelian groups, and the category of algebraic  $k$ -tori which split over  $K$  (see Ono [Ono61, Section 1.2], Voskresenskii [Vos98, page 27, Example 6] and Knus, Merkurjev, Rost and Tignol [KMRT98, page 333, Proposition 20.17]). Indeed, if  $T$  is an algebraic  $k$ -torus, then the character module  $\hat{T} = \text{Hom}(T, \mathbb{G}_m)$  of  $T$  may be regarded as a  $G$ -lattice. Let  $X$  be a smooth  $k$ -compactification of  $T$ , i.e. smooth projective  $k$ -variety  $X$  containing  $T$  as a dense open subvariety, and  $\bar{X} = X \times_k \bar{k}$ . There exists such a smooth  $k$ -compactification of an algebraic  $k$ -torus  $T$  over any field  $k$  (due to Hironaka [Hir64] for char  $k = 0$ , see Colliot-Thélène, Harari and Skorobogatov [CTHS05, Corollaire 1] for any field  $k$ ).

Recall the following basic definitions of  $G$ -lattices.

**Definition 2.1.** Let  $G$  be a finite group and  $M$  be a  $G$ -lattice, i.e. finitely generated  $\mathbb{Z}[G]$ -module which is  $\mathbb{Z}$ -free as an abelian group.

- (i)  $M$  is called a *permutation*  $G$ -lattice if  $M$  has a  $\mathbb{Z}$ -basis permuted by  $G$ , i.e.  $M \simeq \bigoplus_{1 \leq i \leq m} \mathbb{Z}[G/H_i]$  for some subgroups  $H_1, \dots, H_m$  of  $G$ .
- (ii)  $M$  is called a *stably permutation*  $G$ -lattice if  $M \oplus P \simeq P'$  for some permutation  $G$ -lattices  $P$  and  $P'$ .
- (iii)  $M$  is called *invertible* (or *permutation projective*) if it is a direct summand of a permutation  $G$ -lattice, i.e.  $P \simeq M \oplus M'$  for some permutation  $G$ -lattice  $P$  and a  $G$ -lattice  $M'$ .
- (iv)  $M$  is called *flabby* (or *flasque*) if  $\hat{H}^{-1}(H, M) = 0$  for any subgroup  $H$  of  $G$  where  $\hat{H}$  is the Tate cohomology.
- (v)  $M$  is called *coflabby* (or *coflasque*) if  $H^1(H, M) = 0$  for any subgroup  $H$  of  $G$ .

**Theorem 2.2** (Voskresenskii [Vos69, Section 4, page 1213], [Vos70, Section 3, page 7], see also [Vos98, Section 4.6], [Kun07, Theorem 1.9], [Vos74] and [CT07, Theorem 5.1, page 19] for any field  $k$ ). *Let  $k$  be a field and  $\mathcal{G} = \text{Gal}(\bar{k}/k)$ . Let  $T$  be an algebraic  $k$ -torus,  $X$  be a smooth  $k$ -compactification of  $T$  and  $\bar{X} = X \times_k \bar{k}$ . Then there exists an exact sequence of  $\mathcal{G}$ -lattices*

$$0 \rightarrow \hat{T} \rightarrow \hat{Q} \rightarrow \text{Pic } \bar{X} \rightarrow 0$$

where  $\hat{Q}$  is permutation and  $\text{Pic } \bar{X}$  is flabby.

We have  $H^1(k, \text{Pic } \bar{X}) \simeq H^1(G, \text{Pic } X_K)$  where  $K$  is the splitting field of  $T$ ,  $G = \text{Gal}(K/k)$  and  $X_K = X \times_k K$ . Hence Theorem 2.2 says that for  $G$ -lattices  $M = \hat{T}$  and  $P = \hat{Q}$ , the exact sequence  $0 \rightarrow M \rightarrow P \rightarrow \text{Pic } X_K \rightarrow 0$  gives a flabby resolution of  $M$  and the flabby class of  $M$  is  $[M]^{fl} = [\text{Pic } X_K]$  as  $G$ -lattices (see Theorem 4.3).

**Definition 2.3.** The kernel of the norm map  $R_{K/k}(\mathbb{G}_m) \rightarrow \mathbb{G}_m$  is called *the norm one torus*  $R_{K/k}^{(1)}(\mathbb{G}_m)$  of  $K/k$  where  $R_{K/k}$  is the Weil restriction (see [Vos98, page 37, Section 3.12]).

A norm one torus  $R_{K/k}^{(1)}(\mathbb{G}_m)$  is biregularly isomorphic to the norm hyper surface  $f(x_1, \dots, x_n) = 1$  where  $f \in k[x_1, \dots, x_n]$  is the polynomial of total degree  $n$  defined by the norm map  $N_{K/k} : K^\times \rightarrow k^\times$ . When  $K/k$  is a finite Galois extension, we have that:

**Theorem 2.4** (Voskresenskii [Vos70, Theorem 7], Colliot-Thélène and Sansuc [CTS77, Proposition 1]). *Let  $k$  be a field and  $K/k$  be a finite Galois extension with Galois group  $G = \text{Gal}(K/k)$ . Let  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  be the norm one torus of  $K/k$  and  $X$  be a smooth  $k$ -compactification of  $T$ . Then  $H^1(H, \text{Pic } X_K) \simeq H^3(H, \mathbb{Z})$  for any subgroup  $H$  of  $G$ . In particular,  $H^1(k, \text{Pic } \overline{X}) \simeq H^1(G, \text{Pic } X_K) \simeq H^3(G, \mathbb{Z})$  which is isomorphic to the Schur multiplier  $M(G)$  of  $G$ .*

In other words, for  $G$ -lattice  $J_G = \widehat{T}$ ,  $H^1(H, [J_G]^{fl}) \simeq H^3(H, \mathbb{Z})$  for any subgroup  $H$  of  $G$  and  $H^1(G, [J_G]^{fl}) \simeq H^3(G, \mathbb{Z}) \simeq H^2(G, \mathbb{Q}/\mathbb{Z})$ ; the Schur multiplier of  $G$ . By the exact sequence  $0 \rightarrow \mathbb{Z} \rightarrow \mathbb{Z}[G] \rightarrow J_G \rightarrow 0$ , we also have  $\delta : H^1(G, J_G) \simeq H^2(G, \mathbb{Z}) \simeq G^{ab} \simeq G/[G, G]$  where  $\delta$  is the connecting homomorphism and  $G^{ab}$  is the abelianization of  $G$  (cf. Section 4).

### 3. HASSE PRINCIPLE AND HASSE NORM PRINCIPLE

Let  $k$  be a global field, i.e. a number field (a finite extension of  $\mathbb{Q}$ ) or a function field of an algebraic curve over  $\mathbb{F}_q$  (a finite extension of  $\mathbb{F}_q(t)$ ).

**Definition 3.1.** Let  $T$  be an algebraic  $k$ -torus and  $T(k)$  be the group of  $k$ -rational points of  $T$ . Then  $T(k)$  embeds into  $\prod_{v \in V_k} T(k_v)$  by the diagonal map where  $V_k$  is the set of all places of  $k$  and  $k_v$  is the completion of  $k$  at  $v$ . Let  $\overline{T(k)}$  be the closure of  $T(k)$  in the product  $\prod_{v \in V_k} T(k_v)$ . The group

$$A(T) = \left( \prod_{v \in V_k} T(k_v) \right) / \overline{T(k)}$$

is called *the kernel of the weak approximation* of  $T$ . We say that  $T$  has *the weak approximation property* if  $A(T) = 0$ .

**Definition 3.2.** Let  $E$  be a principal homogeneous space (= torsor) under  $T$ . *Hasse principle holds for  $E$*  means that if  $E$  has a  $k_v$ -rational point for all  $k_v$ , then  $E$  has a  $k$ -rational point. The set  $H^1(k, T)$  classifies all such torsors  $E$  up to (non-unique) isomorphism. We define *the Shafarevich-Tate group* of  $T$ :

$$\text{III}(T) = \text{Ker} \left\{ H^1(k, T) \xrightarrow{\text{res}} \bigoplus_{v \in V_k} H^1(k_v, T) \right\}.$$

Then Hasse principle holds for all torsors  $E$  under  $T$  if and only if  $\text{III}(T) = 0$ .

**Theorem 3.3** (Voskresenskii [Vos69, Theorem 5, page 1213], [Vos70, Theorem 6, page 9], see also [Vos98, Section 11.6, Theorem, page 120]). *Let  $k$  be a global field,  $T$  be an algebraic  $k$ -torus and  $X$  be a smooth  $k$ -compactification of  $T$ . Then there exists an exact sequence*

$$0 \rightarrow A(T) \rightarrow H^1(k, \text{Pic } \overline{X})^\vee \rightarrow \text{III}(T) \rightarrow 0$$

where  $M^\vee = \text{Hom}(M, \mathbb{Q}/\mathbb{Z})$  is the Pontryagin dual of  $M$ . Moreover, if  $L$  is the splitting field of  $T$  and  $L/k$  is an unramified extension, then  $A(T) = 0$  and  $H^1(k, \text{Pic } \overline{X})^\vee \simeq \text{III}(T)$ .

For the last assertion, see [Vos98, Section 11.5]. It follows that  $H^1(k, \text{Pic } \overline{X}) = 0$  if and only if  $A(T) = 0$  and  $\text{III}(T) = 0$ , i.e.  $T$  has the weak approximation property and Hasse principle holds for all torsors  $E$  under  $T$ . Theorem 3.3 was generalized to the case of linear algebraic groups by Sansuc [San81].

**Definition 3.4.** Let  $k$  be a global field,  $K/k$  be a finite extension and  $\mathbb{A}_K^\times$  be the idele group of  $K$ . We say that *the Hasse norm principle holds for  $K/k$*  if  $(N_{K/k}(\mathbb{A}_K^\times) \cap k^\times) / N_{K/k}(K^\times) = 1$  where  $N_{K/k}$  is the norm map.

Hasse [Has31, Satz, page 64] proved that the Hasse norm principle holds for any cyclic extension  $K/k$  but does not hold for bicyclic extension  $\mathbb{Q}(\sqrt{-39}, \sqrt{-3})/\mathbb{Q}$ . For Galois extensions  $K/k$ , Tate [Tat67] gave the following theorem:

**Theorem 3.5** (Tate [Tat67, page 198]). *Let  $k$  be a global field,  $K/k$  be a finite Galois extension with Galois group  $\text{Gal}(K/k) \simeq G$ . Let  $V_k$  be the set of all places of  $k$  and  $G_v$  be the decomposition group of  $G$  at  $v \in V_k$ . Then*

$$(N_{K/k}(\mathbb{A}_K^\times) \cap k^\times) / N_{K/k}(K^\times) \simeq \text{Coker} \left\{ \bigoplus_{v \in V_k} \widehat{H}^{-3}(G_v, \mathbb{Z}) \xrightarrow{\text{cores}} \widehat{H}^{-3}(G, \mathbb{Z}) \right\}$$

where  $\widehat{H}$  is the Tate cohomology. In particular, the Hasse norm principle holds for  $K/k$  if and only if the restriction map  $H^3(G, \mathbb{Z}) \xrightarrow{\text{res}} \bigoplus_{v \in V_k} H^3(G_v, \mathbb{Z})$  is injective.

If  $G \simeq C_n$  is cyclic, then  $\widehat{H}^{-3}(G, \mathbb{Z}) \simeq H^3(G, \mathbb{Z}) \simeq H^1(G, \mathbb{Z}) = 0$  and hence the Hasse's original theorem follows. If there exists a place  $v$  of  $k$  such that  $G_v = G$ , then the Hasse norm principle also holds for  $K/k$ . For example, the Hasse norm principle holds for  $K/k$  with  $G \simeq V_4$  if and only if there exists a place  $v$  of  $k$  such that  $G_v = V_4$  because  $H^3(V_4, \mathbb{Z}) \simeq \mathbb{Z}/2\mathbb{Z}$  and  $H^3(C_2, \mathbb{Z}) = 0$ . The Hasse norm principle holds for  $K/k$  with  $G \simeq (C_2)^3$  if and only if (i) there exists a place  $v$  of  $k$  such that  $G_v = G$  or (ii) there exist places  $v_1, v_2, v_3$  of  $k$  such that  $G_{v_i} \simeq V_4$  and  $H^3(G, \mathbb{Z}) \xrightarrow{\text{res}} H^3(G_{v_1}, \mathbb{Z}) \oplus H^3(G_{v_2}, \mathbb{Z}) \oplus H^3(G_{v_3}, \mathbb{Z})$  is isomorphism because  $H^3(G, \mathbb{Z}) \simeq (\mathbb{Z}/2\mathbb{Z})^{\oplus 3}$  and  $H^3(V_4, \mathbb{Z}) \simeq \mathbb{Z}/2\mathbb{Z}$ .

The Hasse norm principle for Galois extensions  $K/k$  was investigated by Gerth [Ger77], [Ger78] and Gurak [Gur78a], [Gur78b], [Gur80] (see also [PR94, pages 308–309]). For non-Galois extension  $K/k$ , the Hasse norm principle was investigated by Bartels [Bar81a] ( $[K : k] = p$ ; prime), [Bar81b] ( $\text{Gal}(L/k) \simeq D_n$ ), Voskresenskii and Kunyavskii [VK84] ( $\text{Gal}(L/k) \simeq S_n$ ) and Macedo [Mac20] ( $\text{Gal}(L/k) \simeq A_n$ ) where  $L/k$  be the Galois closure of  $K/k$  (see also [HKY22, Section 1]).

Ono [Ono63] established the relationship between the Hasse norm principle for  $K/k$  and the Hasse principle for all torsors  $E$  under the norm one torus  $R_{K/k}^{(1)}(\mathbb{G}_m)$ . The quotient group  $k^\times/N_{K/k}(K^\times)$  is related to the norm one torus  $R_{K/k}^{(1)}(\mathbb{G}_m)$  of  $K/k$  because by taking the cohomology of the exact sequence

$$1 \rightarrow R_{K/k}^{(1)}(\mathbb{G}_m) \rightarrow R_{K/k}(\mathbb{G}_m) \xrightarrow{N} \mathbb{G}_m \rightarrow 1,$$

we have the exact sequence

$$K^\times \xrightarrow{N_{K/k}} k^\times \rightarrow H^1(k, R_{K/k}^{(1)}(\mathbb{G}_m)) \rightarrow H^1(k, R_{K/k}(\mathbb{G}_m)) \simeq H^1(K, \mathbb{G}_m) = 0 \text{ (by Hilbert 90)}$$

and (see Platonov and Rapinchuk [PR94, Lemma 2.5, page 73])

$$H^1(k, R_{K/k}^{(1)}(\mathbb{G}_m)) \simeq k^\times/N_{K/k}(K^\times).$$

Similarly, the Hasse norm principle for  $K/k$  is related to the norm one torus  $R_{K/k}^{(1)}(\mathbb{G}_m)$  of  $K/k$  (see also Platonov and Rapinchuk [PR94, Section 6.3]):

**Theorem 3.6** (Ono [Ono63, page 70], see also Platonov [Pla82, page 44], Kunyavskii [Kun84, Remark 3], Platonov and Rapinchuk [PR94, page 307]). *Let  $k$  be a global field and  $K/k$  be a finite extension. Then*

$$\text{III}(R_{K/k}^{(1)}(\mathbb{G}_m)) \simeq (N_{K/k}(\mathbb{A}_K^\times) \cap k^\times)/N_{K/k}(K^\times).$$

*In particular,  $\text{III}(R_{K/k}^{(1)}(\mathbb{G}_m)) = 0$  if and only if the Hasse norm principle holds for  $K/k$ .*

**Remark 3.7.** Applying Theorem 3.3 to  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$ , it follows from Theorem 3.6 that  $H^1(k, \text{Pic } \overline{X}) = 0$  if and only if  $A(T) = 0$  and  $\text{III}(T) = 0$ , i.e.  $T$  has the weak approximation property and the Hasse norm principle holds for  $K/k$ . In the algebraic language, the latter condition  $\text{III}(T) = 0$  means that for the corresponding norm hyper surface  $f(x_1, \dots, x_n) = b$ , it has a  $k$ -rational point if and only if it has a  $k_v$ -rational point for any place  $v$  of  $k$  where  $f \in k[x_1, \dots, x_n]$  is the polynomial of total degree  $n$  defined by the norm map  $N_{K/k} : K^\times \rightarrow k^\times$  and  $b \in k^\times$  (see [Vos98, Example 4, page 122]).

#### 4. FLABBY RESOLUTION OF $G$ -LATTICE AND RATIONALITY OF ALGEBRAIC $k$ -TORUS

Let  $k$  be a field,  $K/k$  be a separable field extension of degree  $n$  and  $L/k$  be the Galois closure of  $K/k$ . Let  $G = \text{Gal}(L/k)$  and  $H = \text{Gal}(L/K)$  with  $[G : H] = n$ . The Galois group  $G$  may be regarded as a transitive subgroup of the symmetric group  $S_n$  of degree  $n$  via an injection  $G \rightarrow S_n$  which is derived from the action of  $G$  on the left cosets  $\{g_1H, \dots, g_nH\}$  by  $g(g_iH) = (gg_i)H$  for any  $g \in G$  and we may assume that  $H$  is the stabilizer of one of the letters in  $G$ , i.e.  $L = k(\theta_1, \dots, \theta_n)$  and  $K = k(\theta_i)$  for some  $1 \leq i \leq n$ . The norm one torus  $R_{K/k}^{(1)}(\mathbb{G}_m)$  has the Chevalley module  $J_{G/H}$  as its character module and the field  $L(J_{G/H})^G$  as its function field where  $J_{G/H} = (I_{G/H})^\circ = \text{Hom}_{\mathbb{Z}}(I_{G/H}, \mathbb{Z})$  is the dual lattice of  $I_{G/H} = \text{Ker } \varepsilon$  and  $\varepsilon : \mathbb{Z}[G/H] \rightarrow \mathbb{Z}$  is the augmentation map (see [Vos98, Section 4.8]). We have the exact sequence

$$0 \rightarrow \mathbb{Z} \rightarrow \mathbb{Z}[G/H] \rightarrow J_{G/H} \rightarrow 0$$

and  $\text{rank } J_{G/H} = n - 1$ . Write  $J_{G/H} = \bigoplus_{1 \leq i \leq n-1} \mathbb{Z}u_i$ . We define the action of  $G$  on  $L(x_1, \dots, x_{n-1})$  by  $\sigma(x_i) = \prod_{j=1}^{n-1} x_j^{a_{i,j}}$  ( $1 \leq i \leq n-1$ ) for any  $\sigma \in G$ , when  $\sigma(u_i) = \sum_{j=1}^{n-1} a_{i,j}u_j$  ( $a_{i,j} \in \mathbb{Z}$ ). Then the invariant field  $L(x_1, \dots, x_{n-1})^G$  may be identified with the function field of the norm one torus  $R_{K/k}^{(1)}(\mathbb{G}_m)$  (see [EM75, Section 1]).

Let  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  be the norm one torus of  $K/k$ . The rationality problem for norm one tori is investigated by [EM75], [CTS77], [Hür84], [CTS87], [LeB95], [CK00], [LL00], [Flo], [End11], [HY17], [HY21], [HHY20] (see also [HKY22, Section 2]).

We recall some basic facts of flabby (flasque)  $G$ -lattices (see [CTS77], [Swa83], [Vos98, Chapter 2], [Lor05, Chapter 2], [Swa10]).

**Definition 4.1** (see [EM75, Section 1], [Vos98, Section 4.7]). Let  $\mathcal{C}(G)$  be the category of all  $G$ -lattices. Let  $\mathcal{S}(G)$  be the full subcategory of  $\mathcal{C}(G)$  of all permutation  $G$ -lattices and  $\mathcal{D}(G)$  be the full subcategory of  $\mathcal{C}(G)$  of all invertible  $G$ -lattices. Let

$$\mathcal{H}^i(G) = \{M \in \mathcal{C}(G) \mid \widehat{H}^i(H, M) = 0 \text{ for any } H \leq G\} \quad (i = \pm 1)$$

be the class of “ $\widehat{H}^i$ -vanish”  $G$ -lattices where  $\widehat{H}^i$  is the Tate cohomology. Then we have the inclusions  $\mathcal{S}(G) \subset \mathcal{D}(G) \subset \mathcal{H}^i(G) \subset \mathcal{C}(G)$  ( $i = \pm 1$ ).

**Definition 4.2.** We say that two  $G$ -lattices  $M_1$  and  $M_2$  are *similar* if there exist permutation  $G$ -lattices  $P_1$  and  $P_2$  such that  $M_1 \oplus P_1 \simeq M_2 \oplus P_2$ . We denote the similarity class of  $M$  by  $[M]$ . The set of similarity classes  $\mathcal{C}(G)/\mathcal{S}(G)$  becomes a commutative monoid (with respect to the sum  $[M_1] + [M_2] := [M_1 \oplus M_2]$  and the zero  $0 = [P]$  where  $P \in \mathcal{S}(G)$ ).

**Theorem 4.3** (Endo and Miyata [EM75, Lemma 1.1], Colliot-Thélène and Sansuc [CTS77, Lemma 3], see also [Swa83, Lemma 8.5], [Lor05, Lemma 2.6.1]). *For any  $G$ -lattice  $M$ , there exists a short exact sequence of  $G$ -lattices  $0 \rightarrow M \rightarrow P \rightarrow F \rightarrow 0$  where  $P$  is permutation and  $F$  is flabby.*

**Definition 4.4.** The exact sequence  $0 \rightarrow M \rightarrow P \rightarrow F \rightarrow 0$  as in Theorem 4.3 is called a *flabby resolution* of the  $G$ -lattice  $M$ .  $\rho_G(M) = [F] \in \mathcal{C}(G)/\mathcal{S}(G)$  is called *the flabby class* of  $M$ , denoted by  $[M]^{fl} = [F]$ . Note that  $[M]^{fl}$  is well-defined: if  $[M] = [M']$ ,  $[M]^{fl} = [F]$  and  $[M']^{fl} = [F']$  then  $F \oplus P_1 \simeq F' \oplus P_2$  for some permutation  $G$ -lattices  $P_1$  and  $P_2$ , and therefore  $[F] = [F']$  (cf. [Swa83, Lemma 8.7]). We say that  $[M]^{fl}$  is *invertible* if  $[M]^{fl} = [E]$  for some invertible  $G$ -lattice  $E$ .

For  $G$ -lattice  $M$ , it is not difficult to see

$$\begin{array}{ccccccc} \text{permutation} & \Rightarrow & \text{stably permutation} & \Rightarrow & \text{invertible} & \Rightarrow & \text{flabby and coflabby} \\ & & \downarrow & & \downarrow & & \\ & & [M]^{fl} = 0 & \Rightarrow & [M]^{fl} \text{ is invertible.} & & \end{array}$$

The above implications in each step cannot be reversed (see, for example, [HY17, Section 1]).

**Definition 4.5.** Let  $k$  be a field, and  $K$  and  $K'$  be finitely generated field extensions of  $k$ .

- (i)  $K$  is called *rational over  $k$*  (or  *$k$ -rational* for short) if  $K$  is purely transcendental over  $k$ , i.e.  $K$  is isomorphic to  $k(x_1, \dots, x_n)$ , the rational function field over  $k$  with  $n$  variables  $x_1, \dots, x_n$  for some integer  $n$ .
- (ii)  $K$  is called *stably  $k$ -rational* if  $K(y_1, \dots, y_m)$  is  $k$ -rational for some algebraically independent elements  $y_1, \dots, y_m$  over  $K$ .
- (iii)  $K$  and  $K'$  are called *stably  $k$ -isomorphic* if  $K(y_1, \dots, y_m) \simeq K'(z_1, \dots, z_n)$  over  $k$  for some algebraically independent elements  $y_1, \dots, y_m$  over  $K$  and  $z_1, \dots, z_n$  over  $K'$ .
- (iv) When  $k$  is an infinite field,  $K$  is called *retract  $k$ -rational* if there is a  $k$ -algebra  $R$  contained in  $K$  such that  $K$  is the quotient field of  $R$ , and the identity map  $1_R : R \rightarrow R$  factors through a localized polynomial ring over  $k$ , i.e. there is an element  $f \in k[x_1, \dots, x_n]$ , which is the polynomial ring over  $k$ , and there are  $k$ -algebra homomorphisms  $\varphi : R \rightarrow k[x_1, \dots, x_n][1/f]$  and  $\psi : k[x_1, \dots, x_n][1/f] \rightarrow R$  satisfying  $\psi \circ \varphi = 1_R$  (cf. [Sal84]).
- (v)  $K$  is called  *$k$ -unirational* if  $k \subset K \subset k(x_1, \dots, x_n)$  for some integer  $n$ .

It is not difficult to see that “ $k$ -rational”  $\Rightarrow$  “stably  $k$ -rational”  $\Rightarrow$  “retract  $k$ -rational”  $\Rightarrow$  “ $k$ -unirational”.

Let  $L/k$  be a finite Galois extension with Galois group  $G = \text{Gal}(L/k)$  and  $M$  be a  $G$ -lattice. The flabby class  $\rho_G(M) = [M]^{fl}$  plays crucial role in the rationality problem for  $L(M)^G$  as follows (see Voskresenskii’s fundamental book [Vos98, Section 4.6] and Kunyavskii [Kun07], see also e.g. Swan [Swa83], Kunyavskii [Kun90, Section 2], Lemire, Popov and Reichstein [LPR06, Section 2], Kang [Kan12], Yamasaki [Yam12], Hoshi and Yamasaki [HY17], Hoshi, Kanai and Yamasaki [HKY22]):

**Theorem 4.6** (Endo and Miyata [EM73], Voskresenskii [Vos74], Saltman [Sal84]). *Let  $L/k$  be a finite Galois extension with Galois group  $G = \text{Gal}(L/k)$ . Let  $M$  and  $M'$  be  $G$ -lattices. Then we have:*

- (i) (Endo and Miyata [EM73, Theorem 1.6])  $[M]^{fl} = 0$  if and only if  $L(M)^G$  is stably  $k$ -rational;
- (ii) (Voskresenskii [Vos74, Theorem 2])  $[M]^{fl} = [M']^{fl}$  if and only if  $L(M)^G$  and  $L(M')^G$  are stably  $k$ -isomorphic;
- (iii) (Saltman [Sal84, Theorem 3.14])  $[M]^{fl}$  is invertible if and only if  $L(M)^G$  is retract  $k$ -rational.

It is easy to see that all the 1-dimensional algebraic  $k$ -tori  $T$ , i.e. the trivial torus  $\mathbb{G}_m$  and the norm one torus  $R_{K/k}^{(1)}(\mathbb{G}_m)$  of  $K/k$  with  $[K : k] = 2$ , are  $k$ -rational. Voskresenskii [Vos67] showed that all the 2-dimensional algebraic  $k$ -tori  $T$  are  $k$ -rational. Kunyavskii [Kun90] gave a rational (stably rational, retract rational) classification of 3-dimensional algebraic  $k$ -tori. Hoshi and Yamasaki [HY17, Theorem 1.9 and Theorem 1.12] classified stably/retract rational algebraic  $k$ -tori of dimension 4 and 5 (see also [HKY22, Section 1]).

For norm one tori  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$ , recall that the function field  $k(T)$  may be regarded as  $L(M)^G$  for the character module  $M = J_{G/H}$  and hence we have:

$$[J_{G/H}]^{fl} = 0 \Rightarrow [J_{G/H}]^{fl} \text{ is invertible} \Rightarrow H^1(G, [J_{G/H}]^{fl}) = 0 \Rightarrow A(T) = 0 \text{ and } \text{III}(T) = 0$$

where the last implication holds over a global field  $k$  (see also Colliot-Thélène and Sansuc [CTS77, page 29]). The last conditions mean that  $T$  has the weak approximation property and the Hasse norm principle holds for  $K/k$  (see Section 1). In particular, it follows that  $[J_{G/H}]^{fl}$  is invertible and hence  $A(T) = 0$  and  $\text{III}(T) = 0$  when  $G = pTm \leq S_p$  is a transitive subgroup of  $S_p$  of prime degree  $p$  and  $H = G \cap S_{p-1} \leq G$  with  $[G : H] = p$  (see Colliot-Thélène and Sansuc [CTS87, Proposition 9.1] and [HY17, Lemma 2.17]). Hence the Hasse norm principle holds for  $K/k$  when  $[K : k] = p$  (see the second paragraph after Theorem 3.5 and also the first paragraph of Section 5).

A necessary and sufficient condition for the classification of stably/retract rational norm one tori  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  with  $[K : k] = n \leq 15$ , but with one exception  $G = 9T27 \simeq \text{PSL}_2(\mathbb{F}_8)$  for the stable rationality, was given in Hoshi and Yamasaki [HY21] (for the case  $n$  is a prime number or the case  $n \leq 10$ ) and Hasegawa, Hoshi and Yamasaki [HHY20] (for  $n = 12, 14, 15$ ).

## 5. PROOF OF THEOREM 1.1

Let  $K/k$  be a separable field extension of degree 12 and  $L/k$  be the Galois closure of  $K/k$ . Let  $G = \text{Gal}(L/k) = 12Tm$  ( $1 \leq m \leq 301$ ) be a transitive subgroup of  $S_{12}$  and  $H = \text{Gal}(L/K)$  with  $[G : H] = 12$ . Let  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  be the norm one torus of  $K/k$  of dimension 11. We have the character module  $\widehat{T} = J_{G/H}$  of  $T$  and then  $H^1(k, \text{Pic } \overline{X}) \simeq H^1(G, [J_{G/H}]^{fl})$  (see Section 4). We may assume that  $H$  is the stabilizer of one of the letters in  $G$ , i.e.  $L = k(\theta_1, \dots, \theta_{12})$  and  $K = k(\theta_i)$  for some  $1 \leq i \leq 12$ . In order to compute  $H^1(G, [J_{G/H}]^{fl})$ , we apply the functions `Norm1TorusJ(12, m)` and `FlabbyResolution(G).actionF` for  $1 \leq m \leq 299$  as in [HY17, Chapter 5]. The function `Norm1TorusJ(12, m)` returns  $J_{G/H}$  for  $G = 12Tm \leq S_{12}$  and  $H$  is the stabilizer of one of the letters in  $G$ , and `FlabbyResolution(G).actionF` returns a flabby class  $F = [J_{G/H}]^{fl}$  for  $G = 12Tm \leq S_{12}$ . The assertion for  $G = 12Tm$  ( $1 \leq m \leq 299$ ) follows from these computations as in Example 5.1.

For  $G = 12T300 \simeq A_{12}$ ,  $12T301 \simeq S_{12}$ , we did not get an answer by the computer calculations because it needs much time and computer resources (memory) in computations. However, we already know that  $H^1(G, [J_{G/H}]^{fl}) = 0$  for  $G = 12T300 \simeq A_{12}$ ,  $12T301 \simeq S_{12}$  by Macedo [Mac20] and Voskresenskii and Kunyavskii [VK84] respectively (see also [Vos88, Theorem 4, Corollary] and [HKY22, Theorem 1.10 and Theorem 1.11]).

The last assertion follows from Theorem 3.3. □

Some related functions for Example 5.1 are available from  
<https://www.math.kyoto-u.ac.jp/~yamasaki/Algorithm/RatProbNorm1Tori/>.

**Example 5.1** (Computation of  $H^1(G, [J_{G/H}]^{fl})$  with  $G = 12Tm$  ( $1 \leq m \leq 299$ )).

## 6. DRAKOKHRUST AND PLATONOV'S METHOD

Let  $k$  be a number field,  $K/k$  be a finite extension,  $\mathbb{A}_K^\times$  be the idele group of  $K$  and  $L/k$  be the Galois closure of  $K/k$ . Let  $G = \text{Gal}(L/k) = nTm$  be a transitive subgroup of  $S_n$  and  $H = \text{Gal}(L/K)$  with  $[G : H] = n$ .

For  $x, y \in G$ , we denote  $[x, y] = x^{-1}y^{-1}xy$  the commutator of  $x$  and  $y$ , and  $[G, G]$  the commutator group of  $G$ . Let  $V_k$  be the set of all places of  $k$  and  $G_v$  be the decomposition group of  $G$  at  $v \in V_k$ .

**Definition 6.1** (Drakokhrust and Platonov [PD85a, page 350], [DP87, page 300]). Let  $k$  be a number field,  $L \supset K \supset k$  be a tower of finite extensions where  $L$  is normal over  $k$ .

We call the group

$$\text{Obs}(K/k) = (N_{K/k}(\mathbb{A}_K^\times) \cap k^\times) / N_{K/k}(K^\times)$$

the total obstruction to the Hasse norm principle for  $K/k$  and

$$\text{Obs}_1(L/K/k) = (N_{K/k}(\mathbb{A}_K^\times) \cap k^\times) / ((N_{L/k}(\mathbb{A}_L^\times) \cap k^\times) N_{K/k}(K^\times))$$

the first obstruction to the Hasse norm principle for  $K/k$  corresponding to the tower  $L \supset K \supset k$ .

Note that (i)  $\text{Obs}(K/k) = 1$  if and only if the Hasse norm principle holds for  $K/k$ ; and (ii)  $\text{Obs}_1(L/K/k) = \text{Obs}(K/k) / (N_{L/k}(\mathbb{A}_L^\times) \cap k^\times)$ .

Drakokhrust and Platonov gave a formula for computing the first obstruction  $\text{Obs}_1(L/K/k)$ :

**Theorem 6.2** (Drakokhrust and Platonov [PD85a, page 350], [PD85b, pages 789–790], [DP87, Theorem 1]). Let  $k$  be a number field,  $L \supset K \supset k$  be a tower of finite extensions where  $L$  is normal over  $k$ . Let  $G = \text{Gal}(L/k)$  and

$H = \text{Gal}(L/K)$ . Then

$$\text{Obs}_1(L/K/k) \simeq \text{Ker } \psi_1 / \varphi_1(\text{Ker } \psi_2)$$

where

$$\begin{array}{ccc} H/[H, H] & \xrightarrow{\psi_1} & G/[G, G] \\ \uparrow \varphi_1 & & \uparrow \varphi_2 \\ \bigoplus_{v \in V_k} \left( \bigoplus_{w|v} H_w/[H_w, H_w] \right) & \xrightarrow{\psi_2} & \bigoplus_{v \in V_k} G_v/[G_v, G_v], \end{array}$$

$\psi_1$ ,  $\varphi_1$  and  $\varphi_2$  are defined by the inclusions  $H \subset G$ ,  $H_w \subset H$  and  $G_v \subset G$  respectively, and

$$\psi_2(h[H_w, H_w]) = x^{-1}hx[G_v, G_v]$$

for  $h \in H_w = H \cap x^{-1}hx[G_v, G_v]$  ( $x \in G$ ).

Let  $\psi_2^v$  be the restriction of  $\psi_2$  to the subgroup  $\bigoplus_{w|v} H_w/[H_w, H_w]$  with respect to  $v \in V_k$  and  $\psi_2^{\text{nr}}$  (resp.  $\psi_2^{\text{r}}$ ) be the restriction of  $\psi_2$  to the unramified (resp. the ramified) places  $v$  of  $k$ .

**Proposition 6.3** (Drakokhrust and Platonov [DP87]). *Let  $k$ ,  $L \supset K \supset k$ ,  $G$  and  $H$  be as in Theorem 6.2.*

- (i) ([DP87, Lemma 1]) *Places  $w_i \mid v$  of  $K$  are in one-to-one correspondence with the set of double cosets in the decomposition  $G = \cup_{i=1}^r Hx_iG_v$  where  $H_{w_i} = H \cap x_iG_vx_i^{-1}$ ;*
- (ii) ([DP87, Lemma 2]) *If  $G_{v_1} \leq G_{v_2}$ , then  $\varphi_1(\text{Ker } \psi_2^{v_1}) \subset \varphi_1(\text{Ker } \psi_2^{v_2})$ ;*
- (iii) ([DP87, Theorem 2])  *$\varphi_1(\text{Ker } \psi_2^{\text{nr}}) = \Phi^G(H)/[H, H]$  where  $\Phi^G(H) = \langle [h, x] \mid h \in H \cap xHx^{-1}, x \in G \rangle$ ;*
- (iv) ([DP87, Lemma 8]) *If  $[K : k] = p^r$  ( $r \geq 1$ ) and  $\text{Obs}(K_p/k_p) = 1$  where  $k_p = L^{G_p}$ ,  $K_p = L^{H_p}$ ,  $G_p$  and  $H_p \leq H \cap G_p$  are  $p$ -Sylow subgroups of  $G$  and  $H$  respectively, then  $\text{Obs}(K/k) = 1$ .*

Note that the inverse direction of Proposition 6.3 (iv) does not hold in general. For example, if  $n = 8$ ,  $G = 8T13 \simeq A_4 \times C_2$  and there exists a place  $v$  of  $k$  such that  $G_v \simeq V_4$ , then  $\text{Obs}(K/k) = 1$  but  $G_2 = 8T3 \simeq (C_2)^3$  and  $\text{Obs}(K_2/k_2) \neq 1$  may occur (see [HKY22, Theorem 1.18]).

**Theorem 6.4** (Drakokhrust and Platonov [DP87, Theorem 3, Corollary 1]). *Let  $k$ ,  $L \supset K \supset k$ ,  $G$  and  $H$  be as in Theorem 6.2. Let  $H_i \leq G_i \leq G$  ( $1 \leq i \leq m$ ),  $H_i \leq H \cap G_i$ ,  $k_i = L^{G_i}$  and  $K_i = L^{H_i}$ . If  $\text{Obs}(K_i/k_i) = 1$  for all  $1 \leq i \leq m$  and*

$$\bigoplus_{i=1}^m \widehat{H}^{-3}(G_i, \mathbb{Z}) \xrightarrow{\text{cores}} \widehat{H}^{-3}(G, \mathbb{Z})$$

*is surjective, then  $\text{Obs}(K/k) = \text{Obs}_1(L/K/k)$ . In particular, if  $[K : k] = n$  is square-free, then  $\text{Obs}(K/k) = \text{Obs}_1(L/K/k)$ .*

We note that if  $L/k$  is an unramified extension, then  $A(T) = 0$  and  $H^1(G, [J_{G/H}]^{fl}) \simeq \text{III}(T) \simeq \text{Obs}(K/k)$  where  $T = R_{K/k}^{(1)}(\mathbb{G}_m)$  (see Theorem 3.3 and Theorem 3.6). If, in addition,  $\text{Obs}(K/k) = \text{Obs}_1(L/K/k)$  (e.g.  $[K : k] = 6, 10, 14, 15$ ; square-free, see Theorem 6.4), then  $\text{Obs}(K/k) = \text{Obs}_1(L/K/k) = \text{Ker } \psi_1 / \varphi_1(\text{Ker } \psi_2^{\text{nr}}) \simeq \text{Ker } \psi_1 / (\Phi^G(H)/[H, H])$  (see Proposition 6.3 (iii)).

**Theorem 6.5** (Drakokhrust [Dra89, Theorem 1], see also Opolka [Opo80, Satz 3]). *Let  $k$ ,  $L \supset K \supset k$ ,  $G$  and  $H$  be as in Theorem 6.2. Assume that  $\widetilde{L} \supset L \supset k$  is a tower of Galois extensions with  $\widetilde{G} = \text{Gal}(\widetilde{L}/k)$  and  $\widetilde{H} = \text{Gal}(\widetilde{L}/K)$  which correspond to a central extension  $1 \rightarrow A \rightarrow \widetilde{G} \rightarrow G \rightarrow 1$  with  $A \cap [\widetilde{G}, \widetilde{G}] \simeq M(G) = H^2(G, \mathbb{C}^\times)$ ; the Schur multiplier of  $G$  (this is equivalent to the inflation  $M(G) \rightarrow M(\widetilde{G})$  being the zero map, see Beyl and Tappe [BT82, Proposition 2.13, page 85]). Then  $\text{Obs}(K/k) = \text{Obs}_1(\widetilde{L}/K/k)$ . In particular, if  $\widetilde{G}$  is a Schur cover of  $G$ , i.e.  $A \simeq M(G)$ , then  $\text{Obs}(K/k) = \text{Obs}_1(\widetilde{L}/K/k)$ .*

Indeed, Drakokhrust [Dra89, Theorem 1] shows that  $\text{Obs}(K/k) \simeq \text{Ker } \widetilde{\psi}_1 / \widetilde{\varphi}_1(\text{Ker } \widetilde{\psi}_2)$  where the maps  $\widetilde{\psi}_1$ ,  $\widetilde{\psi}_2$  and  $\widetilde{\varphi}_1$  are defined as in [Dra89, page 31, the paragraph before Proposition 1]. The proof of [Dra89, Proposition 1] shows that this group is the same as  $\text{Obs}_1(\widetilde{L}/K/k)$  (see also [Dra89, Lemma 2, Lemma 3 and Lemma 4]).

Hoshi, Kanai and Yamasaki [HKY22, Section 6] made the following functions of GAP ([GAP]) which will be used in the proof of Theorem 1.3.

`FirstObstructionN(G, H).ker` returns the list  $[l_1, [l_2, l_3]]$  where  $l_1$  is the abelian invariant of the numerator of the first obstruction  $\text{Ker } \psi_1 = \langle y_1, \dots, y_t \rangle$  with respect to  $G$ ,  $H$  as in Theorem 6.2,  $l_2 = [e_1, \dots, e_m]$  is the abelian

invariant of  $H^{ab} = H/[H, H] = \langle x_1, \dots, x_m \rangle$  with  $e_i = \text{order}(x_i)$  and  $l_3 = [l_{3,1}, \dots, l_{3,t}]$ ,  $l_{3,i} = [r_{i,1}, \dots, r_{i,m}]$  is the list with  $y_i = x_1^{r_{i,1}} \cdots x_m^{r_{i,m}}$  for  $H \leq G \leq S_n$ .

`FirstObstructionN(G).ker` returns the same as `FirstObstructionN(G, H).ker` where  $H = \text{Stab}_1(G)$  is the stabilizer of 1 in  $G \leq S_n$ .

`FirstObstructionDnr(G, H).Dnr` returns the list  $[l_1, [l_2, l_3]]$  where  $l_1$  is the abelian invariant of the unramified part of the denominator of the first obstruction  $\varphi_1(\text{Ker } \psi_2^{\text{nr}}) = \Phi^G(H)/[H, H] = \langle y_1, \dots, y_t \rangle$  with respect to  $G, H$  as in Proposition 6.3 (iii),  $l_2 = [e_1, \dots, e_m]$  is the abelian invariant of  $H^{ab} = H/[H, H] = \langle x_1, \dots, x_m \rangle$  with  $e_i = \text{order}(x_i)$  and  $l_3 = [l_{3,1}, \dots, l_{3,t}]$ ,  $l_{3,i} = [r_{i,1}, \dots, r_{i,m}]$  is the list with  $y_i = x_1^{r_{i,1}} \cdots x_m^{r_{i,m}}$  for  $H \leq G \leq S_n$ .

`FirstObstructionDnr(G).Dnr` returns the same as `FirstObstructionDnr(G, H).Dnr` where  $H = \text{Stab}_1(G)$  is the stabilizer of 1 in  $G \leq S_n$ .

`FirstObstructionDr(G, G_v, H).Dr` returns the list  $[l_1, [l_2, l_3]]$  where  $l_1$  is the abelian invariant of the ramified part of the denominator of the first obstruction  $\varphi_1(\text{Ker } \psi_2^{\text{v}}) = \langle y_1, \dots, y_t \rangle$  with respect to  $G, G_v, H$  as in Theorem 6.2,  $l_2 = [e_1, \dots, e_m]$  is the abelian invariant of  $H^{ab} = H/[H, H] = \langle x_1, \dots, x_m \rangle$  with  $e_i = \text{order}(x_i)$  and  $l_3 = [l_{3,1}, \dots, l_{3,t}]$ ,  $l_{3,i} = [r_{i,1}, \dots, r_{i,m}]$  is the list with  $y_i = x_1^{r_{i,1}} \cdots x_m^{r_{i,m}}$  for  $G_v, H \leq G \leq S_n$ .

`FirstObstructionDr(G, G_v).Dr` returns the same as `FirstObstructionDr(G, G_v, H).Dr` where  $H = \text{Stab}_1(G)$  is the stabilizer of 1 in  $G \leq S_n$ .

`SchurCoverG(G).SchurCover` (resp. `SchurCoverG(G).epi`) returns one of the Schur covers  $\tilde{G}$  of  $G$  (resp. the surjective map  $\pi$ ) in a central extension  $1 \rightarrow A \rightarrow \tilde{G} \xrightarrow{\pi} G \rightarrow 1$  with  $A \simeq M(G)$ ; Schur multiplier of  $G$  (see Karpilovsky [Kap87, page 16]). The Schur covers  $\tilde{G}$  are stem extensions, i.e.  $A \leq Z(\tilde{G}) \cap [\tilde{G}, \tilde{G}]$ , of the maximal size. This function is based on the built-in function `EpimorphismSchurCover` in GAP.

`MinimalStemExtensions(G)[j].MinimalStemExtension` (resp. `MinimalStemExtensions(G)[j].epi`) returns the  $j$ -th minimal stem extension  $\bar{G} = \tilde{G}/A'$ , i.e.  $\bar{A} \leq Z(\bar{G}) \cap [\bar{G}, \bar{G}]$ , of  $G$  provided by the Schur cover  $\tilde{G}$  of  $G$  via `SchurCoverG(G).SchurCover` where  $A'$  is the  $j$ -th maximal subgroup of  $A = M(G)$  (resp. the surjective map  $\bar{\pi}$ ) in the commutative diagram

$$\begin{array}{ccccccc} 1 & \longrightarrow & A = M(G) & \longrightarrow & \tilde{G} & \xrightarrow{\pi} & G \longrightarrow 1 \\ & & \downarrow & & \downarrow & & \parallel \\ 1 & \longrightarrow & \bar{A} = A/A' & \longrightarrow & \bar{G} = \tilde{G}/A' & \xrightarrow{\bar{\pi}} & G \longrightarrow 1 \end{array}$$

(see Robinson [Rob96, Exercises 11.4]). This function is based on the built-in function `EpimorphismSchurCover` in GAP.

`ResolutionNormalSeries(LowerCentralSeries(G), n+1)` (resp. `ResolutionNormalSeries(DerivedSeries(G), n+1)`, `ResolutionFiniteGroup(G, n+1)`) returns a free resolution  $RG$  of  $G$  when  $G$  is nilpotent (resp. solvable, finite). This function is the built-in function of HAP ([HAP]) in GAP ([GAP]).

`ResHnZ(RG, RH, n).HnGZ` (resp. `ResHnZ(RG, RH, n).HnHZ`) returns the abelian invariants of  $H^n(G, \mathbb{Z})$  (resp.  $H^n(H, \mathbb{Z})$ ) with respect to Smith normal form, for free resolutions  $RG$  and  $RH$  of  $G$  and  $H$  respectively.

`ResHnZ(RG, RH, n).Res` returns the list  $L = [l_1, \dots, l_s]$  where  $H^n(G, \mathbb{Z}) = \langle x_1, \dots, x_s \rangle \xrightarrow{\text{res}} H^n(H, \mathbb{Z}) = \langle y_1, \dots, y_t \rangle$ ,  $\text{res}(x_i) = \prod_{j=1}^t y_j^{l_{i,j}}$  and  $l_i = [l_{i,1}, \dots, l_{i,t}]$  for free resolutions  $RG$  and  $RH$  of  $G$  and  $H$  respectively.

`ResHnZ(RG, RH, n).Ker` returns the list  $L = [l_1, [l_2, l_3]]$  where  $l_1$  is the abelian invariant of  $\text{Ker}\{H^n(G, \mathbb{Z}) \xrightarrow{\text{res}} H^n(H, \mathbb{Z})\} = \langle y_1, \dots, y_t \rangle$ ,  $l_2 = [d_1, \dots, d_s]$  is the abelian invariant of  $H^n(G, \mathbb{Z}) = \langle x_1, \dots, x_s \rangle$  with  $d_i = \text{ord}(x_i)$  and  $l_3 = [l_{3,1}, \dots, l_{3,t}]$ ,  $l_{3,j} = [r_{j,1}, \dots, r_{j,s}]$  is the list with  $y_j = x_1^{r_{j,1}} \cdots x_s^{r_{j,s}}$  for free resolutions  $RG$  and  $RH$  of  $G$  and  $H$  respectively.

`ResHnZ(RG, RH, n).Coker` returns the list  $L = [l_1, [l_2, l_3]]$  where  $l_1 = [e_1, \dots, e_t]$  is the abelian invariant of  $\text{Coker}\{H^n(G, \mathbb{Z}) \xrightarrow{\text{res}} H^n(H, \mathbb{Z})\} = \langle \bar{y}_1, \dots, \bar{y}_t \rangle$  with  $e_j = \text{ord}(\bar{y}_j)$ ,  $l_2 = [d_1, \dots, d_s]$  is the abelian invariant of  $H^n(H, \mathbb{Z}) = \langle x_1, \dots, x_s \rangle$  with  $d_i = \text{ord}(x_i)$  and  $l_3 = [l_{3,1}, \dots, l_{3,t}]$ ,  $l_{3,j} = [r_{j,1}, \dots, r_{j,s}]$  is the list with  $\bar{y}_j = \bar{x}_1^{r_{j,1}} \cdots \bar{x}_s^{r_{j,s}}$  for free resolutions  $RG$  and  $RH$  of  $G$  and  $H$  respectively.

`KerResH3Z(G, H)` returns the list  $L = [l_1, [l_2, l_3]]$  where  $l_1$  is the abelian invariant of  $\text{Ker}\{H^3(G, \mathbb{Z}) \xrightarrow{\text{res}} \oplus_{i=1}^{m'} H^3(G_i, \mathbb{Z})\} = \langle y_1, \dots, y_t \rangle$  where  $H_i \leq G_i \leq G$ ,  $H_i \leq H \cap G_i$ ,  $[G_i : H_i] = n$  and the action of  $G_i$  on  $\mathbb{Z}[G_i/H_i]$  may be regarded as  $nTm$  ( $n \leq 15, n \neq 12$ ) which is not in [HKY22, Table 1],  $l_2 = [d_1, \dots, d_s]$  is the abelian invariant of  $H^3(G, \mathbb{Z}) = \langle x_1, \dots, x_s \rangle$  with  $d_{i'} = \text{ord}(x_{i'})$  and  $l_3 = [l_{3,1}, \dots, l_{3,t}]$ ,  $l_{3,j} = [r_{j,1}, \dots, r_{j,s}]$  is the list with  $y_j = x_1^{r_{j,1}} \cdots x_s^{r_{j,s}}$  for groups  $G$  and  $H$  (cf. Theorem 6.5).

The functions above are available from  
<https://www.math.kyoto-u.ac.jp/~yamasaki/Algorithm/Norm1ToriHNP>.

## 7. PROOF OF THEOREM 1.3

In order to prove Theorem 1.3, we made the following additional GAP ([GAP]) functions:

`KerResH3Z(G, H:iterator)` returns the same as `KerResH3Z(G, H)` (in Section 6) but using the built-in function `IteratorByFunctions` of GAP in order to run fast (by applying the new function `ChooseGiIterator(G, H)` to choose suitable  $G_i \leq G$  instead of the old one `ChooseGi(G, H)`) and also using  $nTm$  ( $n \leq 15$ ) which is not in [HKY22, Table 1] or Table 1 instead of  $nTm$  ( $n \leq 15, n \neq 12$ ) which is not in [HKY22, Table 1] (cf. Theorem 6.5).

`ConjugacyClassesSubgroupsNGHOrbitRep(ConjugacyClassesSubgroups(G), H)` returns the list  $L = [l_1, \dots, l_t]$  where  $t$  is the number of subgroups of  $G$  up to conjugacy,  $l_r = [l_{r,1}, \dots, l_{r,u_r}]$  ( $1 \leq r \leq t$ ),  $l_{r,s}$  ( $1 \leq s \leq u_r$ ) is a representative of the orbit  $\text{Orb}_{N_G(H) \backslash G/N_G(G_{v_r,s})}(G_{v_r,s})$  of  $G_{v_r,s} \leq G$  under the conjugate action of  $G$  which corresponds to the double coset  $N_G(H) \backslash G/N_G(G_{v_r,s})$  with  $\text{Orb}_{G/N_G(G_{v_r})}(G_{v_r}) = \bigcup_{s=1}^{u_r} \text{Orb}_{N_G(H) \backslash G/N_G(G_{v_r,s})}(G_{v_r,s})$  corresponding to  $r$ -th subgroup  $G_{v_r} \leq G$  up to conjugacy.

`MinConjugacyClassesSubgroups(l)` returns the minimal elements of the list  $l = \{H_i^G\}$  where  $H_i^G = \{x^{-1}H_i x \mid x \in G\}$  for some subgroups  $H_i \leq G$  which satisfy the condition that if  $H_i^G, H_r^G \in l$  and  $H_i \leq H_r$ , then  $H_j^G \in l$  for any  $H_i \leq H_j \leq H_r$ .

`IsInvariantUnderAutG(l)` returns `true` if the list  $l = \{H_i^G\}$  is closed under the action of all the automorphisms  $\text{Aut}(G)$  of  $G$  where  $H_i^G = \{x^{-1}H_i x \mid x \in G\}$  ( $H_i \leq G$ ). If not, this returns `false`.

The functions above are also available from  
<https://www.math.kyoto-u.ac.jp/~yamasaki/Algorithm/Norm1ToriHNP>.

*Proof of Theorem 1.3.*

Let  $G = \text{Gal}(L/k) = 12Tm \leq S_{12}$  be the  $m$ -th transitive subgroup of  $S_{12}$  and  $H = \text{Gal}(L/K) \leq G$  with  $[G : H] = 12$ . Let  $V_k$  be the set of all places of  $k$  and  $G_v$  be the decomposition group of  $G$  at  $v \in V_k$ .

We may assume that  $H = \text{Stab}_1(G)$  is the stabilizer of 1 in  $G$ , i.e.  $L = k(\theta_1, \dots, \theta_{12})$  and  $K = L^H = k(\theta_1)$ . Note that (the multi-set)  $\{\text{Orb}_{G'}(i) \mid 1 \leq i \leq 12\}$  ( $G' \leq G$ ) is invariant under the conjugacy actions of  $G$ , i.e. inner automorphisms of  $G$ .

We also include the proof for Galois cases  $L = K$ , i.e.  $H = 1$ , (see Tate [Tat67] and Theorem 3.5).

(1) Table 2-1:  $G = 12Tm$  ( $m = 2, 3, 4, 7, 9, 16, 18, 20, 33, 34, 40, 43, 47, 52, 55, 64, 65, 70, 71, 74, 75, 96, 97, 117, 122, 130, 132, 133, 168, 171, 172, 174, 176, 179, 194, 232, 234, 246, 261, 280$ ) (40 cases) with  $\text{III}(T) \leq \mathbb{Z}/2\mathbb{Z}$  (cf. Tate [Tat67, page 198] for Galois cases  $12T2 \simeq C_6 \times C_2$ ,  $12T3 \simeq D_6$  and  $12T4 \simeq A_4(12)$ ).

We split the 40 cases into 3 parts (1-1), (1-2), (1-3) according to the method to prove the assertion:

(1-1)  $m = 7, 9, 34, 47, 52, 55, 64, 65, 74, 75, 96, 97, 122, 172, 174, 232, 246$  (17 cases).

Applying `FirstObstructionN(G)` and `FirstObstructionDnr(G)`, we obtain that  $\text{Ker } \psi_1/\varphi_1(\text{Ker } \psi_2^{\text{nr}}) \simeq \mathbb{Z}/2\mathbb{Z}$ . This implies that  $\text{Obs}(K/k) = \text{Obs}_1(L/K/k)$  if  $L/k$  is unramified. Use Theorem 6.4. Applying `KerResH3Z(G, H:iterator)`, we see  $\text{Ker}\{H^3(G, \mathbb{Z}) \xrightarrow{\text{res}} \oplus_{i=1}^{m'} H^3(G_i, \mathbb{Z})\} = 0$  and hence  $\oplus_{i=1}^{m'} \widehat{H}^{-3}(G_i, \mathbb{Z}) \xrightarrow{\text{cores}} \widehat{H}^{-3}(G, \mathbb{Z})$  is surjective. It follows from Theorem 6.4 that  $\text{Obs}(K/k) = \text{Obs}_1(L/K/k)$ . Apply the function `FirstObstructionDr(G, G_{v_r,s})` to representatives of the orbit  $\text{Orb}_{N_G(H) \backslash G/N_G(G_{v_r,s})}(G_{v_r,s})$  of  $G_{v_r,s} \leq G$  under the conjugate action of  $G$  which corresponds to the double coset  $N_G(H) \backslash G/N_G(G_{v_r,s})$  with  $\text{Orb}_{G/N_G(G_{v_r})}(G_{v_r}) = \bigcup_{s=1}^{u_r} \text{Orb}_{N_G(H) \backslash G/N_G(G_{v_r,s})}(G_{v_r,s})$  corresponding to  $r$ -th subgroup  $G_{v_r} \leq G$  up to conjugacy via the function `ConjugacyClassesSubgroupsNGHOrbitRep(ConjugacyClassesSubgroups(G), H)`. Then we can get the minimal elements of the  $G_{v_r,s}$ 's with  $\text{Ker } \psi_1/\varphi_1(\text{Ker } \psi_2) = 0$  via the function `MinConjugacyClassesSubgroups(l)`. Finally, we get a necessary and sufficient condition for  $\text{Obs}_1(L/K/k) = 1$  for each case (see Example 7.1).

(1-2)  $m = 2, 3, 4, 16, 18, 33, 43, 70, 71, 130, 132, 133, 176, 179, 234$  (15 cases). Applying `FirstObstructionN(G)` and `FirstObstructionDnr(G)`, we have  $\text{Obs}_1(L/K/k) = 1$ . Hence we just apply Theorem 6.5. We have the Schur multiplier  $M(G) \simeq \mathbb{Z}/2\mathbb{Z}$  for  $G = 12Tm$  ( $m = 2, 3, 4, 16, 18, 33, 43, 70, 71, 130, 132, 133, 176, 179, 234$ ). We obtain a Schur cover  $1 \rightarrow M(G) \simeq \mathbb{Z}/2\mathbb{Z} \rightarrow \tilde{G} \xrightarrow{\pi} G \rightarrow 1$  and  $\text{Obs}(K/k) = \text{Obs}_1(\tilde{L}/K/k)$ . By Theorem 1.1, we have  $\text{Ker } \tilde{\psi}_1/\tilde{\varphi}_1(\text{Ker } \tilde{\psi}_2^{\text{nr}}) \simeq \mathbb{Z}/2\mathbb{Z}$ . By applying the functions `FirstObstructionDr`( $\tilde{G}, \tilde{G}_{v,r,s}, \tilde{H}$ ) and `MinConjugacyClassesSubgroups(l)` as in the case (1-1), we can get the minimal elements of the  $\tilde{G}_{v,r,s}$ 's with  $\text{Ker } \tilde{\psi}_1/\tilde{\varphi}_1(\text{Ker } \tilde{\psi}_2) = 0$ . Then we get a necessary and sufficient condition for  $\text{Obs}_1(\tilde{L}/K/k) = 1$  for each case (see Example 7.2).

(1-3)  $m = 20, 40, 117, 168, 171, 194, 261, 280$  (8 cases). Applying the functions `FirstObstructionN(G)` and `FirstObstructionDnr(G)`, we have  $\text{Obs}_1(L/K/k) = 1$ . For the 8 cases  $G = 12Tm$  ( $m = 20, 40, 117, 168, 171, 194, 261, 280$ ), we obtain that the Schur multipliers  $M(G) \simeq \mathbb{Z}/6\mathbb{Z}, \mathbb{Z}/6\mathbb{Z}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 3}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 3}, \mathbb{Z}/2\mathbb{Z} \oplus (\mathbb{Z}/3\mathbb{Z})^{\oplus 2}, \mathbb{Z}/6\mathbb{Z}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 4}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 2}$  respectively. We can take a minimal stem extension  $\bar{G} = \tilde{G}/A'$ , i.e.  $\bar{A} \leq Z(\bar{G}) \cap [\bar{G}, \bar{G}]$  of  $G$  in the commutative diagram

$$\begin{array}{ccccccc} 1 & \longrightarrow & A = M(G) & \longrightarrow & \tilde{G} & \xrightarrow{\pi} & G \longrightarrow 1 \\ & & \downarrow & & \downarrow & & \parallel \\ 1 & \longrightarrow & \bar{A} = A/A' & \longrightarrow & \bar{G} = \tilde{G}/A' & \xrightarrow{\bar{\pi}} & G \longrightarrow 1 \end{array}$$

with  $\bar{A} \simeq \mathbb{Z}/2\mathbb{Z}$  or  $\mathbb{Z}/3\mathbb{Z}$  via the function `MinimalStemExtensions(G)[j].MinimalStemExtension`. Then we apply Theorem 6.4 instead of Theorem 6.5. Applying `KerResH3Z(G, H:iterator)`, we can get  $\text{Ker}\{H^3(\bar{G}_j, \mathbb{Z}) \xrightarrow{\text{res}} \oplus_{i=1}^{m'} H^3(G_i, \mathbb{Z})\} = 0$  for exactly one  $j$  with  $\bar{A} \simeq \mathbb{Z}/2\mathbb{Z}$ . Because  $\oplus_{i=1}^{m'} \hat{H}^{-3}(G_i, \mathbb{Z}) \xrightarrow{\text{cores}} \hat{H}^{-3}(\bar{G}_j, \mathbb{Z})$  is surjective, it follows from Theorem 6.4 that  $\text{Obs}(K/k) = \text{Obs}_1(\bar{L}_j/K/k)$ . We also checked that  $\text{Ker } \bar{\psi}_1/\bar{\varphi}_1(\text{Ker } \bar{\psi}_2^{\text{nr}}) \simeq \mathbb{Z}/2\mathbb{Z}$  for  $\bar{G}_j$  and  $\text{Ker } \bar{\psi}_1/\bar{\varphi}_1(\text{Ker } \bar{\psi}_2^{\text{nr}}) = 0$  for  $\bar{G}_{j'}$  ( $j' \neq j$ ). Hence  $\text{Obs}(K/k) \neq \text{Obs}_1(\bar{L}_j/K/k)$  when  $\bar{L}_j/k$  is unramified. By applying the functions `FirstObstructionDr`( $\bar{G}_j, \bar{G}_{j,v,r,s}, \bar{H}_j$ ) and `MinConjugacyClassesSubgroups(l)` as in the case (1-1), we may find the minimal elements of the  $\bar{G}_{j,v,r,s}$ 's with  $\text{Ker } \bar{\psi}_1/\bar{\varphi}_1(\text{Ker } \bar{\psi}_2) = 0$ . Then we get a necessary and sufficient condition for  $\text{Obs}_1(\bar{L}_j/K/k) = 1$  for each case (see Example 7.3).

(2) Table 2-2:  $G = 12Tm$  ( $m = 10, 37, 54, 56, 59, 61, 66, 77, 88, 92, 93, 100, 102, 144, 188, 210, 214, 230, 242, 255, 271$ ) (21 cases) with  $\text{III}(T) \leq \mathbb{Z}/2\mathbb{Z}$ .

We split the 21 cases into 2 parts (2-1), (2-2) according to the method to prove the assertion:

(2-1)  $m = 54, 56, 59, 61, 66, 88, 92, 93, 100, 102, 144, 188, 230, 255$  (14 cases). This case can be proved by the similar manner as in Case (1-1) (see Example 7.4).

(2-2)  $m = 10, 37, 77, 210, 214, 242, 271$  (7 cases). This case can be proved by the similar manner as in Case (1-3). In particular, for the 7 cases  $G = 12Tm$  ( $m = 10, 37, 77, 210, 214, 242, 271$ ), we obtain that the Schur multipliers  $M(G) \simeq (\mathbb{Z}/2\mathbb{Z})^{\oplus 3}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 3}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 3}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 3}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 2} \oplus \mathbb{Z}/3\mathbb{Z}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 5}, (\mathbb{Z}/2\mathbb{Z})^{\oplus 3}$  respectively (see Example 7.5).

(3) Table 2-3:  $G = 12T31$  with  $\text{III}(T) \leq \mathbb{Z}/4\mathbb{Z}$ . This case can be proved by the similar manner as in Case (1-1) (see Example 7.6).

(4) Table 2-4:  $G = 12T57$  with  $\text{III}(T) \leq \mathbb{Z}/4\mathbb{Z}$ . This case can be proved by the similar manner as in Case (1-1) (see Example 7.7).

(5) Table 2-5:  $G = 12T32$  with  $\text{III}(T) \leq (\mathbb{Z}/2\mathbb{Z})^{\oplus 2}$ . This case can be proved by the similar manner as in Case (1-1) (see Example 7.8).

The last assertion for the cases (1) Table 2-1 and (3) Table 2-3 follows because the statements can be described in terms of the characteristic subgroups of  $G$ , i.e. invariants under the automorphisms of  $G$  although for the cases (2) Table 2-2, (4) Table 2-4 and (5) Table 2-5, the statements are not stable under the action of all the automorphisms  $\text{Aut}(G)$  of  $G$ . We can check this via the function `IsInvariantUnderAutG(l)`.  $\square$

**Example 7.1** ( $G = 12Tm$  ( $m = 7, 9, 34, 47, 52, 55, 64, 65, 74, 75, 96, 97, 122, 132, 172, 174, 232, 246$ )).

## 8. GAP ALGORITHMS

We give GAP algorithms for computing the total obstruction  $\text{Obs}(K/k)$  and the first obstruction  $\text{Obs}_1(L/K/k)$  as in Section 6. The functions which are provided in this section are available from <https://www.math.kyoto-u.ac.jp/~yamasaki/Algorithm/Norm1ToriHNP/>.

```
