#### **Abstract**

There is a longstanding debate in the logico-philosophical community as to why the Gödelian sentences of a consistent and sufficiently strong theory are true. The prevalent argument seems to be something like this: since every one of the Gödelian sentences of such a theory is equivalent to the theory's consistency statement, even provably so inside the theory, the truth of those sentences follows from the consistency of the theory in question. So, Gödelian sentences of consistent theories should be true. In this paper, we show that Gödelian sentences of only sound theories are true; and there is a long road from consistency to soundness, indeed a hierarchy of conditions which are satisfied by some theories and falsified by others. We also study the truth of Rosserian sentences and provide necessary and sufficient conditions for the truth of Rosserian (and also Gödelian) sentences of theories.

Keywords: The Incompleteness Theorem; Gödelian Sentences, Rosser's Trick, Rosserian Sentences, Soundness, Consistency,  $\Sigma_n$ -Soundness.

2020 AMS MSC: 03F40.

# **1 Introduction**

By the first incompleteness theorem of Gödel (1931), for every consistent and sufficiently strong arithmetical theory there are sentences which are undecidable in the theory ([\[5\]](#page-8-0)). Examples of such undecidable sentences are actually constructed in Gödel's original proof (hence *Gödelian sentences*) each of which is equivalent to its own unprovability in the theory; see Definition [2.1](#page-1-0) below. A natural question here is that while the theory in question cannot decide the truth of its Gödelian sentences, what about us (humans)? Can we "see" (or demonstrate) their truth? This question has attracted the attention of many philosophers, physicists, computer scientists, as well as mathematical logicians. As there are numerous papers and books on this subject, it is not possible to cite them all here; see the Conclusions for a few. In this paper, we present necessary and sufficient conditions for the truth of Gödelian sentences (and Rosserian sentences) of consistent and sufficiently strong arithmetical theories (see the diagram in the Conclusions section).

We assume familiarity with the notions of  $\Pi_n$  and  $\Sigma_n$  formulae, Robinson's Arithmetic *Q*, and the fact that *Q* is a sound and  $\Sigma_1$ -complete theory (i.e., every *Q*-provable sentence is true and every true  $\Sigma_1$ -sentence is *Q*-provable); see e.g. [\[9\]](#page-8-1). By the Diagonal Lemma of Gödel and Carnap, see e.g. [\[24\]](#page-9-0), for every formula  $\Psi(x)$ with the only free variable x, there exists a sentence  $\theta$  such that  $\theta \leftrightarrow \Psi(\# \theta)$  is true (in the standard model of natural numbers N) and also provable in *Q*; here  $#A$  denotes the numeral of the Gödel code of A, relative to

<span id="page-1-2"></span>a fixed Gödel numbering (arithmetization) of the syntax. Moreover, if  $\Psi(x)$  is a  $\Pi_n$ -formula, then  $\theta$  can be taken to be a  $\Pi_n$ -sentence; and if  $\Psi(x)$  is  $\Sigma_n$ , then  $\theta$  can be taken to be  $\Sigma_n$  too. We provide more details in the following:

**LEMMA** 1.1 (The Diagonal Lemma): Let  $n \ge 1$ .

For every  $\Pi_n$ -formula  $\Psi(x)$  there exists a  $\Pi_n$ -sentence  $\theta$  such that  $\mathbf{Q} \vdash \theta \leftrightarrow \Psi(\#\theta)$ .

And for every  $\Sigma_n$ -formula  $\Psi(x)$  there exists a  $\Sigma_n$ -sentence  $\theta$  with the above property.

**PROOF**: There exists a  $\Sigma_1$ -formula  $\delta(x, y)$ , in the language of arithmetic, that strongly represents the diagonal (primitive recursive) function d which assigns to a given  $m$  the Gödel code of the expression that results from substituting  $\overline{m}$  (the numeral of m, a term in the language of arithmetic representing m) for all the free variables (if any) of the expression coded by m. So, for every  $m \in \mathbb{N}$  we have  $Q \vdash \forall y [\delta(\overline{m}, y) \leftrightarrow y = d(m)]$ .

If  $\Psi(x)$  is a  $\Pi_n$ -formula, then put  $\alpha(x) = \forall y [\delta(x, y) \rightarrow \Psi(y)]$ , and let a be its Gödel code. Now, let  $\theta = \alpha(\overline{a})$ ; then  $\theta$  is a  $\Pi_n$ -sentence and we have provably in  $\mathbf{\Omega}$  that

$$
\theta = \forall y [\delta(\overline{\mathsf{a}}, y) \to \Psi(y)] \leftrightarrow \forall y [y = \overline{\mathsf{d}(\mathsf{a})} \to \Psi(y)] \leftrightarrow \forall y [y = \#\theta \to \Psi(y)] \leftrightarrow \Psi(\#\theta).
$$

If  $\Psi(x)$  is a  $\Sigma_n$ -formula, then put  $\eta(x) = \exists y[\delta(x, y) \wedge \Psi(y)]$ , and let e be its Gödel code. Now, let  $\theta = \alpha(\bar{e})$ ; then  $\theta$  is a  $\Sigma_n$ -sentence and we have provably in  $\boldsymbol{Q}$  that

$$
\theta = \exists y [\delta(\overline{e}, y) \land \Psi(y)] \leftrightarrow \exists y [y = \overline{\mathbf{d}(e)} \land \Psi(y)] \leftrightarrow \exists y [y = \#\theta \land \Psi(y)] \leftrightarrow \Psi(\#\theta).
$$

This lemma is one of the breakthroughs of Gödel's theorem (and of modern logic). The incompleteness theorem is usually stated for recursively enumerable (RE) theories that extend *Q*; though it also holds for more general theories, see e.g. [\[23\]](#page-9-1). If a theory is RE, then it can be defined by a  $\Sigma_1$ -formula, see [\[9,](#page-8-1) Theorem 3.3.], and so its theorems (i.e., provable sentences) can also be defined by a  $\Sigma_1$ -formula.

<span id="page-1-1"></span>**CONVENTION** 1.2: Throughout, let T be an RE extension of *Q*. Let  $Pr_T(x)$  be a provability predicate for T, which is a  $\Sigma_1$ -formula, relative to a fixed Gödel numbering. A basic property of Pr<sub>T</sub> $(x)$  is that for every sentence  $\varphi$  we have

$$
T\vdash \varphi \iff \mathbb{N} \vDash \Pr_T(\#\varphi) \iff \mathbf{Q} \vdash \Pr_T(\#\varphi).
$$

Let Con $_T = \Pr_T (\# [0 \neq 0])$  be the  $(\Pi_1$ -)sentence that expresses T's consistency.  $\diamond$ 

## **2 Godel Sentences and their Truth. ¨**

<span id="page-1-0"></span>Gödel's proof of his incompleteness theorem uses the diagonal lemma for the negation of the provability predicate of T.

**DEFINITION** 2.1 (Gödelian Sentences): A sentence  $\gamma$  is called a Gödelian sentence of T when we have  $T \vdash \gamma \leftrightarrow \neg \text{Pr}_T(\# \gamma).$ 

Since for sufficiently strong theories  $T$  any two Gödelian sentences are  $T$ -provably equivalent, see e.g. [\[28,](#page-9-2) Remark 2.2.5.], many authors talk of *the* Gödel sentence of T. However, we will show that every unsound theory has both true and false Gödel sentences; so, even though the theory proves (unsoundly) that those sentences are equivalent, in reality they are not. Gödel [\[5\]](#page-8-0), and several authors after him, e.g. [\[28,](#page-9-2) p. 825], [\[29,](#page-9-3) p. 7], or [\[17,](#page-9-4) p. 6], argue that Gödelian sentences of a sufficiently strong theory are true, since

(1) they are provably equivalent with their unprovability in the theory, and

(2) they are indeed unprovable in the theory; and so

(3) they must be true.

<span id="page-2-0"></span>It is argued in [\[12\]](#page-8-2) that this line of reasoning does not demonstrate the truth of Gödelian sentences, and indeed some  $(\Sigma_1$ -)unsound theories may have false Gödelian sentences. In fact, the assumption (2) in the above argument (of Gödel) is redundant:

**LEMMA** 2.2: If T is consistent, then for every sentence  $\varphi$ ,  $T \vdash \varphi \rightarrow \neg \Pr_T(\#\varphi)$  implies  $T \nvdash \varphi$ .

**PROOF:** Since  $T \vdash \varphi$  would imply on the one hand  $T \vdash \neg Pr_T(\#\varphi)$  by the assumption, and on the other hand  $T \vdash \Pr_T(\#\varphi)$  by Convention [1.2.](#page-1-1)

So, the question of the validity of the above reasoning for the truth of Gödelian sentences boils down to the following question:

Does  $T \vdash \gamma \leftrightarrow \neg \Pr_T(\# \gamma)$ , for a consistent T, imply that  $\mathbb{N} \models \gamma$ ?

Or put in another way, under which conditions all the Gödelian sentences of  $T$  are true?

<span id="page-2-2"></span>We answer this question in the present section, and in the next section we answer a similar question for the Rosserian sentences (of arithmetical theories). Let us start with a characterization of the unprovable sentences:

**PROPOSITION** 2.3 (Characterizing Unprovable Sentences): Suppose that Löb's Rule holds for T. The following are equivalent for every sentence  $\varphi$ :

(1)  $\varphi$  is unprovable in T, i.e.,  $T \nvDash \varphi$ ;

(2)  $\varphi$  is a Gödelian sentence of some consistent extension U of T;

(3)  $T + [\varphi \leftrightarrow \neg \Pr_{T}(\#\varphi)]$  is consistent.

#### **PROOF**:

 $(1\Rightarrow 2)$ : There exists, by Lemma [1.1,](#page-1-2) a sentence  $\xi$  such that

 $T \vdash \xi \leftrightarrow [\varphi \leftrightarrow \neg \text{Pr}_{T+\xi}(\#\varphi)].$ 

Let  $U = T + \xi$ ; then  $U \vdash \varphi \leftrightarrow \neg Pr_U(\#\varphi)$  and it remains to show that U is consistent. If not, then  $T \vdash \neg \xi$ . So, on the one hand we have (i)  $T \vdash \neg [\varphi \leftrightarrow \neg Pr_U(\# \varphi)]$ , and on the other hand  $U \vdash \varphi$  which implies (ii)  $T \vdash Pr_U(\#\varphi)$  by Convention [1.2.](#page-1-1) Now, (i) and (ii) imply that  $T \vdash \varphi$ , contradicting the assumption.

 $(2\Rightarrow 3)$ : If  $T + [\varphi \leftrightarrow \neg \Pr_T(\#\varphi)]$  is not consistent, then  $T \vdash \neg [\varphi \leftrightarrow \neg \Pr_T(\#\varphi)]$ , and so  $T \vdash \Pr_T(\#\varphi) \rightarrow \varphi$ , which implies  $T \vdash \varphi$  by Löb's Rule. So, for every extension U of T we have  $U \vdash \varphi$ , and so, by Conven-tion [1.2,](#page-1-1)  $U \vdash Pr_U(\#\varphi)$ . Therefore, for every such U we have  $U \vdash \neg [\varphi \leftrightarrow \neg Pr_U(\#\varphi)]$ , which contradicts the assumption.

 $(3 \Rightarrow 1)$ : If  $T \vdash \varphi$ , then, by Convention [1.2,](#page-1-1) we have that  $T \vdash Pr_T(\#\varphi)$ , and so we should have also  $T \vdash \neg [\varphi \leftrightarrow \neg \text{Pr}_T(\# \varphi)].$ 

<span id="page-2-1"></span>It should be noted that the assumption of holding Löb's Rule for T was used only in the implication  $(2 \Rightarrow 3)$ . So, (1) and (2) are equivalent with each other, and are implied by (3), even when this rule does not hold. We now provide a necessary and sufficient condition, on a sufficiently strong  $T$ , for the truth of all the Gödelian  $\Pi_1$ -sentences of T:

**THEOREM** 2.4 (On the Truth and Independence of Gödelian  $\Pi_1$ -Sentences): Suppose that T satisfies the following two conditions:

- (I)  $T \vdash \neg \text{Con}_T \rightarrow \text{Pr}_T(\# \varphi)$  for every sentence  $\varphi$ , and
- (II)  $T \vdash \text{Con}_T \rightarrow \neg \text{Pr}_T(\# \gamma)$  for every Gödelian sentence  $\gamma$  of T.

If  $T \vdash \neg \text{Con}_T$ , then every false  $\Pi_1$ -sentence is a Gödelian sentence of T, and no Gödelian sentence of T is independent from T.

If  $T \nvdash \neg \text{Con}_T$ , then all the Gödelian  $\Pi_1$ -sentences of T are true, and all the Gödelian sentences of T are independent from T.

**PROOF:** If  $T \vdash \neg \text{Con}_T$ , then by (I) we have  $T \vdash \Pr_T(\#\varphi)$  for every sentence  $\varphi$ . So, for every Gödelian sentence  $\gamma$  of T we have  $T \vdash \neg \gamma$ ; thus no Gödelian sentence of T can be independent from T. Now, let  $\phi$  be an arbitrary false  $\Pi_1$ -sentence; then  $\neg \phi$  is a true  $\Sigma_1$ -sentence, and so provable in *Q*. Thus,  $T \vdash \neg \phi$ ; and so from  $T \vdash \Pr_T(\#\phi)$  we have  $T \vdash \phi \leftrightarrow \neg \Pr_T(\#\phi)$ , which means that  $\phi$  is a (false) Gödelian  $\Pi_1$ -sentence of T.

If  $T \nvdash \neg \text{Con}_T$ , then by (II) for every Gödelian sentence  $\gamma$  of T we have  $T \nvdash \Pr_T(\#\gamma)$ , and so  $T \nvdash \neg \gamma$ ; thus  $\gamma$  is independent from T (noting that T is consistent and so we also have  $T \nvdash \gamma$  by Lemma [2.2\)](#page-2-0). If a Gödelian Π1-sentence τ of T is not true, then ¬τ is a true Σ1-sentence, and so should be *Q*-provable; a contradiction with the T-independence of  $\tau$  proved above.  $QED$ 

Every extension of Peano's Arithmetic *PA* satisfies (I) and (II) in Theorem [2.4;](#page-2-1) as a matter of fact (II) is a formalization of Gödel's first incompleteness theorem (in T). If T is ( $\Sigma_1$ -)sound, then  $T \nvdash \neg \text{Con}_T$ . If T is inconsistent or  $T = S + \neg \text{Con}_S$ , where S is a consistent extension of *PA*, then  $T \vdash \neg \text{Con}_T$ ; in the latter case  $T$  is consistent by Gödel's second incompleteness theorem. Thus, by Theorem [2.4,](#page-2-1) a necessary and sufficient condition for the truth of all the Gödelian  $\Pi_1$ -sentences of T is the consistency of T with Con<sub>T</sub>, a condition obviously implied by  $\omega$ -consistency; though, this condition is stronger than the mere consistency of T, see [\[8,](#page-8-3) Theorem 36]. For investigating the truth of Gödelian  $\Pi_{n+1}$ -sentences (and  $\Sigma_{n+1}$ -sentences) we make a definition and an observation. Before that let us note that no Gödelian  $\Sigma_1$ -sentence of a consistent extension of *Q* can be true:

**PROPOSITION** 2.5 (On the Truth of Gödelian  $\Sigma_1$ -Sentences): No Gödelian  $\Sigma_1$ -sentence of T can be true if  $T$  is consistent.

**PROOF**: If a Gödelian  $\Sigma_1$ -sentence of T were true, then it would have been provable in *Q*, and this would have contradicted Lemma [2.2](#page-2-0) for consistent T.

**DEFINITION** 2.6 (Γ-Soundness): Let Γ be a class of sentences. A theory S is called Γ-sound when every S-provable  $\Gamma$ -sentence is true.  $\Diamond$ 

<span id="page-3-0"></span>The following lemma has been proved for  $\Gamma = \Sigma_1$ ,  $\Sigma_2$  in [\[8,](#page-8-3) Theorems 25, 27, 30,32]:

**LEMMA** 2.7 (On Extensions of Γ-Sound Theories): Let Γ be a class of sentences that is closed under disjunction. If T is a Γ-sound theory, then for every sentence  $\varphi$ , either  $T + \varphi$  or  $T + \neg \varphi$  is Γ-sound.

**PROOF:** If neither  $T + \varphi$  nor  $T + \neg \varphi$  is Γ-sound, then for some false Γ-sentences  $\varsigma$  and  $\varsigma'$  we have  $T + \varphi \vdash \varsigma$ and  $T + \neg \varphi \vdash \varsigma'$ . Thus,  $T \vdash \varsigma \vee \varsigma'$ , and  $\varsigma \vee \varsigma'$  is a false  $\Gamma$ -sentence; a contradiction.

<span id="page-3-1"></span>One of our main results is the following necessary and sufficient condition for the truth of Gödelian ( $\Pi_{n+1}$ ) and  $\Sigma_{n+1}$ ) sentences:

#### **THEOREM** 2.8 (The Truth of Gödel Sentences): Let  $n \ge 1$ .

All the Gödelian  $\Pi_{n+1}$ -sentences of T are true if and only if T is  $\Pi_{n+1}$ -sound. All the Gödelian  $\Sigma_{n+1}$ -sentences of T are true if and only if T is  $\Sigma_{n+1}$ -sound.

**PROOF:** Let  $\Gamma$  be any of  $\Pi_{n+1}$  or  $\Sigma_{n+1}$ .

First, suppose that T is Γ-sound, and let  $\gamma$  be a Gödelian Γ-sentence of the theory T. By Lemma [2.2](#page-2-0) and Convention [1.2](#page-1-1) we have  $\mathbb{N} \models \neg \Pr_T(\# \gamma)$ , and so  $\Pr_T(\# \gamma)$  is a false  $\Sigma_1$ -sentence. Now,  $T + \neg \gamma \vdash \Pr_T(\# \gamma)$ , and so  $T + \neg \gamma$  is not  $\Sigma_1$ -sound; whence, it is not Γ-sound either. Thus, by Lemma [2.7,](#page-3-0) the theory  $T + \gamma$  should be Γ-sound. Therefore,  $\gamma$  must be true.

Now, suppose that all the Gödelian  $\Gamma$ -sentences of T are true. We show that the theory T is  $\Gamma$ -sound. Assume that  $T \vdash \varsigma$  for a Γ-sentence  $\varsigma$ . We prove that  $\varsigma$  is true. By Lemma [1.1](#page-1-2) there exists a Γ-sentence  $\zeta$ such that  $Q \vdash \zeta \leftrightarrow [\zeta \wedge \neg \Pr_T(\# \zeta)]$ . Thus, from  $T \vdash \zeta$  we have  $T \vdash \zeta \leftrightarrow \neg \Pr_T(\# \zeta)$ , and so  $\zeta$  is a Gödelian Γ-sentence of T. Whence,  $\zeta$  is true, and so, by the soundness of *Q*, we have  $\mathbb{N} \models \zeta$ .

Whence, all the Gödelian sentences of a theory are true if and only if the theory is sound; cf. also [\[27,](#page-9-5) Theorem 24.7.].

**REMARK** 2.9 (On the Hierarchy of  $\Pi_n, \Sigma_n$ -Soundness): Let us note that an extension of *Q* is consistent if and only if it is  $\Pi_1$ -sound: indeed, no consistent extension of *Q* can prove a false  $\Pi_1$ -sentence, since the negation of such a sentence would be a true  $\Sigma_1$ -sentence and so would be provable in *Q*.

One can also show that a theory is  $\Sigma_n$ -sound if and only if it is  $\Pi_{n+1}$ -sound: if the theory S is  $\Sigma_n$ -sound and  $S \vdash \pi$ , where  $\pi$  is a  $\Pi_{n+1}$ -sentence, then write  $\pi = \forall x \sigma(x)$  for a  $\Sigma_n$ -formula  $\sigma$ ; since for every  $k \in \mathbb{N}$  we have  $S \vdash \sigma(\overline{k})$ , and  $\sigma(\overline{k})$  is a  $\Sigma_n$ -sentence, then  $\mathbb{N} \models \sigma(\overline{k})$  for every  $k \in \mathbb{N}$ , so  $\mathbb{N} \models \forall x \sigma(x) = \pi$ .

The hierarchy of  $\Sigma_n$ -sound theories is strict, since there are some  $\Sigma_n$ -sound theories which are not  $\Sigma_{n+1}$ -sound; this is proved in e.g. [\[23,](#page-9-1) Theorem 2.5.] and also [\[10,](#page-8-4) Theorem 4.8.]. Therefore, the truth of (even all) the Gödelian  $\Pi_{n+1}$ -sentences (respectively,  $\Sigma_{n+1}$ -sentences) of a theory does not necessarily imply the truth of its Gödelian  $\Pi_{n+2}$ -sentences (respectively,  $\Sigma_{n+2}$ -sentences).

## **3 Rosserian Sentences and their Truth.**

In Theorem [2.4](#page-2-1) we saw that Gödelian sentences of some theories could be refutable in them (though, they are always unprovable in consistent theories, see Lemma [2.2\)](#page-2-0). Rosser's trick ([\[22\]](#page-9-6)) constructs an independent sentence for a given theory (which is an RE extension of *Q*), when it is consistent. Before going into Rosser's construction, let us note that no construction similar to Gödel's can result in an independent sentence.

**DEFINITION** 3.1 (Pseudo-Gödelian Sentences): Let us call  $\psi$  a pseudo-Gödelian sentence of a theory T when there are some propositional formulas  $C_1(p), \cdots, C_n(p)$ , over the one propositional variable p, and there is one propositional formula  $B(p_1, \dots, p_n)$ , over the propositional variables  $p_1, \dots, p_n$ , such that we have  $T \vdash \psi \leftrightarrow B(\Pr_T[\#C_1(\psi)], \cdots, \Pr_T[\#C_n(\psi)])$ .  $\Diamond$ 

For example, the sentences  $\mathfrak{P}_T$  and  $\mathfrak{R}_T$  for which we have

$$
T\vdash \mathfrak{P}_T \leftrightarrow \big[\neg \mathtt{Pr}_T(\#\mathfrak{P}_T) \wedge \neg \mathtt{Pr}_T(\#[\neg \mathfrak{P}_T])\big] \text{ and } T\vdash \mathfrak{R}_T \leftrightarrow \big[\mathtt{Pr}_T(\#\mathfrak{R}_T) \to \neg \mathtt{Pr}_T(\#[\neg \mathfrak{R}_T])\big],
$$

are both some peudo-Gödelian sentences of T. For an alternative formulation of the following result see [\[29,](#page-9-3) Exercise 1, p. 149].

**PROPOSITION** 3.2 (Decidability of Pseudo-Gödelian Sentences): No pseudo-Gödelian sentence of  $U =$  $T + \neg \text{Con}_T$  can be independent from U.

**PROOF:** Let  $\psi$  be a pseudo-Gödelian sentence of the theory  $U = T + \neg \text{Con}_T$ . For every sentence  $\zeta$  we have  $U \vdash$  $Pr_U(\# \zeta)$ . Now,  $B(\top, \dots, \top)$ , where  $\top$  denotes the propositional truth, is equivalent to either  $\top$  or  $\bot$ , where ⊥ denotes the propositional falsum. If  $B(\top, \dots, \top) \equiv \top$ , then  $U \vdash B(\Pr_U[C_1(\# \psi)], \dots, \Pr_U[C_n(\# \psi)])$ ; and if  $B(\top, \dots, \top) \equiv \bot$ , then  $U \vdash \neg B(\Pr_U[C_1(\# \psi)], \dots, \Pr_U[C_n(\# \psi)]$ . As a result, we have either  $U \vdash \psi$  or  $U \vdash \neg \psi$ ; thus  $\psi$  is not independent from U.

In both of the above examples, it can be seen that  $U \vdash \neg \mathfrak{P}_U$  and  $U \vdash \neg \mathfrak{R}_U$  hold for the theory  $U = T + \neg \text{Con}_T$ . Thus, for getting independent sentences (of consistent theories) one should go beyond the (pesudo-)Gödelian sentences.

<span id="page-5-0"></span>The T-provability predicate  $Pr_T(x)$  in Convention [1.2](#page-1-1) is usually constructed from a T-*proof predicate*  $\text{prf}_T(y, x)$ , as  $\text{Pr}_T(x) = \exists y \, \text{prf}_T(y, x)$ ; where  $\text{prf}_T(y, x)$  is a  $\Delta_1$ -formula stating that "y is (the Gödel code of) a proof in  $T$  of the formula (coded by)  $x$ ".

**CONVENTION** 3.3: Let us fix a proof predicate of T as the  $\Delta_1$ -formula pr $f_T(y, x)$  that satisfies the following for every sentence  $\varphi$ :

$$
T \vdash \varphi \iff \mathbf{Q} \vdash \text{prf}_{T}(\overline{m}, \#\varphi) \text{ for some } m \in \mathbb{N}.
$$
  
\n
$$
T \nvdash \varphi \iff \mathbf{Q} \vdash \neg \text{prf}_{T}(\overline{n}, \#\varphi) \text{ for every } n \in \mathbb{N}.
$$

<span id="page-5-2"></span>**DEFINITION** 3.4 (Rosserian Provability and Rosserian Sentences): The following  $\Sigma_1$ -formula, with the free variable  $x$ , is the Rosserian Provability predicate of  $T$ :

$$
\text{R.Pr}_T(x)=\exists y\,[\texttt{prf}_T(y,x)\wedge \forall z\!<\!y\,\neg\texttt{prf}_T(z,\neg x)].
$$

A sentence ρ is called a Rosserian sentence of T when we have T ⊢ ρ↔¬R.Pr<sup>T</sup> (#ρ). ⋄

<span id="page-5-1"></span>The independence of the Rosserian sentences (from the theory in question) follows form the following basic properties of the Rosserian provability:

**LEMMA** 3.5: If T is consistent, then for every sentence  $\varphi$  we have

- (1)  $T \vdash \varphi \iff \mathbf{Q} \vdash R.Prr(T \# \varphi).$
- (2)  $T \vdash \neg \varphi \implies Q \vdash \neg R.Prr_T(\#\varphi).$

**PROOF:** For (1) it suffices to note that for a consistent theory T we have:  $T \vdash \varphi$  if and only if the  $\Sigma_1$ sentence R.Pr<sub>T</sub>( $\#\varphi$ ) is true. For (2) suppose that  $T \vdash \neg \varphi$ ; then by Convention [3.3](#page-5-0) for some m we have  $Q \vdash \text{prf}_{T}(\overline{m}, \#[\neg \varphi])$ . Now, reason inside  $Q$ : for any y with  $\text{prf}_{T}(y, \#\varphi)$  we should have  $y > \overline{m}$ , since no  $i \leq \overline{m}$  (which are  $i = 0, \dots, \overline{m}$ ) could satisfy  $\text{prf}_{T}(\overline{i}, \# \varphi)$  by Convention [3.3,](#page-5-0) and so for some  $z < y$ , which is  $z = \overline{m}$ , we have  $\text{prf}_T(z, \#[\neg \varphi])$ . Thus, we have  $\forall y[\text{prf}_T(y, \#\varphi) \rightarrow \exists z < y \text{prf}_T(z, \#[\neg \varphi])]$  or, equivalently,  $\neg \text{R.Pr}_T(\#\varphi).$ 

<span id="page-5-3"></span>Now, we can characterize the independent sentences of  $T$  similarly to Proposition [2.3:](#page-2-2)

**PROPOSITION** 3.6 (Characterizing Independent Sentences): Let  $\varphi$  be a sentence.

The following are equivalent:

(1)  $\varphi$  is independent from T, i.e.,  $T \nvdash \varphi$  and  $T \nvdash \neg \varphi$ ;

(2)  $\varphi$  is a Rosserian sentence of some consistent extension U of T;

and are implied by the following:

(3)  $T + [\varphi \leftrightarrow \neg R.Prr(T/\# \varphi)]$  is consistent.

**PROOF:** First we show the equivalence of (1) and (2).

(1⇒2): By Lemma [1.1](#page-1-2) for some sentence  $\xi$  we have  $T \vdash \xi \leftrightarrow [\varphi \leftrightarrow \neg R.Pr_{T+\xi}(\#\varphi)]$ . Let  $U = T + \xi$ ; then  $U \vdash \varphi \leftrightarrow \neg R.Prr_U(\#\varphi)$  which shows that  $\varphi$  is a Rosserian sentence of U. We show that U is consistent. If not, then  $T \vdash \neg \xi$ . Thus,  $(*)$   $T \vdash \neg [\varphi \leftrightarrow \neg R.Pr_U(\#\varphi)]$ . Also,  $U \vdash \varphi$  and  $U \vdash \neg \varphi$ , and so by Convention [3.3](#page-5-0) there are  $m,n\in\mathbb{N}$  such that  $\bm{Q}\vdash \texttt{prf}_U(\overline{m},\#\varphi)$  and  $\bm{Q}\vdash \texttt{prf}_U(\overline{n},\#[\neg\varphi])$ ; we can assume that  $m$  and  $n$  are the least such numbers.

(i) If  $m \le n$ , then  $\mathbf{Q} \vdash \text{prf}_U(\overline{m}, \#\varphi) \wedge \forall z < \overline{m} \neg \text{prf}_U(z, \#[\neg \varphi])$  and so  $\mathbf{Q} \vdash R.Pr_U(\#\varphi)$ , which implies by (\*) that  $T \vdash \varphi$ ; contradicting (1).

(ii) If  $n < m$ , then  $\mathbf{Q} \vdash \forall y [\text{prf}_U(y, \#\varphi) \rightarrow y \geq \overline{m} \rightarrow \exists z < y \text{prf}_U(z, \#[\neg \varphi])]$ , since one can take  $z = n$ , and so  $Q \vdash \neg R.Pr_U(\#\varphi)$ , which implies by (\*) that  $T \vdash \neg \varphi$ ; contradicting (1) again.

So, U must be consistent.

 $(2\Rightarrow 1)$ : It suffices to show that  $\varphi$  is independent from U. If  $U \vdash \rho$ , then we should have on the one hand  $U \vdash R.Pr_U(\# \rho)$  by Lemma [3.5\(](#page-5-1)1), and on the other hand  $U \vdash \neg R.Pr_U(\# \rho)$  by Definition [3.4;](#page-5-2) thus, U could not be consistent. Also  $U \vdash \neg \rho$  would imply on the one hand  $U \vdash \neg R.Prr_U(\# \rho)$  by Lemma [3.5\(](#page-5-1)2), and on the other hand  $U \vdash R.Prr_U(\# \rho)$  by Definition [3.4;](#page-5-2) contradicting U's consistency again.

Now, we show that  $(3)$  implies  $(1)$ ; and so  $(2)$  too.

 $(3\Rightarrow 1)$ : Note that the theory T is consistent by the assumption. If  $T \vdash \varphi$ , then by Lemma [3.5\(](#page-5-1)1) we would have  $T \vdash R.Prr(\#\varphi)$ , and so  $T \vdash \neg [\varphi \leftrightarrow \neg R.Prr(\#\varphi)]$ . If  $T \vdash \neg \varphi$ , then Lemma [3.5\(](#page-5-1)2) would imply that  $T \vdash \neg R.Prr_T(\#\varphi)$ , and so we would have  $T \vdash \neg [\varphi \leftrightarrow \neg R.Prr_T(\#\varphi)]$  again.

**REMARK** 3.7 (Löb-Like Rule for Rosserian Provability): Let us note that the contraposition of the impli-cation (1⇒3) in Proposition [3.6](#page-5-3) says that if  $T \vdash \varphi \leftrightarrow R.Pr_{T}(\#\varphi)$ , i.e., if  $\varphi$  is a Rosser-type Henkin sentence so called by Kurahashi (in [\[11\]](#page-8-5)), then  $\varphi$  is not independent from T. Actually, it is shown in [11] that there are *standard* proof predicates  $\text{prf}'_T(y, x)$  which have independent Rosser-type Henkin sentences, and there are standard proof predicates  $\text{prf}''_T(y, x)$  none of whose Rosser-type Henkin sentences are independent. The latter proof predicates satisfy  $(1 \Rightarrow 3)$  in Proposition [3.6](#page-5-3) and satisfy a Löb-like rule for Rosserian provability; while the former ones do not satisfy  $(1\Rightarrow 3)$  in Proposition [3.6,](#page-5-3) and do not satisfy any Löb-like rule for Rosserian provability. So, the implication  $(1 \Rightarrow 3)$  in Proposition [3.6](#page-5-3) depends on the proof predicate  $\text{prf}_T(y, x)$ , and is not robust.  $\Diamond$ 

Unlike Gödelian  $\Pi_1$ -sentences, all the Rosserian  $\Pi_1$ -sentences of consistent theories are true, and like Gödelian  $\Sigma_1$ -sentence, all of their Rosserian  $\Sigma_1$ -sentences are false:

**THEOREM** 3.8 (On the Truth of the Rosserian  $\Pi_1, \Sigma_1$ -Sentences): Every Rosserian  $\Pi_1$ -sentence of T is true, and every Rosserian  $\Sigma_1$ -sentence of T is false, if T is consistent.

**PROOF:** If a Rosserian  $\Pi_1$ -sentence were false, then its negation would be a true  $\Sigma_1$ -sentence, and so would be provable in the theory *Q*; contradicting Rosser's theorem on the independence of Rosserian sentences (Proposition [3.6\)](#page-5-3). If a Rosserian  $\Sigma_1$ -sentence were true, then it would be provable in the theory  $Q$ ; contradicting the unprovability of Rosserian sentences.  $QED$ 

However, for  $n \geq 1$ , the truth of all the Gödelian  $\Pi_{n+1}$ -sentences is equivalent to the truth of all the Rosserian  $\Pi_{n+1}$ -sentences; and the truth of all the Gödelian  $\Sigma_{n+1}$ -sentences is equivalent to the truth of all the Rosserian  $\Sigma_{n+1}$ -sentences:

**THEOREM** 3.9 (On the Truth of the Rosserian  $\Pi_{n+1}, \Sigma_{n+1}$ -Sentences): Fix  $n \geq 1$ .

All the Rosserian  $\Pi_{n+1}$ -sentences of T are true if and only if T is  $\Pi_{n+1}$ -sound.

All the Rosserian  $\Sigma_{n+1}$ -sentences of T are true if and only if T is  $\Sigma_{n+1}$ -sound.

**PROOF:** This can be proved in the same lines of the proof of Theorem [2.8](#page-3-1) by using Lemma [3.5](#page-5-1) (instead of Lemma [2.2\)](#page-2-0) which implies that R.Pr<sub>T</sub> ( $\# \rho$ ) is a false  $\Sigma_1$ -sentence when  $\rho$  is a Rosserian sentence of consistent theory  $T$ .

Whence, all the Rosserian sentences of T are true if and only if T is sound; cf. [\[27,](#page-9-5) Theorem 24.7.].

# **4 Conclusions.**

The first one who talked about the truth of Gödelian sentences was Gödel himself [\[5\]](#page-8-0). This turned into a serious debate with [\[6\]](#page-8-6) in which (what we call now) the *Godel Disjunction* was announced; see [\[4\]](#page-8-7) and [\[7\]](#page-8-8) and the references therein. The so called *Anti-Mechanism Thesis*, or the *Lucas-Penrose Argument*, started with [\[13\]](#page-8-9) and popularized by [\[16\]](#page-9-7); see also [\[15\]](#page-8-10) and [\[20\]](#page-9-8). After that, there has been a large discussion on the truth of Gödelian sentences; see e.g. [\[3\]](#page-8-11), [\[28\]](#page-9-2), [\[1\]](#page-8-12), [\[26\]](#page-9-9), [\[30\]](#page-9-10), [\[21\]](#page-9-11), [\[17\]](#page-9-4), [\[14\]](#page-8-13), [\[25\]](#page-9-12), [\[8\]](#page-8-3), [\[2\]](#page-8-14), [\[18\]](#page-9-13) and [\[19\]](#page-9-14). As shown above, the consistency of a theory need not imply the truth of (all of) its Gödelian ( $\Pi_1$ -)sentences; but does imply the truth of its all Rosserian  $\Pi_1$ -sentences. One wonders why the proponents of the anti-mechanism thesis have not used the Rosserian  $(\Pi_1$ -)sentences for their reasoning; since the truth of those sentences are straightforward (and immediately follows from the consistency of the theory). Though, the opponents have argued that actually for "seeing" the truth of Gödelian  $(\Pi_1$ -)sentences one should "see" (at least) the consistency of the theory (and indeed, more than that). Our old and new results are summarized in the following diagram; note that the conditions get (strictly) stronger from bottom to top.

> $Soundness \equiv Truth \overline{of} Gödelian$  and Rosserian Sentences . . .  $\Sigma_{n+1}$  ( $\Pi_{n+2}$ ) Soundness  $\equiv$  Truth of Gödelian, Rosserian  $\Sigma_{n+1}$ ,  $\Pi_{n+2}$  Sentences . . .  $\Sigma_2$  ( $\Pi_3$ ) Soundness  $\equiv$  Truth of Gödelian, Rosserian  $\Sigma_2$ ,  $\Pi_3$  Sentences  $\Sigma_1$  ( $\Pi_2$ ) Soundness  $\equiv$  Truth of Gödelian, Rosserian  $\Pi_2$  Sentences Consistency of  $T + Con_T \equiv$  Truth of Gödelian  $\Pi_1$  Sentences Consistency ( $\Pi_1$  Soundness)  $\equiv$  Truth of Rosserian  $\Pi_1$  Sentences . Consistency ( $\Pi_1$  Soundness)  $\equiv$  Falsity of Gödelian, Rosserian  $\Sigma_1$  Sentences
