# FREIMAN COVER IDEALS OF UNMIXED BIPARTITE GRAPHS 

GUANGJUN ZHU*, YAKUN ZHAO AND YIJUN CUI

#### Abstract

An equigenerated monomial ideal $I$ in the polynomial ring $R=$ $k\left[z_{1}, \ldots, z_{n}\right]$ is a Freiman ideal if $\mu\left(I^{2}\right)=\ell(I) \mu(I)-\binom{\ell(I)}{2}$ where $\ell(I)$ is the analytic spread of $I$ and $\mu(I)$ is the number of minimal generators of $I$. In this paper we classify all simple connected unmixed bipartite graphs whose cover ideals are Freiman ideals.

## Introduction

Let $I$ be a monomial ideal in the polynomial ring $R=k\left[z_{1}, \ldots, z_{n}\right]$ over a field $k$. Let $\mu(I)$ denote the least number of generators of $I$. It is a very difficult problem to exactly compute $\mu\left(I^{k}\right)$ for each integer $k \geq 2$. If $I$ is generated by a regular sequence and $\mu(I)=m$, it is well known that $\mu\left(I^{k}\right)=\binom{k+m-1}{m-1}$, which is the maximal that $\mu\left(I^{k}\right)$ can reach. At the other extreme, Eliahou et. al. 5] constructed ideals of height 2 in $k[x, y]$ such that $\mu\left(I^{2}\right)=9$ and $\mu(I)=m$, where $m \geq 6$ can be any integer.

As a consequence of a well known theorem from additive number theory, due to Freiman [6], Herzog et. al. showed in [11, Theorem 1.8] that if $I$ is an equigenerated monomial ideal, that is, all its generators are of the same degree, then $\mu\left(I^{2}\right) \geq$ $\ell(I) \mu(I)-\binom{\ell(I)}{2}$, where $\ell(I)$ is the analytic spread of $I$. If the equality holds, then Herzog and Zhu [12] called this ideal $I$ to be a Freiman ideal (or simply Freiman). Herzog et. al. provided in [10, Theorem 2.3] several equivalent conditions for an equigenerated monomial ideal $I$ to be a Freiman ideal. For example, they show that $I$ is Freiman if and only if $\mu\left(I^{k}\right)=\binom{\ell(I)+k-2}{k-1} \mu(I)-(k-1)\binom{\ell(I)+k-2}{k}$ for some $k \geq 2$ if and only if the fiber cone $F(I)$ of $I$ has minimal multiplicity if and only if $F(I)$ is Cohen-Macaulay and its defining ideal has a 2-linear resolution. It is a very restrictive condition for ideals arising from combinatorial structures, which often guarantees strong combinatorial properties.

Freiman ideals in the classes of principal Borel ideals, Hibi ideals, Veronese type ideals, matroid ideals, sortable ideals, edge ideals of graphs, and cover ideals of some classes of graphs such as trees, circulant graphs, and whiskered graphs have been studied (see [4, 10, 12, 13]).

The purpose of this paper is to give a full classification of Freiman ideals for cover ideals of all connected unmixed bipartite graphs.

[^0]Let $[n]$ denote the set $\{1, \ldots, n\}$. Thanks to this fact, let $G$ be an unmixed bipartite graph on the vertex set $V(G)=\left\{x_{1}, \ldots, x_{n}\right\} \cup\left\{y_{1}, \ldots, y_{n}\right\}$, then each of its minimal vertex covers has the form $\left\{x_{i_{1}}, \ldots, x_{i_{s}}, y_{i_{s+1}}, \ldots, y_{i_{n}}\right\}$, where $\left\{i_{1}, \ldots, i_{n}\right\}=$ $[n]$. Therefore, the set

$$
\mathcal{L}_{G}=\left\{C \cap\left\{x_{1}, \ldots, x_{n}\right\} \mid C \text { is a minimal vertex cover of } G\right\}
$$

is a sublattice of the Boolean lattice $\mathcal{L}_{n}$ on $P_{n}=\left\{p_{1}, \ldots, p_{n}\right\}$ such that $\emptyset \in \mathcal{L}_{G}$ and $P_{n} \in \mathcal{L}_{G}$. In section 2 , we associated the lattice $\mathcal{L}_{G}$ with its Hibi ideal $H_{\mathcal{L}_{G}}$, which is exactly the cover ideal of $G$, and show that the result as follows

Theorem 0.1. Let $G$ be a connected unmixed bipartite graph on the vertex set $V_{n}=\left\{x_{1}, \ldots, x_{n}\right\} \cup\left\{y_{1}, \ldots, y_{n}\right\}$, then $H_{\mathcal{L}_{G}}$ is Freiman if and only if $G$ is an almost complete $C$-M bipartite graph, or there exist some complete bipartite subgraphs $K_{m_{1}, m_{1}}, \ldots, K_{m_{s}, m_{s}}$ of $G$ such that the induced graph of $G$ on $V_{n} \backslash\left(\bigcup_{i=1}^{s} V_{m_{i}-1}\right)$ is an almost complete $C$-M bipartite graph, where $V_{m_{i}}=\left\{x_{i 1}, \ldots, x_{i m_{i}}\right\} \cup\left\{y_{i 1}, \ldots, y_{i m_{i}}\right\}$ is the vertex set of $K_{m_{i}, m_{i}}$ for any $i \in[s]$.

We greatfully acknowledge the use of the computer algebra system CoCoA ([3]) for our experiments.

## 1. Preliminaries

In this section, we gather together the needed definitions and basic facts, which will be used throughout this paper. However, for more details, we refer the reader to [2, 7, 12, 10, 14].

Let $G$ be a simple (i.e., finite, undirected, loopless and without multiple edges) graph with the vertex set $V(G)$ and the edge set $E(G)$. Throughout this paper, we assume that $G$ is connected without isolated vertices. A vertex cover of $G$ is a subset $C \subset V(G)$ such that each edge has at least one vertex in $C$. Such a vertex cover $C$ is called minimal if no subset $C^{\prime} \subsetneq C$ is a vertex cover of $G$. The graph $G$ is unmixed (also called well-covered) if all minimal vertex covers of $G$ have the same cardinality. The graph $G$ is called bipartite if there are two disjoint subsets $W, W^{\prime} \subset V(G)$ such that $V(G)=W \cup W^{\prime}$, and $E(G) \subseteq W \times W^{\prime}$.

As stated before, if $G$ is an unmixed bipartite graph on the vertex set $V(G)=$ $\left\{x_{1}, \ldots, x_{n}\right\} \cup\left\{y_{1}, \ldots, y_{n}\right\}$, then each of its minimal vertex covers has the form $\left\{x_{i_{1}}, \ldots, x_{i_{s}}, y_{i_{s+1}}, \ldots, y_{i_{n}}\right\}$, where $\left\{i_{1}, \ldots, i_{n}\right\}=[n]$. It is shown in [9] that the set

$$
\mathcal{L}_{G}=\left\{C \cap\left\{x_{1}, \ldots, x_{n}\right\} \mid C \text { is a minimal vertex cover of } G\right\}
$$

is a sublattice of the Boolean lattice $\mathcal{L}_{n}$ on $P_{n}=\left\{p_{1}, \ldots, p_{n}\right\}$ such that $\emptyset \in \mathcal{L}_{G}$ and $P_{n} \in \mathcal{L}_{G}$, and for any sublattice $\mathcal{L}$ of $\mathcal{L}_{n}$ such that $\emptyset \in \mathcal{L}$ and $P_{n} \in \mathcal{L}$, there exists an unmixed bipartite graph $G$ such that $\mathcal{L}=\mathcal{L}_{G}$. Attached to this lattice $\mathcal{L}_{G}$ is a monomial ideal $H_{\mathcal{L}_{G}}$ in the polynomial ring $S=k\left[x_{1}, \ldots, x_{n}, y_{1}, \ldots, y_{n}\right]$, this ideal is called the Hibi ideal of $\mathcal{L}_{G}$. To define $H_{\mathcal{L}_{G}}$, let $\mathcal{J}\left(P_{n}\right)$ be the set of poset ideals
of $P_{n}$. Recall that a subset $J \subset P_{n}$ is called a poset ideal of $P_{n}$, if for all $p \in J$ with $q \in P_{n}$ and $q \leq p$, it follows that $q \in J$. Now $H_{\mathcal{L}_{G}}$ is defined as follows:

$$
H_{\mathcal{L}_{G}}=\left(\left\{u_{J}\right\}_{J \in \mathcal{J}\left(P_{n}\right)}\right), \quad \text { where } u_{J}=\left(\prod_{p \in J} x_{p}\right)\left(\prod_{p \in P_{n} \backslash J} y_{p}\right) .
$$

The ideal

$$
I(G)=\left(x_{i} y_{j} \mid\left\{x_{i}, y_{j}\right\} \in E(G)\right)
$$

is called the edge ideal of $G$. Note that $H_{\mathcal{L}_{G}}$ is the Alexander dual of $I(G)$ and actually the cover ideal of $G$. Since each $u_{J}$ is a squarefree monomial of degree $n$, and $H_{\mathcal{L}_{G}}$ is an equigenerated monomial ideal.

We say that a simple graph $G$ is Cohen-Macaulay (C-M for short) if the quotient ring $R / I(G)$ is Cohen-Macaulay. Observe that if $G$ is C-M then $G$ is unmixed by [1]. A graph theoretical characterization of C-M bipartite graphs was given in 8] and that of unmixed bipartite graphs was given in [15].

Lemma 1.1. ([8, Theorem 3.4]) Let $G$ be a bipartite graph with the bipartition of its vertices $V(G)=\left\{x_{1}, \ldots, x_{m}\right\} \cup\left\{y_{1}, \ldots, y_{n}\right\}$. Then $G$ is $C-M$ if and only if $n=m$, and there is a labeling such that
(i) $\left\{x_{i}, y_{i}\right\} \in E(G)$ for all $i \in[n]$;
(ii) If $\left\{x_{i}, y_{j}\right\} \in E(G)$, then $i \leq j$;
(iii) If $\left\{x_{i}, y_{j}\right\},\left\{x_{j}, y_{k}\right\} \in E(G)$ with $i<j<k$, then $\left\{x_{i}, y_{k}\right\} \in E(G)$.

Lemma 1.2. ([15, Theorem 1.1]) Let $G$ be a bipartite graph. Then $G$ is unmixed if and only if there is a bipartition $V(G)=\left\{x_{1}, \ldots, x_{n}\right\} \cup\left\{y_{1}, \ldots, y_{n}\right\}$ such that
(i) $\left\{x_{i}, y_{i}\right\} \in E(G)$ for all $i \in[n]$;
(ii) If $\left\{x_{i}, y_{j}\right\},\left\{x_{j}, y_{k}\right\} \in E(G)$ for distinct $i, j, k \in[n]$, then $\left\{x_{i}, y_{k}\right\} \in E(G)$.

Definition 1.3. A bipartite graph $G$ is called complete $C-M$ if there exists a bipartition of $V(G)=\left\{x_{1}, \ldots, x_{n}\right\} \cup\left\{y_{1}, \ldots, y_{n}\right\}$ such that, for any $i, j \in[n],\left\{x_{i}, y_{j}\right\} \in$ $E(G)$ if and only if $i \leq j$.

Let $\left(P_{n}, \leq\right)$ be a finite poset with $P_{n}=\left\{p_{1}, \ldots, p_{n}\right\}$. We write $G\left(P_{n}\right)$ for the bipartite graph on the set $V_{n}=W \cup W^{\prime}$, where $W=\left\{x_{1}, \ldots, x_{n}\right\}$ and $W^{\prime}=$ $\left\{y_{1}, \ldots, y_{n}\right\}$, whose edges are those $\left\{x_{i}, y_{j}\right\}$ such that $p_{i} \leq p_{j}$. A bipartite graph $G$ on $V_{n}=W \cup W^{\prime}$ is said to come from a poset, if there exists a finite poset $P_{n}$ on $\left\{p_{1}, \ldots, p_{n}\right\}$ such that $p_{i} \leq p_{j}$ implies $\left\{x_{i}, y_{j}\right\} \in E(G)$, and after relabeling of the vertices of $G$ one has $G=G\left(P_{n}\right)$. Herzog and Hibi in [8] proved that a bipartite graph $G$ is C-M if and only if $G$ comes from a poset.

Remark 1.4. A complete $C$ - $M$ bipartite graph $G$ is connected and a $C$-M bipartite graph, hence it is also an unmixed bipartite graph. It follows that $G$ comes from a poset.

A poset $P$ is called a chain if it is totally ordered, that is if any two elements of $P$ are comparable.
Theorem 1.5. Let $G$ be an unmixed bipartite graph, which comes from a poset $P_{n}$. Then $G$ is a complete $C$-M bipartite graph if and only if $P_{n}$ is a chain.

Proof. Let $\left(P_{n}, \leq\right)$ be a poset on $P_{n}=\left\{p_{1}, \ldots, p_{n}\right\}$ such that $p_{i} \leq p_{j}$ implies $i \leq j$, and $G=G\left(P_{n}\right)$. For any $i, j \in[n]$ with $i \leq j$, we obtain by Definition 1.3 that $G$ is a complete C-M bipartite graph if and only if $\left\{x_{i}, y_{j}\right\} \in E(G)$ if and only if $p_{i} \leq p_{j}$, as desired.

Theorem 1.6. Let $G$ be a C-M bipartite graph on the vertex set $V(G)=\left\{x_{1}, \ldots, x_{n}\right\}$ $\cup\left\{y_{1}, \ldots, y_{n}\right\}$, and $H_{\mathcal{L}_{G}}$ the Hibi ideal of $G$. Then $H_{\mathcal{L}_{G}}$ is Freiman if and only if the induced subgraph of $G$ on $V(G) \backslash\left\{x_{i}, y_{i}\right\}$ is a complete $C$-M bipartite graph for some $i \in[n]$.

Proof. Let $\left(P_{n}, \leq\right)$ be a poset on $P_{n}=\left\{p_{1}, \ldots, p_{n}\right\}$ and $G=G\left(P_{n}\right)$ comes from the poset $P_{n}$. It follows from [12, Theorem 4.4] that $H_{\mathcal{L}_{G}}$ is Freiman if and only if there exist some $i \in[n]$ such that the subposet $P_{n} \backslash\left\{p_{i}\right\}$ is a chain. Let $H$ be the induced subgraph of $G$ on $V(G) \backslash\left\{x_{i}, y_{i}\right\}$. Then $H$ comes from the subposet $P_{n} \backslash\left\{p_{i}\right\}$. Indeed, let $p_{k}, p_{\ell} \in P_{n} \backslash\left\{p_{i}\right\}$ such that $p_{k} \leq p_{\ell}$, it is obvious that $k, \ell \notin\{i\}$ and $p_{k} \leq p_{\ell}$ in $P_{n}$. It implies that $\left\{x_{k}, y_{\ell}\right\} \in E(G)$ and $k, \ell \notin\{i\}$. Hence $\left\{x_{k}, y_{\ell}\right\} \in E(H)$. The desired results from Theorem 1.5.

A typical example of a Freiman cover ideal of an unmixed bipartite graph is shown in Figure 1.

Figure 4

## 2. UNMIXED BIPARTITE GRAPHS

A bipartite graph is called complete if its two vertices are adjacent if and only if they are in different partite sets. The complete bipartite graph with partite sets of size $m$ and $n$ is denoted $K_{m, n}$.

Theorem 2.1. Let $G$ be an unmixed bipartite graph on the vertex set $V_{n}=\left\{x_{1}, \ldots, x_{n}\right\} \cup$ $\left\{y_{1}, \ldots, y_{n}\right\}$. Then the following conditions are equivalent:
(i) $G$ is $C$ - $M$;
(ii) Any complete bipartite graph $K_{m, m}$ with the vertex set $\left\{x_{i_{1}}, \ldots, x_{i_{m}}\right\} \cup\left\{y_{i_{1}}, \ldots\right.$, $\left.y_{i_{m}}\right\}$ cannot be an induced subgraph of $G$, where $m \geq 2$ and $\left\{i_{1}, \ldots, i_{m}\right\} \subset[n]$;
(3) Any complete bipartite graph $K_{2,2}$ with the vertex set $\left\{x_{i}, x_{j}\right\} \cup\left\{y_{i}, y_{j}\right\}$ cannot be an induced subgraph of $G$, where $\{i, j\} \subset[n]$.
Proof. (1) $\Rightarrow(2)$ follows from (ii) of Lemma 1.1, and (2) $\Rightarrow(3)$ is trivial.
$(3) \Rightarrow(1)$. We only need to find a finite poset $P_{n}$ such that $G=G\left(P_{n}\right)$ comes from this poset. Let $P_{n}=\left\{p_{1}, \ldots, p_{n}\right\}$ and $\leq$ denote the binary relation on $P_{n}$ defined by setting $p_{i} \leq p_{j}$ if and only if $\left\{x_{i}, y_{j}\right\} \in E(G)$. Lemma 1.2 implies that $p_{i} \leq p_{i}$ for any $i \in[n]$, and if $p_{i} \leq p_{j}$ and $p_{j} \leq p_{k}$ for any $i, j, k \in[n]$, then $p_{i} \leq p_{k}$. Let $p_{i} \leq p_{j}$ and $p_{j} \leq p_{i}$ for any $i, j \in[n]$, then $i=j$. Otherwise, the complete bipartite graph $K_{2,2}$ on the vertex set $\left\{x_{i}, x_{j}\right\} \cup\left\{y_{i}, y_{j}\right\}$ is an induced subgraph of $G$, a contradiction. Thus $\leq$ is a partial order on $P_{n}$ and $G=G\left(P_{n}\right)$ comes from the poset $P_{n}$ by [8, Lemma 3.1]. Hence $G$ is C-M, as desired.
Theorem 2.2. Let $G$ be an unmixed bipartite graph on the vertex set $V_{n}=\left\{x_{1}, \ldots, x_{n}\right\}$ $\cup\left\{y_{1}, \ldots, y_{n}\right\}$. Suppose that $G$ has an induced subgraph $K_{m, m}(m \geq 2)$, with the vertex set $V_{m}=\left\{x_{i_{1}}, \ldots, x_{i_{m}}\right\} \cup\left\{y_{i_{1}}, \ldots, y_{i_{m}}\right\}$. Let $H$ be the subgraph of $G$ induced by the subset $V_{n} \backslash V_{m-1}$, where $V_{m-1}=\left\{x_{i_{1}}, \ldots, x_{i_{m-1}}\right\} \cup\left\{y_{i_{1}}, \ldots, y_{i_{m-1}}\right\}$. Then there exists a one-to-one correspondence between the sets $\mathcal{M}(G)$, respectively $\mathcal{M}(H)$, of minimal vertex covers of $G$, respectively $H$. More precisely, for all subsets $C \in V_{n} \backslash V_{m-1}$, we have
(i) If $x_{i_{m}} \in C$, then $C \in \mathcal{M}(H) \Leftrightarrow C \cup\left\{x_{i_{1}}, \ldots, x_{i_{m}}\right\} \in \mathcal{M}(G)$;
(ii) If $x_{i_{m}} \notin C$, then $C \in \mathcal{M}(H) \Leftrightarrow C \cup\left\{y_{i_{1}}, \ldots, y_{i_{m}}\right\} \in \mathcal{M}(G)$.

Proof. $(\Rightarrow)$ Let $x_{i_{m}} \in C$, put $B=C \cup\left\{x_{i_{1}}, \ldots, x_{i_{m}}\right\}$. We show that $B \in \mathcal{M}(G)$. We distinguish into the following three cases:
(1) For any $\left\{x_{k}, y_{\ell}\right\} \in E(H)$, we have $C \cap\left\{x_{k}, y_{\ell}\right\} \neq \emptyset$ since $C \in \mathcal{M}(H)$. In particular, $B \cap\left\{x_{k}, y_{\ell}\right\} \neq \emptyset$.
(2) For any $\left\{x_{i_{k}}, y_{\ell}\right\} \in E(G)$ with $k \in[m]$, we have $x_{i_{k}} \in B \cap\left\{x_{i_{k}}, y_{\ell}\right\}$.
(3) For any $\left\{x_{i_{k}}, y_{i_{\ell}}\right\} \in E(G)$ with $\ell \in[m-1]$ and $k \notin[m]$. By Lemma 1.2 (ii), we obtain that $\left\{x_{i_{k}}, y_{i_{m}}\right\} \in E(G)$ since $\left\{x_{i_{\ell}}, y_{i_{m}}\right\} \in E(G)$. Hence $\left\{x_{i_{k}}, y_{i_{m}}\right\} \in E(H)$, it implies $C \cap\left\{x_{i_{k}}, y_{i_{m}}\right\} \neq \emptyset$.

Note that $\left|C \cap\left\{x_{i_{m}}, y_{i_{m}}\right\}\right|=1$, we have $y_{i_{m}} \notin C$ because of $x_{i_{m}} \in C$. It follows that $x_{i_{k}} \in C$. Thus $B \cap\left\{x_{i_{k}}, y_{i_{m}}\right\}=\left\{x_{i_{k}}\right\}$ and $B \in \mathcal{M}(G)$.

If $x_{i_{m}} \notin C$, then $y_{i_{m}} \in C$. Put $B=C \cup\left\{y_{i_{1}}, \ldots, y_{i_{m}}\right\}$. By similar arguments as above, we can show that $B \in \mathcal{M}(G)$.
$(\Leftarrow)$ Let $B=C \cup\left\{x_{i_{1}}, \ldots, x_{i_{m}}\right\}$ and $B \in \mathcal{M}(G)$. Then $\left|B \cap\left\{x_{i_{\ell}}, y_{i_{\ell}}\right\}\right|=1$ for any $\ell \in[m-1]$. This implies that either $B \cap\left\{x_{i_{\ell}}, y_{i_{\ell}}\right\}=\left\{x_{i_{\ell}}\right\}$ or $B \cap\left\{x_{i_{\ell}}, y_{i_{\ell}}\right\}=\left\{y_{i_{\ell}}\right\}$. If $B \cap\left\{x_{i_{\ell}}, y_{i_{\ell}}\right\}=\left\{x_{i_{\ell}}\right\}$, then $y_{i_{\ell}} \notin B$, it means that $B \cap\left\{x_{i_{m}}, y_{i_{\ell}}\right\}=\left\{x_{i_{m}}\right\}$ because of $\left\{x_{i_{m}}, y_{i_{\ell}}\right\} \in E(G)$. Set $C=B \backslash\left\{x_{i_{1}}, \ldots, x_{i_{m-1}}\right\}$. Then $B \cap\left\{x_{k}, y_{l}\right\} \neq \emptyset$ for any $\left\{x_{k}, y_{l}\right\} \in E(H)$, and $B \cap\left\{x_{k}, y_{l}\right\} \subset C$. Hence $C$ is a vertex cover of $H$. Since $|C|=|B|-(m-1)=n-m+1$, we get $C \in \mathcal{M}(H)$. If $B \cap\left\{x_{i_{\ell}}, y_{i_{\ell}}\right\}=\left\{y_{i_{\ell}}\right\}$, then $x_{i_{\ell}} \notin B$ and $C=B \backslash\left\{y_{i_{1}}, \ldots, y_{i_{m-1}}\right\} \in \mathcal{M}(H)$.

For every monomial $z^{a_{1}} \cdots z^{a_{n}} \in R$, we write $Z^{\mathbf{a}}$ for $z^{a_{1}} \cdots z^{a_{n}}$, where $\mathbf{a}=$ $\left(a_{1}, \ldots, a_{n}\right)$ with $a_{i} \geq 0$ for any $i \in[n]$. We call a to be the exponential vector of $z^{\mathrm{a}}$. Let $\mathcal{G}(I)$ denote the unique minimal set of monomial generators of a monomial ideal.

Lemma 2.3. ([1, Lemma 10.3.19]) Let $I \subset R$ be a monomial ideal generated in a single degree with $\mathcal{G}(I)=\left\{z^{\mathbf{a}_{\mathbf{1}}}, \ldots, z^{\mathbf{a}_{\mathbf{m}}}\right\}$, and let $A$ be the $m \times n$ matrix whose rows are the vectors $\left\{\mathbf{a}_{\mathbf{1}}, \ldots, \mathbf{a}_{\mathbf{m}}\right\}$. Then $\ell(I)=\operatorname{rank}(A)$.

Now, we are ready to prove major result of this section.
Theorem 2.4. Let $G$ be a connected unmixed bipartite graph on the vertex set $V_{n}=\left\{x_{1}, \ldots, x_{n}\right\} \cup\left\{y_{1}, \ldots, y_{n}\right\}$. Suppose that $G$ has an induced subgraph $K_{m, m}$ $(m \geq 2)$ with the vertex set $V_{m}=\left\{x_{i_{1}}, \ldots, x_{i_{m}}\right\} \cup\left\{y_{i_{1}}, \ldots, y_{i_{m}}\right\}$. Let $H$ be the induced subgraph of $G$ on the subset $V_{n} \backslash V_{m-1}$, where $V_{m-1}=\left\{x_{i_{1}}, \ldots, x_{i_{m-1}}\right\} \cup$ $\left\{y_{i_{1}}, \ldots, y_{i_{m-1}}\right\}$. Let $H_{\mathcal{L}_{G}}$ (resp. $H_{\mathcal{L}_{H}}$ ) be the Hibi ideal of the lattice $\mathcal{L}_{G}$ (resp. $\mathcal{L}_{H}$ ). Then $H_{\mathcal{L}_{G}}$ is Freiman if and only if $H_{\mathcal{L}_{H}}$ is Freiman.

Proof. Without loss of generality, we can assume that $i_{j}=j$ for all $j \in[m]$. By Theorem [2.2, we obtain that generators of $H_{\mathcal{L}_{G}}$ can be obtained from generators of $H_{\mathcal{L}_{H}}$. Therefore, all generators of $H_{\mathcal{L}_{G}}$ are of the form

$$
u_{1} \prod_{i=1}^{m} x_{i}, \ldots, u_{s} \prod_{i=1}^{m} x_{i}, v_{1} \prod_{i=1}^{m} y_{i}, \ldots, v_{t} \prod_{i=1}^{m} y_{i}
$$

where $x_{m} u_{1}, \ldots, x_{m} u_{s}, y_{m} v_{1}, \ldots, y_{m} v_{t}$ are all generators of $H_{\mathcal{L}_{H}}$ and monomials $u_{i}, v_{j} \in$ $K\left[x_{m+1}, \ldots, x_{n}, y_{m+1}, \ldots, y_{n}\right]$ for all $i \in[s], j \in[t]$. It follows that

$$
\begin{equation*}
\mu\left(H_{\mathcal{L}_{G}}\right)=\mu\left(H_{\mathcal{L}_{H}}\right) \tag{1}
\end{equation*}
$$

Now we prove that $\mu\left(H_{\mathcal{L}_{G}}^{2}\right)=\mu\left(H_{\mathcal{L}_{H}}^{2}\right)$. Note that

$$
\begin{aligned}
H_{\mathcal{L}_{G}} & =\left(u_{1} \prod_{i=1}^{m} x_{i}, \ldots, u_{s} \prod_{i=1}^{m} x_{i}, v_{1} \prod_{i=1}^{m} y_{i}, \ldots, v_{t} \prod_{i=1}^{m} y_{i}\right) \\
& =\left(u_{1}, \ldots, u_{s}\right) \prod_{i=1}^{m} x_{i}+\left(v_{1}, \ldots, v_{t}\right) \prod_{i=1}^{m} y_{i}
\end{aligned}
$$

and

$$
\begin{aligned}
H_{\mathcal{L}_{H}} & =\left(x_{m} u_{1}, \ldots, x_{m} u_{s}, y_{m} v_{1}, \ldots, y_{m} v_{t}\right) \\
& =\left(u_{1}, \ldots, u_{s}\right) x_{m}+\left(v_{1}, \ldots, v_{t}\right) y_{m} .
\end{aligned}
$$

It follows that

$$
\begin{aligned}
H_{\mathcal{L}_{G}}^{2} & =\left[\left(u_{1}, \ldots, u_{s}\right) \prod_{i=1}^{m} x_{i}+\left(v_{1}, \ldots, v_{t}\right) \prod_{i=1}^{m} y_{i}\right]^{2} \\
& =\left(u_{1}, \ldots, u_{s}\right)^{2} \prod_{i=1}^{m} x_{i}^{2}+\left(v_{1}, \ldots, v_{t}\right)^{2} \prod_{i=1}^{m} y_{i}^{2}+\left(u_{1}, \ldots, u_{s}\right)\left(v_{1}, \ldots, v_{t}\right) \prod_{i=1}^{m} x_{i} y_{i}
\end{aligned}
$$

and

$$
\begin{aligned}
H_{\mathcal{L}_{H}}^{2} & =\left[\left(u_{1}, \ldots, u_{s}\right) x_{m}+\left(v_{1}, \ldots, v_{t}\right) y_{m}\right]^{2} \\
& =\left(u_{1}, \ldots, u_{s}\right)^{2} x_{m}^{2}+\left(v_{1}, \ldots, v_{t}\right)^{2} y_{m}^{2}+\left(u_{1}, \ldots, u_{s}\right)\left(v_{1}, \ldots, v_{t}\right) x_{m} y_{m}
\end{aligned}
$$

Note that generators of ideals $\left(u_{1}, \ldots, u_{s}\right)^{2} \prod_{i=1}^{m} x_{i}^{2},\left(v_{1}, \ldots, v_{t}\right)^{2} \prod_{i=1}^{m} y_{i}^{2}$ and $\left(u_{1}, \ldots, u_{s}\right)$ $\cdot\left(v_{1}, \ldots, v_{t}\right) \prod_{i=1}^{m} x_{i} y_{i}$ are different from each other, and so are generators of ideals $\left(u_{1}, \ldots, u_{s}\right)^{2} x_{m}^{2},\left(v_{1}, \ldots, v_{t}\right)^{2} y_{m}^{2}$ and $\left(u_{1}, \ldots, u_{s}\right)\left(v_{1}, \ldots, v_{t}\right) x_{m} y_{m}$. Thus we get

$$
\begin{align*}
\mu\left(H_{\mathcal{L}_{G}}^{2}\right) & =\mu\left(\left(u_{1}, \ldots, u_{s}\right)^{2}\right)+\mu\left(\left(v_{1}, \ldots, v_{t}\right)^{2}\right)+\mu\left(\left(u_{1}, \ldots, u_{s}\right)\left(v_{1}, \ldots, v_{t}\right)\right) \\
& =\mu\left(H_{\mathcal{L}_{H}}^{2}\right) . \tag{2}
\end{align*}
$$

By (1) and (2), it is enough to show that $\ell\left(H_{\mathcal{L}_{G}}\right)=\ell\left(H_{\mathcal{L}_{H}}\right)=n-m+2$.
Since $G$ is a connected unmixed bipartite graph and $K_{m, m}$ is its unique induced subgraph, we obtain that $H$ is a C-M bipartite graph on the vertex set $\left\{x_{m}, \ldots, x_{n}\right\} \cup$ $\left\{y_{m}, \ldots, y_{n}\right\}$ by Theorem 2.1 and $H$ is connected. Indeed, there is some edge in $G$ connects a vertex of $V_{m}$ and a vertex of $V_{n} \backslash V_{m}$. Say $x_{k} y_{\ell} \in E(G)$ with $k \in[n] \backslash[m]$ and $\ell \in[m]$. One has $x_{k} y_{m} \in E(H)$. Actually, if $\ell \in[m-1]$, then the desired result from Lemma 1.2 because of $x_{k} y_{\ell} \in E(H)$ and $x_{\ell} y_{m} \in E(H)$. Note that $\left\{y_{m}, \ldots, y_{n}\right\}$ and $\left\{x_{m}, \ldots, x_{j}, y_{j+1}, \ldots, y_{n}\right\}$ are the minimal vertex covers of $H$ for all $m \leq j \leq n$. It follows that

$$
\left\{x_{m} \cdots x_{n}, x_{m} \cdots x_{n-1} y_{n}, \ldots, x_{m} y_{m+1} \cdots y_{n}, y_{m} \cdots y_{n}\right\} \subset \mathcal{G}\left(H_{\mathcal{L}_{H}}\right)
$$

Let $\mathcal{G}\left(H_{\mathcal{L}_{H}}\right)=\left\{X^{\mathbf{b}_{1}}, \ldots, X^{\mathbf{b}_{q}}\right\}$, where $\mathbf{b}_{j}=\left(b_{m j}, \ldots, b_{n j}, 1-b_{m j}, \ldots, 1-b_{n j}\right)$, $b_{i j} \in\{0,1\}, m \leq i \leq n$ and $j \in[q]$, is the exponential vector of monomial $X^{\mathbf{b}_{j}}=x_{m}^{b_{m j}} \cdots x_{n}^{b_{n j}} y_{m}^{1-b_{m j}} \cdots y_{n}^{1-b_{n j}}$, and let $A$ be the $q \times 2(n-m+1)$ matrix whose rows are the vectors $\left\{\mathbf{b}_{\mathbf{1}}, \ldots, \mathbf{b}_{\mathbf{q}}\right\}$. Let $\alpha_{0}=(\underbrace{1, \ldots, 1}_{n-m+1}, 0, \ldots, 0), \alpha_{n-m+1}=$ $(0, \ldots, 0, \underbrace{1, \ldots, 1}_{n-m+1}), \alpha_{i}=(\underbrace{1, \ldots, 1}_{n-m+1-i}, 0, \ldots, 0, \underbrace{1, \ldots, 1}_{i}) \in \mathbb{Z}^{2(n-m+1)}$ for any $i \in[n-m]$, then $\left\{\alpha_{0}, \alpha_{1}, \ldots, \alpha_{n-m+1}\right\} \subset\left\{\mathbf{b}_{\mathbf{1}}, \ldots, \mathbf{b}_{\mathbf{q}}\right\}$. Let $B$ be a matrix whose rows are the vectors $\left\{\alpha_{0}, \alpha_{1}, \ldots, \alpha_{n-m+1}\right\}$. Then $\operatorname{rank}(B)=n-m+2$. This implies that $\operatorname{rank}(A) \geq n-m+2$.

On the other hand, for any $\mathbf{b}_{j} \in\left\{\mathbf{b}_{\mathbf{1}}, \ldots, \mathbf{b}_{\mathbf{q}}\right\}$, we have

$$
\mathbf{b}_{j}=b_{n j} \alpha_{0}+\left(b_{n-1, j}-b_{n j}\right) \alpha_{1}+\cdots+\left(b_{m j}-b_{m+1, j}\right) \alpha_{n-m}+\left(1-b_{m j}\right) \alpha_{n-m+1} .
$$

Therefore, $\operatorname{rank}(A)=n-m+2$.
Let $\mathcal{G}\left(H_{\mathcal{L}_{G}}\right)=\left\{X^{\mathbf{a}_{1}}, \ldots, X^{\mathbf{a}_{q}}\right\}$, where $\mathbf{a}_{j}=\left(a_{1 j}, \ldots, a_{n j}, 1-a_{1 j}, \ldots, 1-a_{n j}\right)$, $a_{i j} \in\{0,1\}, i \in[n]$ and $j \in[q]$, is the exponential vector of $X^{\mathbf{a}_{j}}=x_{1}^{a_{1 j}} \cdots x_{n}^{a_{n j}} y_{1}^{1-a_{1 j}}$ $\cdots y_{n}^{1-a_{n j}}$, and let $D$ be the $q \times 2 n$ matrix whose rows are the vectors $\left\{\mathbf{a}_{\mathbf{1}}, \ldots, \mathbf{a}_{\mathbf{q}}\right\}$. For convenience, we may assume that $x_{m}$ is a factor of $X^{\mathbf{b}_{i}}$ for any $1 \leq i \leq t$ and $y_{m}$ is a factor of $X^{\mathbf{b}_{i}}$ for any $t+1 \leq i \leq n$. By the relationship between generators of ideal $H_{\mathcal{L}_{G}}$ and $H_{\mathcal{L}_{H}}$, we obtain that $\prod_{i=1}^{m} x_{i}$ is a factor of $X^{\mathbf{a}_{i}}$ for any $1 \leq i \leq t$ and $\prod_{i=1}^{m} y_{i}$ is a factor of $X^{\mathbf{a}_{i}}$ for any $t+1 \leq i \leq n$. Thus the $i$-th column of matrix $D$ is a copy of its $m$-th column for $1 \leq i \leq m-1$ and the $j$-th column of matrix $D$ is a copy
of its $(n+m)$-th column for $n+1 \leq j \leq n+m-1$. Therefore, $\operatorname{rank}(D)=\operatorname{rank}(A)$. The desired result from Lemma 2.3.

Theorem 2.5. Let $G$ be a connected unmixed bipartite graph on the vertex set $V_{n}=\left\{x_{1}, \ldots, x_{n}\right\} \cup\left\{y_{1}, \ldots, y_{n}\right\}$. Let $K_{m_{1}, m_{1}}, \ldots, K_{m_{s}, m_{s}}$ be all induced complete bipartite subgraphs of $G$ on the subsets $V_{m_{1}}, \ldots, V_{m_{s}}$ of $V(G)$ respectively, where $m_{i} \geq 2$ for any $i \in[s]$ and $s \geq 1$. Let $V_{m_{i}}=\left\{x_{i 1}, \ldots, x_{i m_{i}}\right\} \cup\left\{y_{i 1}, \ldots, y_{i m_{i}}\right\}$ and $H$ the induced subgraph of $G$ on the subset $V_{n} \backslash\left(\bigcup_{i=1}^{s} V_{m_{i}-1}\right)$. Let $H_{\mathcal{L}_{G}}$ (resp. $\left.H_{\mathcal{L}_{H}}\right)$ be the Hibi ideal of the lattice $\mathcal{L}_{G}$ (resp. $\mathcal{L}_{H}$ ). Then $H_{\mathcal{L}_{G}}$ is Freiman if and only if $H_{\mathcal{L}_{H}}$ is Freiman.

Proof. We apply induction on $s$. The case $s=1$ follows from Theorem [2.4. Now we assume that $s \geq 2$. Let $H^{\prime}$ be the induced subgraph of $G$ on the subset $V_{n} \backslash V_{m_{s}-1}$. Then $H_{\mathcal{L}_{G}}$ is Freiman if and only if $H_{\mathcal{L}_{H^{\prime}}}$ is Freiman by Theorem 2.4. Note that $H^{\prime}$ is a connected unmixed bipartite graph by Theorem 2.2 and similar arguments in the proof of Theorem 2.4. Thus, by induction hypothesis, $H_{\mathcal{L}_{H^{\prime}}}$ is Freiman if and only if $H_{\mathcal{L}_{H}}$ is Freiman. The proof is completed.

Two typical examples of Freiman cover ideals of unmixed bipartite graphs as in Theorem [2.5 are shown in Figure 2 and Figure 3.

Figure 2

Figure 3

For the convenience of the following description, we call the graph $G$ in theorem 1.6 almost complete C-M bipartite graph. An immediate consequence of the above theorem and Theorem is the following corollary.

Corollary 2.6. Let $G$ be a connected unmixed bipartite graph on the vertex set $V_{n}=\left\{x_{1}, \ldots, x_{n}\right\} \cup\left\{y_{1}, \ldots, y_{n}\right\}$. Then $H_{\mathcal{L}_{G}}$ is Freiman if and only if $G$ is an almost complete $C$-M bipartite graph, or there exist some complete bipartite subgraphs $K_{m_{1}, m_{1}}, \ldots, K_{m_{s}, m_{s}}$ of $G$ such that the induced graph of $G$ on $V_{n} \backslash\left(\bigcup_{i=1}^{s} V_{m_{i}-1}\right)$ is an almost complete $C$ - $M$ bipartite graph, where $V_{m_{i}}=\left\{x_{i 1}, \ldots, x_{i m_{i}}\right\} \cup\left\{y_{i 1}, \ldots, y_{i m_{i}}\right\}$ is the vertex set of $K_{m_{i}, m_{i}}$ for any $i \in[s]$.

The following example shows that the cover ideal of the union of two disjoint graphs, whose cover ideals are of Freiman, is not always Freiman ideal.

Example 2.7. Let $H_{\mathcal{L}_{G_{1}}}=\left(x_{1} x_{2}, x_{1} y_{2}, y_{1} y_{2}\right), H_{\mathcal{L}_{G_{2}}}=\left(x_{3} x_{4}, x_{3} y_{4}, y_{3} y_{4}\right)$ and $H_{\mathcal{L}_{G_{1} \cup G_{2}}}$ $=H_{\mathcal{L}_{G_{1}}} H_{\mathcal{L}_{G_{2}}}$ be cover ideals of graphs $G_{1}, G_{2}$ and $G_{1} \sqcup G_{2}$ in Figure 4, respectively. By using CoCoA, we obtain that $H_{\mathcal{L}_{G_{1}}}^{2}=\left(x_{1}^{2} x_{2}^{2}, x_{1}^{2} x_{2} y_{2}, x_{1}^{2} y_{2}^{2}, x_{1} x_{2} y_{1} y_{2}, x_{1} y_{1} y_{2}^{2}, y_{1}^{2} y_{2}^{2}\right)$, $H_{\mathcal{L}_{G_{2}}}^{2}=\left(x_{3}^{2} x_{4}^{2}, x_{3}^{2} x_{4} y_{4}, x_{3}^{2} y_{4}^{2}, x_{3} x_{4} y_{3} y_{4}, x_{3} y_{3} y_{4}^{2}, y_{3}^{2} y_{4}^{2}\right), H_{\mathcal{L}_{G_{1} \cup G_{2}}}^{2}=H_{\mathcal{L}_{G_{1}}}^{2} H_{\mathcal{L}_{G_{2}}}^{2}, \ell\left(H_{\mathcal{L}_{G_{1}}}\right)=$ $\ell\left(H_{\mathcal{L}_{G_{2}}}\right)=3$ and $\ell\left(H_{\mathcal{L}_{G_{1} \cup G_{2}}}\right)=5$. Thus $\mu\left(H_{\mathcal{L}_{G_{i}}}^{2}\right)-\ell\left(H_{\mathcal{L}_{G_{i}}}\right) \mu\left(H_{\mathcal{L}_{G_{i}}}\right)+\binom{\ell\left(H_{\mathcal{L}_{G_{i}}}\right)}{2}=$ $6-3 \times 3+3=0$ for $i=1,2$ and $\mu\left(H_{\mathcal{L}_{G_{1} \cup G_{2}}}^{2}\right)-\ell\left(H_{\mathcal{L}_{G_{1} \cup G_{2}}}\right) \mu\left(H_{\mathcal{L}_{G_{1} \cup G_{2}}}\right)+\left({ }_{2}^{\ell\left(H_{\mathcal{L}_{G_{1}} \cup G_{2}}\right.}\right)=$ $36-5 \times 9+10=1$. Therefore, the cover ideals of graphs $G_{1}$ and $G_{2}$ are Freiman, but the cover ideal of their disjoint union $G_{1} \sqcup G_{2}$ is not Freiman.
