# Two Families of Unravelled Abstract Regular Polytopes in $\mathrm{B}_{n}$ 

Robert Nicolaides and Peter Rowley

2020

#### Abstract

This paper exhibits two families of unravelled abstract regular polytopes in Coxeter groups of type $\mathrm{B}_{n}$. For one family they have rank 4 while the other family has arbitrarily large rank.

## 1 Introduction

Unravelled abstract regular polytopes were first introduced and studied in [4]. In that paper, among other things, certain unravelled polytopes for $\mathrm{SL}_{3}(q) \rtimes\langle t\rangle, t$ being the transpose inverse automorphism of $\mathrm{SL}_{3}(q)$, were analyzed. Here we continue investigating unravelled polytopes this time in Coxeter groups of type $\mathrm{B}_{n}$.

The study of abstract regular polytopes may be carried out entirely in a group theoretic environment. The parallel group theoretic concept is that of a C-string. See [3] for details of this reformulation. For a finite group $G$ and $\left\{t_{1}, \ldots, t_{n}\right\}$ a set of involutions is $G$, set $I=\{1, \ldots, n\}$ and for $J \subseteq I G_{J}=\left\langle t_{j} \mid j \in J\right\rangle$, with $G_{\emptyset}=1$ by convention. If $J=\left\{j_{1}, \ldots, j_{k}\right\}$, then $G_{J}$ is sometimes written as $G_{j_{1} \ldots j_{k}}$. A C-string of rank $n$ for $G$ is a set of involutions $\left\{t_{1}, \ldots, t_{n}\right\}$ in $G$ such that
(i) $G=\left\langle t_{1}, \ldots t_{n}\right\rangle$
(ii) $t_{i}$ and $t_{j}$ commute whenever $|i-j| \geq 2$; and
(iii) for $J, K \subseteq I, G_{J} \cap G_{K}=G_{J \cap K}$.

We can now define unravelled C-strings and unravelled abstract regular polytopes.

Definition 1.1. Suppose $G$ is a finite group with $\left\{t_{1}, \ldots, t_{n}\right\}$ a $C$-string for $G$ of rank $n$.
(i) For $N \unlhd G$, set $\bar{G}=G / N$ and use $\bar{g}$ for the image of $g$ in $\bar{G}, g \in G$. If either $\left|\left\{\overline{t_{1}}, \ldots, \overline{t_{n}}\right\}\right|<n$ or, $\left|\left\{\overline{t_{1}}, \ldots, \overline{t_{n}}\right\}\right|=n$ and $\left\{\overline{t_{1}}, \ldots, \overline{t_{n}}\right\}$ is not a $C$-string for $\bar{G}$, we say that $\left\{t_{1}, \ldots, t_{n}\right\}$ is an $N$-unravelled $C$-string for $G$.
(ii) If $\left\{t_{1}, \ldots, t_{n}\right\}$ is an $N$-unravelled $C$-string for all non-trivial proper normal subgroups $N$ of $G$, we call $\left\{t_{1}, \ldots, t_{n}\right\}$ an unravelled $C$-string for $G$, and refer to the associated abstract regular polytope as being unravelled.

Our first theorem, just as for those on $\mathrm{SL}_{3}(q) \rtimes\langle t\rangle$, yields unravelled C-strings of rank 4.

Theorem 1.2. Suppose that $G=\mathrm{B}_{n}$ where $n$ is odd and $n \geq 5$. Then $G$ has a rank 4 C-string $\left\{t_{1}, t_{2}, t_{3}, t_{4}\right\}$ with Schlafi symbol

which is unravelled when $n>5$. Further $G_{123} \cong \operatorname{Sym}(n)$ and $G_{234} \cong \mathbb{Z}_{2} \times \operatorname{Sym}(5)$.
Our second theorem, by contrast, gives examples in $B_{n}$ of arbitrary large rank.
Theorem 1.3. Suppose that $G=\mathrm{B}_{n}$ where $n \geq 8$, and set $m=n-4$. Then $G$ has a rank $m C$-string $\left\{t_{1}, t_{2}, \ldots, t_{m}\right\}$ with Schlafti symbol

Further, when $n$ is even, this $C$-string is unravelled.
The proofs of Theorems 1.2 and 1.3 occupy Sections 3 and 4 respectively, while in Section 2 we cover preliminary results for these proofs.

## 2 Preliminary Results

This short section contains the results we need in the two following sections. First of these results is one which identifies the Coxeter groups of type $\mathrm{B}_{n}$. For a set $\Omega=\{1, \ldots, n\}, \operatorname{Sym}(n)=\operatorname{Sym}(\Omega)$ denotes the symmetric group of degree $n$ defined on $\Omega$.

Lemma 2.1. Suppose that $\Omega=\{1,2 \ldots, n, n+1, \ldots, 2 n\}$. Let $\beta_{0}=(1, n+1)$ and $\beta_{i}=(i, i+1)(n+i, n+i+1)$ for $1 \leq i<n$. Then $\left\langle\beta_{0}, \beta_{1}, \ldots, \beta_{n-1}\right\rangle$ is isomorphic to $\mathrm{B}_{n}$.

Proof. See (2.10) of [2].
In a similar vein to Lemma 2.1, we have the well-known characterization of $\operatorname{Sym}(n)$.
Lemma 2.2. Suppose that $H$ is a group with presentation $\left.\left.\left\langle r_{1}, \ldots, r_{n-1}\right|\left(r_{i} r_{j}\right)^{m_{i j}}\right)\right\rangle$. If $m_{i i}=1$ for $i=1, \ldots, n-1, m_{i j}=3$ if $|i-j|=1$ and $m_{i j}=2$ if $|i-j|>1$, then $H \cong \operatorname{Sym}(n)$.

Proof. See (6.4) of [2].
We make frequent use of the next lemma to verify that particular sets of involutions are C-strings.

Lemma 2.3. Let $G=\left\langle t_{1}, \ldots t_{n}\right\rangle$ where for all $1 \leq i, j \leq n$ we have $|i-j| \geq 2$ implies that $\left(t_{i} t_{j}\right)^{2}=1$ and each $t_{i}$ an involution. If $\left\{t_{1}, \ldots, t_{n-1}\right\}$ and $\left\{t_{2}, \ldots, t_{n}\right\}$ are $C$-strings for $\left\langle t_{1}, \ldots, t_{n-1}\right\rangle$ and $\left\langle t_{2}, \ldots, t_{n}\right\rangle$, then $\left\{t_{1}, \ldots, t_{n}\right\}$ is a $C$-string for $G$ if

$$
\left\langle t_{1}, \ldots, t_{n-1}\right\rangle \cap\left\langle t_{2}, \ldots, t_{n}\right\rangle=\left\langle t_{2}, \ldots, t_{n-1}\right\rangle .
$$

Proof. See 2E16(a) in 3].
Our group theoretic notation is standard, as given for example in [5], with the addition that $\operatorname{Dih}(n)$ denotes the dihedral group of order $n$.

## 3 Rank 4 Unravelled C-strings

Here we establish Theorem 1.2. So we are assuming that $n$ is odd and $n \geq 5$. We shall construct the C-string for $\mathrm{B}_{n}$ working in $\operatorname{Sym}(2 n)$. First we define the involutions $t_{i}$, $i=1,2,3,4$ in $\operatorname{Sym}(2 n)=\operatorname{Sym}(\Omega)$, where $\Omega=\{1, \ldots, 2 n\}$.
(3.1.)

$$
\begin{aligned}
& t_{1}=\prod_{i=0}^{\left\lfloor\frac{n-2}{2}\right\rfloor}(1+2 i, 2+2 i)(n+1+2 i, n+2+2 i) \\
& t_{2}=\prod_{i=1}^{\left\lfloor\frac{n-3}{2}\right\rfloor}(2+2 i, 3+2 i)(n+2+2 i, n+3+2 i) \\
& t_{3}=(1,3)(2,4)(n+1, n+3)(n+2, n+4) \\
& t_{4}=(1,2)(n+1, n+2) \prod_{i=1}^{n-2}(2+i, n+2+i)
\end{aligned}
$$

Observe that $t_{1} t_{2}$ when written as a product of pairwise disjoint cycles has two of length 2 and two of length $n-2$. Hence, as $n-2$ is odd, $t_{1} t_{2}$ has order $2 n-4$. It is easy to check that $t_{2} t_{3}$ has order 6 and $t_{3} t_{4}$ has order 4 . Also we see that $t_{1} t_{3}=t_{3} t_{1}$ and $t_{2} t_{4}=t_{4} t_{2}$.
Put $G=\left\langle t_{1}, t_{2}, t_{3}, t_{4}\right\rangle$. We will show in (3.10) that $G \cong \mathrm{~B}_{n}$, after we have first investigated the subgroups $G_{123}=\left\langle t_{1}, t_{2}, t_{3}\right\rangle$ and $G_{234}=\left\langle t_{2}, t_{3}, t_{4}\right\rangle$.

Beginning with $G_{234}$ and setting

$$
\begin{aligned}
& \Delta_{1}=\{1,2,3,4,5, n+1, n+2, n+3, n+4, n+5\}, \\
& \Delta_{6}=\{6,7, n+6, n+7\}, \\
& \Delta_{8}=\{8,9, n+8, n+9\}, \\
& \vdots \\
& \Delta_{n-1}=\{n-1, n, 2 n-1,2 n\},
\end{aligned}
$$

we note that
(3.2.) the $G_{234}$ orbits of the $\Omega$ are $\Delta_{1}, \Delta_{6}, \Delta_{8}, \ldots, \Delta_{n-1}$.

We also note
(3.3.) the induced action of $\left\langle t_{2}, t_{4}\right\rangle$ on each of $\Delta_{6}, \Delta_{8}, \ldots, \Delta_{n-1}$ is identical to its action on $\Delta_{4}=\{4,5, n+4, n+5\}$.

Set $s_{2}=(4,5)(9,10), s_{3}=(1,3)(2,4)(6,8)(7,9)$ and $s_{4}=(1,2)(3,8)(4,9)(5,10)(6,7)$ (these are $t_{2}, t_{3}, t_{4}$ for the case $n=5$ ), and $H=\left\langle s_{2}, s_{3}, s_{4}\right\rangle$.
( 3.4.) $G_{234} \cong H \cong \mathbb{Z}_{2} \times \operatorname{Sym}(5)$ with $\left\{t_{2}, t_{3}, t_{4}\right\}$ a $C$-string for $G_{234}$. Further $\left\langle\left(t_{2} t_{3} t_{4}\right)^{5}\right\rangle=Z\left(G_{234}\right)$.

Restricting $G_{234}$ to $\Delta_{1}$ yields a homomorphism from $G_{234}$ to $H$, and then (3.3) implies $G_{234} \cong H$. Employing Magma[1] quickly reveals the structure of $H$ and that $\left\{s_{2}, s_{3}, s_{4}\right\}$ is a $C$-string for $H$. This proves (3.4).

We now turn our attention to $G_{123}$.

## (3.5.)

(i). The $G_{123^{-}}$orbits of $\Omega$ are $\Lambda_{1}=\{1, . ., n\}$ and $\Lambda_{n+1}=\{n+1, \ldots, 2 n\}$.
(ii). For $j \in \Lambda_{1}$ and $g \in G_{123},(j) g=k$ if and only if $(j+n) g=k+n$.
(3.6.) For $1 \leq i<n$, we have $(i, i+1)(n+i, n+i+1) \in G_{123}$.

In view of $3.5\left(\right.$ (ii) it will be sufficient to look at the action of elements of $G_{123}$ on $\Lambda_{1}$. So, for $i=1,2,3$, let $\hat{t}_{i}$ denote the induced action of $t_{i}$ on $\Lambda_{1}$. Hence

$$
\begin{aligned}
& \hat{t}_{1}=\prod_{i=0}^{\left\lfloor\frac{n-2}{2}\right\rfloor}(1+2 i, 2+2 i), \\
& \hat{t}_{2}=\prod_{i=1}^{\left\lfloor\frac{n-3}{2}\right\rfloor}(2+2 i, 3+2 i) \text { and } \\
& \hat{t}_{3}=(1,3)(2,4) .
\end{aligned}
$$

Consequently

$$
\hat{t}_{1} \hat{t}_{2}=(1,2)(3,5,7, \ldots, n, n-1, n-3, \ldots, 6,4) .
$$

Since $n-2$ is odd, $\left(\hat{t_{1}} \hat{t}_{2}\right)^{n-2}=(1,2)$. Therefore, $(1,2)(n+1, n+2) \in G_{123}$. Also

$$
\begin{aligned}
\hat{t}_{3} \hat{t}_{1} \hat{t}_{2} & =(1,3)(2,4)(1,2)(3,5,7, \ldots, n, n-1, n-3, \ldots, 6,4) \\
& =(1,5,7, \ldots, n, n-1, n-3, \ldots, 6,4)(2,3)
\end{aligned}
$$

which is in disjoint cycle form. Again, since $n-2$ is odd, we have $\left(\hat{t}_{3} \hat{t}_{1} \hat{t}_{2}\right)^{n-2}=(2,3)$. Hence $(2,3)(n+2, n+3) \in G_{123}$. Now $(3,4)=(1,2)^{\hat{t}_{3}}$, so $(3,4)(n+3, n+4) \in G_{123}$.

Now we recursively construct the remaining $(i, i+1)(n+i, n+i+1)$ for all $i$, with $3<i<n$. Supposing we have $(i, i+1)(n+i, n+i+1) \in G_{123}$ for all $3 \leq i \leq k$. We show that $(k+1, k+2)(n+k+1, n+k+2) \in G_{123}$. If $k$ is even, then

$$
(k, k+1)(n+k, n+k+1)^{t_{1}}=(k-1, k+2)(n+k-1, n+k+2) .
$$

Since
$(k-1, k+2)(n+k-1, n+k+2)^{(k-1, k+1)(n+k-1, n+k+1)}=(k+1, k+2)(n+k+1, n+k+2)$
and
$(k-1, k+1)(n+k-1, n+k+1)=(k-1, k)(n+k-1, n+k)^{(k, k+1)(n+k, n+k+1)} \in G_{123}$, we deduce that $(k+1, k+2)(n+k+1, n+k+2) \in G_{123}$. When $k$ is odd, a similar calculation using $t_{2}$ in place of $t_{1}$, also yields the same conclusion, so proving (3.6).
(3.7.) $G_{123} \cong \operatorname{Sym}(n)$.

From (3.6)

$$
K=\langle(i, i+1)(n+i, n+i+1) \mid 1 \leq i<n\rangle \leq G_{123},
$$

with the generators of $K$ satisfying the Coxeter relations for $\operatorname{Sym}(n)$. Thus, by Lemma 2.2, $K$ is isomorphic to a quotient of $\operatorname{Sym}(n)$ and hence $K \cong \operatorname{Sym}(n)$. The action of $G_{123}$ on $\left\{\{i, n+i\} \mid i \in \Lambda_{1}\right\}$ forces $K=G_{123}$, so giving (3.7).
(3.8.) $\left\{t_{1}, t_{2}, t_{3}\right\}$ is a C-string for $G_{123}$.

We only need check $\left\langle t_{1}, t_{2}\right\rangle \cap\left\langle t_{2}, t_{3}\right\rangle=\left\langle t_{2}\right\rangle$, the other intersections being clear. Now $\left\langle t_{2} t_{3}\right\rangle$ has $\{1,3\}$ and $\{2,4,5\}$ as an orbits on $\Omega$ and so $\left\langle\left(t_{2} t_{3}\right)^{2}\right\rangle$ has $\{2,4,5\}$ as an orbit and $\left\langle\left(t_{2} t_{3}\right)^{3}\right\rangle$ has $\{1,3\}$. Since $\left\langle t_{1} t_{2}\right\rangle$ has $\{1,2\}$ as an orbit and $t_{2} t_{3}$ has order 6 , we conclude that $\left\langle t_{1}, t_{2}\right\rangle \cap\left\langle t_{2}, t_{3}\right\rangle=\left\langle t_{2}\right\rangle$. So (3.8) holds.
Set $\omega_{0}=\prod_{i=1}^{n}(i, n+i)$.
(3.9.) $\omega_{0}=\left(t_{1} t_{2} t_{3} t_{4}\right)^{n}$.

We calculate that

$$
\begin{aligned}
& t_{1} t_{2}=(1,2)(3,5,7, \ldots, n, n-1, \ldots, 6,4)(n+1, n+2)(n+3, \ldots, 2 n, 2 n-1, \ldots n+4) \\
& t_{1} t_{2} t_{3}=t_{1} t_{2}(1,3)(2,4)(n+1, n+3)(n+2, n+4) \\
&=(1,4)(3,5, \ldots, n, n-1, \ldots, 8,6,2)(n+1, n+4)(n+3, \ldots, 2 n, 2 n-1, \ldots, n+4), \\
& t_{1} t_{2} t_{3} t_{4}=t_{1} t_{2} t_{3}(1,2)(n+1, n+2) \prod_{i=1}^{n-2}(2+i,(n+2)+i) \\
&=(\underbrace{1, n+4, n+2,3, n+5,7, \ldots, n, 2 n-1, n-3,2 n-5, \ldots, n+6, n+1}_{n+1,} \\
&\underbrace{4,2, n+3, \ldots, 6}_{n-1}) \\
&=\underbrace{\text { when } n \equiv 1 \bmod 3 \text { and }}_{n+1} \\
&\underbrace{4,2, n+3, \ldots, 6}_{n-1})
\end{aligned}
$$

when $n \equiv 3 \quad \bmod 3$.

Therefore $t_{1} t_{2} t_{3} t_{4}=\prod_{i=1}^{n}(i, n+i)$.
(3.10.) $G \cong \mathrm{~B}_{n}$.

Set $\beta_{0}=(1, n+1)$ and, for $1 \leq i<n, \beta_{i}=(i, i+1)(n+i, n+i+1)$. Put $L=\left\langle\beta_{0}, \beta_{1}, \ldots, \beta_{n-1}\right\rangle$. By Lemma $2.2 L \cong \mathrm{~B}_{n}$.
Directly from their definitions, we have

$$
\begin{aligned}
& t_{1}=\prod_{i=0}^{\left\lfloor\frac{n-2}{2}\right\rfloor} \beta_{1+2 i} \text { and } \\
& t_{2}=\prod_{i=0}^{\left\lfloor\frac{n-3}{2}\right\rfloor} \beta_{2+2 i} .
\end{aligned}
$$

An easy check shows $t_{3}=\beta_{1}{ }^{\beta_{2}} \beta_{2}{ }^{\beta_{3}}$. Since

$$
\begin{aligned}
t_{4} & =(1,2)(n+1, n+2) \prod_{i=1}^{n-2}(2+i, n+2+i) \\
& =\beta_{1} \prod_{i=2}^{n} \beta_{0}^{\Pi_{j=i}^{i} \beta_{j}},
\end{aligned}
$$

we infer that $G \leq L$.
By (3.6) $\beta_{i} \in G$ for $1 \leq i<n$. Thus to complete the proof of (3.10) we need to demonstrate that $\beta_{0} \in G$. Now

$$
\begin{aligned}
t_{2}^{t_{3}} & =\left(\prod_{i=1}^{\left\lfloor\frac{n-3}{2}\right\rfloor}(2+2 i, 3+2 i)(n+2+2 i, n+3+2 i)\right)^{(1,3)(2,4)(n+1, n+3)(n+2, n+4)} \\
& =(2,5)(n+2, n+5) t_{2}(4,5)(n+4, n+5)
\end{aligned}
$$

and

$$
t_{2}{ }^{t_{3} t_{4}}=(1, n+5)(n+1,5) t_{2}(4,5)(n+4, n+5)
$$

Hence

$$
\begin{aligned}
t_{2}{ }^{t_{3}} t_{2}{ }^{t_{3} t_{4}} & =(2,5)(n+2, n+5) t_{2}(4,5)(n+4, n+5)(1, n+5)(n+1,5) t_{2}(4,5)(n+4, n+5) \\
& =(2,5)(n+2, n+5)(1, n+5)(n+1,5) \\
& =(2, n+1,5)(1, n+5, n+2)
\end{aligned}
$$

Therefore

$$
\begin{aligned}
t_{1} t_{2}{ }^{t_{3}} t_{2}{ }^{t_{3} t_{4}}= & t_{1} t_{2}(2, n+1,5)(1, n+5, n+2) \\
= & (1, n+1)(2, n+5, n+7, \ldots, 2 n, 2 n-1, \ldots, n+4, n+3 \\
& n+2,5,7,9, \ldots, n, n-1, \ldots, 6,4,3)
\end{aligned}
$$

and so
$\left(t_{1} t_{2}{ }^{t_{3}} t_{2}{ }^{t_{3} t_{4}}\right)^{n-1}=\prod_{i=2}^{n}(i, n+i)$,

Hence, using (3.9),

$$
\beta_{0}=\prod_{i=1}^{n}(i, n+i)\left(t_{1} t_{2}^{t_{3}} t_{2}^{t_{3} t_{4}}\right)^{-n+1} \in G
$$

which proves (3.10).
(3.11.) $\left\{t_{1}, t_{2}, t_{3}, t_{4}\right\}$ is a string C-string for $G$.

From (3.4) $G_{234} \cong \mathbb{Z}_{2} \times \operatorname{Sym}(5)$ and $\left\langle\left(t_{2} t_{3} t_{4}\right)^{5}\right\rangle=Z\left(G_{234}\right)$. If $G_{123} \cap G_{234}>G_{23}$, then, as $G_{23} \cong \operatorname{Dih}(12)$, we must have either $\left(t_{2} t_{3} t_{4}\right)^{5} \in G_{123} \cap G_{234}$ or $G_{123} \cap G_{234}$ has index at most 2 in $G_{234}$ (and so $t_{3} t_{4} \in G_{123}$ ). Either of these possibilities would contradict (3.5) (i) as $\left(t_{2} t_{3} t_{4}\right)^{5}: 1 \rightarrow n+1$ and $t_{3} t_{4}: 5 \rightarrow n+5$. Thus $G_{123} \cap G_{234}=G_{23}$. Using (3.4) and (3.8) we now obtain (3.11).
(3.12.) When $n \geq 7,\left\{t_{1}, t_{2}, t_{3}, t_{4}\right\}$ is an unravelled C-string for $G$.

Let $M_{1}=\langle(i, n+i) \mid 1 \leq i \leq n\rangle\left(=\mathrm{O}_{2}(G)\right)$ and $M_{2}=\langle(1, n+1)(i, n+i)| 1<$ $i \leq n\rangle$. From (3.10) $G \cong \mathrm{~B}_{n}$ and hence for $N \unlhd G, 1 \neq N \neq G$, we either have $[G: N] \leq 4$ or $N=\left\langle\omega_{0}\right\rangle, M_{1}$ or $M_{2}$. Set $\bar{G}=G / N$. Since $\left\{t_{1}, t_{2}, t_{3}, t_{4}\right\}$ has rank 4, we are only required to check that $\left\{\bar{t}_{1}, \bar{t}_{2}, \bar{t}_{3}, \bar{t}_{4}\right\}$ is not a C-string for $N=\left\langle\omega_{0}\right\rangle, M_{1}$ and $M_{2}$.

Suppose $N=M_{1}$ or $M_{2}$. Then

$$
g=\left(t_{3} t_{4}\right)^{2}=(1, n+2)(2, n+1)(3, n+4)(4, n+3) \in G_{234} .
$$

Also, using (3.6),

$$
h=(1,2)(3,4)(n+1, n+2)(n+3, n+4) \in G_{123}
$$

Since

$$
g h^{-1}=(1, n+1)(2, n+2)(3, n+3)(4, n+4) \in M_{2} \leq M_{1},
$$

we get $\bar{g}=\bar{h} \in \bar{G}_{123} \cap \bar{G}_{234}$. The non-trivial elements of $M_{1}$ either fix an element of $\Lambda_{1}$ or maps it to an element of $\Lambda_{2}$. Hence, as $\{1,3\}$ is a $G_{23}$-orbit, $\bar{h} \notin \bar{G}_{23}$. Thus $\bar{G}_{123} \cap \bar{G}_{234}>\bar{G}_{23}$ when $N=M_{1}$ or $M_{2}$. Now suppose $N=\left\langle\omega_{0}\right\rangle$. This time we take

$$
g=\prod_{i=1}^{5}(i, n+i) \prod_{j=1}^{\left\lfloor\frac{n-5}{2}\right\rfloor}(4+2 j, n+5+2 j)(5+2 j, n+4+2 j) \text { and }
$$

$$
h=\prod_{j=1}^{\left\lfloor\frac{n-5}{2}\right\rfloor}(4+2 j, 5+2 j)(n+4+2 j, n+5+2 j) .
$$

Then $g \in G_{234}, h \in G_{123}$ and $g h^{-1}=\omega_{0}$. Therefore $\bar{g}=\bar{h} \in \bar{G}_{123} \cap \bar{G}_{234}$. It is straightforward to also see that $\bar{g} \notin \bar{G}_{23}$, and consequently (3.12) is proven.

Combining (3.10), (3.11) and (3.12) completes the proof of Theorem 1.2 .

## 4 Rank $n-4$ Unravelled C-Strings

This final section is devoted to the proof of Theorem 1.3. Thus we assume $n \geq 8$ and we set $m=n-4$.

Just as in the proof of Theorem 1.2 we construct $\left\{t_{1}, t_{2}, \ldots, t_{m}\right\}$ as a subset of $\operatorname{Sym}(2 n)$ and then show that it is a C-string for $\mathrm{B}_{n}$. Finally, when $n$ is even, we prove that it is an unravelled C-string. So again, let $\Omega=\{1, \ldots, 2 n\}$ and define the $t_{i}$ as follows.
(4.1.)

$$
\begin{aligned}
& t_{1}=(2,3)(n+2, n+3)(4,5)(n+4, n+5) \prod_{i=6}^{n}(i, n+i) \\
& t_{2}=(1,2)(n+1, n+2)(3,4)(n+3, n+4)(5,6)(n+5, n+6) \prod_{i=7}^{n}(i, n+i) \\
& t_{3}=(2,3)(n+2, n+3)(6,7)(n+6, n+7)
\end{aligned}
$$

and for $k=4, \ldots, m$,

$$
t_{k}=(k+3, k+4)(n+k+3, n+k+4) .
$$

Set $I=\{1,2, \ldots, m\}$.
(4.2.) $t_{3} t_{4}=(2,3)(n+2, n+3)(6,8,7)(n+6, n+8, n+7)$.

Next we show that
(4.3.) $\left(t_{1} t_{2} \ldots t_{m} t_{3} t_{4}\right)^{n}=\prod_{i=1}^{n}(i, n+i)$.

We calculate that

$$
t_{4} t_{5} \ldots t_{m}=(7, n, n-1, n-2, \ldots, 9,8)(n+7,2 n, 2 n-1, \ldots, n+8)
$$

and

$$
t_{1} t_{2} t_{3}=(1,3)(n+1, n+3)(2,4,7,6, n+5, n+2, n+4, n+7, n+6,5)
$$

Hence

$$
\begin{aligned}
t_{1} t_{2} \ldots t_{m}= & (1,3)(n+1, n+3)(2,4, n, n-1, \ldots, 9,8,7,6, n+5, \\
& n+2, n+4,2 n, 2 n-1, \ldots, n+8, n+7, n+6,5) .
\end{aligned}
$$

Using (4.2) we now get

$$
\begin{aligned}
t_{1} t_{2} \ldots t_{m} t_{3} t_{4}= & (1,2,4, n, n-1, \ldots, 9,7,8,6, n+5 \\
& n+3, n+1, n+2, n+4,2 n, \ldots, n+9, n+7, n+8, n+6,5,3),
\end{aligned}
$$

which yields (4.3).
(4.4.) $\left(t_{1} t_{2} \ldots t_{m-1} t_{3} t_{4}\right)^{n-1}=\prod_{i=1}^{n-1}(i, n+i)$.

First we have

$$
\begin{aligned}
t_{1} t_{2} \ldots t_{m-1}= & (1,3)(n+1, n+3)(2,4, n-1, n-2, \ldots, 6 \\
& n+5, n+2, n+4,2 n-1, \ldots, n+7, n+6,5),
\end{aligned}
$$

then, using (4.2),

$$
\begin{aligned}
t_{1} t_{2} \ldots t_{m-1} t_{3} t_{4}= & (1,2,4, n-1, \ldots, 9,7,8,6, n+5, n+3 \\
& n+1, n+2, n+4,2 n-1, \ldots, n+9, n+7, n+8, n+6,5,3) .
\end{aligned}
$$

This gives the desired expression for $\left(t_{1} t_{2} \ldots t_{m-1} t_{3} t_{4}\right)^{n-1}$.

Combining (4.3) and (4.4) we observe that
(4.5.) $\left(t_{1} t_{2} \ldots t_{m-1} t_{3} t_{4}\right)^{n-1}\left(t_{1} t_{2} \ldots t_{m} t_{3} t_{4}\right)^{n}=(n, 2 n)$.
(4.6.) For $i, j \in\{1,2, \ldots, m\}$, the order of

$$
t_{i} t_{j} \text { is } \begin{cases}1 & \text { if } i=j \\ 2 & \text { if }|i-j| \geq 2 \\ 12 & \text { if } i=1, j=2 \text { or } i=2, j=3 \\ 6 & \text { if } i=3, j=4 \\ 3 & \text { otherwise. }\end{cases}
$$

It is evident that each $t_{i}$ is an involution as they are defined as the products of pairwise disjoint transpositions. Since

$$
t_{1} t_{2}=(1,2,4,6, n+5, n+3, n+1, n+2, n+4, n+6,5,3),
$$

$t_{1} t_{2}$ has order 12 . Similarly we have

$$
t_{2} t_{3}=(1,3,4,2)(n+1, n+3, n+4, n+2)(5,7, n+6, n+5, n+7,6) \prod_{i=8}^{n}(i, n+i)
$$

and so $t_{2} t_{3}$ also has the order 12. From (4.2) we see that order of $t_{3} t_{4}$ is 6 . If, $|i-j|=1$ and $4 \leq i<j \leq m$, then

$$
t_{i} t_{j}=(3+i, 5+i, 4+i)(n+3+i, n+5+i, n+4+i)
$$

has order 3 . That $t_{i}$ and $t_{j}$ commute when $|i-j| \geq 2$ is readily checked, so verifying (4.6).

Put $G=\left\langle t_{1}, t_{2}, \ldots, t_{m}\right\rangle$.
(4.7.) $G \cong \mathrm{~B}_{n}$.

We again employ Lemma 2.1 to identify $G$. So set $\beta_{0}=(1, n+1), \beta_{i}=(i, i+$ 1) $(n+i, n+i+1)$, for $1 \leq i<n$, and $L=\left\langle\beta_{0}, \beta_{1}, \ldots, \beta_{n-1}\right\rangle \leq \operatorname{Sym}(2 n)$. Also set $\eta_{i}=(i, n+i)$ for $1 \leq i \leq n$. Note that $\eta_{1}=\beta_{0}$ and $\eta_{i}=\beta_{0} \prod_{j=1}^{i-1} \beta_{j}$ for $i=2, \ldots, n$.

Therefore $\eta_{i} \in L$ for $i=1, \ldots, n$. Because

$$
\begin{aligned}
& t_{1}=\beta_{2} \beta_{4} \prod_{i=6}^{n} \eta_{i} \\
& t_{2}=\beta_{1} \beta_{3} \beta_{5} \prod_{i=7}^{n} \eta_{i} \\
& t_{3}=\beta_{2} \beta_{6} \text { and, for } 4 \leq i \leq m, \\
& t_{i}=\beta_{i+3}
\end{aligned}
$$

we conclude that $G \leq L$.
From (4.5), $\eta_{n}=(n, 2 n) \in G$. Now let $g=t_{m} t_{m-1} \ldots t_{4} t_{3} t_{2} t_{1} t_{2} t_{1} t_{2} \in G$. Then we see that $\eta_{n}{ }^{g}=\eta_{1}=\beta_{0}$, whence $\beta_{0} \in G$. Since $\beta_{i}=t_{i-3}$ for $i=7, \ldots, n-1$, it remains to show that $\beta_{1}, \beta_{2}, \beta_{3}, \beta_{4}, \beta_{5}$ and $\beta_{6}$ are in $G$.

Employing (4.2) again we have

$$
\begin{aligned}
& \beta_{2}=\left(t_{3} t_{4}\right)^{3}, \\
& \beta_{6}=t_{3}\left(t_{3} t_{4}\right)^{3}, \\
& \beta_{1}=\beta_{6}{ }^{t_{2} t_{3} t_{1} t_{2} t_{1} t_{2} t_{3}} \\
& \beta_{3}=\beta_{6}{ }^{t_{2} t_{3} t_{1} t_{2} t_{1} t_{3}} \\
& \beta_{4}=\beta_{6}{ }^{t_{2} t_{1} t_{2} t_{1} t_{3} t_{2}} \text { and } \\
& \beta_{5}=\beta_{6}{ }^{t_{2} t_{3} \eta_{6}} .
\end{aligned}
$$

Since $\eta_{6}=\eta_{n}{ }^{h}$ where $h=t_{m} t_{m-1} \ldots t_{4} t_{3}$, we have now shown that $\beta_{i} \in G$ for $i=0, \ldots, n-1$. Thus $G=L$, and (4.7) is proven.

We now turn our attention to showing that $\left\{t_{1}, \ldots, t_{m}\right\}$ is a C-string.
For $t_{1}, \ldots, t_{m}$ if we wish to highlight that they are permutations in $\operatorname{Sym}(2 n)$ we shall write $t_{1}^{(n)}, \ldots, t_{m}{ }^{(n)}$. Set $G_{1234}^{(n)}=\left\langle t_{1}^{(n)}, t_{2}^{(n)}, t_{3}^{(n)}, t_{4}^{(n)}\right\rangle, G_{123}^{(n)}=\left\langle t_{1}^{(n)}, t_{2}^{(n)}, t_{3}^{(n)}\right\rangle, G_{234}^{(n)}=$ $\left\langle t_{2}^{(n)}, t_{3}^{(n)}, t_{4}^{(n)}\right\rangle$ and $G_{23}^{(n)}=\left\langle t_{2}^{(n)}, t_{3}^{(n)}\right\rangle$.
(4.8.) For $n \geq 8,\left\{t_{1}^{(n)}, t_{2}^{(n)}, t_{3}^{(n)}, t_{4}^{(n)}\right\}$ is a C-string for $G_{1234}^{(n)}$.

First we may verify 4.8) for $n=8$ using Magma. Then we may define $\mu \in \operatorname{Sym}(2 n)$
by

$$
\begin{aligned}
\mu & : \omega \rightarrow \omega-n+8 \text { for } \omega \in \Lambda=\{n+1, n+2, n+3, n+4, n+5, n+6, n+7, n+8\} \\
& : \omega \rightarrow \omega \text { for } \omega \in \Omega \backslash \Lambda .
\end{aligned}
$$

For $i=1,2,3,4$ define

$$
\phi\left(t_{i}^{(n)}\right)=\widehat{\left(t_{i}^{(n)}\right)^{\mu}}
$$

where - denotes the induced action upon the set $\Phi=\{1, \ldots, 16\}$. When we write equalities in this context, it is as a permutation of $\Phi$. Observe that $\phi$ extends to a homomorphism from $G_{1234}^{(n)}$ to $\operatorname{Sym}(\Phi)$ with $\phi\left(G_{1234}^{(n)}=G_{1234}^{(8)}\right.$.

Because

$$
\phi\left(G_{23}^{(n)}\right) \leq \phi\left(G_{123}^{(n)} \cap G_{234}^{(n)}\right) \leq \phi\left(G_{123}^{(n)}\right) \cap \phi\left(G_{234}^{(n)}\right)=G_{123}^{(n)} \cap G_{234}^{(n)}
$$

and (4.8) holds for $n=8$, we have

$$
\phi\left(G_{123}^{(n)} \cap G_{234}^{(n)}\right)=G_{23}^{(8)}
$$

We now investigate the structure of $H=G_{234}^{(n)}$. Set $s_{2}=t_{2}^{(n)}$, $s_{3}=t_{3}^{(n)}, s_{4}=t_{4}^{(n)}$ and $R=\left\langle\left(s_{2} s_{3}\right)^{3},\left(s_{3} s_{4}\right)^{3}\right\rangle$. Now $\left(s_{3} s_{4}\right)^{3}$ inverts $\left(s_{2} s_{3}\right)^{3}$ which has order 4. Therefore $R \cong \operatorname{Dih}(8)$. Calculation shows that $s_{2}, s_{3}$ and $s_{4}$ normalize $R$ and hence $R \unlhd H$. Set $C=C_{H}(R)$. Further calculation shows that $s_{2}, s_{3}, s_{2} s_{3} \notin C$ but $s_{4},\left(s_{2} s_{3}\right)^{2} \in C$. Therefore, as $H=\left\langle s_{2}, s_{3}, s_{4}\right\rangle, H=\left\langle s_{2}, s_{3}\right\rangle C$ with $H / C \cong 2^{2}$. Also we have $\left(s_{2} s_{3}\right)^{6} \in$ $Z(H)$ with $s_{4}\left(s_{2} s_{3}\right)^{4}$ of order 4 . Thus, as $\left(s_{2} s_{3}\right)^{4}$ has order 3 and $s_{4}$ has order 2 , $\left\langle\left(s_{2} s_{3}\right)^{4}, s_{4}\right\rangle \cong \operatorname{Sym}(4)$. Thus $S=\left\langle\left(s_{2} s_{3}\right)^{2}, s_{4}\right\rangle \cong 2 \times \operatorname{Sym}(4)$ with $S \leq C$. Since $s_{2}$ and $s_{3}$ normalize $S$, we infer $C=S$. In particular, we have shown $G_{234}^{(n)}=H$ has order $2^{6} .3$ for all $n \geq 8$.

Consequently $\phi$ restricted to $G_{234}^{(n)} \rightarrow G_{234}^{(8)}$ is an isomorphism. So calculation in $G_{234}^{(n)}$ may be performed in $G_{234}^{(8)}$ and, using $\phi$, we may keep track of the action on $\Omega$.

Now $G_{234}^{(n)}$ has orbit $\{5,6,7,8, n+5, n+6, n+7, n+8\}$ on $\Omega$ and $G_{123}^{(n)}$ has $\{8, n+8\}$ as an orbit. Thus

$$
\left.G_{23}^{(n)} \leq G_{123}^{(n)} \cap G_{234}^{(n)} \leq \operatorname{Stab}(5,6,7, n+5, n+6, n+7\}\right)=T^{(n)}
$$

Calculation shows that $T^{(n)}=\left\langle G_{123}^{(n)},(6,7)(n+6, n+7)\right\rangle$ with $\left[T^{(n)}: G_{23}^{(n)}\right]=2$. If $G_{23}^{(n)}<G_{123}^{(n)} \cap G_{234}^{(n)}$, then $G_{123}^{(n)} \cap G_{234}^{(n)}=T^{(n)}$ must contain a normal subgroup of order

2 intersecting $G_{23}^{(n)}$ trivially (the kernel of $\phi$, restricted to $G_{123}^{(n)} \cap G_{234}^{(n)}$ ), but it does not. Thus $G_{23}^{(n)}=G_{123}^{(n)} \cap G_{234}^{(n)}$. That $\left\{t_{2}^{(n)}, t_{3}^{(n)}, t_{4}^{(n)}\right\}$ is a C-string for $G_{234}^{(n)}$ follows from $G_{234}^{(n)}$ and $G_{234}^{(8)}$ being isomorphic and the fact that $\phi$ maps generator to generator. Observe that the $G_{23}$-orbits of $\Omega$ are $\{1,2,3,4\},\{5,6,7, n+5, n+6, n+7\},\{n+$ $1, n+2, n+3, n+4\},\{i, n+i\}(i=8, \ldots, n)$. If $G_{12} \cap G_{23}>G_{2}$ then one of

$$
\begin{aligned}
& \left(t_{1} t_{2}\right)^{4}=(1, n+5, n+4)(2, n+3, n+6)(4, n+1,5)(6, n+2,3) \text { and } \\
& \left(t_{2} t_{3}\right)^{6}=(1, n+1)(2, n+2)(3, n+3)(4, n+4)(5, n+5)(6, n+6)
\end{aligned}
$$

would be in $G_{23}$. But then 1 and $n+1$ would be in the same $G_{23}$-orbit, a contradiction. Therefore $G_{12} \cap G_{23}=G_{2}$. Appealing to Lemma 2.3 this now proves (4.8).
(4.9.) Let $4 \leq k \leq m$ and set $J_{k}=I_{k} \backslash\{1,2\}$. Then
(i) $G_{J_{k}} \cong \operatorname{Sym}(k-2)$ and
(ii) $\left\{t_{4}, \ldots, t_{k}\right\}$ is a C-string for $G_{J_{k}}$.

Since $G \cong \mathrm{~B}_{n}$ by (4.7), $\left\langle t_{4}, \ldots, t_{k}\right\rangle=\left\langle\beta_{1}, \ldots, \beta_{k+3}\right\rangle$ is a standard parabolic subgroup of $G$. Hence (4.9) (i) and (ii) follow.
(4.10.) Let $4 \leq k \leq m$ and set $J_{k}=I_{k} \backslash\{1,2\}$. Then
(i) $G_{J_{k}} \equiv \mathbb{Z}_{2} \times \operatorname{Sym}(k-1)$; and
(ii) $\left\{t_{3}, \ldots, t_{k}\right\}$ is a C-string for $G_{J_{k}}$.

Recall that $t_{3}=\beta_{2} \beta_{6}$, and that $t_{i}=\beta_{i+3}$ for $4 \leq i \leq k$. Since $\left(\beta_{2} \beta_{6} \beta_{7}\right)^{3}=\beta_{2}$, we have

$$
\begin{aligned}
\left\langle t_{3}, \ldots, t_{k}\right\rangle & =\left\langle\beta_{2} \beta_{6}, \beta_{7} \ldots, \beta_{k+3}\right\rangle \\
& =\left\langle\beta_{2}, \beta_{6}, \beta_{7} \ldots, \beta_{k+3}\right\rangle \\
& \cong \mathbb{Z}_{2} \times \operatorname{Sym}(k-1)
\end{aligned}
$$

so giving part $(i)$. Further, as $\left\langle t_{3}, \ldots, t_{k}\right\rangle$ is a Coxeter group,

$$
\begin{aligned}
\left\langle t_{3}, t_{4}, \ldots, t_{k-1}\right\rangle \cap\left\langle t_{4}, \ldots t_{k}\right\rangle & =\left\langle\beta_{2}, \beta_{6}, \beta_{7}, \ldots, \beta_{k+2}\right\rangle \cap\left\langle\beta_{7}, \ldots \beta_{k+3}\right\rangle \\
& =\left\langle\beta_{7}, \ldots, \beta_{k+2}\right\rangle \\
& =\left\langle t_{4}, \ldots, t_{k-1}\right\rangle .
\end{aligned}
$$

To prove (ii) we may argue by induction on $k, k=4$ being covered by (4.8). Thus $\left\{t_{3}, t_{4}, \ldots, t_{k-1}\right\}$ is a C-string for $G_{\{3, \ldots, k-1\}}$ and, as $\left\{t_{4}, \ldots, t_{k}\right\}$ is a C-string for
$G_{\{4, \ldots, k\}}$, Lemma 2.3 yields (ii).
Set $t_{0}=t_{4}{ }^{\left(t_{3} t_{4} t_{2} t_{3}\right)} t_{2}$.
(4.11.) For $4 \leq k \leq m$, set $J_{k}=I_{k} \backslash\{1\}$. Then

$$
\begin{aligned}
G_{J_{k}} & =\left\langle t_{0}, \beta_{2}\right\rangle \times\left\langle\beta_{5}, \beta_{6}, \ldots, \beta_{k+3}\right\rangle \\
& \cong \operatorname{Dih}(8) \times \operatorname{Sym}(k) .
\end{aligned}
$$

Clearly $t_{0} \in G_{J}$ and calculation reveals that

$$
t_{0}=(1,2)(n+1, n+2)(3,4)(n+3, n+4) \prod_{i=7}^{n}(i, n+i)
$$

Hence $t_{0} \beta_{5}=t_{2}$.
Set $H=\left\langle t_{0}, \beta_{2}, \beta_{5}, \beta_{6}, \ldots, \beta_{k+3}\right\rangle$. Observing that $t_{0}$ and $\beta_{2}$ commute with each of $\beta_{5}, \beta_{6}, \ldots, \beta_{k+3}$, we have

$$
H=\left\langle t_{0}, \beta_{2}\right\rangle \times\left\langle\beta_{5}, \beta_{6}, \ldots, \beta_{k+3}\right\rangle
$$

We show that $G_{J_{k}}=H$. Recalling that $\beta_{i+3}=t_{i}, 4 \leq i \leq m$ and $t_{3}=\beta_{2} \beta_{6}, t_{2}=t_{0} \beta_{5}$ implies $G_{J_{k}} \leq H$. Since $t_{0}=t_{2} \beta_{5}, \beta_{5}=t_{0} t_{2}, \beta_{6}=t_{3}\left(t_{3} t_{4}\right)^{3}$ and $\beta_{2}=t_{3} \beta_{6}$, we also have $H \leq G_{J_{k}}$. Because $t_{0} \beta_{2}$ has order 4 and $\left\langle\beta_{2}, \beta_{6}, \ldots, \beta_{k+3}\right\rangle$ is a standard parabolic subgroup of $\mathrm{B}_{n}$, we deduce that $G_{J_{k}} \cong \operatorname{Dih}(8) \times \operatorname{Sym}(k)$.
(4.12.) For $J_{k}=I_{k} \backslash\{1\}$ where $4 \leq k \leq m,\left\{t_{2}, \ldots, t_{k}\right\}$ is a C-string for $G_{J_{k}}$.

We argue by induction on $k$. By our induction hypothesis we have that $\left\{t_{2}, t_{3}, \ldots, t_{k-1}\right\}$ is a C-string for $G_{J_{k} \backslash\{k\}}$. From 4.10 $\left\{t_{3}, \ldots, t_{k}\right\}$ is a C-string for $G_{J_{k} \backslash\{2\}}$. Also, from (4.10),

$$
\begin{aligned}
G_{J_{k} \backslash\{2, k\}} & \cong \mathbb{Z}_{2} \times \operatorname{Sym}(n-6) \quad \text { and } \\
G_{J_{k} \backslash\{k\}} & \cong \mathbb{Z}_{2} \times \operatorname{Sym}(n-5)
\end{aligned}
$$

Hence $G_{J_{k} \backslash\{2, k\}}$ is a maximal subgroup of $G_{J_{k} \backslash\{k\}}$. So, if $G_{J_{k} \backslash\{k\}} \cap G_{J_{k} \backslash\{2\}}>G_{J_{k} \backslash\{2, k\}}$, then $G_{J_{k} \backslash\{k\}} \leq G_{J_{k} \backslash\{2\}}$ which means $t_{2} \in G_{J_{k} \backslash\{2\}}$. But $G_{J_{k} \backslash\{2\}}$ fixes 1 whereas $t_{2}$ does not, a contradiction. Therefore $G_{J_{k} \backslash\{k\}} \cap G_{J_{k} \backslash\{2\}}=G_{J_{k} \backslash\{2, k\}}$. Thus, using Lemma 2.3, we get 4.12).
(4.13.) For $4 \leq k \leq m,\left\{t_{1}, t_{2}, \ldots, t_{k}\right\}$ is a C-string for $G_{I_{k}}$.

We again argue by induction on $k$, with 4.8) starting the induction. So $k>4$ and
$\left\{t_{1}, t_{2}, \ldots, t_{k-1}\right\}$ is a C-string for $G_{I_{k-1}}$. By 4.12 we have that $\left\{t_{2}, \ldots, t_{k-1}\right\}$ is a C-string for $G_{I_{k-1} \backslash\{1\}}$. Then, using (4.11) we have that

$$
\begin{aligned}
G_{I_{k} \backslash\{1\}} & \cong \operatorname{Dih}(8) \times \operatorname{Sym}(k) \quad \text { and } \\
G_{I_{k-1} \backslash\{1\}} & \cong \operatorname{Dih}(8) \times \operatorname{Sym}(k-1)
\end{aligned}
$$

Hence $G_{I_{k-1} \backslash\{1\}}$ is a maximal subgroup of $G_{I_{k} \backslash\{1\}}$. So, if $G_{I_{k} \backslash\{1\}} \cap G_{I_{k-1}}>G_{I_{k-1} \backslash\{1\}}$, then $G_{I_{k} \backslash\{1\}} \leq G_{I_{k-1}}$. But then $t_{k} \in G_{I_{k-1}}$, which is not the case as $t_{k}$ moves $k+3$
 Thus, using Lemma 2.3, we get 4.13).
(4.14.) $\left\{t_{1}, t_{2}, \ldots, t_{k}\right\}$ is a C-string for $G$.

Taking $m=k$ in (4.13) gives (4.14).
(4.15.) If $n$ is even, then $\left\{t_{1}, \ldots, t_{m}\right\}$ is an unravelled C-string.

Set $w_{0}=\prod_{i=1}^{n}(i, n+i), g=\left(t_{3}\left(t_{3} t_{4}\right)\right)^{3}\left(=\beta_{6}\right)$ and

$$
h=\left(t_{1} t_{2}\right)^{2} t_{1}\left(t_{3} t_{2} t_{1}\right)^{3} t_{3}^{t_{2}}\left(t_{1} t_{3} t_{2}\right)^{4} .
$$

Then

$$
h=\prod_{i=1}^{5}(i, n+i)(6,7, n+6, n+7) \prod_{i=8}^{n}(i, n+i)
$$

Hence $g h=w_{0}$, and $g \in G_{\{3,4\}}, h \in G_{\{1,2,3\}}$.
Put $M_{1}=\langle(i, n+i) \mid 1 \leq i \leq n\rangle$ and $M_{2}=\langle(1, n+1)(i, n+i) \mid 1<i \leq n\rangle$. Since $n$ is even, $\left\langle w_{0}\right\rangle \leq M_{2} \leq M_{1}$. Let $\bar{G}=G / N$ where $N$ is one of $\left\langle w_{0}\right\rangle, M_{2}, M_{1}$. Then $\bar{g} \overline{h^{-1}} \in \bar{G}_{\{1,2,3\}} \cap \bar{G}_{\{3,4\}}$ with $\bar{g} \neq \overline{t_{3}}$ whence $\bar{G}_{\{1,2,3\}} \cap \bar{G}_{\{3,4\}}>\bar{G}_{\{3\}}$, which proves (4.14).

Together, (4.14) and (4.15) establish Theorem 1.3 .
