# On the weak norm of  $\mathscr{U}_p$ -residuals of all subgroups of a finite group<sup>∗</sup>

Yubo Lv<sup>†</sup> Yangming Li<sup>‡§</sup>

#### Abstract

Let  $\mathscr F$  be a formation and G a finite group. The weak norm of a subgroup H in G with respect to  $\mathscr F$  is defined by  $N_{\mathscr F}(G,H) = \bigcap$  $T \leq H$  $N_G(T^{\mathscr{F}})$ . In particular,  $N_{\mathscr{F}}(G) = N_{\mathscr{F}}(G,G)$ . Let  $N_{\mathscr{F}}^i(G), i \geq 1$ , be a upper series of G by setting  $N_{\mathscr{F}}^0(G) = 1, N_{\mathscr{F}}^{i+1}(G)/N_{\mathscr{F}}^i(G) = N_{\mathscr{F}}(G/N_{\mathscr{F}}^i(G))$  and denoted by  $N_{\mathscr{F}}^{\infty}(G)$  the terminal term of the series. In this paper, for the case  $\mathscr{F} \in \{ \mathscr{U}_p, \mathscr{U} \}$ , where  $\mathscr{U}_p(\mathscr{U}, \text{respectively})$  is the class of all finite p-supersolvable groups(supersolvable groups,respectively), we characterize the structure of some given finite groups by the properties of weak norm of some subgroups in G with respect to  $\mathscr{F}$ . Some of our main results may regard as a continuation of many nice previous work.

*Keywords:* Weak norm; Normalizer; supersolvable residual; p-supersolvable residual; p-length; p-Fitting length.

*MSC 2020:* 20D10, 20D25.

### 1 Introduction

Throughout this paper, all groups are finite. We use the standard terminology and notations as in [\[1\]](#page-18-0). For the specific, we denote

•  $G$ : a finite group.

- $|G|$ : the order of G.
- $\pi(G)$ : the set of prime divisors of |G|.
- $\bullet$  *p*: a prime.
- $G_p$ : the Sylow p-subgroup of G.
- $F_p(G)$ : the *p*-Fitting subgroup of *G*.
- $\mathfrak{G}$ : the class of all finite groups.
- $\mathscr{F}$ : a formation of groups, that is a class of finite groups satisfying the following: (1) if  $G \in \mathscr{F}$  and N is a normal subgroup of G, then  $G/N \in \mathscr{F}$ , and (2) if  $N_1, N_2$  are normal subgroups of G such that  $G/N_i \in \mathscr{F}(i = 1, 2)$ , then  $G/(N_1 \cap N_2) \in \mathscr{F}.$
- $G^{\mathscr{F}}$ : the  $\mathscr{F}$ -residual of G, that is the intersection of all those normal subgroups N of G such that  $G/N \in \mathscr{F}$ .
- $\mathscr{F}_1\mathscr{F}_2$ : the formation product or Gaschëtz product of  $\mathscr{F}_1$  and  $\mathscr{F}_2$ , that is the class  $\{G \in \mathfrak{G} \mid G^{\mathscr{F}_2} \in \mathscr{F}_1\}$ . In particular, denote  $\mathscr{F}^2 = \mathscr{F} \mathscr{F}$ .
- $\mathscr{A}$ : the class of all Abelian groups.
- $\mathcal N$ : the class of all nilpotent groups.
- $\mathcal{N}_p$ : the class of all *p*-nilpotent groups.
- $\mathscr{U}$ : the class of all supersolvable groups.
- $\mathscr{U}_p$ : the class of all *p*-supersolvable groups.
- $l_p(G)$ : the p-length of a p-solvable group G, that is the number of the p-factor groups in the upper  $p$ -series of  $G$ :

 $1 = P_0(G) \trianglelefteq M_0(G) \trianglelefteq P_1(G) \trianglelefteq M_1(G) \trianglelefteq \cdots \trianglelefteq P_n(G) \trianglelefteq M_n(G) = G$ 

such that  $M_i(G)/P_i(G) = O_{p'}(G/P_i(G))$  and  $P_i(G)/M_{i-1}(G) = O_p(G/M_{i-1}(G)).$ 

•  $h_p(G)$ : the p-Fitting length of a p-solvable group G, that is the smallest positive integer n such that

$$
1 = F_p^0(G) \le F_p^1(G) \le \cdots \le F_p^{n-1}(G) \le F_p^n(G) = G,
$$

where  $F_p^1(G) = F_p(G)$  and  $F_p^{i+1}(G)/F_p^i(G) = F_p(G/F_p^i(G))$  for  $i = 1, 2, \dots, n-1$ 1.

- $h(G)$ : the Fitting length of a solvable group G, that is the positive integer *n* such that  $1 = F^0(G) \leq F^1(G) \leq \cdots \leq F^{n-1}(G) \leq F^n(G) = G$ , where  $F^1(G) = F(G)$  and  $F^{i+1}(G)/F^i(G) = F(G/F^i(G))$  for  $i = 1, 2, \dots, n-1$ .
- $N(G)$ : the intersection of the normalizers of all subgroups of G.
- $S(G)(or N<sub>N</sub>(G))$ : the intersection of the normalizers of the nilpotent residuals of all subgroups of G.
- $N^{\mathcal{N}_p}(G)$ : the intersection of the normalizers of the p-nilpotent residuals of all subgroups of G.

It is interesting to characterize the structure of a given group by using of some special subgroups. For example, Gashëtz and N. Itô  $[1, Satz 5.7, p.436]$  proved that  $G$  is solvable with Fitting length at most 3 if all minimal subgroups of  $G$  are normal. Also, it is well know that G is nilpotent if  $G'$  normalizers each subgroup of  $G$ (see Baer's theorem in [\[2\]](#page-18-1)). Further more, R. Baer in [\[3](#page-18-2)] defined the subgroup  $N(G)$ , the norm of a group  $G$ . Obviously, a group  $G$  is a Dedeking group if and only if  $G = N(G)$ . The norm of a group has many other good properties and has studied further by many scholars. In recent years, some weaker versions of the concepts of norm of groups have been introduced. Let  $\mathscr F$  be a non-empty formation. Recently, Su and Wang in [\[4](#page-18-3), [5](#page-18-4)] introduced the subgroup  $N_{\mathscr{F}}(G)$ , the norm of  $\mathscr{F}$ -residual of a group  $G$  as follows

$$
N_{\mathscr{F}}(G) = \bigcap_{H \le G} N_G(H^{\mathscr{F}}). \tag{\star}
$$

As in [\[4](#page-18-3)], we set  $N_{\mathscr{F}}^0(G) = 1$  and if  $N_{\mathscr{F}}^i(G)$  is defined, set  $N_{\mathscr{F}}^{i+1}(G)/N_{\mathscr{F}}^i(G) =$  $N_{\mathscr{F}}(G/N_{\mathscr{F}}^i(G))$ . The subgroup  $N_{\mathscr{F}}^{\infty}(G)$  is the terminal term of the ascending series. In fact,  $N_{\mathscr{F}}^{\infty}(G) = N_{\mathscr{F}}^{k}(G)$  for some integer k such that  $N_{\mathscr{F}}^{k}(G) = N_{\mathscr{F}}^{k+1}(G) = N_{\mathscr{F}}^{k+2}(G) =$ · · · .

Many scholars also call  $N_{\mathscr{F}}(G)(\mathscr{F} = \mathscr{A}, \mathscr{N}, \mathscr{N}_p$ , respectively) the *generalized norm* of group G. Obviously,  $N_{\mathscr{F}}(G)$  is a characteristic subgroup and every element of  $N_{\mathscr{F}}(G)$  normalize the  $\mathscr{F}$ -residual of each subgroup of G. The so called norm of  $\mathscr F$ -residual has many other nice properties and also closely related to the global properties of a given group. For some given formation  $\mathscr{F}$ , there are many papers devoted to study the p-length, Fitting length, solvability, (p-)nilpotency and so on. For example, for the case  $\mathscr{F} = \mathscr{A}$ , Li and Shen in [\[6\]](#page-18-5) denoted  $N_{\mathscr{A}}(G)$  by  $D(G)$ . They fingered out that  $G$  is solvable with Fitting length at most 3 if all elements of G of prime order are in  $D(G)(\text{see }[6, \text{ Theorem 4.1}])$ . It is a dual problem of Gashëtz and N. Itô[\[1](#page-18-0), Satz 5.7, p. 436]. Li and Shen also defined the D-group, i.e.,  $G = D(G)$ , they characterized the relationship between  $D(G)$  and G. Shen, Shi and Qian in [\[7\]](#page-18-6) considered the case  $\mathscr{F} = \mathscr{N}$ , they denoted  $N_{\mathscr{N}}(G)$  by  $S(G)$ . Shen et al., deeply studied the dual problem of Gashëtz and N. Itô and characterized the  $\mathscr{F}_{nn}$ -groups by means of the subgroup  $S^{\infty}(G)$ , where  $S^{\infty}(G) = N_{\mathcal{N}}^{\infty}(G)$  and  $\mathscr{F}_{nn}$ -groups are class of groups belong to  $\mathcal{N} \mathcal{N}$ . They also introduced the S-group, i.e.,  $G = S(G)$  and given some sufficient and necessary conditions involved S-groups. Meanwhile, Gong and Guo in [\[8\]](#page-18-7) also consider the case  $\mathscr{F} = \mathscr{N}$  and given some meaningful conclusions. In the case  $\mathscr{F} = \mathscr{N}_p$ , Guo and Li in [\[9\]](#page-18-8) introduced the norm of  $\mathscr{N}_p$ -residual of a group G, they denoted  $N_{\mathscr{N}_p}(G)$  by  $N^{\mathscr{N}_p}(G)$ . As a local version of Gong's results, Li and Guo characterized the relationship between  $C_G(G^{\mathcal{N}_p})$  and  $N^{\mathcal{N}_p}(G)$ . In particular, Li and Guo in [\[9](#page-18-8)] also investigated the relationship between  $N_{\mathcal{N}}(G)$  and  $N^{\mathcal{N}_p}(G)$ . For more detail and other relevant conclusions about the norm of  $\mathscr{F}\text{-residual}$ , please see [\[4](#page-18-3)[–13\]](#page-19-0).

We wonder whether the above conclusions hold for general formations. A natural idea is to replace  $\mathscr{F}(\mathscr{F} \in \{\mathscr{N}_p, \mathscr{N}, \mathscr{A}\})$  by  $\mathscr{U}_p$  or  $\mathscr{U}$  in  $(\star)$ .

**Remark 1.1.** *(1)* In general, for a group G and some  $p \in \pi(G)$ ,  $N_{\mathscr{U}_p}(G) \neq N_{\mathscr{F}}(G)$ *is possible, where*  $\mathscr{F} \in \{\mathscr{N}_p, \mathscr{N}, \mathscr{A}\}\$ . For example, let  $G = S_4$ , the symmetric group *of degree* 4. *Obviously, G is a* 3-supersolvable non-3-nilpotent group, so  $G = N_{\mathscr{U}_3}(G)$ . *Pick a subgroup*  $H \cong S_3$ *, the symmetric group of degree* 3*, but*  $N_G(H^{\mathcal{N}_3}) = N_G(S_3^{\mathcal{N}_3})$  $\binom{3}{3} =$  $N_G(C_3) = S_3 < S_4$ , so  $N_{\mathscr{N}_3}(G) < G$ .

*(2)* The condition in definition  $\star$  that the intersection of the  $\mathscr F$ -residuals of *all subgroups of* G *may be too strong and some of the subgroups may be redundant whenever*  $\mathscr{F} = \mathscr{U}_p$  *(see Example [1.3](#page-4-0) below).* 

(3) The case that  $N_\mathscr{U}(G) = N_{\mathscr{U}_p}(G) = 1$  is possible for a solvable group G and  $p \in \pi(G)$ *. Let*  $H = \langle a, b \mid a^3 = b^3 = 1, [a, b] = 1 \rangle \cong C_3 \times C_3$  and  $Q_8 = \langle c, d \mid$  $c^4 = 1, c^2 = d^2 = e, c^d = c^{-1}$ . Considering the irreducible action of  $Q_8$  on H by  $a^c = a^{-1}b, b^c = ab, a^d = b^{-1}, b^d = a$ , denote  $T = H \rtimes Q_8 \cong (C_3 \times C_3) \rtimes Q_8$ . Let  $C = \langle f \rangle$ *be a cyclic group of order* 3 *and let* C *act on* T *by*  $a^f = b^{-1}$ ,  $b^f = ab^{-1}$ ,  $c^f = d^3$ ,  $d^f = cd$ . *Then*  $G = \langle a, b, c, d, e, f \rangle \cong ((C_3 \times C_3) \rtimes Q_8) \rtimes C_3$  *is solvable(IdGroup=[216,153]). It is easy to see that*  $G^{\mathscr{U}_2} = \langle a, b, c, d, e \rangle \cong (C_3 \times C_3) \rtimes Q_8$  *and*  $C_G(G^{\mathscr{U}_2}) = 1$ *. By Theorem* [3.4,](#page-8-0)  $N_{\mathcal{U}_2}(G) = 1$ . Further more, by Theorem [3.14,](#page-11-0)  $N_{\mathcal{U}}(G) = 1$ . So we have  $N_{\mathscr{U}}(G) = N_{\mathscr{U}_2}(G) = 1.$ 

Recall that the weak centralizer of H in  $G, C^*_G(H)$ , introduced in [\[14](#page-19-1), P.33,Definitions], is defined by

$$
C_G^*(H) = \bigcap \{ N_G(K) : K \le H \}.
$$

In the above investigation, we introduce the following more general and interesting definition.

**Definition 1.2.** Let G be a group and  $\mathscr F$  a formation. We define  $N_{\mathscr F}(G, H)$ , the weak norm of H in G with respect to  $\mathscr F$  as follows:

$$
N_{\mathscr{F}}(G, H) = \bigcap_{T \le H} N_G(T^{\mathscr{F}}).
$$

In particular,  $N_{\mathscr{U}}(G,H) = \bigcap$  $T \leq H$  $N_G(T^{\mathscr{U}})$  and  $N_{\mathscr{U}_p}(G,H) = \bigcap$  $T \leq H$  $N_G(T^{\mathscr{U}_p})$ .

<span id="page-4-0"></span>**Example 1.3.** Let  $G = \langle a, b, c, d \rangle \rtimes \langle e, f \rangle \cong C_2^4 \rtimes C_6$ , where  $e^2 = f^3 = 1$  and  $a^e =$  $ac, b^e = bd, c^e = c, d^e = d, a^f = b, b^f = ab, c^f = d, d^f = cd$  (IdGroup=[96,70] in GAP [\[15](#page-19-2)]). Let  $H = \langle a, b, f \rangle$ , then  $N_{\mathcal{U}_2}(G) = N_{\mathcal{U}_2}(G, H) = \langle a, b, c, d, f \rangle \cong C_2^4 \rtimes C_3 < G$ .

Obviously,  $N_{\mathscr{F}}(G) = N_{\mathscr{F}}(G, G) \leq N_{\mathscr{F}}(G, H) \leq G$ . Without causing confusion, we call  $N_{\mathscr{F}}(G) = N_{\mathscr{F}}(G, G)$  the norm of G with respect to  $\mathscr{F}$ . Moreover, for a subgroup H of G, we call G is an  $\mathcal{N}_1$ -group with respect to H and  $\mathcal{F}$  if  $G =$  $N_{\mathscr{F}}(G, H)$ . In this paper, we mainly investigate properties of  $N_{\mathscr{F}}(G, H)$  and the influence of  $N_{\mathscr{F}}(G, H)$  on the structure of group G. Actually, we mainly consider the case  $\mathscr{F} \in \{ \mathscr{U}, \mathscr{U}_p \}$ . Our main work may be regard as the continuation of some conclusions in [\[6](#page-18-5)[–9\]](#page-18-8).

#### 2 Preliminaries

In this section, we always assume that  $\mathscr F$  is a non-empty formation and G is a group. We first give some important lemmas.

<span id="page-4-1"></span>**Lemma 2.1.** Let H, K, N be subgroups of G and  $N \triangleleft G$ . Then

*(1)* If  $H \leq K$ , then  $N_{\mathscr{F}}(G, K) \leq N_{\mathscr{F}}(G, H)$ ;  $(2)$  K ∩ N<sub>F</sub> $(G, H)$  < N<sub>F</sub> $(K, K \cap H)$ *, in particular, if*  $H \leq K$ *, then* K ∩  $N_{\mathscr{F}}(G,H) \leq N_{\mathscr{F}}(K,H).$ (3) If  $N \leq H$ , then  $N_{\mathscr{F}}(G, H)N/N \leq N_{\mathscr{F}}(G/N, H/N)$ .

*Proof.* (1) By definition,  $N_{\mathscr{F}}(G, K) = \bigcap$  $T{\leq}K$  $N_G(T^{\mathscr{F}}) \leq \bigcap$  $T \leq H$  $N_G(T^{\mathscr{F}}) = N_{\mathscr{F}}(G, H).$ (2) Obviously,  $K \cap N_{\mathscr{F}}(G, H) = K \cap (\bigcap$  $T \leq H$  $N_G(T^{\mathscr{F}})) \leq \cap$  $T{\leq}H{\cap}K$  $N_K(T^{\mathscr{F}}) = N_{\mathscr{F}}(K, H \cap$ K). In particular, if  $H \leq K$ , then  $K \cap N_{\mathscr{F}}(G, H) \leq N_{\mathscr{F}}(K, H)$ .

(3) Let  $x \in N_{\mathscr{F}}(G,H)$ , then x normalize  $T^{\mathscr{F}}$  for every  $T \leq H$ , so xN normalize  $T^{\mathscr{F}}N/N = (TN/N)^{\mathscr{F}}$ . Thus every element of  $N_{\mathscr{F}}(G,H)N/N$  normalize  $(T/N)^{\mathscr{F}}$  for all subgroups  $T/N$  of  $H/N$ , so  $N_{\mathscr{F}}(G,H)N/N \leq N_{\mathscr{F}}(G/N, H/N)$ .  $\Box$ 

As a corollary, we have

<span id="page-5-1"></span>Lemma 2.2. *Let* G *be a group, let* K *be a subgroup of* G *and* N *a normal subgroup of* G*, then*

 $(1)$  K  $\cap$  N<sub> $\mathscr{F}(G)$ </sub>  $\leq$  N<sub> $\mathscr{F}(K)$ </sub>. *(2)*  $N_{\mathscr{F}}(G)N/N \leq N_{\mathscr{F}}(G/N)$ .

<span id="page-5-2"></span>Lemma 2.3. *[\[4](#page-18-3), Lemmas 2.2,2.3] Let* G *be a group, let* K *be a subgroup of* G *and* N *a normal subgroup of* G*, then*

- $(1)$   $K \cap N^{\infty}_{\mathscr{F}}(G) \leq N^{\infty}_{\mathscr{F}}(K)$ .
- (2)  $N^{\infty}_{\mathscr{F}}(G)N/N \leq N^{\infty}_{\mathscr{F}}(G/N)$ .
- (3) If  $N \leq N^{\infty}_{\mathscr{F}}(G)$ , then  $N^{\infty}_{\mathscr{F}}(G)/N = N^{\infty}_{\mathscr{F}}(G/N)$ .

<span id="page-5-3"></span>Lemma 2.4. *Let* G *be a* p*-solvable group.*

*(1)* If  $N \triangleleft G$ , then  $l_p(G/N) \leq l_p(G)$ .

*(2)* If  $U \leq G$ , then  $l_p(U) \leq l_p(G)$ .

*(3) Let*  $N_1$  *and*  $N_2$  *be two normal subgroups of* G, *then*  $l_p(G/(N_1 \cap N_2)) \leq$  $max\{l_p(G/N_1), l_p(G/N_2)\}.$ 

- $(4)$   $l_p(G/\Phi(G)) = l_p(G)$ .
- (5) If N is a normal p'-group of G, then  $l_p(G/N) = l_p(G)$ .

*Proof.* The proof of  $(1)-(4)$  follows from  $[1, VI, 6.4]$  and  $(5)$  is obviously.

 $\Box$ 

 $\Box$ 

<span id="page-5-0"></span>Lemma 2.5. *Let* G *be a group and* N *a normal subgroup of* G*. Then*

*(1) if*  $N/N \cap \Phi(G)$  *is p*-nilpotent, then N *is p*-nilpotent;

(2) Let  $H$  be a subgroup of  $G$  and  $N$  be a  $p'$ -group, if  $HN/N$  is p-nilpotent, then H *is* p*-nilpotent.*

*Proof.* The statement (1) is directly form [\[16](#page-19-3), Lemma 2.5], and (2) is easy.

<span id="page-5-4"></span>Lemma 2.6. *Let* G *be a* p*-solvable group and* H *a subgroup of* G*, let* H, N, A, B *be subgroups of* G *and* N, A, B *are normal in* G*, then*

*(1)*  $h_p(H) \leq h_p(G)$ .  $(2)$   $h_p(G/N) \leq h_p(G)$ . *(3)* If  $G = A \times B$ *, then*  $h_p(G) = \max\{h_p(A), h_p(B)\}.$ 

- (4) If  $h_p(G/A) \leq k$  and  $h_p(G/N) \leq k$ , then  $h_p(G/(A \cap B)) \leq k$ .
- $(5)$   $h_p(G/\Phi(G))) = h_p(G)$ .
- (6) If N is a p'-group, then  $h_p(G/N) = h_p(G)$ .

*Proof.* Let  $1 = N_0 \leq N_1 \leq N_2 \leq \cdots \leq N_r = G$  be the shortest normal chain of G with p-nilpotent factors  $N_i/N_{i-1}$  for all  $i = 1, 2, \cdots, r$ .

(1) If  $H \leq G$ , then  $1 = N_0 \cap H \leq N_1 \cap H \leq N_2 \cap H \leq \cdots \leq N_r \cap H = G \cap H = H$ is a normal chain of H with  $N_i \cap H/N_{i-1} \cap H \cong (N_i \cap H)N_{i-1}/N_{i-1}$  a p-nilpotent factors for all  $i = 1, 2, \dots, r$ , so  $h_p(H) \leq h_p(G)$ .

(2) If  $N \trianglelefteq G$ , obviously,  $\overline{1} = N_0 N/N \leq N_1 N/N \leq N_2 N/N \leq \cdots \leq N_r/N =$  $G/N$  is a normal chain of  $G/N$ . Note that  $N_iN/N/N_{i-1}N/N = N_iN/N_{i-1}N \approx$  $N_i/N_{i-1}(N_i \cap N) \leq N_i/N_{i-1}$  is p-nilpotent, so  $h_p(G/N) \leq h_p(G)$ .

(3) Let  $1 = A_0 \le A_1 \le A_2 \le \cdots \le A_r = A$  and  $1 = B_0 \le B_1 \le B_2 \le$  $\cdots \leq B_t = B$  be the shortest normal chain of A and B with p-nilpotent factors respectively. Without loss of generality, assume  $r \leq t$ , then  $1 = A_0 B_0 \leq A_1 B_1 \leq$  $A_2B_2 \leq \cdots \leq A_rB_r \leq A_rB_{r+1} \leq A_rB_{r+2} \leq A_rB_t = AB$  is a normal chain. Since  $A_i B_i/A_{i-1}B_{i-1} \cong A_i/A_{i-1}(A_i \cap B_{i-1}) \cdot B_i/B_{i-1}(B_i \cap A_{i-1})$  whenever  $i \leq r$ and  $A_r B_j/A_r B_{j-1} \cong B_j/B_{j-1}(B_j \cap A_i)$  whenever  $r < j \leq t$  are p-nilpotent. So  $h_p(G) = \max\{h_p(A), h_p(B)\}.$ 

(4) Since  $G/(A \cap B) \cong G/A \times G/B$ , the result follows from (1) and (3).

(5) Assume that  $\overline{1} = \Phi(G)/\Phi(G) = T_0/\Phi(G) \leq T_1/\Phi(G) \leq T_2/\Phi(G) \leq \cdots \leq$  $T_s/\Phi(G) = G/\Phi(G)$  is the normal chain of G with p-nilpotent factors, so  $s \leq r$  and  $T_i/T_{i-1} \cong T_i/\Phi(G)/T_{i-1}/\Phi(G)$  is p-nilpotent. Since  $T_1/\Phi(G)$  is p-nilpotent, then  $T_1$ is p-nilpotent by Lemma [2.5,](#page-5-0) so  $1 \leq T_1 \leq T_2 \leq \cdots \leq T_s = G$  is a normal chain with p-nilpotent factors. Now we have  $r \leq s$ , hence  $s = r$ .

(6) Let  $\overline{1} = N_0/N \leq N_1/N \leq N_2/N \leq \cdots \leq N_r/N = G/N$  be a normal chain of  $G/N$  with p-nilpotent factors  $N_i/N/N_{i-1}/N \cong N_i/N_{i-1}$  for all  $i = 1, 2, \cdots, r$ . Now by Lemma [2.5,](#page-5-0)  $N_1$  is p-nilpotent since N is a p'-group, so  $1 \le N_1 \le N_2 \le \cdots \le N_r = G$ is a normal chain of G with p-nilpotent factors  $N_i/N_{i-1}$  for all  $i = 1, 2, \dots, r$ , which implies that  $h_p(G) \leq h_p(G/N)$ , now by (1), we have  $h_p(G/N) = h_p(G)$ .  $\Box$ 

As a local vision of [\[17](#page-19-4), Lemma 3.2], we have

<span id="page-6-1"></span>**Lemma 2.7.** Let G be a solvable group, then  $l_p(G) \leq 1$  if  $h(G) \leq 2$  for every  $p \in \pi(G)$ .

<span id="page-6-0"></span>**Lemma 2.8.** [\[18](#page-19-5)*, Theorem 1 and Proposition 1] Let*  $\mathcal{F}$  *be a saturated formation.* 

*(1) Assume that* G *is a group such that* G *does not belong to* F*, but all its proper*  $subgroups$  belong to  $\mathscr{F}$ . Then  $F'(G)/\Phi(G)$  is the unique minimal normal subgroup of  $G/\Phi(G)$ , where  $F'(G) = Soc(G \mod \Phi(G))$ , and  $F'(G) = G^{\mathscr{F}}\Phi(G)$ . In addition, *if the derived subgroup of*  $G^{\mathscr{F}}$  *is a proper subgroup of*  $G^{\mathscr{F}}$ *, then*  $G^{\mathscr{F}}$  *is a soluble group.* Furthermore, if  $G^{\mathscr{F}}$  is soluble, then  $F'(G) = F(G)$ , the Fitting subgroup of G. *Moreover*  $(G^{\mathscr{F}})' = T \cap G^{\mathscr{F}}$  for every maximal subgroup T of G such that  $G/T_G \notin \mathscr{F}$ and  $F'(G)T = G$ *.* 

*(2) Assume that* G *is a group such that* G *does not belong to* F *and there exists a* maximal subgroup M of G such that  $M \in \mathscr{F}$  and  $G = MF(G)$ . Then  $G^{\mathscr{F}}/(G^{\mathscr{F}})'$ *is a chief factor of* G,  $G^{\mathscr{F}}$  *is a p-group for some prime p,*  $G^{\mathscr{F}}$  *has exponent* p *if*  $p > 2$  *and exponent at most* 4 *if*  $p = 2$ *. Moreover, either*  $G^{\mathscr{F}}$  *is elementary abelian* 

*or*  $(G^{\mathscr{F}})' = Z(G^{\mathscr{F}}) = \Phi(G^{\mathscr{F}})$  *is an elementary abelian group.* 

<span id="page-7-0"></span>**Lemma 2.9.** Let G be a p-solvable minimal non-p-supersolvable group, then  $G^{\mathscr{U}_p}$  is *a* p*-group.*

*Proof.* By Lemma [2.8\(](#page-6-0)1),  $G/\Phi(G)$  has the unique minimal normal subgroup  $F'(G)/\Phi(G)$ , where  $F'(G) = G^{\mathscr{U}_p} \Phi(G)$ , so  $F'(G)/\Phi(G)$  is an elementary abelian p-group since G is a p-solvable group. Otherwise,  $F'(G)/\Phi(G)$  is a p'-group and the p-supersolvability of  $G/\Phi(G)/F'(G)/\Phi(G)$  implies that  $G/\Phi(G)$  is p-supersolvable, thus G is p-supersolvable, a contradiction. Furthermore,  $\Phi(G) = 1$ . Now we have  $G^{\mathscr{U}_p}$  is solvable and  $F'(G) =$  $F(G)$ ,  $G = F(G)T$  for some maximal subgroup T of G. Now by Lemma [2.8\(](#page-6-0)2),  $G^{\mathscr{U}_p}$ is a p-group.  $\Box$ 

<span id="page-7-1"></span>**Lemma 2.10.** *Let* G *be a group and*  $\pi(G) = \{p_1, p_2, \cdots, p_n\}$ , *then*  $G^{\mathscr{U}} = G^{\mathscr{U}_{p_1}} G^{\mathscr{U}_{p_2}} \cdots G^{\mathscr{U}_{p_n}}$ .

*Proof.* It follows from the supersolvability of  $G/G^{\mathscr{U}}$  that  $G^{\mathscr{U}_{p_i}} \leq G^{\mathscr{U}}$  for all  $p_i \in \pi(G)$ , so  $G\mathscr{U}_{p_1}G\mathscr{U}_{p_2}\cdots G\mathscr{U}_{p_n}\leq G\mathscr{U}$ . Conversely, obviously,  $G/(G\mathscr{U}_{p_1}G\mathscr{U}_{p_2}\cdots G\mathscr{U}_{p_n})\in\mathscr{U}_{p_i}$  for any  $p_i \in \pi(G)$ , so  $G^{\mathscr{U}} \leq G^{\mathscr{U}_{p_1}}G^{\mathscr{U}_{p_2}} \cdots G^{\mathscr{U}_{p_n}}$ , as desired. П

#### 3 Basic properties

Now we give some elementary properties. Firstly, we have

**Proposition 3.1.** Let  $G = A \times B$  with  $(|A|, |B|) = 1$  and  $H \leq G$ , then  $N_{\mathscr{U}_p}(G, H) =$  $N_{\mathscr{U}_p}(A, A \cap H) \times B$  whenever  $p \in \pi(A)$  or  $A \times N_{\mathscr{U}_p}(B, B \cap H)$  whenever  $p \in \pi(B)$ .

*Proof.* By hypothesis, we may assume that  $p \in \pi(A) \setminus \pi(B)$ . Note that  $H = (H \cap$  $A) \times (H \cap B)$  and  $T = (T \cap A) \times (T \cap B)$ , so  $T^{\mathscr{U}_p} = (T \cap A)^{\mathscr{U}_p} \times (T \cap B)^{\mathscr{U}_p} = (T \cap A)^{\mathscr{U}_p}$ , where  $T \leq H$ . Now  $N_G(T^{\mathscr{U}_p}) = N_{A \times B}(T^{\mathscr{U}_p}) = N_A((T \cap A)^{\mathscr{U}_p}) \times B$ . We have

$$
N_{\mathscr{U}_p}(G, H) = \bigcap_{T \le H} N_G(T^{\mathscr{U}_p})
$$
  
= 
$$
(\bigcap_{T \le H} N_A((T \cap A)^{\mathscr{U}_p})) \times B
$$
  
= 
$$
(\bigcap_{T \le H \cap A} N_A(T^{\mathscr{U}_p})) \times B
$$
  
= 
$$
N_{\mathscr{U}_p}(A, A \cap H) \times B.
$$

 $\Box$ Similarly, if  $p \in \pi(B) \setminus \pi(A)$ , we have  $N_{\mathscr{U}_p}(G, H) = A \times N_{\mathscr{U}_p}(B, B \cap H)$ .

<span id="page-7-2"></span>**Proposition 3.2.** Let G be a p-solvable group, then the  $\mathscr{U}_p$ -residual of  $N_{\mathscr{U}_p}(G)$  is a p*-group.*

*Proof.* Denote  $X = N_{\mathscr{U}_p}(G)$ . We first prove this result in the case that  $X = G$ . Assume  $G \in \mathscr{U}_p$ , obviously  $G^{\mathscr{U}_p} = 1$  is a p-group. Assume now that  $G \notin \mathscr{U}_p$ , if  $O_p(G) > 1$ , then by Lemma [2.2\(](#page-5-1)2),  $G/O_p(G) = N_{\mathscr{U}_p}(G/O_p(G))$ . By induction on  $|G|, (G/O_p(G))^{\mathscr{U}_p} = N^{\mathscr{U}_p}_{\mathscr{U}_p}$  $\mathcal{U}_p^{\mathcal{U}_p}(G/O_p(G))$  is a p-group. Obviously  $G^{\mathcal{U}_p}$  is a p-group. If  $O_p(G) = 1$ , then for any  $K < G$ , by Lemma [2.2\(](#page-5-1)1),  $K = N_{\mathscr{U}_p}(K)$ , so by induction,  $K^{\mathscr{U}_p}$  is a p-group. Note that  $K^{\mathscr{U}_p} \leq G$ , so  $K^{\mathscr{U}_p} \leq O_p(G) = 1$ , this implies that G is a *p*-solvable minimal non-*p*-supersolvable group, now by Lemma [2.9,](#page-7-0)  $G^{\mathscr{U}_p}$  is a *p*-group.

Assume now that  $X < G$ , by Lemma [2.2\(](#page-5-1)1),  $X = X \cap N_{\mathscr{U}_p}(G) \leq N_{\mathscr{U}_p}(X) \leq X$ , so  $X = N_{\mathscr{U}_p}(X)$ . As a similar argument above, we also have the conclusion. □

Denote  $Z_{\infty}(G)$  be the terminal term of the ascending central series of G. As we know,  $Z_{\infty}(G) = \bigcap \{ N \leq G \mid Z(G/N) = 1 \}$ , we have the following similar result.

**Theorem 3.3.** Let G be a group, then  $N^{\infty}_{\mathscr{U}_p}(G) = \bigcap \{ N \leq G \mid N_{\mathscr{U}_p}(G/N) = 1 \}.$ 

*Proof.* Let  $N \trianglelefteq G$  such that  $N_{\mathcal{U}_p}(G/N) = 1$ , then  $N_{\mathcal{U}_p}(G/N) = 1$ . By Lemma [2.3\(](#page-5-2)2),  $N^{\infty}_{\mathscr{U}_p}(G)N/N \leq N^{\infty}_{\mathscr{U}_p}(G/N) = 1$ , so  $N^{\infty}_{\mathscr{U}_p}(G) \leq N$ , thus  $N^{\infty}_{\mathscr{U}_p}(G) \leq \bigcap \{N \leq G \mid$  $N_{\mathscr{U}_p}(G/N) = 1$ .

Conversely, choice the least positive integer n such that  $N^{\infty}_{\mathscr{U}_p}(G) = N^{\mathfrak{n}}_{\mathscr{U}_p}(G)$ . By definition,  $N_{\mathscr{U}_p}(G/N_{\mathscr{U}_p}^n(G)) = N_{\mathscr{U}_p}^{n+1}(G)/N_{\mathscr{U}_p}^n(G) = N_{\mathscr{U}_p}^n(G)/N_{\mathscr{U}_p}^n(G) = 1$ . Obviously,  $\bigcap \{N \leq G \mid N_{\mathscr{U}_p}(G/N) = 1\} \leq N_{\mathscr{U}_p}^{\infty}(G).$ 

Now we give some characterizations between  $N_{\mathscr{U}_p}(G,H)$  and  $C_G(H^{\mathscr{U}_p})$ .

<span id="page-8-0"></span>Theorem 3.4. *Let* G *be a* p*-solvable group and* H *a normal subgroup of* G*, then*  $N_{\mathscr{U}_p}(G,H) = 1$  if and only if  $C_G(H^{\mathscr{U}_p}) = 1$ .

*Proof.* As we know,  $C_G(H^{\mathscr{U}_p}) \leq N_{\mathscr{U}_p}(G,H)$ , the necessary is obviously. Assume now  $C_G(H^{\mathscr{U}_p}) = 1$ , we prove that  $N_{\mathscr{U}_p}(G,H) = 1$ . If not, let N be a minimal normal subgroup of G contained in  $N_{\mathscr{U}_p}(G,H)$ , if  $N \nleq H$ , then N normalize  $H^{\mathscr{U}_p}$ by definition, we have  $[N, H^{\mathscr{U}_p}] \leq N \cap H^{\mathscr{U}_p} = 1$  by the minimal normality of N, so  $N \leq C_G(H^{\mathscr{U}_p}) = 1$ , a contradiction. If  $H < G$ , then  $(H, H)$  satisfies our hypothesis. By induction on  $|G||H|$  and Lemma [2.1\(](#page-4-1)2),  $N \leq H \cap N_{\mathscr{U}_p}(G,H) \leq N_{\mathscr{U}_p}(H,H) = 1$ , a contradiction, thus  $H = G$ . Now by the p-solvability of G, N is a p'-group or an elementary abelian p-group. If N is a p'-group, then  $G/C_G(N) \in \mathscr{U}_p$ , otherwise, there is a minimal non-p-supersolvable subgroup  $T/C_G(N)$  of  $G/C_G(N)$ . Let  $T = C_G(N)L$ such that  $C_G(N) \cap L \leq \Phi(L)$ . Since  $L/\Phi(L) \leq T/C_G(N) \cong L/L \cap C_G(N)$  is a minimal non-p-supersolvable group, we have  $(L/\Phi(L))^{w_p} = L^{w_p} \Phi(L)/\Phi(L)$  is a p-group by Lemma [2.9.](#page-7-0) Now let  $P \in Syl_p(L^{\mathscr{U}_p})$ , then  $L^{\mathscr{U}_p} = P(L^{\mathscr{U}_p} \cap \Phi(L))$ . By Frattini argument,  $L = N_L(P)L^{\mathscr{U}_p} = N_L(P)P(L^{\mathscr{U}_p} \cap \Phi(L)) = N_L(P)$ , we have  $P \trianglelefteq L^{\mathscr{U}_p}$  and N normalize P, so  $P \leq C_G(N) \cap L \leq \Phi(L)$ , thus  $(L/\Phi(L))^{\mathscr{U}_p} = 1, L \in \mathscr{U}_p$ , contrary to our choice of  $T/C_G(N)$ . Consequently,  $G^{\mathscr{U}_p} \leq C_G(N)$ , hence  $N \leq C_G(G^{\mathscr{U}_p}) = 1$ , a contradiction. So N is an elementary abelian p-group and  $N \leq C_G(N)$ . Note that  $\Phi(G) \leq F(G) \leq C_G(N)$ , we consider the following two cases:

Case 1.  $\Phi(G) = C_G(N)$ .

In this case,  $F(G) = C_G(N) = \Phi(G) \leq F_p(G)$ , so  $N \leq \Phi(G)$ . By the *p*-solvability of G,  $F_p(G/\Phi(G)) = F_p(G)/\Phi(G) \neq 1$ , so  $\Phi(G) = F(G) < F_p(G)$ . Now follows from  $F_p(G)/O_{p'}(G) = O_{p'p}(G)/O_{p'}(G) = O_p(G/O_{p'}(G))$  that  $O_{p'}(G) > 1$ , so  $O_{p'}(G) \le$  $C_G(N) = \Phi(G)$ . On the other hand, Let  $P \in Syl_p(F_p(G))$ , then  $F_p(G) = [O_{p'}(G)]P$ . By the Frattini argument, we have  $G = F_p(G)N_G(P) = O_{p'}(G)N_G(P) = N_G(P)$ , so  $F_p(G) = P \times O_{p'}(G) = F(G)$ , a contradiction.

Case 2.  $\Phi(G) < C_G(N)$ .

In this case, if  $N \nleq \Phi(G)$ , then there exists some maximal subgroup M of G such that  $G = NM$  and  $N \cap M = 1$ . Obviously,  $(G/N)^{\mathscr{U}_p} = G^{\mathscr{U}_p}N/N \cong G^{\mathscr{U}_p}/G^{\mathscr{U}_p} \cap N \cong$  $M^{\mathscr{U}_p}$  and N normalize  $M^{\mathscr{U}_p}$ . By the minimal normality of N, we have  $G^{\mathscr{U}_p} \cap N = 1$ or  $G^{\mathscr{U}_p} \cap N = N$ . If the former holds, then  $N \leq C_G(G^{\mathscr{U}_p}) = 1$ , a contradiction. If the later holds, then  $G^{\mathscr{U}_p}/N \cong M^{\mathscr{U}_p}$ . On the other hand,  $[N, M^{\mathscr{U}_p}] = 1$ , so  $N \leq C_G(M^{\mathscr{U}_p}) \cap C_G(N) = C_G(G^{\mathscr{U}_p}) = 1$  since  $G^{\mathscr{U}_p} = NM^{\mathscr{U}_p} = N \times M^{\mathscr{U}_p}$ , a contradiction. Now if  $G = C_G(N)$ , then  $N \leq C_G(G^{\mathscr{U}_p}) = 1$ , a contradiction. So  $C_G(N) < G$ and we may chose a non-p-supersolvable subgroup L of G such that  $G = C_G(N)L$ and  $C_G(N) \cap L \leq \Phi(L)$ . Obviously, N normalize  $L^{\mathscr{U}_p}$  and  $N \cap L^{\mathscr{U}_p} \trianglelefteq G$ . Since N is a minimal normal subgroup of G, we have  $N \cap L^{\mathscr{U}_p} = 1$  or  $N \cap L^{\mathscr{U}_p} = N$ . If  $N \cap L^{\mathscr{U}_p} = 1$ , then  $L^{\mathscr{U}_p} \leq C_G(N) \cap L$ , so  $G/C_G(N) \cong L/L \cap C_G(N) \in \mathscr{U}_p$ , thus  $G^{\mathscr{U}_p} \leq C_G(N)$  and hence  $N \leq C_G(G^{\mathscr{U}_p}) = 1$ , a contradiction. Which implies that  $N \leq L^{\mathscr{U}_p}$ . Now by the fact  $G = C_G(N)L$  that N is a minimal normal subgroup of L. So  $F(L) = C<sub>L</sub>(N) = C<sub>G</sub>(N) \cap L = \Phi(L)$  and  $F(L) < F<sub>p</sub>(L)$ , as a similar argument of **Case 1**, we also have a contradiction that  $F_p(L) = F(L)$ . □

As corollaries of Theorem [3.4,](#page-8-0) we have

<span id="page-9-2"></span>Corollary 3.5. *Let* G *be a solvable group and* H *a normal subgroup of* G*, then*  $N_{\mathscr{U}}(G, H) = 1$  *if and only if*  $C_G(H^{\mathscr{U}}) = 1$ *.* 

<span id="page-9-0"></span>**Corollary 3.6.** Let G be a p-solvable group. Then  $N_{\mathscr{U}_p}(G) = 1$  if and only if  $C_G(G^{\mathscr{U}_p}) = 1.$ 

<span id="page-9-1"></span>**Corollary 3.7.** Let G be a p-solvable group, if  $Z(G^{\mathscr{U}_p}) = 1$ , then  $C_G(G^{\mathscr{U}_p}) = N_{\mathscr{U}_p}(G)$ .

*Proof.* By Corollary [3.6,](#page-9-0) we may assume that  $C_G(G^{\mathscr{U}_p}) > 1$ . Moreover, obviously,

 $C_G(G^{\mathscr{U}_p}) \leq N_{\mathscr{U}_p}(G)$ . Now consider  $G/C_G(G^{\mathscr{U}_p})$ , let

$$
gC_G(G^{\mathscr{U}_p}) \in C_{G/C_G(G^{\mathscr{U}_p})}((G/C_G(G^{\mathscr{U}_p})^{\mathscr{U}_p}) = C_{G/C_G(G^{\mathscr{U}_p})}(G^{\mathscr{U}_p}C_G(G^{\mathscr{U}_p})/C_G(G^{\mathscr{U}_p})),
$$

then  $[g, G^{\mathscr{U}_p}] \leq C_G(G^{\mathscr{U}_p}) \cap G^{\mathscr{U}_p} = Z(G^{\mathscr{U}_p}) = 1$ , thus  $g \in C_G(G^{\mathscr{U}_p})$  and  $C_{G/C_G(G^{\mathscr{U}_p})}(G/C_G(G^{\mathscr{U}_p})^{\mathscr{U}_p}) =$ 1. By Corollary [3.6,](#page-9-0) we have  $N_{\mathscr{U}_p}(G/C_G(G^{\mathscr{U}_p})) = \overline{1}$ , so by Lemma [2.2\(](#page-5-1)2),  $N_{\mathscr{U}_p}(G) \leq$  $C_G(G^{\mathscr{U}_p})$ , as desired. П

**Corollary 3.8.** Let G be a p-solvable group, then  $Z(G^{\mathscr{U}_p}) = 1$  if and only if  $G^{\mathscr{U}_p} \cap$  $N_{\mathscr{U}_p}(G) = 1.$ 

*Proof.* Since  $Z(G^{\mathscr{U}_p}) \leq G^{\mathscr{U}_p} \cap N_{\mathscr{U}_p}(G)$ , so the "only if" part is obviously. Now assume that  $Z(G^{\mathscr{U}_p}) = 1$ , it follows form Corollary [3.7](#page-9-1) that  $C_G(G^{\mathscr{U}_p}) = N_{\mathscr{U}_p}(G)$ , so  $G^{\mathscr{U}_p} \cap$  $N_{\mathscr{U}_p}(G) = G^{\mathscr{U}_p} \cap C_G(G^{\mathscr{U}_p}) = Z(G^{\mathscr{U}_p}) = 1$ , as desired.  $\Box$ 

**Theorem 3.9.** Let G be a group, then  $Z_{\infty}(G^{\mathscr{U}_p}) \leq N^{\infty}_{\mathscr{U}_p}(G)$ .

*Proof.* If  $Z(G^{\mathscr{U}_p}) = 1$ , obviously the result holds. So we assume  $Z(G^{\mathscr{U}_p}) > 1$ . Now,  $Z(G^{\mathscr{U}_p}) \leq N_{\mathscr{U}_p}(G)$  by definition. By induction on  $|G|$ ,  $Z_{\infty}(G^{\mathscr{U}_p}/Z(G^{\mathscr{U}_p})) =$  $Z_{\infty}((G/Z(G^{\mathscr{U}_{p}}))^{\mathscr{U}_{p}}) \leq N_{\mathscr{U}_{p}}^{\infty}(G/Z(G^{\mathscr{U}_{p}})),$  so  $Z_{\infty}(G^{\mathscr{U}_{p}}) \leq N_{\mathscr{U}_{p}}^{\infty}(G)$  by Lemma [2.3\(](#page-5-2)3).

As a similar argument above, we have

**Corollary 3.10.** *Let* G *be a group, then*  $Z_{\infty}(G^{\mathscr{U}}) \leq N^{\infty}_{\mathscr{U}_p}(G)$  *for every*  $p \in \pi(G)$ *.* 

At the end of this section, we investigate the relationship between  $N_{\mathscr{U}_p}(G,H)$  and  $N_{\mathscr{U}}(G,H).$ 

<span id="page-10-0"></span>**Lemma 3.11.** Let G be a group and H a subgroup of G, then  $\bigcap$  $p \in \pi(H)$  $N_{\mathscr{U}_p}(G,H) \leq$  $N_{\mathscr{U}}(G,H).$ 

*Proof.* Denote  $T = \bigcap$  $N_{\mathscr{U}_p}(G,H)$ , then for any subgroup K of H, by definition, T  $p{\in}\pi(G)$ normalize  $K^{\mathscr{U}_p}$  for every  $p \in \pi(K)$ . Now by Lemma [2.10,](#page-7-1) T normalize  $K^{\mathscr{U}}$  for any  $K \leq H$ , so  $T \leq N_{\mathcal{U}}(G, H)$ , as desired.  $\Box$ 

<span id="page-10-1"></span>**Lemma 3.12.** Let G be a group and H a subgroup of G. If  $H^{\mathscr{U}}$  is a p-group for some  $p \in \pi(H)$ *, where*  $\pi(H) = \{p_1, p_2, \cdots, p_n\}$ *, then*  $\bigcap$  $\bigcap_{p_i \in \pi(H)} N_{\mathscr{U}_{p_i}}(G, H) = N_{\mathscr{U}}(G, H).$ 

*Proof.* By Lemma [3.11,](#page-10-0) we only need to prove  $N_{\mathcal{U}}(G, H) \leq \bigcap$  $\bigcap_{p_i \in \pi(H)} N_{\mathscr{U}_{p_i}}(G,H)$ . Without loss of generality, we assume  $p = p_1$ . By Lemma [2.10,](#page-7-1)  $H^{\mathscr{U}_{p_i}}$  is a p-group for every  $p_i \in \pi(H)$ . Now if  $j \neq 1$ , the  $p_j$ -supersolvability of  $H/H^{\mathscr{U}_{p_j}}$  implies that  $H \in \mathscr{U}_{p_j}$ . Thus by Lemma [2.10,](#page-7-1)  $K^{\mathscr{U}} = K^{\mathscr{U}_p}$  for every subgroup K of H and  $G = N_{\mathscr{U}_{p_j}}(G, H)$ 

for every  $p \neq p_j \in \pi(H)$ , so  $\bigcap$  $\bigcap_{p_i \in \pi(H)} N_{\mathscr{U}_{p_i}}(G,H) = N_{\mathscr{U}_p}(G,H) = N_{\mathscr{U}}(G,H)$ , as desired.  $\Box$ 

<span id="page-11-1"></span>Theorem 3.13. *Let* G *be a solvable group and* H *a normal subgroup of* G*, then*  $\bigcap N_{\mathscr{U}_p}(G,H) = G$  if and only if  $N_{\mathscr{U}}(G,H) = G$ .  $p \in \pi(H)$ 

*Proof.* Denote  $\pi(H) = \{p_1, p_2, \dots, p_n\}$ , the " $\Rightarrow$ " part of this result follows from Lemma [3.11.](#page-10-0) Now we prove the " $\Leftarrow$ " part, this is equivalent to prove that  $N_{\mathscr{U}_{p_i}}(G,H)$  = G for arbitrary  $p_i \in \pi(H)$ . Assume false, then there is at least one prime, say p in  $\pi(H)$  such that  $N_{\mathscr{U}_p}(G,H) < G$ . If  $p \notin \pi(H^{\mathscr{U}_p})$ , then the p-supersolvability of  $H/H^{\mathscr{U}_p}$  implies that  $H \in \mathscr{U}_p$ , then  $H^{\mathscr{U}_p} = 1$ , so  $G = N_{\mathscr{U}_p}(G,H)$ , a contradic-tion. By Lemma [2.2\(](#page-5-1)1),  $H = N_{\mathcal{U}}(H)$ . So  $H^{\mathcal{U}}$  is nilpotent by [\[5,](#page-18-4) Theorem B]. Note that  $p \in \pi(H^{\mathscr{U}})$ , so there is a minimal normal subgroup N of G contained in  $O_p(H^{\mathscr{U}})$ . By Lemma [2.1,](#page-4-1)  $G/N = N_{\mathscr{U}}(G/N, H/N)$ . By induction on  $|G||H|$ , we have  $G/N = N_{\mathscr{U}_{p_i}}(G/N, H/N)$  for any  $p_i \in \pi(H)$ . Now by Proposition [3.2,](#page-7-2)  $(H/N)^{\mathscr{U}_{p_i}}$  is a  $p_i$ -group for any  $p_i \in \pi(H)$ . In particular,  $H^{\mathscr{U}_p}$  is a p-group. If there exists some  $p \neq p_i \in \pi(H)$  such that  $H^{\mathscr{U}_{p_i}} \neq 1$ , then as a similar proof above, there is a minimal normal subgroup T of G contained in  $O_{p_i}(H^{\mathscr{U}_{p_i}})$  such that  $G/T = N_{\mathscr{U}_p}(G/T, H/T)$ . For any subgroup K of H, we have  $(KT/T)^{\mathscr{U}_p} \trianglelefteq G/T$ , so  $K^{\mathscr{U}_p}T \trianglelefteq G$ . Note that  $[K^{\mathscr{U}_p}, T] \leq [H^{\mathscr{U}_p}, T] \leq H^{\mathscr{U}_p} \cap T = 1$  since  $p \neq p_i$ , hence  $K^{\mathscr{U}_p}$  char  $K^{\mathscr{U}_p} T \leq G$ , which implies that  $K^{\mathscr{U}_p} \trianglelefteq G$ . This is also contrary to that  $G = N_{\mathscr{U}_p}(G, H)$ . So  $H^{\mathscr{U}_{p_i}} = 1$ for any  $p \neq p_i \in \pi(H)$ , thus by Lemma [2.10,](#page-7-1)  $H^{\mathscr{U}} = H^{\mathscr{U}_{p_1}} H^{\mathscr{U}_{p_2}} \cdots H^{\mathscr{U}_{p_n}} = H^{\mathscr{U}_p}$  is a p-group, now by Lemma [3.12,](#page-10-1) we have  $\bigcap$  $\bigcap_{p_i \in \pi(H)} N_{\mathscr{U}_{p_i}}(G,H) = N_{\mathscr{U}}(G,H)$ , a contradiction.  $\Box$ 

<span id="page-11-0"></span>Theorem 3.14. *Let* G *be a solvable group and* H *a normal subgroup of* G*, then*  $\bigcap_{\mathscr{U}_p}(G,H) = 1$  if and only if  $N_{\mathscr{U}}(G,H) = 1$ .  $p \in \pi(H)$ 

*Proof.* Assume that  $N_{\mathscr{U}}(G, H) = 1$ , then by Lemma [3.11,](#page-10-0)  $\bigcap$  $N_{\mathscr{U}_p}(G,H) = 1.$  $p \in \pi(H)$ Now assume that  $\bigcap N_{\mathscr{U}_p}(G,H) = 1$ , since  $C_G(H^{\mathscr{U}}) \leq C_G(H^{\mathscr{U}_p}) \leq N_{\mathscr{U}_p}(G,H)$ , so  $p \in \pi(H)$  $1 = C_G(H^{\mathscr{U}}) \leq \bigcap$  $N_{\mathscr{U}_p}(G,H)$ . By Corollary [3.5,](#page-9-2)  $N_{\mathscr{U}}(G,H) = 1$ .  $\Box$  $p \in \pi(H)$ 

## 4  $\mathcal{N}_1$ -group

Let  $G$  be a group and  $H$  a subgroup of  $G$ . We now consider the case that  $G = N_{\mathscr{U}_p}(G, H)$ , i.e., G is an  $\mathscr{N}_1$ -group with respect to H and  $\mathscr{U}_p$ . Obviously, G is an  $\mathcal{M}_1$ -group with respect to H and  $\mathcal{U}_p$  if and only if  $K^{\mathcal{U}_p} \trianglelefteq G$  for every  $K \leq H$ . There are many groups which are  $\mathcal{N}_1$ -groups, here we list some of them.

**Proposition 4.1.** *The following groups are*  $\mathcal{N}_1$ -groups with respect to some subgroup H and  $\mathscr{U}_p$ :

*(1) All (*p*-)supersolvable groups.*

*(2) Groups with* H *a (*p*-)supersolvable subgroup.*

*(3) Groups all of whose non-(*p*-)supersolvable subgroups are normal.*

 $(4)$  *Groups with*  $G^{\mathscr{U}_p}$  *a cyclic subgroup.* 

*(5) Groups with a normal minimal non-*p*-supersolvable subgroup* H*.*

**Proposition 4.2.** Let G be an  $\mathcal{N}_1$ -group with respect to H and  $\mathcal{U}_p$ , then

*(1) For any*  $K \leq G$ , K *is an*  $\mathcal{N}_1$ -group with respect to  $H \cap K$  and  $\mathcal{U}_p$ ;

*(2)* Let  $N \leq G$  and  $N \leq H$ , then  $G/N$  is an  $\mathcal{N}_1$ -group with respect to  $H/N$  and  $\mathscr{U}_p$ ;

*Proof.* The proof of (1) and (2) follows from Lemmas  $2.1(2)(3)$  respectively.  $\Box$ 

In general, if both of a normal subgroup N and corresponding quotient group  $G/N$ are  $\mathcal{N}_1$ -groups with respect to themselves and  $\mathcal{U}_p$ , then G may be not an  $\mathcal{N}_1$ -group.

**Example 4.3.** Let  $G = \langle a, b, c, d \rangle \rtimes \langle e, f \rangle \cong C_2^4 \rtimes C_6$ , where  $e^2 = f^3 = 1$  and  $a^e = ac, b^e = bd, c^e = c, d^e = d, a^f = b, b^f = ab, c^f = d, d^f = cd$  (IdGroup=[96,70] in GAP [\[15\]](#page-19-2)). Let  $N = \langle a, b, c, d, e \rangle$ , then  $N = N_{\mathscr{U}_2}(N)$  and  $G/N = N_{\mathscr{U}_2}(G/N)$ . Now let  $H = \langle a, b, f \rangle \cong A_4$ , the alternating group of degree 4, then  $H^{\mathscr{U}_2} = \langle a, b \rangle$  is not normal in G, so G is not an  $\mathcal{N}_1$ -group with respect to itself and  $\mathcal{U}_2$ .

In the case  $\mathscr{F} \in \{ \mathscr{A}, \mathscr{N} \}$ , the solvability of  $N_{\mathscr{F}}(G)$  has been investigated by many scholars. For example, see [\[6,](#page-18-5) [7\]](#page-18-6). For the case  $\mathscr{F} = \mathscr{U}$ , we have

<span id="page-12-0"></span>**Theorem 4.4.** Let G be an  $\mathcal{N}_1$ -group with respect to itself and  $\mathcal{U}$ . Then G is *solvable. In particular,*  $N_{\mathcal{U}}(G)$  *and*  $N_{\mathcal{U}}^{\infty}$  *are solvable.* 

*Proof.* Obviously, every subgroup and every homomorphic image of G satisfies our hypothesis. If  $G$  is not solvable, then  $G$  is a non-abelian simple group. Let  $H$  be a proper subgroup of G, then  $H^{\mathscr{U}} \leq G$ , so  $H^{\mathscr{U}} = 1$  and H is supersolvable. This implies that  $G$  is a minimal non-supersolvable group. Now by Doerk's result [\[19](#page-19-6)],  $G$ is solvable, a contradiction.  $\Box$ 

Let H be a subgroup of G, for the case of  $\mathscr{F} = \mathscr{U}_p$ , the solvability of  $N_{\mathscr{U}_p}(G, H)$ does not always holds. Here, we have

<span id="page-13-0"></span>Theorem 4.5. *Let* G *be a group and* H *a subgroup of* G*, if* G *is an* N1*-group with respect to* H and  $\mathcal{U}_p$ , where p is the smallest prime in  $\pi(H)$ , then H is p-solvable.

*Proof.* Assume that the result is false and let the pair  $(G, H)$  be a counterexample with  $|G||H|$  minimal. By Feit-Thompson's theorem, we may assume that  $p = 2$ . If  $H < G$ , then by Lemma [2.1\(](#page-4-1)2),  $H = N_{\mathscr{U}_2}(H, H) = N_{\mathscr{U}_2}(H)$ , so H is 2-solvable by the choice of  $(G, H)$ , a contradiction. Now we assume that  $H = G$ , by hypothesis,  $G = N_{\mathscr{U}_2}(G)$ . If G is a non-abelian simple group, we prove the contradiction that G is a solvable simple group. Let K be any proper subgroup of G, then  $K^{\mathscr{U}_2} \trianglelefteq G$ , so  $K^{\mathscr{U}_2} = 1$  and K is 2-supersolvable. Which implies that G is a non-2-supersolvable group all of whose proper subgroups are 2-supersolvable. Now by  $[20, 1.1], G$  $[20, 1.1], G$  is solvable, a contradiction. Let  $N$  be a minimal normal subgroup of  $G$ , then Lemma [2.2](#page-5-1) implies that  $G/N = N_{\mathscr{U}_2}(G/N)$  and  $N = N_{\mathscr{U}_2}(N)$ , thus  $G/N$  and N are 2-solvable by our choice of  $(G, H)$ , hence G is 2-solvable, the finial contradiction complement our proof. Π

**Corollary 4.6.** Let G be a group and p is the smallest prime in  $\pi(G)$ . If G is an  $\mathcal{N}_1$ -group with respect to itself and  $\mathcal{U}_p$ , then G is p-solvable.

In Theorem [4.5,](#page-13-0) the restriction that p is smallest prime in  $\pi(H)$  is necessary. Furthermore, in general, we can't obtain the *p*-solvability of G even though  $p = 2$ .

Example 4.7. Let  $G = SL(2, 5)$ (IdGroup=[120,5], see [\[15](#page-19-2)]), then  $\pi(G) = \{2, 3, 5\}$ and G is not 2-solvable and not 3-solvable. But  $G = N_{\mathscr{U}_3}(G)$ .

Furthermore, G has a normal subgroup, say  $H \cong C_2$ , obviously,  $G = N_{\mathscr{U}_2}(G, H)$ . But we have the following obvious conclusions:

**Theorem 4.8.** Let G be a group and H a subgroup of G  $\cdot$  Assume G is an  $\mathcal{N}_1$ -group *with respect to* H and  $\mathcal{U}_p$ , where p *is the smallest prime divisor of* |H|*.* Then G *is* p*-solvable if one of the statement holds:*

*(1)*  $H \triangleleft G$  *and*  $G/H$  *is p-solvable; (2)*  $G^{\mathscr{U}_p} \leq H$ ;

**Theorem 4.9.** Let G be a group and P a Sylow p-subgroup of G. Assume that  $P \triangleleft G$ and *G* is an  $\mathcal{N}_1$ -group with itself and  $\mathcal{U}_p$ , then *G* is solvable.

<span id="page-13-1"></span>**Theorem 4.10.** Let G be a p-solvable  $\mathcal{N}_1$ -group with respect to itself and  $\mathcal{U}_p$ , then

*(1)*  $G^{\mathscr{U}_p}$  *is a p-group.* (2)  $N_{\mathscr{U}_p}(G/N) > 1$  *for any proper normal subgroup* N *of* G. *(3)*  $h_p(G) \leq 3$ *;* 

*Proof.* (1) It follows from Proposition [3.2.](#page-7-2)

(2) Let N be a proper normal subgroup of G, by Lemma [2.2\(](#page-5-1)2),  $G/N = N_{\mathscr{U}_p}(G/N)$ , so  $N_{\mathscr{U}_p}(G/N) > 1$  by our choice of N.

(3) By (1),  $G^{\mathscr{U}_p}$  is a p-group, then  $G^{\mathscr{U}_p} \leq F_p(G)$ . Consider  $\bar{G} = G/F_p(G)$ , then  $\bar{G}$ is p-supersolvable, thus  $\bar{G}' = G'F_p(G)/F_p(G)$  is p-nilpotent. So  $h_p(G) \leq h_p(\bar{G}) + 1 \leq$  $h_p(\bar{G}/\bar{G}') + h_p(\bar{G}') + 1 = 3.$ 

As a corollary of Theorem [4.10,](#page-13-1) we have

**Corollary 4.11.** Let G be a  $\mathcal{N}_1$ -group with respect to itself and  $\mathcal{U}_p$  for every  $p \in \pi(G)$ , *then*

*(1)* G *is solvable. (2)*  $G = N_{\mathscr{U}}(G)$ .  $(3)$   $G^{\mathscr{U}}$  *is nilpotent.*  $(4) G/N \in \mathcal{N}\mathcal{U}$  for every normal subgroup N of G. *(5)*  $h(G) < 3$ . *(6)*  $l_r(G) \leq 2$  *for every*  $r \in \pi(G)$ *.* 

*Proof.* (1) Let  $p \in \pi(G)$  be the smallest prime, if  $p > 2$ , obviously G is solvable by the well know Feit-Thompson Theorem. If  $p = 2$ , then by Theorem [4.5,](#page-13-0) G is 2-solvable, so G is solvable, as desired.

(2) By hypothesis,  $G = N_{\mathscr{U}_p}(G)$  for every  $p \in \pi(G)$ . Now by Theorem [3.13,](#page-11-1)  $G = N_{\mathscr{U}}(G)$ .

(3) Let  $p \in \pi(G)$ , if  $G \in \mathscr{U}_p$ , then  $G^{\mathscr{U}_p} = 1$ , if  $G \notin \mathscr{U}_p$ , by Theorem [4.10\(](#page-13-1)1),  $G^{\mathscr{U}_p}$  is a p-group. Now assume  $\pi(G) = \{p_1, p_2, \cdots, p_n\}$ , then by Lemma [2.10,](#page-7-1)  $G^{\mathscr{U}} =$  $G^{\mathscr{U}_{p_1}}G^{\mathscr{U}_{p_2}}\cdots G^{\mathscr{U}_{p_n}}$ , so  $G^{\mathscr{U}}$  is nilpotent.

(4) By (2),  $G^{\mathscr{U}}$  is nilpotent. Let N be a proper normal subgroup of G, then  $(G/N)^{\mathscr{U}} = G^{\mathscr{U}} N/N \cong G^{\mathscr{U}}/G^{\mathscr{U}} \cap N$  is nilpotent, as desired.

 $(5)$  It follows from Theorem [4.10\(](#page-13-1)3).

(6) If  $O_{r'}(G) > 1$ , then  $N_{\mathscr{U}_p}(G/O_{r'}(G)) = G/O_{r'}(G)$  for every  $p \in \pi(G)$  by Lemma [2.2\(](#page-5-1)2), so  $G/O_{r'}(G)$  satisfies our hypothesis. By induction,  $l_r(G/O_{r'}(G)) \leq 2$ , which implies that  $l_r(G) \leq 2$ . As a similarly argument above and by Lemma [2.4,](#page-5-3) we have  $l_r(G) = l_r(G/\Phi(G)) \leq 2$ , hence we may assume that  $O_{r'}(G) = \Phi(G) = 1$ , so  $F(G) = F<sub>r</sub>(G) = O<sub>r</sub>(G)$ . Now consider  $G/F(G)$ , by (5),  $h(G/F(G)) \leq 2$ . Now by Lemma [2.7,](#page-6-1)  $l_r(G/F(G)) = l_r(G/O_r(G)) \leq 1$ , so  $l_r(G) \leq l_r(G/O_r(G)) + 1 \leq 2$ , as desired. □

Recall that the well-know results of P.Hall and D.J.S. Robinson as follows:

Theorem 4.12. *Let* G *be a group and* N *a nilpotent normal subgroup of* G*. Then (1) (P. Hall) If* G/N′ *is nilpotent, then* G *is nilpotent.*

*(2) (D.J.S. Robinson). If* G/N′ *is supersolvable, then* G *is supersolvable.*

Here we have

**Theorem 4.13.** Let G be a p-solvable  $\mathcal{N}_1$ -group with respect to itself and  $\mathcal{U}_p$ . Then  $G \in \mathcal{N}$  if  $G^{\mathcal{N}} \leq G^{\mathcal{U}_{p}^{2}}$ .

**Theorem 4.14.** Let G be an  $\mathcal{N}_1$ -group with respect to itself and  $\mathcal{U}$ . Then  $G \in \mathcal{U}$  if  $G^{\mathscr{U}} \leq G^{\mathscr{U}^2}.$ 

#### 5 Applications

<span id="page-15-0"></span>Theorem 5.1. *Let* G *be a* p*-solvable group, then the following statements are equivalent:*

 $(1)$   $G \in \mathcal{N}_n\mathcal{U}_n$ .  $(2) G/N_{\mathscr{U}_p}(G) \in \mathscr{N}_p \mathscr{U}_p.$ 

*Proof.* (1) $\Rightarrow$  (2). It is obviously.

 $(2) \Rightarrow (1)$ . Assume the result is false and let G be a counterexample of minimal order. If  $N_{\mathscr{U}_p}(G) = 1$ , there is nothing to prove. Now we assume that  $N_{\mathscr{U}_p}(G)$ 1. Let N be a minimal normal subgroup of G contained in  $N_{\mathscr{U}_p}(G)$ . Then either N is an elementary abelian p-group or a p'-group. Note that  $G/N/N_{\mathscr{U}_p}(G/N) \leq$  $G/N/N_{\mathscr{U}_p}(G)/N \cong G/N_{\mathscr{U}_p}(G)$  by Lemma [2.2\(](#page-5-1)2), then  $G/N \in \mathscr{N}_p \mathscr{U}_p$  by the choice of G. So we may assume that N is an elementary abelian p-group, otherwise,  $G^{\mathscr{U}_p}N/N \cong$  $G^{\mathscr{U}_p}/(G^{\mathscr{U}_p}\cap N)\in \mathscr{N}_p$ , so  $G\in \mathscr{N}_p\mathscr{U}_p$  by Lemma [2.5\(](#page-5-0)2), a contradiction. Furthermore, if  $N \leq \Phi(G)$ , then  $G/\Phi(G) \in \mathcal{N}_p \mathcal{U}_p$ , so  $G^{\mathcal{U}_p} \Phi(G)/\Phi(G) \in \mathcal{N}_p$ , hence  $G \in \mathcal{N}_p \mathcal{U}_p$  by Lemma [2.5\(](#page-5-0)1), a contradiction again. Now there exist some maximal subgroup  $M$ of G such that  $G = MN$  and  $M \cap N = 1$ . Also we have  $M^{\mathscr{U}_p} = (G/N)^{\mathscr{U}_p} \in \mathscr{N}_p$ . Note that  $N \leq N_{\mathscr{U}_p}(G)$ , then N normalize  $M^{\mathscr{U}_p}$ , thus  $[N, M^{\mathscr{U}_p}]=1$  and  $NM^{\mathscr{U}_p}=1$  $N \times M^{\mathscr{U}_p} \trianglelefteq G$ . Since  $G/NM^{\mathscr{U}_p} = MN/NM^{\mathscr{U}_p} = MNM^{\mathscr{U}_p}/NM^{\mathscr{U}_p} \cong M/M \cap NM^{\mathscr{U}_p} =$  $M/M^{\mathscr{U}_p} \in \mathscr{U}_p$ , then  $G^{\mathscr{U}_p} \leq NM^{\mathscr{U}_p} \in \mathscr{N}_p$ , a contradiction.  $\Box$ 

<span id="page-15-1"></span>**Corollary 5.2.** Let G be a p-solvable group, if  $G = N^{\infty}_{\mathcal{U}_p}(G)$ , then *(1) G* ∈  $\mathcal{N}_p\mathcal{U}_p$ *.* (2)  $N^{\infty}_{\mathscr{U}_p}(G/N) > 1$  *for any proper normal subgroup* N *of* G. *(3)*  $h_p(G) \leq 3$ ;

*Proof.* (1) Set  $G = N_{\mathscr{U}_p}^n(G)$  for some positive integer n. If  $n = 1$ , the result follows from Theorem [4.10\(](#page-13-1)1). If  $n \geq 2$ , then  $N_{\mathscr{U}_p}(G) < G$ . By Lemma [2.3,](#page-5-2)  $G/N_{\mathscr{U}_p}(G) =$  $N^{\infty}_{\mathscr{U}_p}(G/N_{\mathscr{U}_p}(G))$ , so  $G/N_{\mathscr{U}_p}(G)$  satisfies our hypothesis, thus  $G/N_{\mathscr{U}_p}(G) \in \mathscr{N}_p \mathscr{U}_p$  by induction on |G|. Now by Theorem [5.1,](#page-15-0)  $G \in \mathcal{N}_p\mathcal{U}_p$ , as desired.

(2) If there exists some proper normal subgroup N of G such that  $N^{\infty}_{\mathscr{U}_p}(G/N) = 1$ , then  $G = N^{\infty}_{\mathscr{U}_p}(G) \leq N$  by Lemma [2.3\(](#page-5-2)3), that is impossible.

 $\Box$ 

The proof of  $(3)$  is similar to Theorem 4.10 $(3)$ .

We have proved in Theorem [4.4](#page-12-0) that G is solvable if  $G = N^{\infty}_{\mathscr{U}}(G)$ . Now as similar argument above, we have

<span id="page-16-0"></span>**Corollary 5.3.** Let G be a group, if  $G = N^{\infty}_{\mathcal{U}}(G)$ , then

- $(1)$   $G \in \mathcal{N}\mathcal{U}$ .
- *(2)*  $h(G) \leq 3$ *.*

*(3)*  $l_p(G) \leq 2$  *for every*  $p \in \pi(G)$ *.* 

<span id="page-16-1"></span>**Theorem 5.4.** *Let* G *be a group and*  $p \in \pi(G)$ *.* 

(1) Assume G is p-solvable, then  $h_p(G) \leq k$  if and only if  $h_p(G/N_{\mathcal{U}_p}^{\infty}(G)) \leq k$ , *where*  $k > 3$ *.* 

(2) Assume *G* is solvable, then  $l_p(G) \leq k$  if and only if  $l_p(G/N_{\mathcal{U}}^{\infty}(G)) \leq k$ , where  $k > 2$ .

*Proof.* We only prove (1) since the proof of (2) is similar and based on Corollary [5.3\(](#page-16-0)4). The " $\Rightarrow$ " part of this theorem is obviously, so we prove the " $\Leftarrow$ " part. Setting  $N^{\infty}_{\mathscr{U}_p}(G) = N^{\bar{n}}_{\mathscr{U}_p}(G)$  for some positive integer n. If  $G = N^{\bar{n}}_{\mathscr{U}_p}(G)$ , then the result follows form Corollary [5.2\(](#page-15-1)3). So we assume that  $N_{\mathscr{U}_p}^n(G) < G$ .

Assume that the result is false and let the pair  $(G, n)$  be a counterexample with  $n|G|$  minimal. For the case  $n = 1$ , we have  $h_p(G/N_{\mathscr{U}_p}(G)) \leq k$  by hypothesis. Let N be a minimal normal subgroup of G, then by Lemma [2.2\(](#page-5-1)2),  $G/N/N_{\mathscr{U}_p}(G/N) \leq$  $G/N/N_{\mathscr{U}_p}(G)N/N \cong G/N_{\mathscr{U}_p}(G)N \cong G/N_{\mathscr{U}_p}(G)/N_{\mathscr{U}_p}(G)N/N_{\mathscr{U}_p}(G)$ , so  $h_p(G/N/N_{\mathscr{U}_p}(G/N)) \le$ k by Lemma [2.6\(](#page-5-4)2), thus  $h_p(G/N) \leq k$  by the choice of  $(G, 1)$ . Suppose that N is not unique, that is G has at least two minimal normal subgroups, say  $N_1$ ,  $N_2$  and  $N_1 \neq N_2$ , then as above,  $h_p(G/N_1)$ ,  $h_p(G/N_2) \leq k$ , so  $h_p(G) \leq k$  by Lemma [2.6\(](#page-5-4)4), a contradiction. With similar argument and by using of Lemma [2.6\(](#page-5-4)5), we have  $\Phi(G) = 1$ . Furthermore, if  $O_{p'}(G) > 1$ , then it follows from Lemma [2.6\(](#page-5-4)6) that  $h_p(G/O_{p'}(G)) = h_p(G) \leq k$ , a contradiction. So  $F_p(G) = F(G) = C_G(N) = N \leq$  $N_{\mathscr{U}_p}(G)$ . Therefore,  $G = MN$ ,  $M \cap N = 1$  for some maximal subgroup M of G. If  $M^{\mathscr{U}_p} = 1$ , that is  $G/N$  is p-supersolvable, so  $G/N = N_{\mathscr{U}_p}(G/N) = N_{\mathscr{U}_p}(G/N) =$  $N^{\infty}_{\mathscr{U}_p}(G)/N$ , thus  $G = N^{\infty}_{\mathscr{U}_p}(G)$ , a contradiction. If  $M^{\mathscr{U}_p} > 1$ , then N normalize  $M^{\mathscr{U}_p}$ , so  $[N, M^{\mathscr{U}_p}] = 1$  and hence  $M^{\mathscr{U}_p} \leq C_G(N) = N$ ,  $M^{\mathscr{U}_p} \leq N \cap M = 1$ , a contradiction again. Now assume that  $n > 1$ , since  $G/N_{\mathscr{U}_p}^n(G) \cong G/N_{\mathscr{U}_p}^{n-1}(G)/N_{\mathscr{U}_p}^n(G)/N_{\mathscr{U}_p}^{n-1}(G)$  $G/N_{\mathscr{U}_p}^{n-1}(G)/N_{\mathscr{U}_p}(G/N_{\mathscr{U}_p}^{n-1}(G))$ , so by induction and combining the proof of the case  $n = 1$ , we have that  $h_p(G/N_{\mathscr{U}_p}^{n-1}(G)) \leq k$ , hence  $h_p(G) \leq k$  by our choice of  $(G, n)$ , a contradiction.  $\Box$ 

<span id="page-17-1"></span>Theorem 5.5. *Let* G *be a* p*-solvable group. If all elements of order* p *and order* 4*(if*  $p = 2$ *)* of G are in  $N^{\infty}_{\mathscr{U}_p}(G)$ , then  $h_p(G) \leq 3$ .

*Proof.* Assume that the result is false and let G be a counterexample with minimal order, we prove this result by several steps:

**Step 1.** Let  $H < G$ , then  $h_p(H) \leq 3$ .

Let H be a proper subgroup of G, then all elements of H of order  $p$  and order  $4$  (if  $p = 2$ ) are contained in  $H \cap N^{\infty}_{\mathscr{U}_p}(G) \leq N^{\infty}_{\mathscr{U}_p}(H)$  by Lemma [2.3\(](#page-5-2)1), so H satisfies our hypothesis,  $h_p(H) \leq 3$  by the choice of G.

**Step 2.**  $O_{p'}(G) = 1$ ,  $C_G(O_p(G)) \le O_p(G) = F(G)$ .

Let  $T = O_{p'}(G)$ , if  $T \neq 1$ , for any  $xT \in N^{\infty}_{\mathscr{U}_p}(G)T/T$  with  $|x| = p$  or  $|x| = 4$ (if  $p = 2$ ,  $xT \leq N^{\infty}_{\mathscr{U}_p}(G/T)$  by Lemma [2.3\(](#page-5-2)3), so  $G/T$  satisfies our hypothesis, thus  $h_p(G/T) \leq 3$  by the choice of G. It is easy to see that  $h_p(G) \leq 3$ , a contradiction. Further more, we have  $C_G(O_n(G)) \leq O_n(G) = F(G)$  since G is p-solvable and  $O_{p'}(G) = 1.$ 

Step 3.  $\Phi(G) < O_p(G)$ .

By (2),  $\Phi(G) \le O_p(G)$ , if  $O_p(G) = \Phi(G)$ , then  $O_{pp'}(G)/\Phi(G) = O_{p'}(G/\Phi(G)) > 1$ since G is p-solvable and  $O_p(G/\Phi(G)) = 1$ . Let  $O_{pp'}(G) = \Phi(G)T$ , where  $T > 1$  is a p'-group, then  $G = N_G(T)O_{pp'}(G) = N_G(T)$  by Frattini argument, it follows that  $T \trianglelefteq G$  and then  $T \leq O_{p'}(G) = 1$  by **Step** 2, a contradiction.

Step 4. Finial contradiction.

Denote by  $\mathscr{F}_p$  the class of all p-solvable groups whose p-Fitting length are less than 3, then by Lemma [2.6,](#page-5-4)  $\mathscr{F}_p$  is a saturated formation. Now by Step 1, G is an  $\mathscr{F}_p$ -critical group, i.e, G is not belongs to  $\mathscr{F}_p$ , but all proper subgroups of G belong to  $\mathscr{F}_p$ . Now by **Steps** 1,3, there exists some maximal subgroup M of G such that  $G = O_p(G)M = F(G)M$  and  $M \in \mathscr{F}_p$ , so by Lemma [2.8\(](#page-6-0)2),  $G^{\mathscr{F}_p}$  is a p-group and  $G^{\mathscr{F}_p}$  has exponent p if  $p > 2$  and exponent at most 4 if  $p = 2$ , hence  $G^{\mathscr{F}_p} \leq O_p(G)$ and  $G^{\mathscr{F}_p} \leq N^{\infty}_{\mathscr{U}_p}(G)$ , it follows that  $h_p(G/N^{\infty}_{\mathscr{U}_p}(G)) \leq 3$ . Now by Theorem [5.4\(](#page-16-1)2),  $h_p(G) \leq 3$ , a contradiction.  $\Box$ 

<span id="page-17-2"></span>Corollary 5.6. *Let* G *be a* p*-solvable group, if every cyclic subgroup of order prime* p and order  $4(if\ p = 2)$  of G is contained in  $N_{\mathscr{U}_p}(G)$ , then  $h_p(G) \leq 3$ .

Combining Theorem [5.4,](#page-16-1) Lemma [2.4](#page-5-3) and Lemma [2.8,](#page-6-0) we have the following Theorem [5.7.](#page-17-0) It's proof is similar to Theorem [5.5.](#page-17-1)

<span id="page-17-0"></span>Theorem 5.7. *Let* G *be a solvable group, if every cyclic subgroup of order prime* p *and order*  $4(if\ p = 2)$  of G *is contained in*  $N^{\infty}_{\mathcal{U}}(G)$ *, then*  $l_p(G) \leq 2$ *.* 

As a local vision of Theorem [5.7,](#page-17-0) we have the following question.

<span id="page-18-9"></span>Question 5.8. *Let* G *be a* p*-solvable group, if every cyclic subgroup of order prime* p and order  $4(if\ p = 2)$  of G is contained in  $N^{\infty}_{\mathscr{U}_p}(G)$ , does  $l_p(G) \leq 2^{\frac{p}{2}}$ 

Remark 5.9. *(1) In Theorem [5.5,](#page-17-1) Corollary [5.6](#page-17-2) and Question [5.8,](#page-18-9) the Theorem [4.5](#page-13-0) implies the hypothesises that* G *is* p*-solvable are necessary. For example, consider*  $G = A_5$ , the alternating group of degree 5, then  $G = N_{\mathscr{U}_3}(G) = N_{\mathscr{U}_5}(G)$ , so  $G$  satisfies *our condition, but* G *is simple.*

*(2) In Theorem [5.7,](#page-17-0) the solvability of* G *is necessary. For example, choice the non-solvable group*  $G = C_7 \times A_5(IdGroup=[420,13])$  and let  $p = 7$ . Then  $N_{\mathcal{U}}(G)$  $N^{\infty}_{\mathscr{U}}(G) = C_7$  and every cyclic subgroup of order 7 is in  $C_7$ .

*(3) In Question [5.8,](#page-18-9) the integer 2 is the minimum upper bound. For example, let*  $G = C_5 \times S_4$  *(IdGroup=[120,37] in GAP). Obviously, G is 2-solvable and the proper non-2-supersolvable groups of* G *isomorphism to one of*  $A_4$ ,  $S_4$ ,  $C_5 \times A_4$ . As  $A_4, S_4, C_5 \times A_4$  are normal in G, so  $G = N_{\mathscr{U}_2}(G)$ . Note that  $1 < C_5 < C_{10} \times C_2 <$  $C_5 \times A_4 < C_5 \times S_4 = G$  *is the upper 2-series of*  $G$ *, so*  $l_2(G) = 2$ *.*
