On singularity of energy measures for symmetric diffusions with full off-diagonal heat kernel estimates II: Some borderline examples

Naotaka Kajino

Research Institute for Mathematical Sciences, Kyoto University
nkajino@kurims.kyoto-u.ac.jp

Abstract. We present a concrete family of fractals, which we call the *(two-dimensional) thin scale irregular Sierpiński gaskets* and each of which is equipped with a canonical strongly local regular symmetric Dirichlet form. We prove that any fractal K in this family satisfies the full off-diagonal heat kernel estimates with some space-time scale function Ψ_K and the singularity of the associated energy measures with respect to the canonical volume measure (uniform distribution) on K , and also that the decay rate of $r^{-2}\Psi_K(r)$ to 0 as $r \downarrow 0$ can be made arbitrarily slow by suitable choices of K . These results together support the energy measure singularity dichotomy conjecture [*Ann. Probab.* **48** (2020), no. 6, 2920–2951, Conjecture 2.15] stating that, if the full off-diagonal heat kernel estimates with space-time scale function Ψ satisfying $\lim_{r \downarrow 0} r^{-2}\Psi(r) = 0$ hold for a strongly local regular symmetric Dirichlet space with complete metric, then the associated energy measures are singular with respect to the reference measure of the Dirichlet space.

Keywords: Thin scale irregular Sierpiński gasket, singularity of energy measure, sub-Gaussian heat kernel estimate

Acknowledgements. The author would like to thank Martin T. Barlow for his valuable suggestion in [3] of the family of fractals studied in this paper as possible examples to examine the validity of the energy measure singularity dichotomy conjecture (Conjecture 1.3 below). The author was supported in part by JSPS KAKENHI Grant Number JP18H01123.

1 Introduction

This paper is a follow-up of the author’s recent joint work [26] with Mathav Murugan on singularity of energy measures associated with a strongly local regular symmetric Dirichlet space $(K, d, m, \mathcal{E}, \mathcal{F})$ satisfying full off-diagonal heat kernel estimates. The \mathcal{E} -energy measure $\mu_{\langle u \rangle}$ of $u \in \mathcal{F}$ is a Borel measure on K which plays, in the theory of regular symmetric Dirichlet forms as presented in

[17,13], the same roles as the classical energy integral measure $|\nabla u|^2 dx$ on \mathbb{R}^N . It is defined for $u \in \mathcal{F} \cap L^\infty(K, m)$ as the unique Borel measure on K such that

$$\int_K f d\mu_{\langle u \rangle} = \mathcal{E}(u, fu) - \frac{1}{2}\mathcal{E}(u^2, f) \quad \text{for any } f \in \mathcal{F} \cap \mathcal{C}_c(K), \quad (1.1)$$

where $\mathcal{C}_c(K)$ denotes the space of \mathbb{R} -valued continuous functions on K with compact supports, and then for $u \in \mathcal{F}$ by $\mu_{\langle u \rangle}(A) := \lim_{n \rightarrow \infty} \mu_{\langle (-n)v(u \wedge n) \rangle}(A)$ for each Borel subset A of K ; see [17, Theorem 1.4.2-(ii),(iii), (3.2.13), (3.2.14) and (3.2.15)] for the details of this definition.

The main results of [26] concern the singularity and the absolute continuity of the \mathcal{E} -energy measures $\mu_{\langle u \rangle}$ with respect to the reference measure m . While $\mu_{\langle u \rangle}$ is easily identified as $\langle \nabla u, \nabla u \rangle_x dm(x)$ if $\mathcal{E} = \int_K \langle \nabla \cdot, \nabla \cdot \rangle_x dm(x)$ for some linear differential operator ∇ satisfying the Leibniz rule and some measurable field $\langle \cdot, \cdot \rangle_x$ of non-negative definite symmetric bilinear forms, there is no simple expression of $\mu_{\langle u \rangle}$ and the nature of $\mu_{\langle u \rangle}$ is a deep mystery when K is a fractal. The question of whether $\mu_{\langle u \rangle}$ is singular with respect to m is probably the most fundamental one toward better understanding of $\mu_{\langle u \rangle}$ in such cases, had been answered affirmatively for essentially all known examples of self-similar Dirichlet forms on self-similar fractals in [30,31,11,23,24], but had been studied only under the assumption of exact self-similarity until [26]. As the main results of [26], it has been now proved that the \mathcal{E} -energy measures $\mu_{\langle u \rangle}$ are singular or absolutely continuous with respect to m according to whether the behavior of the associated heat kernel $p_t(x, y)$ in infinitesimal scale is “sufficiently sub-Gaussian” or “Gaussian”, as stated in the following theorem. Recall that a family $\{p_t\}_{t \in (0, \infty)}$ of $[-\infty, \infty]$ -valued Borel measurable functions on $K \times K$ is called a *heat kernel* of $(K, d, m, \mathcal{E}, \mathcal{F})$ if and only if the symmetric Markovian semigroup $\{T_t\}_{t \in (0, \infty)}$ on $L^2(K, m)$ associated with $(\mathcal{E}, \mathcal{F})$ is expressed as $T_t u = \int_K p_t(\cdot, y)u(y) dm(y)$ m -a.e. for any $t \in (0, \infty)$ and any $u \in L^2(K, m)$. We set $\text{diam}(K, d) := \sup_{x, y \in K} d(x, y)$ and $B_d(x, r) := \{y \in K \mid d(x, y) < r\}$ for $(x, r) \in K \times (0, \infty)$.

Theorem 1.1 (A simplification of [26, Theorem 2.13]). *Let $(K, d, m, \mathcal{E}, \mathcal{F})$ be a metric measure Dirichlet space, i.e., a strongly local regular symmetric Dirichlet space with (K, d) complete and K containing at least two elements, so that $\text{diam}(K, d) \in (0, \infty]$. Let $\Psi: [0, \infty) \rightarrow [0, \infty)$ be a homeomorphism satisfying*

$$c_\Psi^{-1} \left(\frac{R}{r} \right)^{\beta_0} \leq \frac{\Psi(R)}{\Psi(r)} \leq c_\Psi \left(\frac{R}{r} \right)^{\beta_1} \quad \text{for any } r, R \in (0, \infty) \text{ with } r \leq R \quad (1.2)$$

for some $c_\Psi, \beta_0, \beta_1 \in [1, \infty)$ with $1 < \beta_0 \leq \beta_1$, and define $\Phi_\Psi: [0, \infty) \rightarrow [0, \infty)$ by $\Phi_\Psi(s) := \sup_{r \in (0, \infty)} (s/r - 1/\Psi(r))$. Suppose further that $(K, d, m, \mathcal{E}, \mathcal{F})$ satisfies the full off-diagonal heat kernel estimates fHKE(Ψ), i.e., that there exist a heat kernel $\{p_t\}_{t \in (0, \infty)}$ of $(K, d, m, \mathcal{E}, \mathcal{F})$ and $c_1, c_2, c_3, c_4 \in (0, \infty)$ such that

$$\frac{c_1 \exp(-c_2 t \Phi_\Psi(d(x, y)/t))}{m(B_d(x, \Psi^{-1}(t)))} \leq p_t(x, y) \leq \frac{c_3 \exp(-c_4 t \Phi_\Psi(d(x, y)/t))}{m(B_d(x, \Psi^{-1}(t)))} \quad \text{fHKE}(\Psi)$$

for m -a.e. $x, y \in K$ for each $t \in (0, \infty)$. Then the following hold:

- (1) (**fHKE**(Ψ) with “sufficiently sub-Gaussian” Ψ implies singularity) *If*

$$\liminf_{\lambda \rightarrow \infty} \liminf_{r \downarrow 0} \frac{\lambda^2 \Psi(r/\lambda)}{\Psi(r)} = 0, \quad (1.3)$$

then $\mu_{\langle u \rangle}$ is singular with respect to m for any $u \in \mathcal{F}$.

- (2) (**fHKE**(Ψ) with “Gaussian” Ψ implies absolute continuity) *If*

$$\limsup_{r \downarrow 0} \frac{\Psi(r)}{r^2} > 0, \quad (1.4)$$

then $m(A) = 0$ if and only if $\sup_{u \in \mathcal{F}} \mu_{\langle u \rangle}(A) = 0$ for each Borel subset A of K , thus in particular $\mu_{\langle u \rangle}$ is absolutely continuous with respect to m for any $u \in \mathcal{F}$, and there exist $r_1 \in (0, \text{diam}(K, d))$ and $c_5 \in [1, \infty)$ such that

$$c_5^{-1} r^2 \leq \Psi(r) \leq c_5 r^2 \quad \text{for any } r \in (0, r_1). \quad (1.5)$$

Remark 1.2. Let $\Psi: [0, \infty) \rightarrow [0, \infty)$ be a homeomorphism satisfying (1.2) for some $c_\Psi, \beta_0, \beta_1 \in [1, \infty)$ with $1 < \beta_0 \leq \beta_1$, and let $(K, d, m, \mathcal{E}, \mathcal{F})$ be a metric measure Dirichlet space satisfying **fHKE**(Ψ).

- (1) It is known that in this situation $(K, d, m, \mathcal{E}, \mathcal{F})$ satisfies the assumptions of [26, Theorem 2.13], namely VD, **PI**(Ψ), **CS**(Ψ) and the chain condition for (K, d) . Indeed, VD follows in the same way as [8, Proof of Lemma 5.1-(i)] by integrating the lower inequality in **fHKE**(Ψ) on $B_d(x, 2\Psi^{-1}(t))$ with respect to m and applying the upper bound on $\Phi_\Psi(R, t) := t\Phi_\Psi(R/t)$ in [20, (5.13)], (1.2) and the inequality $\int_{B_d(x, 2\Psi^{-1}(t))} p_t(x, y) dm(y) \leq \int_K p_t(x, y) dm(y) \leq 1$ for m -a.e. $x \in K$. Then VD and **fHKE**(Ψ) imply **PI**(Ψ) and **CS**(Ψ) by the results in [6,7,1,19] as summarized in [32, Theorem 3.2] and [26, Theorem 2.8 and Remark 2.9], and **fHKE**(Ψ) also implies the chain condition for (K, d) by [33, Theorem 2.11].
- (2) *If $\Psi_0: [0, \infty) \rightarrow [0, \infty)$ is a homeomorphism and $\Psi_0(r)/\Psi(r) \in [c_0^{-1}, c_0]$ for any $r \in (0, \infty)$ for some $c_0 \in [1, \infty)$, then $(K, d, m, \mathcal{E}, \mathcal{F})$ satisfies **fHKE**(Ψ_0). Indeed, this is immediate from **fHKE**(Ψ), VD, which is implied by **fHKE**(Ψ) as noted in (1) above, and the elementary observation based on (1.2) that $\Phi_{\Psi_0}(s)/\Phi_\Psi(s) \in [(c_0 c_\Psi)^{-\frac{1}{\beta_0-1}}, (c_0 c_\Psi)^{\frac{1}{\beta_0-1}}]$ for any $s \in (0, \infty)$.*

Note that, if $\Psi(r) = r^\beta$ for any $r \in [0, \infty)$ for some $\beta \in (1, \infty)$, then $\Phi(s) = \beta^{-\frac{\beta}{\beta-1}} (\beta-1) s^{\frac{\beta}{\beta-1}}$ for any $s \in [0, \infty)$, so that **fHKE**(Ψ) with this Ψ is the typical form of heat kernel estimates known to hold widely; see, e.g., [36,37,35,18] and references therein for the studies on the case of $\beta = 2$ and [10,29,16,4,5] for known results with $\beta > 2$ for self-similar fractals. For this class of Ψ , the classification by (1.3) and (1.4) gives a complete dichotomy between $\beta > 2$ and $\beta \leq 2$, with the latter identified further as $\beta = 2$ by (1.5). On the other hand, (1.3) and (1.4) do not give a complete classification of general Ψ since there are examples of Ψ , like $\Psi(r) = r^2 / \log(e-1+r^{-1})$, satisfying (1.2) but neither (1.3) nor (1.4), and it is not clear under **fHKE**(Ψ) with such Ψ whether the \mathcal{E} -energy measures $\mu_{\langle u \rangle}$ are singular or absolutely continuous with respect to the reference measure m . In view of Theorem 1.1, one might expect the following conjecture to hold.

Conjecture 1.3 (Energy measure singularity dichotomy; a simplification of [26, Conjecture 2.15]). *Theorem 1.1-(1) with (1.3) replaced by*

$$\lim_{r \downarrow 0} \frac{\Psi(r)}{r^2} = 0 \quad (1.6)$$

(fHKE(Ψ) with “however weakly sub-Gaussian” Ψ implies singularity) *holds.*

As announced already in [26, Remark 2.14], this paper is aimed at giving a clear evidence that Conjecture 1.3 should be true, by presenting concrete examples of metric measure Dirichlet spaces satisfying both the singularity of the energy measures and fHKE(Ψ) for some Ψ , whose decay rate at 0 can be made arbitrarily close to r^2 . Their state spaces are certain fractals, which we call the (two-dimensional) thin scale irregular Sierpiński gaskets (see Figure 2 below), obtained by modifying the construction of the scale irregular (or homogeneous random) Sierpiński gaskets studied in [21,9,22] (see also [28, Chapter 24]) so as to make them look very much like one-dimensional frames in infinitesimal scale. An arbitrarily slow decay rate of $\Psi(r)/r^2$ as $r \downarrow 0$ can be then realized by choosing suitably the parameters defining the fractal to make its infinitesimal geometry arbitrarily close to being one-dimensional, which is an idea suggested to the author by Martin T. Barlow in [3]. An important point here is to allow *infinitely* many patterns of cell subdivisions to be present in the construction of the fractal, in contrast to that of the usual scale irregular Sierpiński gaskets considered in [21,9,22,28], each of which involves only finitely many patterns of cell subdivisions and typically falls within the scope of Theorem 1.1-(1) as illustrated in [26, Section 5]. We remark that the singularity of the energy measures has been proved also in [25] for a class of (two-dimensional) spatially inhomogeneous Sierpiński gaskets, which typically do not satisfy the volume doubling property VD and are thereby beyond the scope of [26, Theorem 2.13].

The rest of this paper is organized as follows. In Section 2 we define the thin scale irregular Sierpiński gaskets and construct the canonical Dirichlet forms (resistance forms) on them, and we verify in Section 3 that they satisfy fHKE(Ψ) with Ψ explicit in terms of their defining parameters (Theorem 3.3). In Section 4 we prove the singularity of the energy measures for the canonical Dirichlet form on *any* thin scale irregular Sierpiński gasket (Theorem 4.3), and Section 5 is devoted to stating and proving our last main result that an arbitrarily slow decay rate of $\Psi(r)/r^2$ can be realized by some thin scale irregular Sierpiński gasket (Theorem 5.1 and Proposition 5.2).

Notation. In this paper, we adopt the following notation and conventions.

- (1) The symbols \subset and \supset for set inclusion *allow* the case of the equality.
- (2) $\mathbb{N} := \{n \in \mathbb{Z} \mid n > 0\}$, i.e., $0 \notin \mathbb{N}$.
- (3) The cardinality (the number of elements) of a set A is denoted by $\#A$.
- (4) We set $a \vee b := \max\{a, b\}$, $a \wedge b := \min\{a, b\}$, $a^+ := a \vee 0$, $a^- := -(a \wedge 0)$ and $\lfloor a \rfloor := \max\{n \in \mathbb{Z} \mid n \leq a\}$ for $a, b \in \mathbb{R}$, and we use the same notation also for \mathbb{R} -valued functions and equivalence classes of them. All numerical functions in this paper are assumed to be $[-\infty, \infty]$ -valued.

- (5) The Euclidean inner product and norm on \mathbb{R}^2 are denoted by $\langle \cdot, \cdot \rangle$ and $|\cdot|$, respectively.
- (6) Let K be a non-empty set. We define $\text{id}_K: K \rightarrow K$ by $\text{id}_K(x) := x$, $\mathbb{1}_A = \mathbb{1}_A^K \in \mathbb{R}^K$ for $A \subset K$ by $\mathbb{1}_A(x) := \mathbb{1}_A^K(x) := \begin{cases} 1 & \text{if } x \in A, \\ 0 & \text{if } x \notin A, \end{cases}$ set $\mathbb{1}_x := \mathbb{1}_x^K := \mathbb{1}_{\{x\}}$ for $x \in K$ and $\|u\|_{\text{sup}} := \|u\|_{\text{sup}, K} := \sup_{x \in K} |u(x)|$ for $u: K \rightarrow \mathbb{R}$.
- (7) Let K be a topological space. We set $\mathcal{C}(K) := \{u \in \mathbb{R}^K \mid u \text{ is continuous}\}$, and the closure of $K \setminus u^{-1}(0)$ in K is denoted by $\text{supp}_K[u]$ for each $u \in \mathcal{C}(K)$. The Borel σ -algebra of K is denoted by $\mathcal{B}(K)$.
- (8) Let (K, d) be a metric space. We set $B_d(x, r) := \{y \in K \mid d(x, y) < r\}$ for $(x, r) \in K \times (0, \infty)$.
- (9) Let (K, \mathcal{B}) be a measurable space and let μ, ν be measures on (K, \mathcal{B}) . We write $\nu \ll \mu$ and $\nu \perp \mu$ to mean that ν is absolutely continuous and singular, respectively, with respect to μ .

2 The examples: Thin scale irregular Sierpiński gaskets

In this section, we introduce the (two-dimensional) thin scale irregular Sierpiński gaskets, and construct the canonical Dirichlet forms (resistance forms) on them by applying the standard method developed in [27, Chapters 2 and 3]. We closely follow [26, Section 5] for the presentation of this section.

To start with, the thin scale irregular Sierpiński gaskets are defined as follows.

Definition 2.1 (Thin scale irregular Sierpiński gasket). Let $q_0, q_1, q_2 \in \mathbb{R}^2$ satisfy $|q_j - q_k| = 1$ for any $j, k \in \{0, 1, 2\}$ with $j \neq k$, so that the convex hull Δ of $V_0 := \{q_0, q_1, q_2\}$ in \mathbb{R}^2 is a closed equilateral triangle with side length 1. For each $l \in \mathbb{N} \setminus \{1, 2, 3, 4\}$, we set

$$S_l := \{(i_1, i_2) \in (\mathbb{N} \cup \{0\})^2 \mid i_1 + i_2 \leq l - 1, i_1 i_2 (l - 1 - i_1 - i_2) = 0\}, \quad (2.1)$$

and for each $i = (i_1, i_2) \in S_l$ set $q_i^l := q_0 + \sum_{k=1}^2 (i_k/l)(q_k - q_0)$ and define $f_i^l: \mathbb{R}^2 \rightarrow \mathbb{R}^2$ by $f_i^l(x) := q_i^l + l^{-1}(x - q_0)$. Let $\mathbf{l} = (l_n)_{n=1}^\infty \in (\mathbb{N} \setminus \{1, 2, 3, 4\})^\mathbb{N}$, set $W_n^{\mathbf{l}} := \prod_{k=1}^n S_{l_k}$ for $n \in \mathbb{N} \cup \{0\}$, $W_*^{\mathbf{l}} := \bigcup_{n=0}^\infty W_n^{\mathbf{l}}$, $|w| := n$ and $f_w^{\mathbf{l}} := f_{w_1}^{l_1} \circ \dots \circ f_{w_n}^{l_n}$ for $n \in \mathbb{N} \cup \{0\}$ and $w = w_1 \dots w_n \in W_n^{\mathbf{l}}$, where $W_0^{\mathbf{l}}$ is defined as the singleton $\{\emptyset\}$ of the empty word \emptyset and $f_\emptyset^{\mathbf{l}} := \text{id}_{\mathbb{R}^2}$. Noting that $\{\bigcup_{w \in W_n^{\mathbf{l}}} f_w^{\mathbf{l}}(\Delta)\}_{n=0}^\infty$ is a strictly decreasing sequence of non-empty compact subsets of Δ , we define the

Figure 1. The level- l (self-similar) thin Sierpiński gaskets K^l ($l = 5, 6, 7, 8$)

Figure 2. A level- l thin scale irregular Sierpiński gasket K^l ($l = (5, 7, 6, 12, \dots)$)

(two-dimensional) level- l thin scale irregular Sierpiński gasket K^l as the non-empty compact subset of Δ given by

$$K^l := \bigcap_{n=0}^{\infty} \bigcup_{w \in W_n^l} f_w^l(\Delta) \quad (2.2)$$

(see Figure 2), and set $K_w^l := K^l \cap f_w^l(\Delta)$ and $F_w^l := f_w^l|_{K_w^l}$ for $w \in W_*^l$, where $l^k := (l_{n+k})_{n=1}^{\infty}$ for $k \in \mathbb{N} \cup \{0\}$. We also set $V_n^l := \bigcup_{w \in W_n^l} f_w^l(V_0)$ for $n \in \mathbb{N} \cup \{0\}$ and $V_*^l := \bigcup_{n=0}^{\infty} V_n^l$, so that $V_0^l = V_0$, $\{V_n^l\}_{n=0}^{\infty}$ is a strictly increasing sequence of finite subsets of K^l , and V_*^l is dense in K^l .

In particular, for each $l \in \mathbb{N} \setminus \{1, 2, 3, 4\}$ we let $l_l := (l)_{n=1}^{\infty}$ denote the constant sequence with value l , set $K^l := K^{l_l}$ and $V_n^l := V_n^{l_l}$ for $n \in \mathbb{N} \cup \{0\}$, and call K^l the (two-dimensional) level- l thin Sierpiński gasket, which is exactly self-similar in the sense that $K^l = \bigcup_{i \in S_l} f_i^l(K^l)$ (see Figure 1 and, e.g., [27, Section 1.1]).

We fix an arbitrary $l = (l_n)_{n=1}^{\infty} \in (\mathbb{N} \setminus \{1, 2, 3, 4\})^{\mathbb{N}}$ in the rest of this section. The following proposition is immediate from Definition 2.1.

Proposition 2.2. (1) Let $w = w_1 \dots w_{|w|}, v = v_1 \dots v_{|v|} \in W_*^l \setminus \{\emptyset\}$ satisfy $w_k \neq v_k$ for some $k \in \{1, \dots, |w| \wedge |v|\}$. Then $\#(K_w^l \cap K_v^l) \leq 1$ and

$$f_w^l(\Delta) \cap f_v^l(\Delta) = K_w^l \cap K_v^l = F_w^l(V_0) \cap F_v^l(V_0). \quad (2.3)$$

- (2) $K^l = \bigcup_{w \in W_n^l} K_w^l$ for any $n \in \mathbb{N} \cup \{0\}$, and $F_w^l(K^{l|w|}) = K_w^l$ for any $w \in W_*^l$.
 (3) $V_{n+k}^l = \bigcup_{w \in W_n^l} F_w^l(V_k^{l^n})$ and $V_*^l = \bigcup_{w \in W_n^l} F_w^l(V_*^{l^n})$ for any $n, k \in \mathbb{N} \cup \{0\}$.

In exactly the same way as in [21,9,22] (see also [28, Part 4]), we can define a canonical strongly local regular symmetric Dirichlet space $(K^l, d_l, m_l, \mathcal{E}^l, \mathcal{F}_l)$ over K^l . First, the metric d_l on K^l is defined as follows.

Definition 2.3. We define $d_l: K^l \times K^l \rightarrow [0, \infty]$ by

$$d_l(x, y) := \inf\{\ell_{\mathbb{R}^2}(\gamma) \mid \gamma: [0, 1] \rightarrow K^l, \gamma \text{ is continuous, } \gamma(0) = x, \gamma(1) = y\}, \quad (2.4)$$

where $\ell_{\mathbb{R}^2}(\gamma)$ denotes the Euclidean length of γ , i.e., the total variation of the \mathbb{R}^2 -valued map γ with respect to the Euclidean norm $|\cdot|$. We also set $L_n^l := l_1 \dots l_n$ ($L_0^l := 1$) for $n \in \mathbb{N} \cup \{0\}$.

Proposition 2.4. d_l is a metric on K^l , and it is geodesic, i.e., for any $x, y \in K^l$ there exists $\gamma: [0, 1] \rightarrow K^l$ such that $\gamma(0) = x, \gamma(1) = y$ and $d_l(\gamma(s), \gamma(t)) = |s - t|d_l(x, y)$ for any $s, t \in [0, 1]$. Moreover,

$$|x - y| \leq d_l(x, y) \leq 6|x - y| \quad \text{for any } x, y \in K^l. \quad (2.5)$$

Proof. This proof is similar to [9, Proof of Lemma 2.4], but some additional argument is required to take care of the possible unboundedness of $l = (l_n)_{n=1}^\infty$. It is immediate from (2.4) that $|x - y| \leq d_l(x, y) < \infty$ for any $x, y \in K^l$ and thereby that d_l is a metric on K^l , which is also geodesic by [12, Proposition 2.5.19]; indeed, the infimum in (2.4) is easily seen to be attained for each $x, y \in K$, by choosing a sequence $\{\gamma_n\}_{n=1}^\infty$ of continuous maps as in (2.4) with $\lim_{n \rightarrow \infty} \ell_{\mathbb{R}^2}(\gamma_n) = d_l(x, y)$, reparameterizing them by arc length on the basis of [12, Proposition 2.5.9], and applying to them the Arzelà–Ascoli theorem [12, Theorem 2.5.14] and the lower semi-continuity [12, Proposition 2.3.4-(iv)] of $\ell_{\mathbb{R}^2}$ with respect to pointwise convergence.

Thus it remains to prove the upper inequality in (2.5) for any $x, y \in K^l$ with $x \neq y$. First, for any $w \in W_*^l$ and any $x \in K_w^l$, we easily see that

$$\max_{k \in \{0, 1, 2\}} d_l(F_w^l(q_k), x) \leq \sum_{n=|w|+1}^\infty \frac{\frac{3}{2}l_n - \frac{5}{2}}{L_n^l} \leq \frac{\frac{3}{2}l_{|w|+1} - \frac{5}{2} + \sum_{n=0}^\infty \frac{3}{2}(\frac{1}{5})^n}{L_{|w|}^l l_{|w|+1}} < \frac{\frac{3}{2}}{L_{|w|}^l}, \quad (2.6)$$

from which it further follows that for any $j, k \in \{0, 1, 2\}$ with $j \neq k$,

$$d_l(F_w^l(q_k), x) \leq 5|\langle x - F_w^l(q_k), e_{k,j} \rangle|, \quad (2.7)$$

where $e_{k,j} := q_j - q_k$. Now let $x, y \in K^l$ satisfy $x \neq y$ and set $n_0 := \min\{n \in \mathbb{N} \mid \{x, y\} \not\subset K_w^l \text{ for any } w \in W_n^l\}$, so that $x, y \in K_w^l$ for a unique $w \in W_{n_0-1}^l$

by Proposition 2.2-(1). If $K_{wi_x}^l \cap K_{wi_y}^l \neq \emptyset$ for some $i_x, i_y \in S_{l_{n_0}}$ with $x \in K_{wi_x}^l$ and $y \in K_{wi_y}^l$, then $i_x \neq i_y$ by the definition of n_0 , $q_{x,y} = F_{wi_x}^l(q_k) = F_{wi_y}^l(q_j)$ for the unique element $q_{x,y}$ of $K_{wi_x}^l \cap K_{wi_y}^l$ and some $j, k \in \{0, 1, 2\}$ with $j \neq k$ by Proposition 2.2-(1), and from (2.7) we obtain

$$\begin{aligned} d_l(x, y) &\leq d_l(x, q_{x,y}) + d_l(q_{x,y}, y) \\ &\leq 5|\langle x - q_{x,y}, e_{k,j} \rangle| + 5|\langle q_{x,y} - y, e_{k,j} \rangle| = 5|\langle x - y, e_{k,j} \rangle| \leq 5|x - y|. \end{aligned}$$

On the other hand, if $K_{wi_x}^l \cap K_{wi_y}^l = \emptyset$ for any $i_x, i_y \in S_{l_k}$ with $x \in K_{wi_x}^l$ and $y \in K_{wi_y}^l$, then setting

$$n_1 := \min \left\{ n \in \mathbb{N} \mid \begin{array}{l} \text{there exists } \{i_k\}_{k=0}^n \subset S_{l_{n_0}} \text{ such that } x \in K_{wi_0}^l, y \in K_{wi_n}^l \\ \text{and } K_{wi_{k-1}}^l \cap K_{wi_k}^l \neq \emptyset \text{ for any } k \in \{1, \dots, n\} \end{array} \right\},$$

we have $2 \leq n_1 \leq \frac{3}{2}l_{n_0} - \frac{5}{2}$, $L_{n_0}^l d_l(x, y) \leq \frac{3}{2} + (n_1 - 1) + \frac{3}{2} = n_1 + 2 \leq \frac{3}{2}l_{n_0}$ by (2.6), $\frac{2}{\sqrt{3}}L_{n_0}^l|x - y| \geq (\frac{1}{2}l_{n_0} - 1) \wedge \lfloor \frac{1}{2}n_1 \rfloor$, and thus $d_l(x, y)/|x - y| \leq \frac{10}{\sqrt{3}} < 6$. \square

Next, the canonical volume measure m_l on K^l is defined as follows.

Definition 2.5. We define m_l as the unique Borel measure on K^l such that

$$m_l(K_w^l) = \frac{1}{M_{|w|}^l} \quad \text{for any } w \in W_*^l, \quad (2.8)$$

where $M_n^l := (\#S_{l_1}) \cdots (\#S_{l_n}) = \prod_{k=1}^n (3l_k - 3)$ ($M_0^l := 1$) for $n \in \mathbb{N} \cup \{0\}$.

The measure m_l can be considered as the ‘‘uniform distribution on K^l ’’. Its uniqueness stated in Definition 2.5 is immediate from the Dynkin class theorem (see, e.g., [15, Appendixes, Theorem 4.2]). It is also easily seen to be obtained as $m_l = (\prod_{n=1}^{\infty} \text{unif}(S_{l_n}))(\pi_l^{-1}(\cdot))$, where $\text{unif}(S_{l_n})$ denotes the uniform distribution on S_{l_n} , $\prod_{n=1}^{\infty} \text{unif}(S_{l_n})$ their product probability measure on $\prod_{n=1}^{\infty} S_{l_n}$ (see, e.g., [14, Theorem 8.2.2] for its unique existence) and $\pi_l: \prod_{n=1}^{\infty} S_{l_n} \rightarrow K^l$ the continuous surjection given by $\{\pi_l((\omega_n)_{n=1}^{\infty})\} := \bigcap_{n=1}^{\infty} K_{\omega_1 \dots \omega_n}^l$.

Now we turn to the construction of the canonical Dirichlet form (resistance form) $(\mathcal{E}^l, \mathcal{F}_l)$ on K^l , which is achieved by taking the ‘‘inductive limit’’ of a certain canonical sequence of discrete Dirichlet forms on the finite sets $\{V_n^l\}_{n=0}^{\infty}$ via the standard method presented in [27, Chapters 2 and 3] (see also [2, Sections 6 and 7]). The whole construction is based on the following definition and lemma.

Definition 2.6. Recalling that $V_0^l = V_0$, we define a non-negative definite symmetric bilinear form $\mathcal{E}^0: \mathbb{R}^{V_0} \times \mathbb{R}^{V_0} \rightarrow \mathbb{R}$ on $\mathbb{R}^{V_0} = \mathbb{R}^{V_0^l}$ by

$$\mathcal{E}^0(u, v) := \frac{1}{2} \sum_{j,k=0}^2 (u(q_j) - u(q_k))(v(q_j) - v(q_k)), \quad u, v \in \mathbb{R}^{V_0}, \quad (2.9)$$

and set $r_l := (\frac{2}{3}l + \frac{1}{9})^{-1}$ for each $l \in \mathbb{N} \setminus \{1, 2, 3, 4\}$.

The value of r_l is specifically chosen in order for the following lemma to hold.

Lemma 2.7. *Let $l \in \mathbb{N} \setminus \{1, 2, 3, 4\}$. Then for any $u \in \mathbb{R}^{V_0}$,*

$$\min \left\{ \sum_{i \in S_l} \mathcal{E}^0(v \circ F_i^l|_{V_0}, v \circ F_i^l|_{V_0}) \mid v \in \mathbb{R}^{V_l^l}, v|_{V_0} = u \right\} = r_l \mathcal{E}^0(u, u). \quad (2.10)$$

Proof. This is immediate from a direct calculation using the Δ -Y transform (see, e.g., [27, Lemma 2.1.15]). \square

We would like to define a bilinear form $\mathcal{E}^{l,n}$ on $\mathbb{R}^{V_n^l}$ for each $n \in \mathbb{N}$ as the sum of the copies of (2.9) on $\{F_w^l(V_0)\}_{w \in W_n^l}$ and then to take their limit as $n \rightarrow \infty$, which is enabled by introducing the scaling factors R_n^l suggested by Lemma 2.7 as in the following definition.

Definition 2.8. For each $n \in \mathbb{N} \cup \{0\}$, we define a non-negative definite symmetric bilinear form $\mathcal{E}^{l,n} : \mathbb{R}^{V_n^l} \times \mathbb{R}^{V_n^l} \rightarrow \mathbb{R}$ on $\mathbb{R}^{V_n^l}$ by

$$\mathcal{E}^{l,n}(u, v) := \frac{1}{R_n^l} \sum_{w \in W_n^l} \mathcal{E}^0(u \circ F_w^l|_{V_0}, v \circ F_w^l|_{V_0}), \quad u, v \in \mathbb{R}^{V_n^l}, \quad (2.11)$$

where $R_n^l := r_{l_1} \cdots r_{l_n} = \prod_{k=1}^n (\frac{2}{3}l_k + \frac{1}{9})^{-1}$ ($R_0^l := 1$), so that $\mathcal{E}^{l,0} = \mathcal{E}^0$.

Proposition 2.9. *The sequence $\{\mathcal{E}^{l,n}\}_{n=0}^\infty$ of forms is compatible, i.e., for any $n, k \in \mathbb{N} \cup \{0\}$ and any $u \in \mathbb{R}^{V_n^l}$,*

$$\min \{ \mathcal{E}^{l,n+k}(v, v) \mid v \in \mathbb{R}^{V_{n+k}^l}, v|_{V_n^l} = u \} = \mathcal{E}^{l,n}(u, u). \quad (2.12)$$

Proof. This is immediate from an induction on k based on Lemma 2.7. \square

Proposition 2.9 allows us to take the ‘‘inductive limit’’ of $\{\mathcal{E}^{l,n}\}_{n=0}^\infty$ as in the following definition. Note that $\{\mathcal{E}^{l,n}(u|_{V_n^l}, u|_{V_n^l})\}_{n=0}^\infty \subset [0, \infty)$ is non-decreasing by (2.12) and hence has a limit in $[0, \infty]$ for any $u \in \mathbb{R}^{V_*^l}$.

Definition 2.10. We define a linear subspace \mathcal{F}_l of $\mathbb{R}^{V_*^l}$ and a non-negative definite symmetric bilinear form $\mathcal{E}^l : \mathcal{F}_l \times \mathcal{F}_l \rightarrow \mathbb{R}$ on \mathcal{F}_l by

$$\mathcal{F}_l := \left\{ u \in \mathbb{R}^{V_*^l} \mid \lim_{n \rightarrow \infty} \mathcal{E}^{l,n}(u|_{V_n^l}, u|_{V_n^l}) < \infty \right\}, \quad (2.13)$$

$$\mathcal{E}^l(u, v) := \lim_{n \rightarrow \infty} \mathcal{E}^{l,n}(u|_{V_n^l}, v|_{V_n^l}) \in \mathbb{R}, \quad u, v \in \mathcal{F}_l. \quad (2.14)$$

Then applying [27, Lemma 2.2.2, Proposition 2.2.4, Lemma 2.2.5 and Theorem 2.2.6] on the basis of Proposition 2.9, we obtain the following proposition. See [27, Definition 2.3.1] or [28, Definition 3.1] for the notion of resistance forms.

Proposition 2.11. *$(\mathcal{E}^l, \mathcal{F}_l)$ is a resistance form on V_*^l , i.e., the following hold:*

$$(RF1) \quad \{u \in \mathcal{F}_l \mid \mathcal{E}^l(u, u) = 0\} = \mathbb{R}1_{V_*^l}.$$

- (RF2) $(\mathcal{F}_l/\mathbb{R}\mathbf{1}_{V_*^l}, \mathcal{E}^l)$ is a Hilbert space.
(RF3) $\{u|_V \mid u \in \mathcal{F}_l\} = \mathbb{R}^V$ for any non-empty finite subset V of V_*^l .
(RF4) $R_{\mathcal{E}^l}(x, y) := \sup\left\{\frac{|u(x) - u(y)|^2}{\mathcal{E}^l(u, u)} \mid u \in \mathcal{F}_l \setminus \mathbb{R}\mathbf{1}_{V_*^l}\right\} < \infty$ for any $x, y \in V_*^l$.
(RF5) $u^+ \wedge 1 \in \mathcal{F}_l$ and $\mathcal{E}^l(u^+ \wedge 1, u^+ \wedge 1) \leq \mathcal{E}^l(u, u)$ for any $u \in \mathcal{F}_l$.

Moreover, $R_{\mathcal{E}^l}: V_*^l \times V_*^l \rightarrow [0, \infty)$ is a metric on V_*^l , called the resistance metric of $(\mathcal{E}^l, \mathcal{F}_l)$, and for any $u \in \mathcal{F}_l$ and any $x, y \in V_*^l$,

$$|u(x) - u(y)|^2 \leq R_{\mathcal{E}^l}(x, y)\mathcal{E}^l(u, u). \quad (2.15)$$

Recalling Proposition 2.2-(3), we also see from the above construction that the following (non-exact) self-similarity of $(\mathcal{E}^l, \mathcal{F}_l)$ holds.

Proposition 2.12. *Let $n \in \mathbb{N} \cup \{0\}$. Then*

$$\mathcal{F}_l = \{u \in \mathbb{R}^{V_*^l} \mid u \circ F_w^l|_{V_*^{l^n}} \in \mathcal{F}_l^n \text{ for any } w \in W_n^l\}, \quad (2.16)$$

$$\mathcal{E}^l(u, v) = \frac{1}{R_n^l} \sum_{w \in W_n^l} \mathcal{E}^{l^n}(u \circ F_w^l|_{V_*^{l^n}}, v \circ F_w^l|_{V_*^{l^n}}) \quad \text{for any } u, v \in \mathcal{F}_l. \quad (2.17)$$

Proof. It follows from Proposition 2.2-(3) and (2.11) that for each $n, k \in \mathbb{N} \cup \{0\}$,

$$\mathcal{E}^{l, n+k}(u, v) = \frac{1}{R_n^l} \sum_{w \in W_n^l} \mathcal{E}^{l^n, k}(u \circ F_w^l|_{V_k^{l^n}}, v \circ F_w^l|_{V_k^{l^n}}) \quad \text{for any } u, v \in \mathbb{R}^{V_{n+k}^l},$$

which together with (2.13) and (2.14) immediately yields (2.16) and (2.17). \square

Lemma 2.13. *For any $w \in W_*^l$ and any $x, y \in V_*^{l|w|}$,*

$$R_{\mathcal{E}^l}(F_w^l(x), F_w^l(y)) \leq R_{|w|}^l R_{\mathcal{E}^{l|w|}}(x, y). \quad (2.18)$$

Proof. This is immediate from Proposition 2.12 and Proposition 2.11-(RF4). \square

Later we will use the following definition and proposition several times.

Definition 2.14. Let $h \in \mathbb{R}^{V_*^l}$ and $n \in \mathbb{N} \cup \{0\}$. We say that h is \mathcal{E}^l -harmonic off V_n^l if and only if $h \in \mathcal{F}_l$ and

$$\begin{aligned} \mathcal{E}^l(h, h) &= \min\{\mathcal{E}^l(v, v) \mid v \in \mathcal{F}_l, v|_{V_n^l} = h|_{V_n^l}\}, \\ \text{or equivalently, } \mathcal{E}^l(h, v) &= 0 \quad \text{for any } v \in \mathcal{F}_l \text{ with } v|_{V_n^l} = 0. \end{aligned} \quad (2.19)$$

We set $\mathcal{H}_{l, n} := \{h \in \mathbb{R}^{V_*^l} \mid h \text{ is } \mathcal{E}^l\text{-harmonic off } V_n^l\}$, which is a linear subspace of \mathcal{F}_l .

Proposition 2.15. *Let $n \in \mathbb{N} \cup \{0\}$. Then for each $h \in \mathbb{R}^{V_*^l}$, the following four conditions (1), (2), (3) and (4) are equivalent to each other and imply (5) below:*

- (1) $h \in \mathcal{H}_{l, n}$.

- (2) $\sum_{y \in V_{n+k}^l, L_{n+k}^l d_l(x,y)=1} (h(y) - h(x)) = 0$ for any $k \in \mathbb{N}$ and any $x \in V_{n+k}^l \setminus V_n^l$.
- (3) $h \in \mathcal{F}_l$ and $\mathcal{E}^l(h, h) = \mathcal{E}^{l,n}(h|_{V_n^l}, h|_{V_n^l})$.
- (4) $h \circ F_w^l|_{V_*^l} \in \mathcal{H}_{l,n,0}$ for any $w \in W_n^l$.
- (5) (Maximum principle) For any $w \in W_n^l$ and any $x \in F_w^l(V_*^l)$,

$$\min_{q \in F_w^l(V_0)} h(q) \leq h(x) \leq \max_{q \in F_w^l(V_0)} h(q). \quad (2.20)$$

Also, for each $u \in \mathbb{R}^{V_n^l}$ there exists a unique $h_n^l(u) \in \mathcal{H}_{l,n}$ with $h_n^l(u)|_{V_n^l} = u$, and the map $h_n^l: \mathbb{R}^{V_n^l} \rightarrow \mathcal{H}_{l,n}$ is a linear isomorphism.

Proof. The assertions for h_n^l and the equivalence of (1), (2) and (3) follow from Proposition 2.9, [27, Lemma 2.2.2] and (2.11). Moreover, noting that $\mathcal{E}^{l,n}(u, u) \geq \mathcal{E}^0(u|_{V_0}, u|_{V_0})$ for any $u \in \mathcal{F}_{l,n}$, we easily see from (2.16), (2.17) and (2.11) that (3) holds if and only if $h \circ F_w^l|_{V_*^l} \in \mathcal{F}_{l,n}$ and $\mathcal{E}^{l,n}(h \circ F_w^l|_{V_*^l}, h \circ F_w^l|_{V_*^l}) = \mathcal{E}^0(h \circ F_w^l|_{V_0}, h \circ F_w^l|_{V_0})$ for any $w \in W_n^l$, which is equivalent to (4) by the equivalence of (3) and (1) with $h \circ F_w^l|_{V_*^l}, l^n, 0$ in place of h, l, n . Lastly, (4) implies (5) by [27, Lemma 2.2.3] applied to $h \circ F_w^l|_{V_*^l}$ for each $w \in W_n^l$. \square

Note that at this stage the domain \mathcal{F}_l of \mathcal{E}^l is only a linear subspace of $\mathbb{R}^{V_*^l}$, unlike that of a regular symmetric Dirichlet form on $L^2(K^l, m_l)$, which is a linear subspace of $L^2(K^l, m_l)$ including a dense subalgebra of $(\mathcal{C}(K^l), \|\cdot\|_{\text{sup}})$. As the last step of the construction of the canonical Dirichlet form on K^l , we now fill this gap by proving that $\text{id}_{V_*^l}: (V_*^l, d_l|_{V_*^l \times V_*^l}) \rightarrow (V_*^l, R_{\mathcal{E}^l})$ is uniformly continuous with uniformly continuous inverse and consequently that each $u \in \mathcal{F}_l$ uniquely extends to an element of $\mathcal{C}(K^l)$ by virtue of (2.15).

Proposition 2.16. *For any $x, y \in V_*^l$ and any $n \in \mathbb{N}$, the following hold:*

- (1) If $d_l(x, y) < 1/L_n^l$, then $R_{\mathcal{E}^l}(x, y) \leq 4R_n^l$.
- (2) If $R_{\mathcal{E}^l}(x, y) < \frac{1}{6}R_n^l$, then $d_l(x, y) \leq 3/L_n^l$.

In particular, $R_{\mathcal{E}^l}$ uniquely extends to $\overline{R}_{\mathcal{E}^l} \in \mathcal{C}(K^l \times K^l)$, $\overline{R}_{\mathcal{E}^l}$ is a metric on K^l compatible with the original (Euclidean) topology of K^l , and $((K^l, \overline{R}_{\mathcal{E}^l}), \text{id}_{V_*^l})$ is the completion of $(V_*^l, R_{\mathcal{E}^l})$.

Proof. We essentially follow [28, Chapter 22], but the possible unboundedness of $l = (l_n)_{n=1}^\infty$ requires some additional care. First, since

$$R_{\mathcal{E}^l}(q_j, q_k) = (\min\{\mathcal{E}^0(u, u) \mid u \in \mathbb{R}^{V_0}, u(q_j) = 1, u(q_k) = 0\})^{-1} = \frac{2}{3}$$

for any $j, k \in \{0, 1, 2\}$ with $j \neq k$ by [27, (2.2.3) and Lemma 2.2.5], it follows from Lemma 2.13 that for any $w \in W_*^l$ and any $j, k \in \{0, 1, 2\}$,

$$R_{\mathcal{E}^l}(F_w^l(q_j), F_w^l(q_k)) \leq \frac{2}{3}R_{|w|}^l. \quad (2.21)$$

Recalling that $R_{\mathcal{E}^l}$ is a metric on V_*^l as stated in Proposition 2.11, we easily see from (2.21) and the triangle inequality for $R_{\mathcal{E}^l}$ that for any $x \in V_*^l$,

$$\max_{k \in \{0,1,2\}} R_{\mathcal{E}^l}(q_k, x) \leq \sum_{n=1}^{\infty} \frac{3l_n - 5}{2} \cdot \frac{2}{3} R_n^l \leq \frac{l_1 - \frac{5}{3} + \sum_{n=2}^{\infty} \frac{3}{2} \left(\frac{9}{31}\right)^{n-2}}{\frac{2}{3}l_1 + \frac{1}{9}} < 2, \quad (2.22)$$

which together with Lemma 2.13 further implies that for any $w \in W_*^l$ and any $x \in F_w^l(V_*^{l|w|})$,

$$\max_{k \in \{0,1,2\}} R_{\mathcal{E}^l}(F_w^l(q_k), x) < 2R_{|w|}^l. \quad (2.23)$$

To see (1) and (2), let $x, y \in V_*^l$, $n \in \mathbb{N}$, choose $w \in W_n^l$ so that $x \in K_w^l$, and set $\Lambda_{n,w} := \{v \in W_n^l \mid K_w^l \cap K_v^l \neq \emptyset\}$ and $U_{n,w} := \bigcup_{v \in \Lambda_{n,w}} K_v^l$. It holds that

$$\text{if } y \in U_{n,w}, \text{ then } d_l(x, y) < \frac{3}{L_n^l} \quad \text{and} \quad R_{\mathcal{E}^l}(x, y) < 4R_n^l \quad (2.24)$$

by (2.3), the triangle inequality for d_l and $R_{\mathcal{E}^l}$, (2.6) and (2.23). On the other hand, if $y \notin U_{n,w}$, then clearly $d_l(x, y) \geq 1/L_n^l$ by (2.3) and (2.4), and recalling Proposition 2.15 and setting $h_{n,w} := h_n^l(\mathbb{1}_{F_w^l(V_0)})$, we have $h_{n,w}|_{F_w^l(V_*^{l|w|})} = 1$, $h_{n,w}|_{F_v^l(V_*^{l|v|})} = 0$ for any $v \in W_n^l \setminus \Lambda_{n,w}$, $\mathcal{E}^l(h_{n,w}, h_{n,w}) = \mathcal{E}^{l,n}(\mathbb{1}_{F_w^l(V_0)}, \mathbb{1}_{F_w^l(V_0)})$, and therefore

$$R_{\mathcal{E}^l}(x, y) \geq \frac{|h_{n,w}(x) - h_{n,w}(y)|^2}{\mathcal{E}^l(h_{n,w}, h_{n,w})} = \frac{1}{\mathcal{E}^{l,n}(\mathbb{1}_{F_w^l(V_0)}, \mathbb{1}_{F_w^l(V_0)})} = \frac{\frac{1}{2}R_n^l}{\#\Lambda_{n,w} - 1} \geq \frac{R_n^l}{6}$$

by Proposition 2.11-(RF4), (2.11), (2.9), Proposition 2.2-(1) and $\#\Lambda_{n,w} \leq 4$. It follows that, if either $d_l(x, y) < 1/L_n^l$ or $R_{\mathcal{E}^l}(x, y) < \frac{1}{6}R_n^l$, then $y \in U_{n,w}$, hence $d_l(x, y) < 3/L_n^l$ and $R_{\mathcal{E}^l}(x, y) < 4R_n^l$ by (2.24), proving (1) and (2), which in turn immediately imply the existence and the stated properties of $\overline{R}_{\mathcal{E}^l}$. \square

Definition 2.17. Throughout the rest of this paper, we identify \mathcal{F}_l with the linear subspace of $\mathcal{C}(K^l)$ given by

$$\{u \in \mathcal{C}(K^l) \mid u|_{V_*^l} \in \mathcal{F}_l\} = \left\{ u \in \mathcal{C}(K^l) \mid \lim_{n \rightarrow \infty} \mathcal{E}^{l,n}(u|_{V_n^l}, u|_{V_n^l}) < \infty \right\} \quad (2.25)$$

through the mapping $u \mapsto u|_{V_*^l}$, which is a linear isomorphism from (2.25) to \mathcal{F}_l since each $u \in \mathcal{F}_l$ uniquely extends to an element of $\mathcal{C}(K^l)$ by Proposition 2.16 and (2.15). The pair $(\mathcal{E}^l, \mathcal{F}_l)$ is then called the *canonical resistance form* on K^l .

Theorem 2.18. (1) $(\mathcal{E}^l, \mathcal{F}_l)$ is a resistance form on K^l with resistance metric $\overline{R}_{\mathcal{E}^l}$, which is hereafter denoted as $R_{\mathcal{E}^l}$ for simplicity of the notation.

- (2) $(\mathcal{E}^l, \mathcal{F}_l)$ is regular, i.e., \mathcal{F}_l is a dense subalgebra of $(\mathcal{C}(K^l), \|\cdot\|_{\text{sup}})$.
(3) $(\mathcal{E}^l, \mathcal{F}_l)$ is strongly local, i.e., $\mathcal{E}^l(u, v) = 0$ for any $u, v \in \mathcal{F}_l$ that satisfy $\text{supp}_K[u - a\mathbb{1}_{K^l}] \cap \text{supp}_K[v] = \emptyset$ for some $a \in \mathbb{R}$.

Proof. (1) follows from Propositions 2.11, 2.16, Definition 2.17, [27, Lemma 2.3.9 and Theorem 2.3.10], (2) from (1), the compactness of $(K^l, R_{\mathcal{E}^l})$, [28, Corollary 6.4 and Lemma 6.5], and (3) from $\mathbb{1}_{K^l} \in \mathcal{F}_l$, $\mathcal{E}^l(\mathbb{1}_{K^l}, \mathbb{1}_{K^l}) = 0$ and (2.17). \square

Remark 2.19. (1) To be explicit, Theorem 2.18-(1) means the following:

- Proposition 2.11-(RF1),(RF2),(RF3),(RF5) with K^l in place of V_*^l hold and $\bar{R}_{\mathcal{E}^l}(x, y) = \sup\{|u(x) - u(y)|^2 / \mathcal{E}^l(u, u) \mid u \in \mathcal{F}_l \setminus \mathbb{R}\mathbf{1}_{K^l}\}$ for any $x, y \in K^l$.*
- (2) Under the conventions introduced in Definition 2.17 and Theorem 2.18-(1), we easily get the following, *which we will utilize below without further notice:*
- (2.15) for any $u \in \mathcal{F}_l$ and any $x, y \in K^l$;
 - Proposition 2.12 with $\mathcal{C}(K^l), F_w^l$ in place of $\mathbb{R}^{V_*^l}, F_w^l|_{V_*^{l^n}}$;
 - Lemma 2.13 with $K^{l^{|w|}}$ in place of $V_*^{l^{|w|}}$;
 - Proposition 2.15 with $\mathcal{C}(K^l), F_w^l, K_w^l$ in place of $\mathbb{R}^{V_*^l}, F_w^l|_{V_*^{l^n}}, F_w^l(V_*^{l^n})$;
 - Proposition 2.16-(1),(2) for any $x, y \in K^l$ and any $n \in \mathbb{N}$;
 - (2.23) for any $w \in W_*^l$ and any $x \in K_w^l$.

Finally, we can now consider $(\mathcal{E}^l, \mathcal{F}_l)$ as an irreducible, strongly local, regular symmetric Dirichlet form over K^l as follows. See [17, Sections 1.1 and 1.6] or [13, Sections 1.1, 1.3 and 2.1] for the definitions of the relevant notions.

Theorem 2.20. *Let μ be a Radon measure on K^l with full support, i.e., a Borel measure on K^l with $\mu(K^l) < \infty$ and $\mu(K_w^l) > 0$ for any $w \in W_*^l$. Then $(\mathcal{E}^l, \mathcal{F}_l)$ is an irreducible, strongly local regular symmetric Dirichlet form on $L^2(K^l, \mu)$.*

Proof. Since $\mathcal{C}(K^l)$ is dense in $L^2(K^l, \mu)$ by [34, Theorem 3.14], \mathcal{F}_l is also dense in $L^2(K^l, \mu)$ by Theorem 2.18-(2), and then $(\mathcal{E}^l, \mathcal{F}_l)$ is a regular symmetric Dirichlet form on $L^2(K^l, \mu)$ by Proposition 2.11-(RF2), (2.15), Proposition 2.11-(RF5) and Theorem 2.18-(2), strongly local by Theorem 2.18-(3), and irreducible by Proposition 2.11-(RF1) and [13, Theorem 2.1.11]. \square

3 Space-time scale function Ψ_l and fHKE(Ψ_l)

In this section, we continue to fix an arbitrary $\mathbf{l} = (l_n)_{n=1}^\infty \in (\mathbb{N} \setminus \{1, 2, 3, 4\})^\mathbb{N}$, define a space-time scale function Ψ_l explicitly in terms of $\mathbf{l} = (l_n)_{n=1}^\infty$, and show that $(K^l, d_l, m_l, \mathcal{E}^l, \mathcal{F}_l)$ satisfies fHKE(Ψ_l). First, Ψ_l is defined in a way analogous to [26, (5.11)] for the usual scale irregular Sierpiński gaskets but modified so as to take the ‘‘asymptotically one-dimensional’’ nature of K^l into account, as follows.

Definition 3.1. We define a homeomorphism $\Psi_l: [0, \infty) \rightarrow [0, \infty)$ by

$$\begin{aligned} \Psi_l(s) &:= \left(\frac{1}{M_n^l} + \frac{s - 1/L_n^l}{1/L_{n-1}^l - 1/L_n^l} \left(\frac{1}{M_{n-1}^l} - \frac{1}{M_n^l} \right) \right) \\ &\quad \cdot \left(R_n^l + \frac{s - 1/L_n^l}{1/L_{n-1}^l - 1/L_n^l} (R_{n-1}^l - R_n^l) \right) \\ &= \frac{1}{T_n^l} \left(1 + \frac{3l_n - 4}{l_n - 1} (L_n^l s - 1) \right) \left(1 + \frac{\frac{2}{3}l_n - \frac{8}{9}}{l_n - 1} (L_n^l s - 1) \right) \end{aligned} \quad (3.1)$$

for $n \in \mathbb{N}$ and $s \in [1/L_n^l, 1/L_{n-1}^l]$ and $\Psi_l(s) := s^{\beta_{\mathbf{l},0}}$ for $s \in \{0\} \cup [1, \infty)$, where $T_n^l := M_n^l/R_n^l = (\#S_{l_1}/r_{l_1}) \cdots (\#S_{l_n}/r_{l_n}) = \prod_{k=1}^n (2l_k^2 - \frac{5}{3}l_k - \frac{1}{3})$ ($T_0^l := 1$) and $\beta_{\mathbf{l},0} := \inf_{n \in \mathbb{N}} \beta_{l_n}$ with $\beta_l := \log_l(\#S_l/r_l) = \log_l(2l^2 - \frac{5}{3}l - \frac{1}{3}) \in (2, 2 + \log_5 2)$ for $l \in \mathbb{N} \setminus \{1, 2, 3, 4\}$; note that $\{\beta_l\}_{l=5}^\infty$ is strictly decreasing and converges to 2. We also set $\beta_{\mathbf{l},1} := \max_{n \in \mathbb{N}} \beta_{l_n}$, so that $2 \leq \beta_{\mathbf{l},0} \leq \beta_{\mathbf{l},1} \leq \beta_5 < 2 + \log_5 2$.

Lemma 3.2. $\Psi_{\mathbf{l}}$ satisfies (1.2) with $c_{\Psi} = 81$, $\beta_0 = \beta_{\mathbf{l},0}$ and $\beta_1 = \beta_{\mathbf{l},1}$.

Proof. Let $r, R \in (0, \infty)$ satisfy $r \leq R$. If $r \geq 1$, then $\Psi_{\mathbf{l}}(R)/\Psi_{\mathbf{l}}(r) = (R/r)^{\beta_{\mathbf{l},0}} \leq (R/r)^{\beta_{\mathbf{l},1}}$. Next, if $r, R \in [1/L_n^{\mathbf{l}}, 1/L_{n-1}^{\mathbf{l}}]$ for some $n \in \mathbb{N}$, then we easily see from (3.1), $1 \leq L_n^{\mathbf{l}} r \leq L_n^{\mathbf{l}} R \leq l_n$ and $l_n^{\beta_{\mathbf{l},n}-2} = 2 - \frac{5}{3}l_n^{-1} - \frac{1}{3}l_n^{-2} < 2$ that

$$\frac{1}{9} \left(\frac{R}{r} \right)^{\beta_{\mathbf{l},0}} < \frac{2}{9} l_n^{2-\beta_{\mathbf{l},n}} \left(\frac{R}{r} \right)^{\beta_{\mathbf{l},n}} \leq \frac{2}{9} \left(\frac{R}{r} \right)^2 \leq \frac{\Psi_{\mathbf{l}}(R)}{\Psi_{\mathbf{l}}(r)} \leq \frac{9}{2} \left(\frac{R}{r} \right)^2 \leq \frac{9}{2} \left(\frac{R}{r} \right)^{\beta_{\mathbf{l},1}}. \quad (3.2)$$

Lastly, if $r < 1$ and no such $n \in \mathbb{N}$ exists, then we can choose $j, k \in \mathbb{N} \cup \{0\}$ with $j \leq k$ so that $r \in [1/L_{k+1}^{\mathbf{l}}, 1/L_k^{\mathbf{l}})$ and $R \in [1/L_j^{\mathbf{l}}, 1/L_{j-1}^{\mathbf{l}})$, where $1/L_{-1}^{\mathbf{l}} := \infty$, and by (3.1) and the definitions of $\beta_{\mathbf{l},0}$ and $\beta_{\mathbf{l},1}$ we have

$$\frac{\Psi_{\mathbf{l}}(1/L_j^{\mathbf{l}})}{\Psi_{\mathbf{l}}(1/L_k^{\mathbf{l}})} = \frac{T_k^{\mathbf{l}}}{T_j^{\mathbf{l}}} = \prod_{n=j+1}^k \frac{\#S_{l_n}}{r_{l_n}} = \prod_{n=j+1}^k l_n^{\beta_{\mathbf{l},n}} \in \left[\left(\frac{1/L_j^{\mathbf{l}}}{1/L_k^{\mathbf{l}}} \right)^{\beta_{\mathbf{l},0}}, \left(\frac{1/L_j^{\mathbf{l}}}{1/L_k^{\mathbf{l}}} \right)^{\beta_{\mathbf{l},1}} \right],$$

which together with (3.2) and the equality

$$\frac{\Psi_{\mathbf{l}}(R)}{\Psi_{\mathbf{l}}(r)} = \frac{\Psi_{\mathbf{l}}(1/L_k^{\mathbf{l}})}{\Psi_{\mathbf{l}}(r)} \frac{\Psi_{\mathbf{l}}(1/L_j^{\mathbf{l}})}{\Psi_{\mathbf{l}}(1/L_k^{\mathbf{l}})} \frac{\Psi_{\mathbf{l}}(R)}{\Psi_{\mathbf{l}}(1/L_j^{\mathbf{l}})}$$

immediately yields (1.2) for $\Psi_{\mathbf{l}}$ with $c_{\Psi} = 81$, $\beta_0 = \beta_{\mathbf{l},0}$ and $\beta_1 = \beta_{\mathbf{l},1}$. \square

The main result of this section is the following theorem.

Theorem 3.3. $(K^{\mathbf{l}}, d_{\mathbf{l}}, m_{\mathbf{l}}, \mathcal{E}^{\mathbf{l}}, \mathcal{F}_{\mathbf{l}})$ satisfies fHKE($\Psi_{\mathbf{l}}$).

The rest of this section is devoted to the proof of Theorem 3.3. We will conclude it from [28, Theorem 15.10] by proving that $(K^{\mathbf{l}}, d_{\mathbf{l}}, m_{\mathbf{l}}, \mathcal{E}^{\mathbf{l}}, \mathcal{F}_{\mathbf{l}})$ satisfies the conditions (DM1) $_{\Psi_{\mathbf{l}}, d_{\mathbf{l}}}$ and (DM2) $_{\Psi_{\mathbf{l}}, d_{\mathbf{l}}}$ defined in [28, Definition 15.9-(3),(4)], which are the central assumptions in [28, Theorem 15.10]. A similar argument is given in [28, Chapter 24] for a large class of scale irregular Sierpiński gaskets, but the possible unboundedness of $\mathbf{l} = (l_n)_{n=1}^{\infty}$ requires some additional care.

The core of the proof of Theorem 3.3 is to establish the following proposition, which is an extension of (the proof of) Proposition 2.16 to the case where $n \in \mathbb{N}$, $k \in \{1, \dots, l_n\}$ and either $d_{\mathbf{l}}(x, y) < k/L_n^{\mathbf{l}}$ or $R_{\mathcal{E}^{\mathbf{l}}}(x, y) < \frac{1}{12}kR_n^{\mathbf{l}}$.

Definition 3.4. Let $n \in \mathbb{N}$ and $w \in W_n^{\mathbf{l}}$. For each $k \in \{0, \dots, l_n\}$, we define

$$A_{n,w}^{(k)} := \left\{ v \in W_n^{\mathbf{l}} \mid \begin{array}{l} \text{there exists } \{v^{(j)}\}_{j=0}^k \subset W_n^{\mathbf{l}} \text{ such that } v^{(0)} = w, \\ v^{(k)} = v \text{ and } K_{v^{(j-1)}}^{\mathbf{l}} \cap K_{v^{(j)}}^{\mathbf{l}} \neq \emptyset \text{ for any } j \in \{1, \dots, k\} \end{array} \right\} \quad (3.3)$$

($A_{n,w}^{(0)} := \{w\}$) and $U_{n,w}^{(k)} := \bigcup_{v \in A_{n,w}^{(k)}} K_v^{\mathbf{l}}$, so that $2k+1 \leq \#A_{n,w}^{(k)} \leq (6k) \vee 1$.

Proposition 3.5. Let $n \in \mathbb{N}$, $w \in W_n^{\mathbf{l}}$, $x \in K_w^{\mathbf{l}}$ and $k \in \{1, \dots, l_n\}$.

(1) If $y \in U_{n,w}^{(k)}$, then $d_{\mathbf{l}}(x, y) < (k+2)/L_n^{\mathbf{l}}$ and $R_{\mathcal{E}^{\mathbf{l}}}(x, y) < (\frac{2}{3}k + \frac{10}{3})R_n^{\mathbf{l}}$.

- (2) If $y \in K^l \setminus U_{n,w}^{(k)}$, then $d_l(x, y) \geq k/L_n^l$ and $R_{\mathcal{E}^l}(x, y) \geq \frac{1}{12}kR_n^l$.
 (3) $B_{d_l}(x, k/L_n^l) \subset U_{n,w}^{(k)} \subset B_{d_l}(x, (k+2)/L_n^l)$.
 (4) $B_{R_{\mathcal{E}^l}}(x, \frac{1}{12}kR_n^l) \subset U_{n,w}^{(k)} \subset B_{R_{\mathcal{E}^l}}(x, (\frac{2}{3}k + \frac{10}{3})R_n^l)$.

Proof. (1) is immediate from (2.3), the triangle inequality for d_l and $R_{\mathcal{E}^l}$, (2.6), (2.21) and (2.23). To see (2), assume that $y \notin U_{n,w}^{(k)}$. For $d_l(x, y)$, by Proposition 2.4 we can take $\gamma: [0, 1] \rightarrow K^l$ such that $\gamma(0) = x$, $\gamma(1) = y$ and $d_l(\gamma(s), \gamma(t)) = |s - t|d_l(x, y)$ for any $s, t \in [0, 1]$, and it then follows from (2.3) and $y \notin U_{n,w}^{(k)}$ that $\#(\gamma^{-1}(V_n^l) \cap (0, 1)) \geq k + 1$, which yields $d_l(x, y) = \ell_{\mathbb{R}^2}(\gamma) \geq k/L_n^l$. For $R_{\mathcal{E}^l}(x, y)$, recalling Proposition 2.15, define $u \in \mathbb{R}^{V_n^l}$ by

$$u(z) := \begin{cases} 1 & \text{if } z \in K_w^l = U_{n,w}^{(0)}, \\ 1 - \frac{j}{k} & \text{if } j \in \{1, \dots, k\} \text{ and } z \in U_{n,w}^{(j)} \setminus U_{n,w}^{(j-1)}, \\ 0 & \text{if } z \in K^l \setminus U_{n,w}^{(k)} \end{cases}, \quad (3.4)$$

for each $z \in V_n^l$ and set $h_{n,w}^{(k)} := h_n^l(u)$, so that $\mathcal{E}^l(h_{n,w}^{(k)}, h_{n,w}^{(k)}) = \mathcal{E}^{l,n}(u, u)$, $h_{n,w}^{(k)}|_{K_w^l} = 1$, $h_{n,w}^{(k)}|_{K_v^l} = 0$ for any $v \in W_n^l \setminus \Lambda_{n,w}^{(k)}$, and $u(F_v^l(V_0)) \subset \{1 - \frac{j-1}{k}, 1 - \frac{j}{k}\}$ for any $j \in \{1, \dots, k\}$ and any $v \in \Lambda_{n,w}^{(j)} \setminus \Lambda_{n,w}^{(j-1)}$. Then combining these properties with Proposition 2.11-(RF4), (2.11), (2.9) and $\#\Lambda_{n,w}^{(k)} \leq 6k$, we obtain

$$R_{\mathcal{E}^l}(x, y) \geq \frac{|h_{n,w}^{(k)}(x) - h_{n,w}^{(k)}(y)|^2}{\mathcal{E}^l(h_{n,w}^{(k)}, h_{n,w}^{(k)})} = \frac{1}{\mathcal{E}^{l,n}(u, u)} \geq \frac{\frac{1}{2}k^2R_n^l}{\#\Lambda_{n,w}^{(k)} - 1} \geq \frac{kR_n^l}{12},$$

which proves (2). Lastly, we also get (3) and (4) since the conjunction of (3) and (4) is clearly equivalent to that of (1) and (2). \square

As an easy consequence of Proposition 3.5, we further obtain the following proposition, which contains (DM2) $_{\Psi_l, d_l}$ as defined in [28, Definition 15.9-(4)].

Proposition 3.6. *Let $x, y \in K^l$, $s \in (0, \infty)$, $n \in \mathbb{N}$ and $k \in \{2, \dots, l_n\}$.*

- (1) *If $s \in [(k-1)/L_n^l, k/L_n^l]$, then*

$$\frac{1}{18} \frac{k^2}{T_n^l} \leq \Psi_l(s) \leq \frac{9}{2} \frac{k^2}{T_n^l} \quad \text{and} \quad \frac{7}{36} \frac{k}{M_n^l} \leq m_l(B_{d_l}(x, s)) \leq 6 \frac{k}{M_n^l}, \quad (3.5)$$

whereas if $s \in [1, 3]$, then $1 \leq \Psi_l(s) \leq 14$ and $\frac{7}{12} \leq m_l(B_{d_l}(x, s)) \leq 1$.

- (2) *If $d_l(x, y) \in [(k-1)/L_n^l, k/L_n^l]$, then*

$$\frac{1}{48}kR_n^l \leq R_{\mathcal{E}^l}(x, y) \leq \frac{7}{3}kR_n^l, \quad (3.6)$$

whereas $d_l(x, y) < 3$, $R_{\mathcal{E}^l}(x, y) < 4$, and if $d_l(x, y) \geq 1$ then $R_{\mathcal{E}^l}(x, y) \geq \frac{1}{14}$.

- (3) *If $x \neq y$, then*

$$6^{-4} \frac{\Psi_l(d_l(x, y))}{m_l(B_{d_l}(x, d_l(x, y)))} \leq R_{\mathcal{E}^l}(x, y) \leq 2^8 \frac{\Psi_l(d_l(x, y))}{m_l(B_{d_l}(x, d_l(x, y)))}. \quad (3.7)$$

Proof. (1) Assume that $s \in [(k-1)/L_n^l, k/L_n^l]$. By (3.1) and (3.2) we have

$$\begin{aligned} \frac{1}{18} \frac{k^2}{T_n^l} &\leq \frac{2}{9} \frac{(k-1)^2}{T_n^l} = \frac{2}{9} (k-1)^2 \Psi_l(1/L_n^l) \leq \Psi_l((k-1)/L_n^l) \\ &\leq \Psi_l(s) \leq \Psi_l(k/L_n^l) \leq \frac{9}{2} k^2 \Psi_l(1/L_n^l) = \frac{9}{2} \frac{k^2}{T_n^l}. \end{aligned} \quad (3.8)$$

For $m_l(B_{d_l}(x, s))$, choosing $w \in W_n^l$ so that $x \in K_w^l$, we see from Proposition 3.5-(3), (2.8) and $2j+1 \leq \#\Lambda_{n,w}^{(j)} \leq 6j$ for $j \in \{1, \dots, l_n\}$ that

$$m_l(B_{d_l}(x, s)) \leq m_l(B_{d_l}(x, k/L_n^l)) \leq m_l(U_{n,w}^{(k)}) = \frac{\#\Lambda_{n,w}^{(k)}}{M_n^l} \leq 6 \frac{k}{M_n^l} \quad (3.9)$$

and that, provided $k \geq 4$,

$$m_l(B_{d_l}(x, s)) \geq m_l(B_{d_l}(x, (k-1)/L_n^l)) \geq m_l(U_{n,w}^{(k-3)}) = \frac{\#\Lambda_{n,w}^{(k-3)}}{M_n^l} \geq \frac{2k-5}{M_n^l}. \quad (3.10)$$

If $k \in \{2, 3\}$, then choosing $v \in W_{n+1}^l$ so that $x \in K_v^l$, by Proposition 3.5-(3), (2.8) and $\#\Lambda_{n+1,v}^{(l_{n+1}-2)} \geq 2l_{n+1} - 3$ we get

$$\begin{aligned} m_l(B_{d_l}(x, s)) &\geq m_l(B_{d_l}(x, 1/L_n^l)) = m_l(B_{d_l}(x, l_{n+1}/L_{n+1}^l)) \\ &\geq m_l(U_{n+1,v}^{(l_{n+1}-2)}) = \frac{\#\Lambda_{n+1,v}^{(l_{n+1}-2)}}{M_{n+1}^l} \geq \frac{2l_{n+1}-3}{(3l_{n+1}-3)M_n^l} \geq \frac{7}{12} \frac{1}{M_n^l}. \end{aligned} \quad (3.11)$$

(3.8), (3.9), (3.10) and (3.11) together yield (3.5).

On the other hand, if $s \in [1, 3]$, then $\Psi_l(s) = s^{\beta_l, 0} \in [1, 3^{\beta_5}] \subset [1, 14]$ and $1 = m_l(K^l) \geq m_l(B_{d_l}(x, s)) \geq m_l(B_{d_l}(x, 1)) \geq \frac{7}{12}$ by (3.11) with $n = 0$.

- (2) Assume that $d_l(x, y) \in [(k-1)/L_n^l, k/L_n^l]$. Then by Proposition 3.5-(3), (4), it follows from $d_l(x, y) < k/L_n^l$ that $R_{\mathcal{E}^l}(x, y) \leq (\frac{2}{3}k + \frac{10}{3})R_n^l \leq \frac{7}{3}kR_n^l$, from $d_l(x, y) \geq (k-1)/L_n^l$ that $R_{\mathcal{E}^l}(x, y) \geq \frac{1}{12}(k-3)R_n^l \geq \frac{1}{48}kR_n^l$ provided $k \geq 4$, and from $d_l(x, y) \geq 1/L_n^l = l_{n+1}/L_{n+1}^l$ that, provided $k \in \{2, 3\}$,

$$R_{\mathcal{E}^l}(x, y) \geq \frac{1}{12}(l_{n+1}-2)R_{n+1}^l = \frac{1}{12} \frac{l_{n+1}-2}{\frac{2}{3}l_{n+1} + \frac{1}{9}} R_n^l \geq \frac{9}{124} R_n^l > \frac{kR_n^l}{48}, \quad (3.12)$$

proving (3.6).

On the other hand, $d_l(x, y) < 3$ by (2.6), $R_{\mathcal{E}^l}(x, y) < 4$ by (2.23), and if $d_l(x, y) \geq 1$ then $R_{\mathcal{E}^l}(x, y) \geq \frac{9}{124} > \frac{1}{14}$ by (3.12) with $n = 0$.

- (3) This is immediate from (1) and (2). \square

We need the following definition and lemma for the proof of the other condition (DM1) $_{\Psi_l, d_l}$ required to apply [28, Theorem 15.10].

Definition 3.7. We define homeomorphisms $\Psi_t^M, \Psi_t^R: [0, \infty) \rightarrow [0, \infty)$ by

$$\begin{aligned}\Psi_t^M(s) &:= \frac{1}{M_n^l} + \frac{(s - 1/L_n^l)(1/M_{n-1}^l - 1/M_n^l)}{1/L_{n-1}^l - 1/L_n^l} = \frac{1}{M_n^l} \left(1 + \frac{3l_n - 4}{l_n - 1} (L_n^l s - 1) \right), \\ \Psi_t^R(s) &:= R_n^l + \frac{(s - 1/L_n^l)(R_{n-1}^l - R_n^l)}{1/L_{n-1}^l - 1/L_n^l} = R_n^l \left(1 + \frac{\frac{2}{3}l_n - \frac{8}{9}}{l_n - 1} (L_n^l s - 1) \right)\end{aligned}\quad (3.13)$$

for $n \in \mathbb{N}$ and $s \in [1/L_n^l, 1/L_{n-1}^l]$ and $\Psi_t^M(s) := s^{\beta_{l,0}^M}$ and $\Psi_t^R(s) := s^{\beta_{l,1}^R}$ for $s \in \{0\} \cup [1, \infty)$, where $\beta_{l,0}^M := \inf_{n \in \mathbb{N}} \log_{l_n} \#S_{l_n}$ and $\beta_{l,1}^R := -\inf_{n \in \mathbb{N}} \log_{l_n} r_{l_n}$ (note that $\{\log_l \#S_l\}_{l=5}^\infty$ and $\{\log_l r_l\}_{l=5}^\infty$ are strictly decreasing), so that $\Psi_t = \Psi_t^M \Psi_t^R$. We also set $\beta_{l,1}^M := \max_{n \in \mathbb{N}} \log_{l_n} \#S_{l_n}$ and $\beta_{l,0}^R := -\max_{n \in \mathbb{N}} \log_{l_n} r_{l_n}$.

Lemma 3.8. (1) Ψ_t^M satisfies (1.2) with $c_\Psi = 81$, $\beta_0 = \beta_{l,0}^M$ and $\beta_1 = \beta_{l,1}^M$.
 (2) Ψ_t^R satisfies (1.2) with $c_\Psi = 6$, $\beta_0 = \beta_{l,0}^R$ and $\beta_1 = \beta_{l,1}^R$.

Proof. These are proved in exactly the same way as Lemma 3.2. \square

Finally, $(DM1)_{\Psi_t, d_l}$ as defined in [28, Definition 15.9-(3)] is deduced as follows.

Proposition 3.9. Let $x, y \in K^l$ and $s \in (0, 3]$. Then

$$\frac{1}{16} \Psi_t^M(s) \leq m_l(B_{d_l}(x, s)) \leq 12 \Psi_t^M(s), \quad \frac{1}{12} \Psi_t^R(s) \leq \frac{\Psi_t(s)}{m_l(B_{d_l}(x, s))} \leq 16 \Psi_t^R(s), \quad (3.14)$$

$$2^{-14} \Psi_t^R(d_l(x, y)) \leq R_{\mathcal{E}^l}(x, y) \leq 2^{12} \Psi_t^R(d_l(x, y)). \quad (3.15)$$

In particular, if $x \neq y$, then for any $\lambda \in (0, 1]$,

$$\frac{6^{-4} \lambda^{\beta_{l,1}^R} \Psi_t(d_l(x, y))}{m_l(B_{d_l}(x, d_l(x, y)))} \leq \frac{\Psi_t(\lambda d_l(x, y))}{m_l(B_{d_l}(x, \lambda d_l(x, y)))} \leq \frac{6^4 \lambda^{\beta_{l,0}^R} \Psi_t(d_l(x, y))}{m_l(B_{d_l}(x, d_l(x, y)))}. \quad (3.16)$$

Proof. If $n \in \mathbb{N}$, $k \in \{2, \dots, l_n\}$ and $s \in [(k-1)/L_n^l, kL_n^l]$ then we easily see from (3.13) that $\frac{1}{2}k/M_n^l \leq \Psi_t^M(s) \leq 3k/M_n^l$, and if $s \in [1, 3]$ then $\Psi_t^M(s) = s^{\beta_{l,0}^M} \in [1, 3^{\log_5 \#S_5}] \subset [1, 6]$. These facts, Proposition 3.6-(1) and $\Psi_t = \Psi_t^M \Psi_t^R$ together imply (3.14), which in turn in combination with Proposition 3.6-(3) and Lemma 3.8-(2), respectively, yields (3.15) and (3.16) since $d_l(x, y) \in [0, 3]$ by (2.6). \square

Proof of Theorem 3.3. By Propositions 2.4, 2.16 and Theorem 2.18, $(\mathcal{E}^l, \mathcal{F}_l)$ is a strongly local regular resistance form on K^l whose resistance metric $R_{\mathcal{E}^l}$ gives the same topology as the geodesic metric d_l . We also have (ACC) as defined in [28, Definition 7.4] by [28, Proposition 7.6], $(DM1)_{\Psi_t, d_l}$ by (3.16) and $\beta_{l,0}^R > 0$, and $(DM2)_{\Psi_t, d_l}$ by Proposition 3.6-(3). Thus [28, Theorem 15.10, Cases 1 and 2] are applicable to $(K^l, d_l, m_l, \mathcal{E}^l, \mathcal{F}_l)$ and imply that it satisfies $\text{fHKE}(\Psi_t)$. \square

4 Singularity of the energy measures

As in the previous two sections, we fix an arbitrary $\mathbf{l} = (l_n)_{n=1}^\infty \in (\mathbb{N} \setminus \{1, 2, 3, 4\})^\mathbb{N}$ throughout this section. We first recall the definition of the $\mathcal{E}^{\mathbf{l}}$ -energy measures.

Definition 4.1 ($\mathcal{E}^{\mathbf{l}}$ -energy measure; [17, (3.2.14)]). Let $u \in \mathcal{F}_{\mathbf{l}}$. We define the $\mathcal{E}^{\mathbf{l}}$ -energy measure $\mu_{\langle u \rangle}^{\mathbf{l}}$ of u as the unique Borel measure on $K^{\mathbf{l}}$ such that

$$\int_{K^{\mathbf{l}}} f d\mu_{\langle u \rangle}^{\mathbf{l}} = \mathcal{E}^{\mathbf{l}}(u, fu) - \frac{1}{2}\mathcal{E}^{\mathbf{l}}(u^2, f) \quad \text{for any } f \in \mathcal{F}_{\mathbf{l}}; \quad (4.1)$$

since $\mathcal{F}_{\mathbf{l}}$ is a dense subalgebra of $(\mathcal{C}(K^{\mathbf{l}}), \|\cdot\|_{\text{sup}})$ by Theorem 2.18-(2) and

$$0 \leq \mathcal{E}^{\mathbf{l}}(u, f^+u) - \frac{1}{2}\mathcal{E}^{\mathbf{l}}(u^2, f^+) \leq \|f\|_{\text{sup}}\mathcal{E}^{\mathbf{l}}(u, u) \quad \text{for any } f \in \mathcal{F}_{\mathbf{l}} \quad (4.2)$$

by (2.9), (2.11) and (2.14), such $\mu_{\langle u \rangle}^{\mathbf{l}}$ exists and is unique by the Riesz(-Markov-Kakutani) representation theorem (see, e.g., [34, Theorems 2.14 and 2.18]).

Proposition 2.12 yields the following alternative characterization of $\mu_{\langle u \rangle}^{\mathbf{l}}$.

Proposition 4.2. *Let $u \in \mathcal{F}_{\mathbf{l}}$. Then $\mu_{\langle u \rangle}^{\mathbf{l}}(\{x\}) = 0$ for any $x \in K^{\mathbf{l}}$. Moreover, $\mu_{\langle u \rangle}^{\mathbf{l}}$ is the unique Borel measure on $K^{\mathbf{l}}$ such that*

$$\mu_{\langle u \rangle}^{\mathbf{l}}(K_w^{\mathbf{l}}) = \frac{1}{R_{|w|}^{\mathbf{l}}}\mathcal{E}^{\mathbf{l}|w|}(u \circ F_w^{\mathbf{l}}, u \circ F_w^{\mathbf{l}}) \quad \text{for any } w \in W_*^{\mathbf{l}}. \quad (4.3)$$

Proof. Since $(\mathcal{E}^{\mathbf{l}}, \mathcal{F}_{\mathbf{l}})$ is a strongly local regular symmetric Dirichlet form on $L^2(K^{\mathbf{l}}, m_{\mathbf{l}})$ by Theorem 2.20, the Borel measure $\mu_{\langle u \rangle}^{\mathbf{l}}(u^{-1}(\cdot))$ on \mathbb{R} is absolutely continuous with respect to the Lebesgue measure on \mathbb{R} by [13, Theorem 4.3.8], and therefore $\mu_{\langle u \rangle}^{\mathbf{l}}(\{x\}) \leq \mu_{\langle u \rangle}^{\mathbf{l}}(u^{-1}(u(x))) = 0$ for any $x \in K^{\mathbf{l}}$.

The uniqueness of a Borel measure on $K^{\mathbf{l}}$ satisfying (4.3) is immediate from (2.17) and the Dynkin class theorem (see, e.g., [15, Appendixes, Theorem 4.2]). To show that $\mu_{\langle u \rangle}^{\mathbf{l}}$ has the property (4.3), let $n, k \in \mathbb{N} \cup \{0\}$, $w \in W_n^{\mathbf{l}}$ and set $f_k := h_{n+k}^{\mathbf{l}}(\mathbb{1}_{K_w^{\mathbf{l}} \cap V_{n+k}^{\mathbf{l}}})$, so that $\mathbb{1}_{K_w^{\mathbf{l}}} \leq f_k \leq \mathbb{1}_{K_w^{\mathbf{l}} \cup \bigcup_{q \in F_w^{\mathbf{l}}(V_0)} B_{d_{\mathbf{l}}}(q, 2/L_{n+k}^{\mathbf{l}})}$ by Proposition 2.15 and (2.6). Then from (4.2), (2.17) and (4.1) we obtain

$$\begin{aligned} \frac{\mathcal{E}^{\mathbf{l}n}(u \circ F_w^{\mathbf{l}}, u \circ F_w^{\mathbf{l}})}{R_n^{\mathbf{l}}} &= \frac{1}{R_n^{\mathbf{l}}}\left(\mathcal{E}^{\mathbf{l}n}(u \circ F_w^{\mathbf{l}}, (f_k u) \circ F_w^{\mathbf{l}}) - \frac{1}{2}\mathcal{E}^{\mathbf{l}n}((u^2) \circ F_w^{\mathbf{l}}, f_k \circ F_w^{\mathbf{l}})\right) \\ &\leq \mathcal{E}^{\mathbf{l}}(u, f_k u) - \frac{1}{2}\mathcal{E}^{\mathbf{l}}(u^2, f_k) = \int_{K^{\mathbf{l}}} f_k d\mu_{\langle u \rangle}^{\mathbf{l}} \\ &\leq \mu_{\langle u \rangle}^{\mathbf{l}}\left(K_w^{\mathbf{l}} \cup \bigcup_{q \in F_w^{\mathbf{l}}(V_0)} B_{d_{\mathbf{l}}}(q, 2/L_{n+k}^{\mathbf{l}})\right) \xrightarrow{k \rightarrow \infty} \mu_{\langle u \rangle}^{\mathbf{l}}(K_w^{\mathbf{l}}) \end{aligned}$$

and hence $\mathcal{E}^{\mathbf{l}n}(u \circ F_w^{\mathbf{l}}, u \circ F_w^{\mathbf{l}})/R_n^{\mathbf{l}} \leq \mu_{\langle u \rangle}^{\mathbf{l}}(K_w^{\mathbf{l}})$, where the equality necessarily holds since the sum over $w \in W_n^{\mathbf{l}}$ of each side of this inequality is equal to $\mathcal{E}^{\mathbf{l}}(u, u) = \mu_{\langle u \rangle}^{\mathbf{l}}(K^{\mathbf{l}})$ by (2.17), (2.3), $\mu_{\langle u \rangle}^{\mathbf{l}}(V_n^{\mathbf{l}}) = 0$ and (4.1) with $f = \mathbb{1}_{K^{\mathbf{l}}}$. \square

The purpose of this section is to prove the following theorem.

Theorem 4.3. $\mu_{\langle u \rangle}^l \perp m_l$ for any $u \in \mathcal{F}_l$.

The rest of this section is devoted to the proof of Theorem 4.3. First, we observe that the proof is reduced to the case of $u \in \bigcup_{n=0}^{\infty} \mathcal{H}_{l,n}$ by the following two lemmas.

Lemma 4.4. *Let $u \in \mathcal{F}_l$ and set $u_n := h_n^l(u|_{V_n^l})$ for each $n \in \mathbb{N} \cup \{0\}$ (recall Proposition 2.15). Then $\mathcal{E}^l(u - u_n, u - u_n) = \mathcal{E}^l(u, u) - \mathcal{E}^{l,n}(u|_{V_n^l}, u|_{V_n^l})$ for any $n \in \mathbb{N} \cup \{0\}$. In particular, $\lim_{n \rightarrow \infty} \mathcal{E}^l(u - u_n, u - u_n) = 0$.*

Proof. We follow [27, Proof of Lemma 3.2.17]. Let $n \in \mathbb{N} \cup \{0\}$. Then $\mathcal{E}^l(u_n, u) = \mathcal{E}^l(u_n, u_n) = \mathcal{E}^{l,n}(u|_{V_n^l}, u|_{V_n^l})$ by $u_n \in \mathcal{H}_{l,n}$, (2.19) and Proposition 2.15 and thus $\mathcal{E}^l(u - u_n, u - u_n) = \mathcal{E}^l(u, u) - \mathcal{E}^{l,n}(u|_{V_n^l}, u|_{V_n^l})$, which converges to 0 as $n \rightarrow \infty$ by (2.14). \square

Lemma 4.5. *If a Borel measure μ on K^l , $\{u_n\}_{n=1}^{\infty} \subset \mathcal{F}_l$ and $u \in \mathcal{F}_l$ satisfy $\lim_{n \rightarrow \infty} \mathcal{E}^l(u - u_n, u - u_n) = 0$ and $\mu_{\langle u_n \rangle}^l \perp \mu$ for any $n \in \mathbb{N}$, then $\mu_{\langle u \rangle}^l \perp \mu$.*

Proof. This is a special case of [26, Lemma 3.7-(b)], whose proof works for any regular symmetric Dirichlet space. \square

To prove that $\mu_{\langle h \rangle}^l \perp m_l$ for any $h \in \bigcup_{n=0}^{\infty} \mathcal{H}_{l,n}$, noting that $\mathcal{H}_{l,0} \subset \mathcal{H}_{l,1}$ and recalling Proposition 2.15, in the following lemma we calculate explicitly the matrix representation of the linear maps $\mathbb{R}^{V_0} \ni u \mapsto h_0^l(u) \circ F_i^l|_{V_0} \in \mathbb{R}^{V_0}$, $i \in W_1^l = S_{l_1}$, which we identify with the linear maps $\mathcal{H}_{l,0} \ni h \mapsto h \circ F_i^l \in \mathcal{H}_{l^1,0}$.

Lemma 4.6. *Set $l := l_1$, $a_l := \frac{1}{9}r_l = (6l+1)^{-1}$, and for each $i \in S_l$ let A_i^l denote the matrix representation of the linear map $\mathbb{R}^{V_0} \ni u \mapsto h_0^l(u) \circ F_i^l|_{V_0} \in \mathbb{R}^{V_0}$ with respect to the basis $(\mathbf{1}_{q_0}, \mathbf{1}_{q_1}, \mathbf{1}_{q_2})$ of \mathbb{R}^{V_0} . Then for any $k \in \{2, \dots, l-3\}$,*

$$\begin{aligned} A_{(k,0)}^l &= \begin{pmatrix} 1 - (6k+3)a_l & (6k-2)a_l & 5a_l \\ 1 - (6k+9)a_l & (6k+4)a_l & 5a_l \\ 1 - (6k+6)a_l & (6k+1)a_l & 5a_l \end{pmatrix}, \\ A_{(0,k)}^l &= \begin{pmatrix} 1 - (6k+3)a_l & 5a_l & (6k-2)a_l \\ 1 - (6k+6)a_l & 5a_l & (6k+1)a_l \\ 1 - (6k+9)a_l & 5a_l & (6k+4)a_l \end{pmatrix}, \\ A_{(l-1-k,k)}^l &= \begin{pmatrix} 5a_l & 1 - (6k+6)a_l & (6k+1)a_l \\ 5a_l & 1 - (6k+3)a_l & (6k-2)a_l \\ 5a_l & 1 - (6k+9)a_l & (6k+4)a_l \end{pmatrix}. \end{aligned} \quad (4.4)$$

Proof. This follows by solving the linear equation in $(h(x))_{x \in V_1^l \setminus V_0}$ for $h = h_0^l(u)$ from Proposition 2.15-(2) with $(n, k) = (0, 1)$ under $h(q) = u(q)$ for $q \in V_0$. \square

Our proof that $\mu_{\langle h \rangle}^l \perp m_l$ for $h \in \bigcup_{n=0}^{\infty} \mathcal{H}_{l,n}$ is based on the following fact.

Theorem 4.7 ([23, Theorem 4.1]). *Let $(\Omega, \mathcal{F}, \mathbb{P})$ be a probability space and let $\{\mathcal{F}_n\}_{n=0}^\infty$ be a non-decreasing sequence of σ -algebras in Ω such that $\bigcup_{n=0}^\infty \mathcal{F}_n$ generates \mathcal{F} . Let $\tilde{\mathbb{P}}$ be a probability measure on (Ω, \mathcal{F}) such that $\tilde{\mathbb{P}}|_{\mathcal{F}_n} \ll \mathbb{P}|_{\mathcal{F}_n}$ for any $n \in \mathbb{N} \cup \{0\}$, and for each $n \in \mathbb{N}$ define $\alpha_n \in L^1(\Omega, \mathcal{F}_n, \mathbb{P}|_{\mathcal{F}_n})$ by*

$$\alpha_n := \begin{cases} \frac{d(\tilde{\mathbb{P}}|_{\mathcal{F}_n})/d(\mathbb{P}|_{\mathcal{F}_n})}{d(\tilde{\mathbb{P}}|_{\mathcal{F}_{n-1}})/d(\mathbb{P}|_{\mathcal{F}_{n-1}})} & \text{on } \{d(\tilde{\mathbb{P}}|_{\mathcal{F}_{n-1}})/d(\mathbb{P}|_{\mathcal{F}_{n-1}}) > 0\}, \\ 0 & \text{on } \{d(\tilde{\mathbb{P}}|_{\mathcal{F}_{n-1}})/d(\mathbb{P}|_{\mathcal{F}_{n-1}}) = 0\}, \end{cases} \quad (4.5)$$

so that $\mathbb{E}[\sqrt{\alpha_n} | \mathcal{F}_{n-1}] \leq 1$ $\mathbb{P}|_{\mathcal{F}_{n-1}}$ -a.s. by conditional Jensen's inequality, where $\mathbb{E}[\cdot | \mathcal{F}_{n-1}]$ denotes the conditional expectation given \mathcal{F}_{n-1} with respect to \mathbb{P} . If

$$\sum_{n=1}^{\infty} (1 - \mathbb{E}[\sqrt{\alpha_n} | \mathcal{F}_{n-1}]) = \infty \quad \mathbb{P}\text{-a.s.}, \quad (4.6)$$

then $\tilde{\mathbb{P}} \perp \mathbb{P}$.

We will apply Theorem 4.7 under the setting of the following lemma with $\mathbb{P} = m_l$.

Lemma 4.8. *Set $\Omega := K^l$, $\mathcal{F} := \mathcal{B}(K^l)$ and let $\mathbb{P}, \tilde{\mathbb{P}}$ be probability measures on (Ω, \mathcal{F}) such that $\mathbb{P}(K_w^l) > 0$ for any $w \in W_*^l$ and $\mathbb{P}(V_*^l) = \tilde{\mathbb{P}}(V_*^l) = 0$. Set $\mathcal{F}_n := \{A \cup \bigcup_{w \in \Lambda} (K_w^l \setminus V_n^l) \mid \Lambda \subset W_n^l, \Lambda \subset V_n^l\}$ for each $n \in \mathbb{N} \cup \{0\}$, so that $\{\mathcal{F}_n\}_{n=0}^\infty$ is a non-decreasing sequence of σ -algebras in Ω by (2.3), $\bigcup_{n=0}^\infty \mathcal{F}_n$ generates \mathcal{F} , and $\tilde{\mathbb{P}}|_{\mathcal{F}_n} \ll \mathbb{P}|_{\mathcal{F}_n}$ for any $n \in \mathbb{N} \cup \{0\}$. Let $n \in \mathbb{N}$ and define $\alpha_n \in L^1(\Omega, \mathcal{F}_n, \mathbb{P}|_{\mathcal{F}_n})$ by (4.5). Then for each $w \in W_{n-1}^l$,*

$$\mathbb{E}[\sqrt{\alpha_n} | \mathcal{F}_{n-1}]|_{K_w^l \setminus V_{n-1}^l} = \begin{cases} \sum_{i \in S_{l,n}} \sqrt{\frac{\tilde{\mathbb{P}}(K_{wi}^l)}{\tilde{\mathbb{P}}(K_w^l)}} \sqrt{\frac{\mathbb{P}(K_{wi}^l)}{\mathbb{P}(K_w^l)}} & \text{if } \tilde{\mathbb{P}}(K_w^l) > 0, \\ 0 & \text{if } \tilde{\mathbb{P}}(K_w^l) = 0. \end{cases} \quad (4.7)$$

Proof. This follows easily by direct calculations based on (4.5) and (2.3). \square

The following proposition is the key step of the proof of Theorem 4.3.

Proposition 4.9. *Let $k \in \mathbb{N} \cup \{0\}$, $h \in \mathcal{H}_{l,k}$, $x \in K^l \setminus V_*^l$, and let $\omega^x = (\omega_n^x)_{n=1}^\infty$ be the element of $\prod_{n=1}^\infty S_{l,n}$, unique by (2.3), such that $\{x\} = \bigcap_{n=1}^\infty K_{\omega_1^x \dots \omega_n^x}^l$. Let $n \in \mathbb{N} \cap [k+2, \infty)$ and assume that $\mu_{\langle h \rangle}^l(K_{\omega_1^x \dots \omega_{n-1}^x}^l) > 0$ and that $\omega_{n-1}^x \in S_{l_{n-1}, 1}$, where $S_{l,1} := \{(i_1, i_2) \in S_l \mid i_1 \vee i_2 \in \{2, \dots, l-3\}\}$ for $l \in \mathbb{N} \setminus \{1, 2, 3, 4\}$. Then*

$$\sum_{i \in S_{l,n}} \sqrt{\frac{\mu_{\langle h \rangle}^l(K_{\omega_1^x \dots \omega_{n-1}^x i}^l)}{\mu_{\langle h \rangle}^l(K_{\omega_1^x \dots \omega_{n-1}^x}^l)}} \sqrt{\frac{m_l(K_{\omega_1^x \dots \omega_{n-1}^x i}^l)}{m_l(K_{\omega_1^x \dots \omega_{n-1}^x}^l)}} \leq \sqrt{\frac{361}{372}}. \quad (4.8)$$

Proof. Set $v := \omega_1^x \dots \omega_{n-2}^x$ ($v := \emptyset$ if $n = 2$) and $w := \omega_1^x \dots \omega_{n-1}^x = v\omega_{n-1}^x$. By $h \in \mathcal{H}_{l,k} \subset \mathcal{H}_{l,n-2}$, Proposition 2.15 and (4.3) we have $h \circ F_v^l \in \mathcal{H}_{l,n-2,0}$, $h \circ F_w^l = (h \circ F_v^l) \circ F_{\omega_{n-1}^x}^l \in \mathcal{H}_{l,n-1,0}$ and $\mathcal{E}^0(h \circ F_w^l|_{V_0}, h \circ F_w^l|_{V_0}) = R_{n-1}^l \mu_{\langle h \rangle}^l(K_w^l) > 0$, and

therefore $h \circ F_w^l(V_0) = \{c - b, c, c + b\}$ for some $b, c \in \mathbb{R}$ with $b > 0$ by Lemma 4.6 with l^{n-2} in place of l applied to $i = \omega_{n-1}^x \in S_{l_{n-1},1}$ and $u = h \circ F_v^l|_{V_0}$. Then we see from Lemma 4.6 with l^{n-1} in place of l applied to $i \in S_{l_n,1}$ and $u = h \circ F_w^l|_{V_0}$ that $h \circ F_{wi}^l(V_0) = (h \circ F_w^l) \circ F_i^{l^{n-1}}(V_0)$ is equal to $\{c_i - 3a_{l_n}b, c_i, c_i + 3a_{l_n}b\}$ for some $c_i \in \mathbb{R}$ for $2(l_n - 4)$ elements i of $S_{l_n,1}$ and to $\{c_i - 6a_{l_n}b, c_i, c_i + 6a_{l_n}b\}$ for some $c_i \in \mathbb{R}$ for the other $l_n - 4$ elements i of $S_{l_n,1}$. It follows by combining this fact with (2.8), (4.3), $h \in \mathcal{H}_{l_{n-1}} \subset \mathcal{H}_{l_n}$, Proposition 2.15, (2.9) and (2.17) that

$$\begin{aligned} & \sum_{i \in S_{l_n}} \sqrt{\frac{\mu_{\langle h \rangle}^l(K_{wi}^l)}{\mu_{\langle h \rangle}^l(K_w^l)}} \sqrt{\frac{m_l(K_{wi}^l)}{m_l(K_w^l)}} = \sum_{i \in S_{l_n}} \sqrt{\frac{\mathcal{E}^{l^n}(h \circ F_{wi}^l, h \circ F_{wi}^l)}{(r_{l_n} \# S_{l_n}) \mathcal{E}^{l^{n-1}}(h \circ F_w^l, h \circ F_w^l)}} \\ & \leq (l_n - 4) \frac{2 \cdot 3\sqrt{6}a_{l_n}b + 6\sqrt{6}a_{l_n}b}{\sqrt{r_{l_n} \# S_{l_n}} \cdot \sqrt{6}b} + 3\sqrt{\frac{\sum_{i \in S_{l_n} \setminus S_{l_{n-1},1}} \mathcal{E}^{l^n}(h \circ F_{wi}^l, h \circ F_{wi}^l)}{(r_{l_n} \# S_{l_n}) \cdot 6b^2}} \\ & = \frac{4(l_n - 4)}{\sqrt{\#S_{l_n}/a_{l_n}}} + 3\sqrt{\frac{r_{l_n} \mathcal{E}^{l^{n-1}}(h \circ F_w^l, h \circ F_w^l) - \sum_{i \in S_{l_{n-1},1}} \mathcal{E}^{l^n}(h \circ F_{wi}^l, h \circ F_{wi}^l)}{6b^2 r_{l_n} \# S_{l_n}}} \\ & = \frac{4(l_n - 4)}{\sqrt{\#S_{l_n}/a_{l_n}}} + 3\sqrt{\frac{6b^2 r_{l_n} - (l_n - 4)(2 \cdot 54a_{l_n}^2 b^2 + 216a_{l_n}^2 b^2)}{6b^2 r_{l_n} \# S_{l_n}}} \\ & = \frac{4(l_n - 4)}{\sqrt{\#S_{l_n}/a_{l_n}}} + 3\sqrt{\frac{a_{l_n}^{-1} - 6(l_n - 4)}{\#S_{l_n}/a_{l_n}}} = \frac{4l_n - 1}{\sqrt{(3l_n - 3)(6l_n + 1)}} \leq \sqrt{\frac{361}{372}}, \end{aligned}$$

proving (4.8). \square

Proof of Theorem 4.3. Let $k \in \mathbb{N} \cup \{0\}$ and $h \in \mathcal{H}_{l,k}$. In view of Lemmas 4.4 and 4.5 it suffices to prove, for any such k and h , that $\mu_{\langle h \rangle}^l \perp m_l$, which is obvious if $\mu_{\langle h \rangle}^l(K^l) = 0$. Assume that $\mu_{\langle h \rangle}^l(K^l) > 0$, set $(\Omega, \mathcal{F}, \mathbb{P}) := (K^l, \mathcal{B}(K^l), m_l)$, let $\{\mathcal{F}_n\}_{n=0}^\infty$ denote the non-decreasing sequence of σ -algebras in Ω with $\bigcup_{n=0}^\infty \mathcal{F}_n$ generating \mathcal{F} as defined in Lemma 4.8, and set $\tilde{\mathbb{P}} := \mu_{\langle h \rangle}^l(K^l)^{-1} \mu_{\langle h \rangle}^l$, so that $\mathbb{P}(K_w^l) > 0$ for any $w \in W_*^l$ and $\mathbb{P}(V_*^l) = \tilde{\mathbb{P}}(V_*^l) = 0$ by (2.8) and Proposition 4.2. In particular, $\tilde{\mathbb{P}}|_{\mathcal{F}_n} \ll \mathbb{P}|_{\mathcal{F}_n}$ for any $n \in \mathbb{N} \cup \{0\}$, and define $\alpha_n \in L^1(\Omega, \mathcal{F}_n, \mathbb{P}|_{\mathcal{F}_n})$ by (4.5) for each $n \in \mathbb{N}$. Now let $\omega^x = (\omega_n^x)_{n=1}^\infty \in \prod_{n=1}^\infty S_{l_n}$ for $x \in K^l \setminus V_*^l$ and $S_{l,1} \subset S_l$ for $l \in \mathbb{N} \setminus \{1, 2, 3, 4\}$ be as in Proposition 4.9. Then by (2.8), the \mathbb{P} -a.s. defined Borel measurable maps $K^l \setminus V_*^l \ni x \mapsto \omega_n^x \in S_{l_n}$, $n \in \mathbb{N}$, form a sequence of independent random variables on $(\Omega, \mathcal{F}, \mathbb{P})$ and satisfy

$$\sum_{n=1}^\infty \mathbb{P}(\{x \in K^l \setminus V_*^l \mid \omega_n^x \in S_{l_{n,1}}\}) = \sum_{n=1}^\infty \frac{\#S_{l_{n,1}}}{\#S_{l_n}} = \sum_{n=1}^\infty \frac{3l_n - 12}{3l_n - 3} \geq \sum_{n=1}^\infty \frac{1}{4} = \infty,$$

and hence the second Borel–Cantelli lemma implies that

$$\#\{n \in \mathbb{N} \mid \omega_n^x \in S_{l_{n,1}}\} = \infty \quad \text{for } \mathbb{P}\text{-a.e. } x \in K^l \setminus V_*^l. \quad (4.9)$$

On the other hand, for each $x \in K^l \setminus V_*^l$, Lemma 4.8 and Proposition 4.9 imply that $\mathbb{E}[\sqrt{\alpha_n} \mid \mathcal{F}_{n-1}](x) = 0$ for any $n \in \mathbb{N}$ with $\mu_{\langle h \rangle}^l(K_{\omega_1^x \dots \omega_{n-1}^x}^l) = 0$ and that

$$\mathbb{E}[\sqrt{\alpha_n} \mid \mathcal{F}_{n-1}](x) = \sum_{i \in S_{l_n}} \sqrt{\frac{\mu_{\langle h \rangle}^l(K_{\omega_1^x \dots \omega_{n-1}^x}^l i)}{\mu_{\langle h \rangle}^l(K_{\omega_1^x \dots \omega_{n-1}^x}^l)}} \sqrt{\frac{m_l(K_{\omega_1^x \dots \omega_{n-1}^x}^l i)}{m_l(K_{\omega_1^x \dots \omega_{n-1}^x}^l)}} \leq \sqrt{\frac{361}{372}}$$

for any $n \in \mathbb{N} \cap [k+2, \infty)$ with $\mu_{\langle h \rangle}^l(K_{\omega_1^x \dots \omega_{n-1}^x}^l) > 0$ and $\omega_{n-1}^x \in S_{l_{n-1,1}}$, whence

$$\sum_{n=1}^{\infty} (1 - \mathbb{E}[\sqrt{\alpha_n} \mid \mathcal{F}_{n-1}](x)) \geq \delta \# \{n \in \mathbb{N} \cap [k+2, \infty) \mid \omega_{n-1}^x \in S_{l_{n-1,1}}\}, \quad (4.10)$$

where $\delta := 1 - \sqrt{\frac{361}{372}} \in (0, 1)$. Combining (4.9) and (4.10), we obtain (4.6), so that Theorem 4.7 is applicable and yields $\tilde{\mathbb{P}} \perp \mathbb{P}$, namely $\mu_{\langle h \rangle}^l \perp m_l$. \square

5 Realizing arbitrarily slow decay rates of $\Psi(r)/r^2$

In this last section, we show that an arbitrarily slow decay rate of $\Psi(r)/r^2$ for a homeomorphism $\Psi: [0, \infty) \rightarrow [0, \infty)$ satisfying (1.2) and (1.6) can be realized by Ψ_l (recall Definition 3.1) for some $l = (l_n)_{n=1}^{\infty} \in (\mathbb{N} \setminus \{1, 2, 3, 4\})^{\mathbb{N}}$. We achieve this by providing in Theorem 5.1 a simple sufficient condition for Ψ to be comparable to Ψ_l for some $l = (l_n)_{n=1}^{\infty} \in (\mathbb{N} \setminus \{1, 2, 3, 4\})^{\mathbb{N}}$ with $\sum_{n=1}^{\infty} l_n^{-1} < \infty$ and proving in Proposition 5.2 that the decay rate of $\Psi(r)/r^2$ for such Ψ can be arbitrarily slow. We also give criteria for verifying this sufficient condition for concrete examples of Ψ in Proposition 5.3 and apply them to the case where $\Psi(r)/r^2$ is a multiple composition of the function $r \mapsto 1/\log(e-1+(r \wedge 1)^{-1})$ in Example 5.4.

Theorem 5.1. *Let $\eta: [0, 1] \rightarrow [0, 1]$ be a homeomorphism with $\eta(0) = 0$ such that*

$$\sum_{n=1}^{\infty} \frac{\eta^{-1}(2^{-n})}{\eta^{-1}(2^{1-n})} < \infty, \quad (5.1)$$

*and define a homeomorphism $\Psi_\eta: [0, \infty) \rightarrow [0, \infty)$ by $\Psi_\eta(r) := r^2 \eta(r \wedge 1)$. Then there exists $l = (l_n)_{n=1}^{\infty} \in (\mathbb{N} \setminus \{1, 2, 3, 4\})^{\mathbb{N}}$ with $\sum_{n=1}^{\infty} l_n^{-1} < \infty$ such that $\Psi_\eta(r)/\Psi_l(r) \in [c^{-1}, c]$ for any $r \in (0, \infty)$ for some $c \in [1, \infty)$, and consequently, $(K^l, d_l, m_l, \mathcal{E}^l, \mathcal{F}_l)$ satisfies **fHKE**(Ψ_η).*

Proof. Set $c_\eta := \inf_{n \in \mathbb{N}} \eta^{-1}(2^{1-n})/\eta^{-1}(2^{-n})$, so that $c_\eta \in (1, \infty)$ since the sequence $\{\eta^{-1}(2^{1-n})/\eta^{-1}(2^{-n})\}_{n=1}^{\infty}$ is $(1, \infty)$ -valued and tends to ∞ by (5.1). Then for any $r, R \in (0, 1]$ with $r \leq R$, taking $j, k \in \mathbb{N}$ such that $\eta(r) \in (2^{-k}, 2^{1-k}]$ and $\eta(R) \in (2^{-j}, 2^{1-j}]$, we have $j \leq k$, hence

$$\frac{R}{r} = \frac{\eta^{-1}(\eta(R))}{\eta^{-1}(\eta(r))} \geq \frac{\eta^{-1}(2^{-j})}{\eta^{-1}(2^{1-k})} \vee 1 \geq c_\eta^{k-j-1} = 2^{(k-j-1)/\beta_\eta} \geq \left(\frac{\eta(R)}{4\eta(r)}\right)^{1/\beta_\eta}$$

by the definition of c_η , where $\beta_\eta := (\log_2 c_\eta)^{-1} \in (0, \infty)$, and therefore

$$\frac{\eta(R)}{\eta(r)} \leq 4 \left(\frac{R}{r} \right)^{\beta_\eta}. \quad (5.2)$$

Recalling that $\lim_{n \rightarrow \infty} \eta^{-1}(2^{1-n})/\eta^{-1}(2^{-n}) = \infty$ by (5.1), choose $n_0 \in \mathbb{N}$ so that $\eta^{-1}(2^{1-n})/\eta^{-1}(2^{-n}) \geq 5$ for any $n \in \mathbb{N}$ with $n \geq n_0$, set $l_0 := 1$, and define $\mathbf{l} = (l_n)_{n=1}^\infty \in \mathbb{N}^\mathbb{N}$ inductively by

$$l_n := \left\lfloor \frac{\eta^{-1}(2^{-n-n_0})}{(l_0 \cdots l_{n-1})\eta^{-1}(2^{-n-n_0})} \right\rfloor, \quad n \in \mathbb{N}. \quad (5.3)$$

Then an induction on n based on (5.3) and the choice of n_0 immediately shows that $\mathbf{l} = (l_n)_{n=1}^\infty \in (\mathbb{N} \setminus \{1, 2, 3, 4\})^\mathbb{N}$ and that for any $n \in \mathbb{N} \cup \{0\}$,

$$\frac{\eta^{-1}(2^{-n-n_0})}{\eta^{-1}(2^{-n_0})} \leq \frac{1}{L_n^{\mathbf{l}}} \leq \frac{6}{5} \frac{\eta^{-1}(2^{-n-n_0})}{\eta^{-1}(2^{-n_0})}, \quad (5.4)$$

which together with (5.1) implies in particular that

$$\sum_{n=1}^\infty l_n^{-1} = \sum_{n=1}^\infty \frac{1/L_n^{\mathbf{l}}}{1/L_{n-1}^{\mathbf{l}}} \leq \frac{6}{5} \sum_{n=1}^\infty \frac{\eta^{-1}(2^{-n-n_0})}{\eta^{-1}(2^{1-n-n_0})} < \infty. \quad (5.5)$$

We claim that $\Psi_\eta(r)/\Psi_{\mathbf{l}}(r) \in [c^{-1}, c]$ for any $r \in (0, \infty)$ for some $c \in [1, \infty)$. Indeed, recalling Definition 3.1, we have $\beta_{\mathbf{l},0} = \inf_{n \in \mathbb{N}} \beta_{l_n} = 2$ by (5.5), hence $\Psi_\eta(r)/\Psi_{\mathbf{l}}(r) = r^2/r^{\beta_{\mathbf{l},0}} = 1$ for any $r \in [1, \infty)$, and also see for any $n \in \mathbb{N}$ that

$$2^{-n-n_0} \leq \eta \left(\frac{\eta^{-1}(2^{-n-n_0})}{\eta^{-1}(2^{-n_0})} \right) \leq \eta(1/L_n^{\mathbf{l}}) \leq \eta \left(\frac{6}{5} \frac{\eta^{-1}(2^{-n-n_0})}{\eta^{-1}(2^{-n_0})} \right) \leq c 2^{-n} \quad (5.6)$$

by (5.4) and (5.2), where $c := 2^{2-n_0} (\frac{6}{5}/\eta^{-1}(2^{-n_0}))^{\beta_\eta}$, and thus that

$$\frac{\Psi_\eta(1/L_n^{\mathbf{l}})}{\Psi_{\mathbf{l}}(1/L_n^{\mathbf{l}})} = \frac{T_n^{\mathbf{l}} \eta(1/L_n^{\mathbf{l}})}{(L_n^{\mathbf{l}})^2} = 2^n \eta(1/L_n^{\mathbf{l}}) \prod_{k=1}^n \left(1 - \frac{5}{6} l_k^{-1} - \frac{1}{6} l_k^{-2} \right) \in [c', c], \quad (5.7)$$

where $c' := 2^{-n_0} \prod_{k=1}^\infty (1 - \frac{5}{6} l_k^{-1} - \frac{1}{6} l_k^{-2}) \in (0, 1)$ by (5.5). Now for any $n \in \mathbb{N}$ and any $s \in [1, l_n]$, by (3.1) we have

$$\frac{\Psi_{\mathbf{l}}(s/L_n^{\mathbf{l}})}{s^2 \Psi_{\mathbf{l}}(1/L_n^{\mathbf{l}})} = \frac{1}{s^2} \left(1 + \frac{3l_n - 4}{l_n - 1} (s - 1) \right) \left(1 + \frac{\frac{2}{3}l_n - \frac{8}{9}}{l_n - 1} (s - 1) \right) \in [1, 2), \quad (5.8)$$

and it follows from $\eta(s/L_n^{\mathbf{l}}) \in [\eta(1/L_n^{\mathbf{l}}), \eta(1/L_{n-1}^{\mathbf{l}})]$, (5.6), (5.8) and (5.7) that

$$\begin{aligned} \frac{\Psi_\eta(s/L_n^{\mathbf{l}})}{\Psi_{\mathbf{l}}(s/L_n^{\mathbf{l}})} &= \frac{\Psi_\eta(s/L_n^{\mathbf{l}})}{\Psi_\eta(1/L_n^{\mathbf{l}})} \frac{\Psi_{\mathbf{l}}(1/L_n^{\mathbf{l}})}{\Psi_{\mathbf{l}}(s/L_n^{\mathbf{l}})} \frac{\Psi_\eta(1/L_n^{\mathbf{l}})}{\Psi_{\mathbf{l}}(1/L_n^{\mathbf{l}})} \\ &= \frac{\eta(s/L_n^{\mathbf{l}})}{\eta(1/L_n^{\mathbf{l}})} \frac{s^2 \Psi_{\mathbf{l}}(1/L_n^{\mathbf{l}})}{\Psi_{\mathbf{l}}(s/L_n^{\mathbf{l}})} \frac{\Psi_\eta(1/L_n^{\mathbf{l}})}{\Psi_{\mathbf{l}}(1/L_n^{\mathbf{l}})} \in [c'/2, (c^2 \vee c) 2^{n_0+1}], \end{aligned}$$

proving that $\Psi_\eta(r)/\Psi_{\mathbf{l}}(r) \in [c'/2, (c^2 \vee c) 2^{n_0+1}]$ for any $r \in (0, \infty)$. Lastly, combining this result with Lemma 3.2, Theorem 3.3 and Remark 1.2-(2) shows that $(K^{\mathbf{l}}, d_{\mathbf{l}}, m_{\mathbf{l}}, \mathcal{E}^{\mathbf{l}}, \mathcal{F}_{\mathbf{l}})$ satisfies $\text{fHKE}(\Psi_\eta)$. \square

The decay rate of $\Psi_\eta(r)/r^2 = \eta(r \wedge 1)$ for η as in Theorem 5.1 can be arbitrarily slow in the sense stated in the following proposition.

Proposition 5.2. *Let $\Psi: [0, \infty) \rightarrow [0, \infty)$ be a homeomorphism satisfying (1.6). Then there exists a homeomorphism $\eta: [0, 1] \rightarrow [0, 1]$ with the properties $\eta(0) = 0$ and (5.1) such that $\eta(r) \geq c\Psi(r)/r^2$ for any $r \in (0, 1]$ for some $c \in (0, \infty)$.*

Proof. Noting (1.6), define $\eta_0: [0, 1] \rightarrow [0, \infty)$ by $\eta_0(r) := \sup_{s \in (0, r]} \Psi(s)/s^2$ ($\eta_0(0) := 0$), so that η_0 is continuous and non-decreasing and $\eta_0((0, 1]) \subset (0, \infty)$, and set $s_n := \max \eta_0^{-1}(2^{-n}\eta_0(1))$ for $n \in \mathbb{N} \cup \{0\}$, so that $s_0 = 1$, $0 < s_n < s_{n-1}$ for any $n \in \mathbb{N}$ and $\lim_{n \rightarrow \infty} s_n = 0$. Define a homeomorphism $\eta: [0, 1] \rightarrow [0, 1]$ by

$$\eta(r) := \left(1 + \frac{r - 2^{-n^2} s_n}{2^{-(n-1)^2} s_{n-1} - 2^{-n^2} s_n}\right) 2^{-n} \quad (5.9)$$

for $n \in \mathbb{N}$ and $r \in [2^{-n^2} s_n, 2^{-(n-1)^2} s_{n-1}]$ and $\eta(0) := 0$. Then since $\eta^{-1}(2^{1-n}) = 2^{-(n-1)^2} s_{n-1}$ and $0 < s_n < s_{n-1}$ for any $n \in \mathbb{N}$,

$$\sum_{n=1}^{\infty} \frac{\eta^{-1}(2^{-n})}{\eta^{-1}(2^{1-n})} = \sum_{n=1}^{\infty} \frac{2^{-n^2} s_n}{2^{-(n-1)^2} s_{n-1}} \leq \sum_{n=1}^{\infty} 2^{1-2n} = \frac{2}{3} < \infty,$$

namely η satisfies (5.1), and for any $n \in \mathbb{N}$ and any $r \in [s_n, s_{n-1}]$ we have

$$\eta(r) \geq \eta(s_n) \geq \eta(2^{-n^2} s_n) = 2^{-n} = \frac{\eta_0(s_{n-1})}{2\eta_0(1)} \geq \frac{\eta_0(r)}{2\eta_0(1)} \geq \frac{\Psi(r)/r^2}{2\eta_0(1)},$$

i.e., $\eta(r) \geq c\Psi(r)/r^2$ with $c := (2\eta_0(1))^{-1} \in (0, \infty)$ for any $r \in (0, 1]$. \square

We conclude this paper with the following proposition, which gives criteria for verifying (5.1) for concrete homeomorphisms $\eta: [0, 1] \rightarrow [0, 1]$ with $\eta(0) = 0$, and some applications of it to $\eta(r) = 1/\log(e - 1 + r^{-1})$ in Example 5.4 below.

Proposition 5.3. *Let $\eta: [0, 1] \rightarrow [0, 1]$ be a homeomorphism with $\eta(0) = 0$, let $\delta \in [0, \infty)$, $\alpha, \beta \in (0, \infty)$ and assume that there exists $c \in (0, \infty)$ such that*

$$\frac{\eta(R)}{\eta(r)} \leq 1 + \delta + \frac{c(R/r)^\beta}{(\log(e - 1 + R^{-1}))^\alpha} \quad \text{for any } r, R \in (0, 1] \text{ with } r \leq R. \quad (5.10)$$

- (1) *If $\delta < 1$ and $\beta < \alpha$, then η satisfies (5.1).*
- (2) *Let $\tilde{\eta}: [0, 1] \rightarrow [0, 1]$ be a homeomorphism with $\tilde{\eta}(0) = 0$, let $\tilde{\delta} \in [0, 1)$ and assume that there exist $\tilde{\alpha}, \tilde{c} \in (0, \infty)$ such that $\tilde{\eta}$ satisfies (5.10) with $\tilde{\delta}, \tilde{\alpha}, 1, \tilde{c}$ in place of δ, α, β, c . Then $\tilde{\eta} \circ \eta$ satisfies (5.10) with $\frac{1}{2}(1 + \tilde{\delta}), c'$ in place of δ, c for some $c' \in (0, \infty)$. In particular, if $\beta < \alpha$, then $\tilde{\eta} \circ \eta$ satisfies (5.1).*

Proof. (1) Set $s_n := \eta^{-1}(2^{-n})$ for $n \in \mathbb{N} \cup \{0\}$. For each $n \in \mathbb{N}$, we see from $\eta(s_{n-1})/\eta(s_n) = 2$, (5.10) with $(r, R) = (r_n, r_{n-1})$ and $\delta < 1$ that

$$\frac{s_n}{s_{n-1}} \leq \frac{c^{1/\beta}(1 - \delta)^{-1/\beta}}{(\log(e - 1 + s_{n-1}^{-1}))^{\alpha/\beta}}, \quad (5.11)$$

and from $\eta(1)/\eta(s_{n-1}) = 2^{n-1}$, (5.10) with $(r, R) = (r_{n-1}, 1)$ and $\delta < 1$ that $2^{n-1} \leq 1 + \delta + cs_{n-1}^{-\beta} \leq (2+c)s_{n-1}^{-\beta}$, whence, provided $n \geq 2 + 2\log_2(2+c)$,

$$\log(e-1 + s_{n-1}^{-1}) \geq \log(s_{n-1}^{-1}) \geq \frac{\log 2}{\beta}(n-1 - \log_2(2+c)) \geq \frac{\log 2}{2\beta}n. \quad (5.12)$$

It follows from (5.11), (5.12) and $\alpha/\beta > 1$ that

$$\sum_{n=1}^{\infty} \frac{\eta^{-1}(2^{-n})}{\eta^{-1}(2^{1-n})} = \sum_{n=1}^{\infty} \frac{s_n}{s_{n-1}} \leq \sum_{n=1}^{n_c-1} \frac{s_n}{s_{n-1}} + \sum_{n=n_c}^{\infty} \frac{c^{1/\beta}(2\beta/\log 2)^{\alpha/\beta}}{(1-\delta)^{1/\beta}n^{\alpha/\beta}} < \infty,$$

where $n_c := 3 + \lfloor 2\log_2(2+c) \rfloor$, proving (5.1).

- (2) Set $\tilde{r} := \eta^{-1}(\exp(-2\tilde{c}(1+\delta)/(1-\tilde{\delta}))^{1/\tilde{\alpha}})$ and let $r, R \in (0, 1]$ satisfy $r \leq R$. By (5.10) for $\tilde{\eta}$ and η and $(\log(e-1 + \eta(R)^{-1}))^{-\tilde{\alpha}} \leq 1$ we have

$$\begin{aligned} \frac{\tilde{\eta} \circ \eta(R)}{\tilde{\eta} \circ \eta(r)} &\leq 1 + \tilde{\delta} + \frac{\tilde{c}}{(\log(e-1 + \eta(R)^{-1}))^{\tilde{\alpha}}} \frac{\eta(R)}{\eta(r)} \\ &\leq 1 + \tilde{\delta} + \frac{\tilde{c}(1+\delta)}{(\log(e-1 + \eta(R)^{-1}))^{\tilde{\alpha}}} + \frac{\tilde{c}c(R/r)^{\beta}}{(\log(e-1 + R^{-1}))^{\alpha}}. \end{aligned} \quad (5.13)$$

If $R \leq \tilde{r}$, then $\tilde{c}(1+\delta)/(\log(e-1 + \eta(R)^{-1}))^{\tilde{\alpha}} \leq \frac{1}{2}(1-\tilde{\delta})$ by the definition of \tilde{r} and hence (5.13) yields (5.10) with $\tilde{\eta} \circ \eta, \frac{1}{2}(1+\tilde{\delta}), \tilde{c}c$ in place of η, δ, c , whereas if $R > \tilde{r}$, then we see from (5.13), $\tilde{\delta} < 1$ and $(\log(e-1 + \eta(R)^{-1}))^{-\tilde{\alpha}} \leq 1 \leq (\log(e-1 + \tilde{r}^{-1})/\log(e-1 + R^{-1}))^{\alpha} \wedge (R/r)^{\beta}$ that (5.10) with $\tilde{\eta} \circ \eta, \frac{1}{2}(1+\tilde{\delta}), c'$ in place of η, δ, c holds, where $c' := \tilde{c}(1+\delta)(\log(e-1 + \tilde{r}^{-1}))^{\alpha} + \tilde{c}c$. In particular, if $\beta < \alpha$, then $\tilde{\eta} \circ \eta$ satisfies (5.1) by $\frac{1}{2}(1+\tilde{\delta}) < 1$ and (1). \square

Example 5.4. Define homeomorphisms $\eta_k : [0, 1] \rightarrow [0, 1]$, $k \in \mathbb{N}$, inductively by

$$\eta_1(r) := \frac{1}{\log(e-1 + r^{-1})} \quad (\eta_1(0) := 0) \quad \text{and} \quad \eta_{k+1} := \eta_1 \circ \eta_k, \quad k \in \mathbb{N}. \quad (5.14)$$

Then η_k satisfies (5.10) with $\delta = \frac{1}{2}$ and $\alpha = 1$ for some $c \in (0, \infty)$ for any $\beta \in (0, \infty)$ and any $k \in \mathbb{N}$. Indeed, this follows by a straightforward induction on k based on Proposition 5.3-(2), which is applicable with $\eta = \eta_k$ and $\tilde{\eta} = \eta_1$ since η_1 is easily seen to satisfy (5.10) with $\delta = 0$, $\alpha = 1$ and $c = (e\beta)^{-1}$ for any $\beta \in (0, \infty)$ as follows: for any $r, R \in (0, 1]$ with $r \leq R$,

$$\begin{aligned} \frac{\eta_1(R)}{\eta_1(r)} &= 1 + \frac{\log \frac{e-1+r^{-1}}{e-1+R^{-1}}}{\log(e-1+R^{-1})} = 1 + \frac{\log \frac{R}{r} + \log \frac{1+(e-1)r}{1+(e-1)R}}{\log(e-1+R^{-1})} \\ &\leq 1 + \frac{\beta^{-1} \log((R/r)^{\beta})}{\log(e-1+R^{-1})} \leq 1 + \frac{(e\beta)^{-1}(R/r)^{\beta}}{\log(e-1+R^{-1})}. \end{aligned} \quad (5.15)$$

As a consequence, for each $k \in \mathbb{N}$, recalling that $\Psi_{\eta_k} : [0, \infty) \rightarrow [0, \infty)$ is defined by $\Psi_{\eta_k}(r) := r^2 \eta_k(r \wedge 1)$, we conclude from Proposition 5.3-(1) that η_k satisfies (5.1), thus from Theorem 5.1 that there exists $\mathbf{l}_k = (l_{k,n})_{n=1}^{\infty} \in (\mathbb{N} \setminus \{1, 2, 3, 4\})^{\mathbb{N}}$ with $\sum_{n=1}^{\infty} l_{k,n}^{-1} < \infty$ such that $\Psi_{\eta_k}(r)/\Psi_{\mathbf{l}_k}(r) \in [c_k^{-1}, c_k]$ for any $r \in (0, \infty)$ for some $c_k \in [1, \infty)$, and thereby that $(K^{\mathbf{l}_k}, d_{\mathbf{l}_k}, m_{\mathbf{l}_k}, \mathcal{E}^{\mathbf{l}_k}, \mathcal{F}_{\mathbf{l}_k})$ satisfies $\text{fHKE}(\Psi_{\eta_k})$.
