

CHARACTERIZATION OF ORTHOGONAL POLYNOMIALS ON LATTICES

D. MBOUNA, JUAN F. MAÑAS-MAÑAS, AND JUAN J. MORENO-BALCÁZAR

ABSTRACT. We consider two sequences of orthogonal polynomials $(P_n)_{n \geq 0}$ and $(Q_n)_{n \geq 0}$ such that

$$\sum_{j=1}^M a_{j,n} S_x D_x^k P_{k+n-j}(z) = \sum_{j=1}^N b_{j,n} D_x^m Q_{m+n-j}(z),$$

with $k, m, M, N \in \mathbb{N}$, $a_{j,n}$ and $b_{j,n}$ are sequences of complex numbers,

$$2S_x f(x(s)) = (\Delta + 2I)f(z), \quad D_x f(x(s)) = \frac{\Delta}{\Delta x(s-1/2)} f(z),$$

$z = x(s-1/2)$, I is the identity operator, x defines a lattice, and $\Delta f(s) = f(s+1) - f(s)$. We show that under some natural conditions, both involved orthogonal polynomials sequences $(P_n)_{n \geq 0}$ and $(Q_n)_{n \geq 0}$ are semiclassical whenever $k = m$. Some particular cases are studied closely where we characterize the continuous dual Hahn and Wilson polynomials for quadratic lattices.

1. INTRODUCTION

One of motivations of this work is to obtain a Al-Salam and Chihara type (see [1]) characterization of classical orthogonal polynomials on lattices. That is to characterize all orthogonal polynomials sequences (OPS), $(P_n)_{n \geq 0}$, solutions of the following equation

$$(1.1) \quad (az^2 + bz + c) \frac{\Delta}{\Delta x(s-1/2)} P_n(x(s-1/2)) \\ = (\Delta + 2I)(a_n P_{n+1} + b_n P_n + c_n P_{n-1})(x(s-1/2)),$$

where I is the identity operator, a, b and c are some well chosen complex numbers, x defines a class of lattices (or grids) with, generally, nonuniform step-size, $\Delta f(s) = f(s+1) - f(s)$, and $\nabla f(s) = \Delta f(s-1)$. This problem finds his origin in [4]. The case where the lattice x is q -quadratic and given by $x(s) = (q^{-s} + q^s)/2$ was solved recently in [12], where under some conditions imposed in a, b and c , the only solutions are the Askey-Wilson polynomials including special or limiting cases of them. But as noticed in [9], when we consider a quadratic lattice for (1.1), solutions “can not easily be deduced from those of Askey-Wilson polynomials”. Our objective is to present an analogue of this problem for quadratic lattices $x(s) = c_4 s^2 + c_5 s$ and therefore to provide another characterization of such OPS on lattices. For instance, it is well known that classical OPS on lattices are characterized (see [7, Theorem

Key words and phrases. semiclassical functional, Wilson polynomials, continuous dual Hahn polynomials, lattices.

4.3]) by the following equation

$$(\Delta + 2\mathbf{I})P_n(x(s-1/2)) = \frac{\Delta}{\Delta x(s-1/2)}(a_n P_{n+1} + b_n D_x P_n + c_n D_x P_{n-1})(x(s-1/2)).$$

In addition it is proved in [12] that, for the q -quadratic lattice $x(s) = (q^{-s} + q^s)/2$, the following equation has classical OPS as solutions

$$\sum_{j=n-1}^{n+1} a_{n,j}(\Delta + 2\mathbf{I})P_j(x(s-1/2)) = \sum_{j=n-4}^{n+2} b_{n,j} \frac{\Delta}{\Delta x(s-1/2)} P_j(x(s-1/2)).$$

Therefore a second motivation of this work is to study such structure relations in a more general form. This is why we consider two (monic) OPS $(P_n)_{n \geq 0}$ and $(Q_n)_{n \geq 0}$, and $k, m, M, N \in \mathbb{N}$ such that

$$\sum_{j=1}^M a_{j,n} S_x D_x^k P_{k+n-j}(z) = \sum_{j=1}^N b_{j,n} D_x^m Q_{m+n-j}(z), \quad z = x(s),$$

where $2S_x f(x(s)) = (\Delta + 2\mathbf{I})f(x(s-1/2))$, $D_x f(x(s)) = \frac{\Delta}{\Delta x(s-1/2)} f(x(s-1/2))$, $a_{j,n}$ and $b_{j,n}$ are sequences of complex numbers. Our aim is to study the semiclassical character of the OPS involved in the above equation.

The structure of this note is as follows. Section 2 presents some basic facts of the algebraic theory of OPS on lattices and some preliminary results. In Section 3 our main results are stated and proved. In Section 4 we present a finer result for a special case.

2. BACKGROUND AND PRELIMINARY

Let \mathcal{P} be the vector space of all polynomials with complex coefficients and let \mathcal{P}^* be its algebraic dual. A simple set in \mathcal{P} is a sequence $(Q_n)_{n \geq 0}$ such that $\deg(Q_n) = n$ for each n . A simple set $(Q_n)_{n \geq 0}$ is called an OPS with respect to $\mathbf{w} \in \mathcal{P}^*$ if

$$\langle \mathbf{w}, Q_n Q_m \rangle = h_n \delta_{n,m}, \quad m = 0, 1, \dots; \quad h_n \in \mathbb{C} \setminus \{0\}.$$

In this case, we say that \mathbf{w} is regular. The left multiplication of a functional \mathbf{w} by a polynomial π is defined by

$$\langle \pi \mathbf{w}, p \rangle = \langle \mathbf{w}, \pi p \rangle, \quad p \in \mathcal{P}.$$

A dual basis $(\mathbf{r}_n)_{n \geq 0}$ of a simple set polynomial sequence $(Q_n)_{n \geq 0}$ is a sequence in \mathcal{P}^* such that $\langle \mathbf{r}_n, Q_m \rangle = \delta_{n,m}$, for all n, m . Consequently, if $(Q_n)_{n \geq 0}$ is a (monic) OPS with respect to $\mathbf{w} \in \mathcal{P}^*$, then the corresponding dual basis is explicitly given by

$$(2.1) \quad \mathbf{r}_n = \langle \mathbf{w}, Q_n^2 \rangle^{-1} Q_n \mathbf{w}.$$

In addition any functional $\mathbf{v} \in \mathcal{P}^*$ (when \mathcal{P} is endowed with an appropriate strict inductive limit topology, see [11]) can be written in the sense of the weak topology in \mathcal{P}^* as

$$\mathbf{v} = \sum_{n=0}^{\infty} \langle \mathbf{v}, Q_n \rangle \mathbf{r}_n.$$

It is known (see [6]) that a monic OPS, $(Q_n)_{n \geq 0}$, is characterized by the following three-term recurrence relation (TTRR):

$$(2.2) \quad Q_{-1}(z) = 0, \quad Q_{n+1}(z) = (z - B_n)Q_n(z) - C_n Q_{n-1}(z), \quad C_n \neq 0,$$

and, therefore,

$$(2.3) \quad B_n = \frac{\langle \mathbf{w}, zQ_n^2 \rangle}{\langle \mathbf{w}, Q_n^2 \rangle}, \quad C_{n+1} = \frac{\langle \mathbf{w}, Q_{n+1}^2 \rangle}{\langle \mathbf{w}, Q_n^2 \rangle}.$$

In our framework, a lattice x is a mapping given by (see [2])

$$x(s) := \begin{cases} \mathbf{c}_1 q^{-s} + \mathbf{c}_2 q^s + \mathbf{c}_3, & q \neq 1 \\ \mathbf{c}_4 s^2 + \mathbf{c}_5 s + \mathbf{c}_6, & q = 1, \end{cases}$$

where $q > 0$ and \mathbf{c}_j ($1 \leq j \leq 6$) are complex numbers such that $(\mathbf{c}_1, \mathbf{c}_2) \neq (0, 0)$ if $q \neq 1$. Note that $x(s + \frac{1}{2}) + x(s - \frac{1}{2}) = 2\alpha x(s) + 2\beta$, where

$$\alpha = \frac{q^{1/2} + q^{-1/2}}{2}, \quad \beta = \begin{cases} (1 - \alpha)\mathbf{c}_3, & q \neq 1, \\ \mathbf{c}_4/4, & q = 1. \end{cases}$$

We define $\alpha_n := (q^{n/2} + q^{-n/2})/2$ and

$$\gamma_n := \begin{cases} \frac{q^{n/2} - q^{-n/2}}{q^{1/2} - q^{-1/2}}, & q \neq 1 \\ n, & q = 1. \end{cases}$$

We set $\gamma_{-1} := -1$ and $\alpha_{-1} := \alpha$. We also define two operators D_x and S_x on \mathcal{P} by

$$D_x f(x(s)) = \frac{\Delta}{\Delta x(s - 1/2)} f(x(s - 1/2)), \quad S_x f(x(s)) = \frac{1}{2}(\Delta + 2\mathbf{I})f(x(s - 1/2)),$$

These operators induce two elements on \mathcal{P}^* , say \mathbf{D}_x and \mathbf{S}_x , via the following definition (see [8]):

$$\langle \mathbf{D}_x \mathbf{u}, f \rangle = -\langle \mathbf{u}, D_x f \rangle, \quad \langle \mathbf{S}_x \mathbf{u}, f \rangle = \langle \mathbf{u}, S_x f \rangle.$$

Let $f, g \in \mathcal{P}$ and $\mathbf{u} \in \mathcal{P}^*$. Then the following properties hold (see e.g. [4, 8, 13]):

$$(2.4) \quad D_x(fg) = (D_x f)(S_x g) + (S_x f)(D_x g),$$

$$(2.5) \quad S_x(fg) = (D_x f)(D_x g)U_2 + (S_x f)(S_x g),$$

$$(2.6) \quad fD_x g = D_x \left[\left(S_x f - \frac{U_1}{\alpha} D_x f \right) g \right] - \alpha^{-1} S_x (g D_x f),$$

$$(2.7) \quad \mathbf{D}_x(f\mathbf{u}) = \left(S_x f - \alpha^{-1} U_1 D_x f \right) \mathbf{D}_x \mathbf{u} + \alpha^{-1} D_x f \mathbf{S}_x \mathbf{u},$$

$$(2.8) \quad \mathbf{S}_x(f\mathbf{u}) = \left(\alpha U_2 - \alpha^{-1} U_1^2 \right) D_x f \mathbf{D}_x \mathbf{u} + \left(S_x f + \alpha^{-1} U_1 D_x f \right) \mathbf{S}_x \mathbf{u},$$

$$(2.9) \quad f\mathbf{D}_x \mathbf{u} = \mathbf{D}_x (S_x f \mathbf{u}) - \mathbf{S}_x (D_x f \mathbf{u}),$$

$$(2.10) \quad \alpha \mathbf{D}_x^n \mathbf{S}_x \mathbf{u} = \alpha_{n+1} \mathbf{S}_x \mathbf{D}_x^n \mathbf{u} + \gamma_n U_1 \mathbf{D}_x^{n+1} \mathbf{u},$$

where

$$\begin{aligned} \mathbf{U}_1(z) &= \begin{cases} (\alpha^2 - 1)(z - \mathbf{c}_3), & q \neq 1 \\ 2\beta, & q = 1, \end{cases} \\ \mathbf{U}_2(z) &= \begin{cases} (\alpha^2 - 1)((z - \mathbf{c}_3)^2 - 4\mathbf{c}_1\mathbf{c}_2), & q \neq 1 \\ 4\beta(z - \mathbf{c}_6) + \mathbf{c}_5^2/4, & q = 1. \end{cases} \end{aligned}$$

It is known that (see [4]) if $x(s) = 4\beta s^2 + \mathbf{c}_5 s$, then

$$(2.11) \quad \mathbf{D}_x z^n = n z^{n-1} + v_n z^{n-2} + \dots, \quad \mathbf{S}_x z^n = z^n + \widehat{v}_n z^{n-1} + \dots,$$

with $v_n = \beta n(n-1)(2n-1)/3$ and $\widehat{v}_n = \beta n(2n-1)$.

We denote by $Q_n^{[k]}$, with $k = 0, 1, \dots$, the monic polynomial of degree n defined by

$$Q_n^{[k]}(z) = \frac{\gamma_n!}{\gamma_{n+k}!} \mathbf{D}_x^k Q_{n+k}(z),$$

with $\gamma_0! = 1$, $\gamma_{n+1}! = \gamma_1 \cdots \gamma_n \gamma_{n+1}$. If $(\mathbf{r}_n^{[k]})_{n \geq 0}$ is the dual basis associated to the sequence $(Q_n^{[k]})_{n \geq 0}$, it is known that (see [4])

$$(2.12) \quad \mathbf{D}_x^k \mathbf{r}_n^{[k]} = (-1)^k \frac{\gamma_{n+k}!}{\gamma_n!} \mathbf{r}_{n+k}, \quad k = 0, 1, \dots$$

3. MAIN RESULTS

We start with the following lemma using ideas developed in [14] and [3].

Lemma 3.1. *Let (\mathbf{u}, \mathbf{v}) be a pair of regular functionals and $((P_n)_{n \geq 0}, (Q_n)_{n \geq 0})$ the corresponding pair of monic OPS. Assume that for some $k, m, M, N \in \mathbb{N}$, we have*

$$(3.1) \quad \sum_{j=0}^M a_{j,n} \mathbf{S}_x P_{n-j}^{[k]}(z) = \sum_{j=0}^N b_{j,n} Q_{n-j}^{[m]}(z), \quad n = 0, 1, \dots,$$

for some complex sequences $a_{i,n}$ and $b_{i,n}$, with $a_{0,n} = 1 = b_{0,n}$ and $a_{M,n} b_{N,n} \neq 0$ for all n . Let $\mathcal{A}_{M+N} = [l_{i,j}]_{i,j=0}^{M+N-1}$ be the following matrix of order $M+N$,

$$l_{i,j} = \begin{cases} a_{j-i,j}, & \text{if } 0 \leq i \leq N-1 \text{ and } i \leq j \leq M+i, \\ b_{j-i+N,j}, & \text{if } N \leq i \leq M+N-1 \text{ and } i-N \leq j \leq i, \\ 0, & \text{otherwise.} \end{cases}$$

Assume that $\det(\mathcal{A}_{M+N}) \neq 0$ and $k \geq m$. Then there exist three polynomials ψ_{N+k+n} , $\phi_{M+m+n+1}$ and ρ_{M+m+n} of degrees $N+k+n$, $M+m+n+1$ and $M+m+n$, respectively, such that

$$(3.2) \quad \psi_{N+k+n} \mathbf{u} = \mathbf{D}_x^{k-m} (\phi_{M+m+n+1} \mathbf{D}_x \mathbf{v} + \rho_{M+m+n} \mathbf{S}_x \mathbf{v}), \quad n = 0, 1, \dots$$

Proof. Define

$$R_n(z) = \sum_{j=0}^M a_{j,n} P_{n-j}^{[k]}(z), \quad n = 0, 1, \dots$$

Let $(\mathbf{a}_n)_{n \geq 0}$, $(\mathbf{b}_n)_{n \geq 0}$, $(\mathbf{a}_n^{[k]})_{n \geq 0}$, $(\mathbf{b}_n^{[m]})_{n \geq 0}$ and $(\mathbf{r}_n)_{n \geq 0}$ be the associated dual basis to the sequences $(P_n)_{n \geq 0}$, $(Q_n)_{n \geq 0}$, $(P_n^{[k]})_{n \geq 0}$, $(Q_n^{[m]})_{n \geq 0}$ and $(R_n)_{n \geq 0}$, respectively. We are going to prove that

$$(3.3) \quad \mathbf{a}_n^{[k]} = \sum_{l=n}^{n+M} a_{l-n,l} \mathbf{r}_l, \quad \mathbf{S}_x \mathbf{b}_n^{[m]} = \sum_{l=n}^{n+N} b_{l-n,l} \mathbf{r}_l, \quad n = 0, 1, \dots$$

Indeed, by definition of R_n , we obtain

$$\langle \mathbf{a}_n^{[k]}, R_l \rangle = \sum_{i=0}^M a_{i,l} \langle \mathbf{a}_n^{[k]}, P_{l-i} \rangle = \begin{cases} a_{l-n,l}, & \text{if } n \leq l \leq n+M, \\ 0, & \text{otherwise.} \end{cases}$$

Similarly, using (3.1), we write

$$\langle \mathbf{S}_x \mathbf{b}_n^{[m]}, R_l \rangle = \sum_{i=0}^N b_{i,l} \langle \mathbf{b}_n^{[m]}, Q_{l-i} \rangle = \begin{cases} b_{l-n,l}, & \text{if } n \leq l \leq n+N, \\ 0, & \text{otherwise.} \end{cases}$$

Therefore (3.3) hold by writing

$$\mathbf{a}_n^{[k]} = \sum_{l=0}^{\infty} \langle \mathbf{a}_n^{[k]}, R_l \rangle \mathbf{r}_l, \quad \mathbf{S}_x \mathbf{b}_n^{[m]} = \sum_{l=0}^{\infty} \langle \mathbf{S}_x \mathbf{b}_n^{[m]}, R_l \rangle \mathbf{r}_l,$$

and by using what is preceding. Taking $n = 0, 1, \dots, N-1$ and $n = 0, 1, \dots, M-1$ in the first and in the second equation of (3.3), respectively, we obtain a system of equations whose matrix is \mathcal{A}_{M+N} and since $\det(\mathcal{A}_{M+N}) \neq 0$, then we may write

$$r_n = \sum_{i=0}^{N-1} \hat{a}_{n,i} \mathbf{a}_i^{[k]} + \sum_{j=0}^{M-1} \hat{b}_{n,j} \mathbf{S}_x \mathbf{b}_j^{[m]}, \quad n = 0, 1, \dots, M+N-1,$$

for some complex sequences $\hat{a}_{n,i}$ and $\hat{b}_{n,j}$. Even more we may also write

$$(3.4) \quad \sum_{i=0}^{n+N} a'_{n,i} \mathbf{a}_i^{[k]} = \sum_{j=0}^{n+M} b'_{n,j} \mathbf{S}_x \mathbf{b}_j^{[m]}, \quad n = 0, 1, \dots$$

with $a'_{n,i}$ and $b'_{n,j}$ complex sequences with $a'_{n,n+N} = b_{N,M+N+n}$ and $b'_{n,n+M} = a_{M,M+N+n}$. In addition using successively (2.10), (2.12), (2.7) and (2.8), we obtain

$$\begin{aligned} & \mathbf{D}_x^m \mathbf{S}_x \mathbf{b}_j^{[m]} \\ &= \frac{\alpha_{m+1}}{\alpha} \mathbf{S}_x \mathbf{D}_x^m \mathbf{b}_j^{[m]} + \frac{\gamma_m}{\alpha} \mathbf{U}_1 \mathbf{D}_x^{m+1} \mathbf{b}_j^{[m]} \\ &= \frac{(-1)^m \gamma_{m+j}!}{\gamma_j! \alpha \langle \mathbf{v}, Q_{m+j}^2 \rangle} \left(\alpha_{m+1} \mathbf{S}_x (Q_{m+j} \mathbf{v}) + \gamma_m \mathbf{U}_1 \mathbf{D}_x (Q_{m+j} \mathbf{v}) \right) \\ &= \frac{(-1)^m \gamma_{m+j}!}{\gamma_j! \alpha \langle \mathbf{v}, Q_{m+j}^2 \rangle} \left[\left((\alpha \alpha_{m+1} \mathbf{U}_2 - (\alpha_{m+1} + \gamma_m) \frac{\mathbf{U}_1^2}{\alpha}) \mathbf{D}_x Q_{m+j} + \gamma_m \mathbf{U}_1 \mathbf{S}_x Q_{m+j} \right) \mathbf{D}_x \mathbf{u} \right. \\ & \quad \left. + \left(\alpha_{m+1} \mathbf{S}_x Q_{m+j} + (\alpha_{m+1} + \gamma_m) \frac{\mathbf{U}_1}{\alpha} \mathbf{D}_x Q_{m+j} \right) \mathbf{S}_x \mathbf{u} \right]. \end{aligned}$$

Now since $k \geq m$, we apply \mathbf{D}_x^k to (3.4) using (2.12) to obtain

$$\sum_{i=0}^{n+N} (-1)^k \frac{\gamma_{k+i}!}{\gamma_i!} a'_{n,i} \mathbf{a}_{k+i} = \mathbf{D}_x^{k-m} \left(\sum_{j=0}^{n+M} b'_{n,j} \mathbf{D}_x^m \mathbf{S}_x \mathbf{b}_j^{[m]} \right), \quad n = 0, 1, \dots$$

Hence (3.2) holds where

$$\begin{aligned}\psi_{N+k+n}(z) &= \sum_{i=0}^{n+N} \frac{(-1)^k \gamma_{k+i}!}{\gamma_i! \langle \mathbf{u}, P_{k+i}^2 \rangle} a'_{n,i} P_{k+i}(z), \\ \phi_{M+m+n+1}(z) &= \sum_{j=0}^{n+M} \frac{(-1)^m \gamma_{m+j}!}{\gamma_j! \alpha \langle \mathbf{v}, Q_{m+j}^2 \rangle} b'_{n,j} \left(\left(\alpha \alpha_{m+1} \mathbf{U}_2 - (\alpha_{m+1} + \gamma_m) \frac{\mathbf{U}_1^2}{\alpha} \right) \mathbf{D}_x Q_{m+j}(z) \right. \\ &\quad \left. + \gamma_m \mathbf{U}_1 \mathbf{S}_x Q_{m+j}(z) \right), \\ \rho_{M+m+n}(z) &= \sum_{j=0}^{n+M} \frac{(-1)^m \gamma_{m+j}!}{\gamma_j! \alpha \langle \mathbf{v}, Q_{m+j}^2 \rangle} b'_{n,j} \left(\alpha_{m+1} \mathbf{S}_x Q_{m+j} + (\alpha_{m+1} + \gamma_m) \frac{\mathbf{U}_1}{\alpha} \mathbf{D}_x Q_{m+j} \right).\end{aligned}$$

In addition, since $a'_{n,n+N} b'_{n,n+M} = b_{N,M+N+N} a_{M,M+N+n} \neq 0$ and

$$\begin{aligned}\alpha_{m+1} \alpha_{m+j} + \frac{\alpha^2 - 1}{\alpha} (\alpha_{m+1} + \gamma_m) \gamma_{m+j} &= \alpha_{2m+j+1}, \\ \left(\alpha \alpha_{m+1} - \frac{\alpha^2 - 1}{\alpha} (\alpha_{m+1} + \gamma_m) \right) \gamma_{m+j} + \gamma_m \alpha_{m+j} &= \gamma_{2m+j},\end{aligned}$$

we clearly have $\deg \psi_{N+k+n} = N + k + n$, $\deg \phi_{M+m+n+1} = M + m + n + 1$ and $\deg \rho_{M+m+n} = M + m + n$. Thus the desired result follows. \square

Let us now state the first result.

Theorem 3.1. *Let (\mathbf{u}, \mathbf{v}) be a pair of regular functionals with respect to the pair of monic OPS $((P_n)_{n \geq 0}, (Q_n)_{n \geq 0})$. Assume that (3.1) holds. Under the assumptions and conclusion of Lemma 3.1, assume further that $m = k$,*

$$\phi_{M+k+n+1}(z) \rho_{M+k+n+1}(z) - \phi_{M+k+n+2}(z) \rho_{M+k+n}(z) \neq 0, \quad n = 0, 1, \dots,$$

and $\det(\mathcal{B}_4) \neq 0$, where $\mathcal{B}_4(z) = [c_{i,j}(z)]_{i,j=0}^3$ is the following polynomial matrix of order four

$$c_{i,j}(z) = \begin{cases} \mathbf{U}_1 \mathbf{D}_x \psi_{N+k+i}(z) - \alpha \mathbf{S}_x \psi_{N+k+i}(z), & \text{if } j = 0, \\ \alpha \mathbf{S}_x \phi_{M+k+i+1}(z) - \mathbf{U}_1 (\mathbf{D}_x \phi_{M+k+i+1}(z) - K_{M+k+i}(z)), & \text{if } j = 1, \\ \mathbf{D}_x \phi_{M+k+i+1}(z) + (2\alpha^2 - 1) K_{M+k+i}(z), & \text{if } j = 2, \\ \mathbf{D}_x \rho_{M+k+i}(z), & \text{otherwise.} \end{cases}$$

where $K_{M+k+i}(z) = \mathbf{S}_x \rho_{M+k+i}(z) - \alpha^{-1} \mathbf{U}_1 \mathbf{D}_x \rho_{M+k+i}(z)$, for $i = 0, 1, 2, 3$.

Then \mathbf{u} and \mathbf{v} are semiclassical functionals. That is, there exist four nonzero polynomials ϕ_1, ϕ_2, ψ_1 and ψ_2 , such that

$$\phi_1 \mathbf{D}_x \mathbf{u} = \psi_1 \mathbf{S}_x \mathbf{u}, \quad \phi_2 \mathbf{D}_x \mathbf{v} = \psi_2 \mathbf{S}_x \mathbf{v}.$$

In addition, there exist two nonzero polynomials π and ρ such that

$$\pi \mathbf{u} = \rho \mathbf{S}_x \mathbf{v}.$$

Proof. Since $k = m$, taking $n = 0$ and $n = 1$ in (3.2), we obtain

$$\begin{aligned}\psi_{N+k} \mathbf{u} &= \phi_{M+k+1} \mathbf{D}_x \mathbf{v} + \rho_{M+k} \mathbf{S}_x \mathbf{v}, \\ \psi_{N+k+1} \mathbf{u} &= \phi_{M+k+2} \mathbf{D}_x \mathbf{v} + \rho_{M+k+1} \mathbf{S}_x \mathbf{v}.\end{aligned}$$

The determinant of the above system does not vanish identically by assumption, and so we have $\phi_2 \mathbf{D}_x \mathbf{v} = \psi_2 \mathbf{S}_x \mathbf{v}$ and $\pi \mathbf{u} = \rho \mathbf{S}_x \mathbf{v}$, where

$$\phi_2 = \phi_{M+k+1} \psi_{N+k+1} - \phi_{M+k+2} \psi_{N+k}, \quad \psi_2 = \rho_{M+k+1} \psi_{N+k} - \rho_{M+k} \psi_{N+k+1},$$

$$\pi = \phi_{M+k+2} \psi_{N+k} - \phi_{M+k+1} \psi_{N+k+1}, \quad \rho = \phi_{M+k+2} \rho_{M+k} - \phi_{M+k+1} \rho_{M+k+1}.$$

Now we apply \mathbf{D}_x to (3.2) using (2.7) and (2.10) to obtain

$$\begin{aligned} \mathbf{D}_x \psi_{N+k+n} \mathbf{S}_x \mathbf{u} &= \left(\mathbf{U}_1 \mathbf{D}_x \psi_{N+k+n} - \alpha \mathbf{S}_x \psi_{N+k+n} \right) \mathbf{D}_x \mathbf{u} \\ &+ \left(\alpha \mathbf{S}_x \phi_{M+k+n+1} - \mathbf{U}_1 (\mathbf{D}_x \phi_{M+k+n+1} - K_{M+k+n}) \right) \mathbf{D}_x^2 \mathbf{v} \\ &+ \left(\mathbf{D}_x \phi_{M+k+n+1} + (2\alpha^2 - 1) K_{M+k+n} \right) \mathbf{S}_x \mathbf{D}_x \mathbf{v} \\ &+ \mathbf{D}_x \rho_{M+k+n} \mathbf{S}_x^2 \mathbf{v}, \end{aligned}$$

for $n = 0, 1, \dots$. Taking $n = 0, 1, 2, 3$, we obtain the following system

$$\begin{bmatrix} \mathbf{D}_x \psi_{N+k} \mathbf{S}_x \mathbf{u} \\ \mathbf{D}_x \psi_{N+k+1} \mathbf{S}_x \mathbf{u} \\ \mathbf{D}_x \psi_{N+k+2} \mathbf{S}_x \mathbf{u} \\ \mathbf{D}_x \psi_{N+k+3} \mathbf{S}_x \mathbf{u} \end{bmatrix} = \mathcal{B}_4 \begin{bmatrix} \mathbf{D}_x \mathbf{u} \\ \mathbf{D}_x^2 \mathbf{v} \\ \mathbf{S}_x \mathbf{D}_x \mathbf{v} \\ \mathbf{S}_x^2 \mathbf{v} \end{bmatrix}.$$

Since $B(z) = \det(\mathcal{B}_4(z)) \neq 0$, then we can solve this system for $\mathbf{D}_x \mathbf{u}$, that is, there exists a nonzero polynomial ψ_1 such that $B \mathbf{D}_x \mathbf{u} = \psi_1 \mathbf{S}_x \mathbf{u}$. The proof is done. \square

Remark 3.1. *It is important to notice that if $k > m$ in (3.1), then we can apply \mathbf{D}_x to (3.2) and proceed as in the previous proof to show that, under some assumptions, \mathbf{u} is semiclassical but we can not insure that \mathbf{v} is also semiclassical. We emphasize that the structure relation considered here has no link with the notion of coherence pair of measures and so this explain why our results are different. Regarding this we remind that the idea behind our considered relation was to characterize such OPS and therefore generalize some known results as mentioned in the introduction. Finding possible examples and connection with the so-called Sobolev OPS are not in the scope of this note and may lead to a possible future direction. In what follows we analyze closely some particular cases.*

For our purpose the following result is helpful.

Theorem 3.2. [9, Theorem 3.6] *The Sturm-Liouville type equation*

$$(3.5) \quad \phi(z) \mathbf{D}_x^2 Y(z) + \psi(z) \mathbf{S}_x \mathbf{D}_x Y(z) = \lambda_n Y(z),$$

where ϕ and ψ are polynomials of degree at most two and one, respectively, and λ_n is a constant, has a polynomial solution $P_n(z)$, of degree $n = 0, 1, \dots$, for the lattice $z = 4\beta s^2 + \mathbf{c}_5 s$, $\beta \neq 0$, if and only if up to a multiplicative constant, P_n is the continuous dual Hahn polynomial or the Wilson polynomial.

The following result is the analogue of [12, Theorem 3.1] for quadratic lattices.

Theorem 3.3. *Consider the lattice $z = x(s) := 4\beta s^2 + \mathbf{c}_5 s$, with $(\beta, \mathbf{c}_5) \neq (0, 0)$. Let $(P_n)_{n \geq 0}$ be a monic OPS with respect to $\mathbf{u} \in \mathcal{P}^*$. Assume that the following equation holds*

$$(3.6) \quad (az^2 + bz + c) \mathbf{D}_x P_n = a_n \mathbf{S}_x P_{n+1} + b_n \mathbf{S}_x P_n + c_n \mathbf{S}_x P_{n-1}, \quad n = 0, 1, \dots,$$

with $c_n \neq 0$ for $n = 0, 1, \dots$, where the constant parameters a , b and c are chosen such that

(3.7)

$$6aC_2C_3 + 2(1 + a^{-1})r_3\left(C_1 - \frac{\mathfrak{c}_5^2}{4}\right) + r_3\left((B_1 - B_0)^2 - 8\beta(B_0 + B_1 - 2\beta) - 2C_2\right) = 0,$$

whenever $a \neq 0$, and

$$(3.8) \quad aC_2C_3\left(b_2 + 2aB_2 + b'\right) - r_3\left(a(B_2 + B_1)C_2 + b'C_2 - \frac{r_2}{2}(B_1 - B_0)\right) = 0,$$

with $r_i = c_i + 2aC_i$, $i = 2, 3$ and $b' = b + 2a\beta$. Then $(P_n)_{n \geq 0}$ are the multiple of continuous dual Hahn polynomials or Wilson polynomials or special or limiting cases of them. Moreover (3.5) holds with

(3.9)

$$\phi(z) = (B_0 - z)(\mathfrak{a}z + \mathfrak{b} - \mathfrak{a}B_1) - (\mathfrak{a} + 1)C_1, \quad \psi(z) = z - B_0, \quad \lambda_n = n(1 + (n - 1)\mathfrak{a}),$$

where

$$\mathfrak{a} := \frac{aC_3}{r_3C_1}, \quad \mathfrak{b} := \frac{1}{2}(B_1 - B_0 + 4\beta);$$

being B_0 , B_1 , C_1 , C_2 and C_3 are coefficients for the TTRR relation (2.2) satisfied by $(P_n)_{n \geq 0}$.

Proof. Let $(P_n)_{n \geq 0}$ be a monic OPS with respect to the functional $\mathbf{u} \in \mathcal{P}^*$ and satisfying (3.6). For the quadratic lattice $z = x(s) = 4\beta s^2 + \mathfrak{c}_5 s$, if we set $\pi_2(z) := az^2 + bz + c$, then by using (2.6), we obtain

$$(3.10) \quad \pi_2 D_x P_n = D_x \left[\left(S_x \pi_2 - 2\beta D_x \pi_2 \right) P_n \right] - S_x \left(D_x \pi_2 P_n \right).$$

By direct computations we have

$$D_x \pi_2(z) = 2a(z + \beta) + b, \quad S_x \pi_2(z) = az^2 + (b + 6a\beta)z + \pi_2(\beta) + a\mathfrak{c}_5^2/4.$$

Hence from (3.10), using (2.2) together with (3.6), we obtain

$$\sum_{j=n-1}^{n+1} a_{n,j} S_x P_j(z) = \sum_{j=n-3}^{n+1} b_{n,j} P_j^{[1]}(z), \quad n = 0, 1, \dots,$$

where

$$\begin{aligned} a_{n,n+1} &= 2a + a_n, \quad a_{n,n} = b_n + 2aB_n + b + 2a\beta, \quad a_{n,n-1} = c_n + 2aC_n, \\ b_{n,n+1} &= a(n+2), \quad b_{n,n} = (n+1)\left(a(B_{n+1} + B_n) + b + 2a\beta\right), \\ b_{n,n-2} &= (n-1)C_n\left(a(B_{n-1} + B_n) + b + 2a\beta\right), \quad b_{n,n-3} = a(n-2)C_n C_{n-1}, \\ b_{n,n-1} &= n\left[a\left(C_{n+1} + B_n^2 + C_n\right) + (b + 2a\beta)(B_n - \beta) + c - a\left(\beta^2 - \frac{\mathfrak{c}_5^2}{4}\right)\right]. \end{aligned}$$

Assume $a \neq 0$ and define

$$Q_n(z) := \sum_{j=n-2}^n a_{n-1,j} P_j(z), \quad n = 0, 1, \dots$$

Then $(Q_n)_{n \geq 0}$ is a simple set of polynomials and so let $(\mathbf{a}_n)_{n \geq 0}$, $(\mathbf{a}_n^{[1]})_{n \geq 0}$ and $(\mathbf{r}_n)_{n \geq 0}$ be the associated basis to the sequences $(P_n)_{n \geq 0}$, $(P_n^{[1]})_{n \geq 0}$ and $(Q_n)_{n \geq 0}$, respectively. We then obtain

$$(3.11) \quad \mathbf{a}_n = a_{n-1,n}\mathbf{r}_n + a_{n,n}\mathbf{r}_{n+1} + a_{n+1,n}\mathbf{r}_{n+2} ;$$

$$(3.12) \quad \mathbf{S}_x \mathbf{a}_n^{[1]} = b_{n-1,n}\mathbf{r}_n + b_{n,n}\mathbf{r}_{n+1} + b_{n+1,n}\mathbf{r}_{n+2} + b_{n+2,n}\mathbf{r}_{n+3} + b_{n+3,n}\mathbf{r}_{n+4} ,$$

Let us write $P_n(z) = z^n + f_n z^{n-1} + \dots$, for $n = 0, 1, \dots$, with $f_n = -\sum_{j=0}^{n-1} B_j$. Then using (2.11), we identify the coefficients of the terms in z^{n+1} and in z^n in each member of (3.6) to obtain

$$a_n = na , \quad b_n = bn + anB_n - \frac{2}{3}an\beta(2n^2 + 6n + 1) + a \sum_{j=0}^{n-1} B_j .$$

Without loss of generality, we set $a_{-1} := -a$. Also taking $n = 1$ in (3.6), we obtain

$$c_1 = c - a(B_0 - \beta)(B_1 - \beta) + C_1 - \frac{\mathbf{c}_5^2}{4} + (B_0 - \beta)(b - a(6\beta - B_0 - B_1)) .$$

Then defining

$$A := -\frac{a}{2} \left((B_1 - B_0)^2 - 8\beta(B_0 + B_1 - 2\beta) - 2C_2 \right) - (a+1) \left(C_1 - \frac{\mathbf{c}_5^2}{4} \right) ,$$

we combine the obtained system by taking $n = 0, 1, 2$ in (3.11) and $n = 0$ in (3.12), using what is preceding to obtain

$$(3.13) \quad \mathbf{S}_x \mathbf{a}_0^{[1]} = \mathbf{a}_0 + \frac{1}{2}(B_1 - B_0)\mathbf{a}_1 + \frac{A}{3a}\mathbf{a}_2 ,$$

subject to conditions (3.7)–(3.8). Now apply \mathbf{D}_x to (3.13) using (2.10), (2.12) and (2.9) to write

$$\mathbf{D}_x \left[\mathbf{a}_0 + \frac{1}{2} \left((B_1 - B_0) + 2\mathbf{U}_1 \right) \mathbf{a}_1 + \frac{A}{3a} \mathbf{a}_2 \right] = -\mathbf{S}_x \mathbf{a}_1 .$$

So using (2.1) and (2.3) we obtain

$$\mathbf{D}_x(\phi \mathbf{u}) = \mathbf{S}_x(\psi \mathbf{u}) ,$$

where ϕ and ψ are given in (3.9). This is equivalent to the following equation

$$\phi(z) \mathbf{D}_x^2 P_n(z) + \psi(z) \mathbf{S}_x \mathbf{D}_x P_n(z) = \lambda_n P_n(z) , \quad n = 1, 2, \dots ,$$

with $\lambda_n = n(1 + (n-1)\mathbf{a}) \neq 0$, by applying [8, Theorem 5: (a) \iff (c)]. Thus the desired result follows by Theorem 3.2. \square

4. A SPECIAL CASE

Here we state a finer result for the special case where $a = 0$ in (3.6). For this purpose the following result is appropriate.

Theorem 4.1. [4, 5] *Consider the lattice $z = x(s) = 4\beta s^2 + \mathbf{c}_5 s$. Let $(P_n)_{n \geq 0}$ be a monic OPS with respect to $\mathbf{u} \in \mathcal{P}^*$. Suppose that \mathbf{u} satisfies $\mathbf{D}_x(\phi \mathbf{u}) = \mathbf{S}_x(\psi \mathbf{u})$, where $\phi(z) = az^2 + bz + c$ and $\psi(z) = dz + e$, with $d \neq 0$. Then $(P_n)_{n \geq 0}$ satisfies (2.2) with*

$$(4.1) \quad B_n = \frac{ne_{n-1}}{d_{2n-2}} - \frac{(n+1)e_n}{d_{2n}} - 2\beta n(n-1), \quad C_{n+1} = -\frac{(n+1)d_{n-1}}{d_{2n-1}d_{2n+1}} \phi^{[n]} \left(-\beta n^2 - \frac{e_n}{d_{2n}} \right) ,$$

where $d_n = an + d$, $e_n = bn + e + 2\beta dn^2$, and

$$\phi^{[n]}(z) = az^2 + (b + 6\beta nd_n)z + \phi(\beta n^2) + 2\beta n\psi(\beta n^2) + \frac{n}{4}\mathfrak{c}_5^2 d_n.$$

Recall that the continuous monic dual Hahn polynomial $(H_n(\cdot; a, b, c))_{n \geq 0}$ satisfies (2.2) (see [10, p.197, (9.3.5)]) with

$$\begin{aligned} B_n &= (n + a + b)(n + a + c) + n(n + b + c - 1) - a^2, \\ C_{n+1} &= (n + 1)(n + a + b)(n + a + c)(n + b + c), \quad n = 0, 1, \dots, \end{aligned}$$

with the restrictions $-a - b, -a - c, -b - c \notin \mathbb{N}_0$.

We are now in the position to state our result.

Corollary 4.1. *Consider the lattice $x(s) = 4\beta s^2 + \mathfrak{c}_5 s$ with $(\beta, \mathfrak{c}_5) \neq (0, 0)$. Let $(P_n)_{n \geq 0}$ be a monic OPS with respect to $\mathbf{u} \in \mathcal{P}^*$ satisfying*

$$(4.2) \quad (z + c)\mathbf{D}_x P_n(z) = b_n \mathbf{S}_x P_n(z) + c_n \mathbf{S}_x P_{n-1}(z), \quad n = 0, 1, \dots,$$

with $c_n \neq 0$ for $n = 1, 2, \dots$, where the constant c is chosen such that

$$(4.3) \quad 2(C_2 + (B_0 - B_1)c) = (B_1 - 5\beta)^2 - (B_0 - 5\beta)^2.$$

Then up to an affine transformation of the variable, P_n is one of the following specific case of the continuous dual Hahn polynomial $(H_n(\cdot; a, b, c))_{n \geq 0}$:

$$(4.4) \quad P_n(z) = (-4\beta)^n H_n\left(-\frac{1}{4\beta}\left(z + \frac{\mathfrak{c}_5^2}{16\beta}\right); a, b, \frac{1}{2}\right),$$

or

$$(4.5) \quad P_n(z) = (-4\beta)^n H_n\left(-\frac{1}{4\beta}\left(z + 2\beta + \frac{\mathfrak{c}_5^2}{16\beta}\right); d - \frac{1}{2}, e - \frac{1}{2}, \frac{1}{2}\right),$$

for each $n = 0, 1, \dots$, where d and e are complex numbers such $-d \notin \mathbb{N}_0$ and

$$e := -1 + \frac{1}{1+d} \left(1 - \frac{\mathfrak{c}_5^2}{64\beta^2}\right).$$

Proof. Let $\mathbf{u} \in \mathcal{P}^*$ be the regular functional with respect to which $(P_n)_{n \geq 0}$ is a monic OPS. Suppose that $(P_n)_{n \geq 0}$ satisfies (4.2) and subject to the restriction (4.3). Then from Theorem 3.3 we deduce (by taking $a = 0$, $b = 1$ and taking also $n = 1, 2$ in (4.2)) that $\mathbf{D}_x(\phi\mathbf{u}) = \mathbf{S}_x(\psi\mathbf{u})$ holds where

$$\phi(z) = -\frac{1}{2}(B_1 - B_0 + 4\beta)(z - B_0) - C_1, \quad \psi(z) = z - B_0.$$

We apply (4.1) to obtain

$$(4.6) \quad B_n = -8\beta n^2 + (B_1 - B_0 + 8\beta)n + B_0,$$

$$(4.7) \quad C_{n+1} = \frac{1}{4}(n+1) \left[64\beta^2 n^3 - 16\beta(B_1 - B_0 + 4\beta)n^2 + 4C_1 + \left((B_1 - B_0)^2 - \mathfrak{c}_5^2 + 8\beta(B_1 - 3B_0 + 2\beta) \right) n \right],$$

for each $n = 0, 1, \dots$. In addition, we claim that the parameters B_0 , B_1 and C_1 are related by the following equation

$$(4.8) \quad 2\beta C_1 = (B_1 - B_0 + 8\beta) \left((B_0 - \beta)\beta + \frac{\mathfrak{c}_5^2}{16} \right),$$

with $B_0 + B_1 = 2\beta$ or $B_0 + B_1 \neq 2\beta$.

Indeed writing $P_n(z) = z^n + f_n z^{n-1} + \dots$, where $f_0 := 0$ and $f_n = -\sum_{j=0}^{n-1} B_j$ for $n = 1, 2, \dots$, we identify the coefficients of the two firsts terms with higher degree in (4.2) using (2.11) to obtain

$$(4.9) \quad b_n = n, \quad c_n = \sum_{j=0}^{n-1} B_j - \frac{1}{3}(4n^2 - 1)n\beta + nc, \quad n = 0, 1, \dots$$

Also by direct computations we obtain

$$\begin{aligned} D_x P_2(z) &= 2z + 2\beta - B_0 - B_1, \\ S_x P_2(z) &= z^2 + (6\beta - B_0 - B_1)z + (\beta - B_0)(\beta - B_1) + \frac{\mathfrak{c}_5^2}{4} - C_1. \end{aligned}$$

Similarly we obtain $D_x P_3$ and $S_x P_3$ by taking $n = 3$ in (2.2) using (2.4)–(2.5):

$$\begin{aligned} D_x P_3(z) &= 3z^2 + 2(5\beta - B_0 - B_1 - B_2)z + (\beta - B_2)(2\beta - B_0 - B_1) \\ &\quad + (\beta - B_0)(\beta - B_1) - C_1 - C_2 + \frac{\mathfrak{c}_5^2}{4}, \end{aligned}$$

and

$$\begin{aligned} S_x P_3(z) &= z^3 + (15\beta - B_0 - B_1 - B_2)z^2 + \left(4\beta(2\beta - B_0 - B_1) + 3\frac{\mathfrak{c}_5^2}{4} - C_1 - C_2 \right. \\ &\quad \left. + (\beta - B_0)(\beta - B_1) + (\beta - B_2)(6\beta - B_0 - B_1)\right)z + (B_0 - \beta)C_2 \\ &\quad - (B_0 + B_1 + B_2 - 3\beta)\frac{\mathfrak{c}_5^2}{4} + (\beta - B_2)\left((\beta - B_0)(\beta - B_1) - C_1\right). \end{aligned}$$

Taking $n = 3$ in (4.2), using what is preceding we obtain the following equations:

$$\begin{aligned} &C_2 + C_1 - 2\beta(c_3 - c) + (B_0 + B_1 - 2\beta)\left(\frac{1}{2}c_3 + 7\beta - B_2 - c\right) \\ &\quad + (B_2 - \beta)(6\beta - c) + (B_0 - \beta)(\beta - B_1) - \mathfrak{c}_5^2 = 0, \\ &(3B_0 - 3\beta + c)C_2 + (3B_2 - 3\beta - c_3 + c)C_1 + (\beta - B_0)(\beta - B_1)(c_3 + 3\beta - 3B_2 - c) \\ &\quad - \frac{\mathfrak{c}_5^2}{4}(3B_0 + 3B_1 + 3B_2 - 9\beta - c_3 + c) + c(B_2 - \beta)(2\beta - B_0 - B_1) = 0. \end{aligned}$$

Hence (4.8) is obtained from the previous equations by using the expressions of c_3 , B_2 , C_2 and c giving by (4.9), (4.6), (4.7) and (4.3), respectively.

Recall that from (4.3), $B_1 \neq B_0$ and consequently from (4.8), we obtain $\beta \neq 0$. Further, according to (4.8), only B_0 and B_1 may be consider as free parameters. Let then a and b be two complex numbers solutions of the following quadratic equation:

$$8\beta Z^2 + (B_1 - B_0 + 8\beta)Z + \frac{1}{2}(B_1 - 5B_0) + 4\beta - \frac{\mathfrak{c}_5^2}{8\beta} = 0.$$

That is

$$(a, b) \text{ or } (b, a) \in \left\{ \left(\frac{1}{16\beta}(B_0 - B_1 - 8\beta) - \sqrt{\Delta}, \frac{1}{16\beta}(B_0 - B_1 - 8\beta) + \sqrt{\Delta} \right) \right\},$$

where $\Delta := \frac{1}{256\beta^2}(B_1 - B_0 + 8\beta)^2 + \frac{1}{8\beta}\left(\frac{1}{2}(5B_0 - B_1) - 4\beta + \frac{c_5^2}{8\beta}\right)$. Then we may express B_0 and B_1 in term of a and b as follows

$$\begin{aligned} B_0 &= -2\beta(a + b + 2ab) - \frac{c_5^2}{16\beta}, \\ B_1 &= -2\beta(5a + 5b + 4 + 2ab) - \frac{c_5^2}{16\beta}. \end{aligned}$$

So (4.8) becomes $C_1 = 4\beta^2(a + b)(2a + 1)(2b + 1)$. Then from (4.6)–(4.7) we obtain

$$\begin{aligned} B_n &= -2\beta\left(4n(n + a + b) + 2ab + a + b\right) - \frac{c_5^2}{16\beta}, \\ C_{n+1} &= 4\beta^2(n + a + b)(2n + 2a + 1)(2n + 2b + 1), \quad n = 0, 1, \dots, \end{aligned}$$

with the condition $-a - b, -(2a + 1)/2, -(2b + 1)/2 \notin \mathbb{N}_0$, obtained from the regularity conditions. In addition, using (4.3) and (4.9), we obtain

$$c = \frac{c_5^2}{16\beta}, \quad c_n = -\beta n(2n + 2a - 1)(2n + 2b - 1).$$

Hence (4.4) holds.

We remark that if in addition to (4.8), we have $B_1 = -B_0 + 2\beta$, then B_0 will be the only free parameter. For this case let d and e be two complex numbers solutions of the following quadratic equation

$$4\beta Z^2 + (\beta - B_0)(Z + 1) - \frac{c_5^2}{16\beta} = 0.$$

Then we obtain

$$(d, e) \text{ or } (e, d) \in \left\{ \left(\frac{1}{8\beta}(B_0 - \beta) - \sqrt{\Delta}, \frac{1}{8\beta}(B_0 - \beta) + \sqrt{\Delta} \right) \right\},$$

where $\Delta := \frac{1}{4\beta} \left[(B_0 - \beta) \left(1 + \frac{1}{16\beta}(B_0 - \beta) \right) + \frac{c_5^2}{16\beta} \right]$.

Then we have $\beta(1 + 4d + 4e) = B_0 = \beta - 4\beta de - \frac{c_5^2}{16\beta}$. So d and e are related by the following relation

$$(d + 1)(e + 1) = 1 - \frac{c_5^2}{64\beta^2}.$$

Therefore (4.6)–(4.7) become

$$\begin{aligned} B_n &= -8\beta n^2 - 8\beta(d + e - 1)n + \beta(1 - 4de) - \frac{c_5^2}{16\beta}, \\ C_{n+1} &= 16\beta^2(n + 1)(n + d + e - 1)(n + d)(n + e), \quad n = 0, 1, \dots, \end{aligned}$$

where $-d, -e, -d - e \notin \mathbb{N}_0$ by regularity conditions. We also have

$$c = \frac{c_5^2}{16\beta}, \quad c_n = -\frac{4}{3}n\beta(7n^2 + 6(d + e - 1)n + 3de - 1)$$

Hence (4.5) holds. □
