# Some identities for the Narayana polynomial and its derivatives

Nguyen Tien Dung∗ †

June 18, 2022

#### Abstract

In this note, by employing a nice property of semicircular distributions, we derive some identities for the Narayana polynomial and its derivatives.

Keywords: Narayana polynomials, Semicircular distribution. 2020 Mathematics Subject Classification: 11B83, 60C05.

#### 1 Introduction

The Narayana numbers  $N(r, k)$  and the Narayana polynomials  $\mathcal{N}_r(z)$  are defined by

$$
N(r,k) = \frac{1}{r} \binom{r}{k-1} \binom{r}{k},\tag{1.1}
$$

$$
\mathcal{N}_r(z) = \sum_{k=1}^r N(r,k) z^{k-1}.
$$
\n(1.2)

Because of their applications in Combinatorics theory, the Narayana numbers and the Narayana polynomials have been investigated by several authors. There is a large number of combinatorial properties can be found in the literature, see [\[1,](#page-4-0) [2,](#page-4-1) [3,](#page-4-2) [4\]](#page-4-3) and references therein.

The main result of this paper can be formulated as follows.

<span id="page-0-3"></span>**Theorem 1.1.** For every  $r \geq 3$ , we have

<span id="page-0-0"></span>
$$
\mathcal{N}_r(z) = \frac{2r-1}{r+1}(1+z)\mathcal{N}_{r-1}(z) - \frac{r-2}{r+1}(1-z)^2\mathcal{N}_{r-2}(z),\tag{1.3}
$$

<span id="page-0-1"></span>
$$
\mathcal{N}'_r(z) = \frac{r-1}{2z} \mathcal{N}_r(z) + \frac{(r-1)(z-1)}{2z} \mathcal{N}_{r-1}(z),\tag{1.4}
$$

<span id="page-0-2"></span>
$$
\mathcal{N}_r''(z) = -\frac{r-1}{z^2} \mathcal{N}_r(z) + \left(\frac{(r-1)^2}{z} + \frac{r-1}{z^2}\right) \mathcal{N}_{r-1}(z).
$$
\n(1.5)

The proof of the above theorem is deferred to Section [2.](#page-1-0) Let us end up this Section with some remarks.

Remark 1.1. In his paper [\[3\]](#page-4-2), Lasalle established the following recurrence

<span id="page-1-1"></span>
$$
(z+1)\mathcal{N}_r(z) - \mathcal{N}_{r+1}(z) = \sum_{n\geq 1} (-z)^n \binom{r-1}{2n-1} A_n \mathcal{N}_{r-2n+1}(z),\tag{1.6}
$$

where the numbers  $A_n$  satisfies the recurrence

$$
(-1)^{n-1}A_n = C_n + \sum_{j=1}^{n-1} (-1)^j \binom{2n-1}{2j-1} A_j C_{n-j},
$$

with  $A_1 = 1$  and  $C_n = \frac{1}{n+1} {2n \choose n}$  $\binom{2n}{n}$  the Catalan number. Interestingly, our relation [\(1.3\)](#page-0-0) is simpler than  $(1.6)$ .

Remark 1.2. From [\(1.3\)](#page-0-0) and [\(1.4\)](#page-0-1) we obtain the following recurrence for the first order derivative

$$
\mathcal{N}'_r(z) = \frac{r-1}{2r+2} \frac{r-2+3rz}{z} \mathcal{N}_{r-1}(z) - \frac{(r-1)(r-2)}{2r+2} \frac{(1-z)^2}{z} \mathcal{N}_{r-2}(z).
$$

Similarly, we can express  $\mathcal{N}_r''(z)$  in term of  $\mathcal{N}_{r-1}(z)$  and  $\mathcal{N}_{r-2}(z)$ .

Remark 1.3. It is known that  $C_r := \mathcal{N}_r(1), r \geq 1$  is the sequence of the Catalan numbers. Hence, by choosing  $z = 1$ , we obtain from  $(1.3)$ ,  $(1.4)$  and  $(1.5)$  the following identities

$$
C_r = \frac{4r - 2}{r + 1} C_{r-1},
$$
  

$$
\sum_{k=1}^r (k - 1) N(r, k) = \frac{r - 1}{2} C_r,
$$
  

$$
\sum_{k=1}^r (k - 1)(k - 2) N(r, k) = -(r - 1) C_r + r(r - 1) C_{r-1}.
$$

Similarly, by choosing  $z = 2$ , we also obtain the identities for the sequence of the large Schröder numbers  $S_r := \frac{1}{2} \mathcal{N}_r(2), r \geq 1.$ 

### <span id="page-1-0"></span>2 Proofs

Let  $X$  be a random variable with the semicircular distribution, i.e.  $X$  has a density function  $f(x)$  given by

$$
f(x) = \begin{cases} \frac{2}{\pi}\sqrt{1-x^2} & \text{if } -1 \le x \le 1\\ 0 & \text{otherwise.} \end{cases}
$$
 (2.1)

It is known from [\[1\]](#page-4-0) that the Narayana polynomial can be expressed as follows

<span id="page-1-2"></span>
$$
\mathcal{N}_r(z) = \mathbb{E}[(1+z+2\sqrt{z}X)^{r-1}],
$$
\n(2.2)

where  $E$  denotes the expectation operator.

In order to prove Theorem [1.1,](#page-0-3) we need to use the following property of semicircular distributions.

<span id="page-2-0"></span>**Lemma 2.1.** For any continuously differentiable function  $h$ , we have

$$
\mathbb{E}[h(X)X] = \frac{1}{3}\mathbb{E}[h'(X)(1-X^2)].
$$

Proof. We observe that

$$
F(x) := \int_x^1 y f(y) dy = \frac{2}{\pi} \int_x^1 y \sqrt{1 - y^2} dy = \frac{2}{3\pi} (1 - x^2) \sqrt{1 - x^2}, \ -1 \le x \le 1.
$$

Hence, by integrating by parts, we obtain

$$
\mathbb{E}[h(X)X] = \int_{-1}^{1} h(x)xf(x)dx = -\int_{-1}^{1} h(x)dF(x)
$$
  
= 
$$
\int_{-1}^{1} F(x)h'(x)dx = \int_{-1}^{1} \frac{1}{3}(1-x^2)h'(x)f(x)dx
$$
  
= 
$$
\frac{1}{3}\mathbb{E}[h'(X)(1-X^2)].
$$

The proof of the lemma is complete.

We now are ready to present the proof of Theorem [1.1.](#page-0-3) *Proof of [\(1.3\)](#page-0-0)*. Using the representation  $(2.2)$ , we have

$$
\mathcal{N}_r(z) = \mathbb{E}[(1+z+2\sqrt{z}X)^{r-2}(1+z+2\sqrt{z}X)]
$$
  
=  $(1+z)\mathcal{N}_{r-1}(z) + 2\sqrt{z}\mathbb{E}[(1+z+2\sqrt{z}X)^{r-2}X],$ 

and hence,

<span id="page-2-1"></span>
$$
\mathcal{N}_r(z) - (1+z)\mathcal{N}_{r-1}(z) = 2\sqrt{z}\mathbb{E}[(1+z+2\sqrt{z}X)^{r-2}X].
$$
\n(2.3)

Furthermore, by using Lemma [2.1](#page-2-0) and the relation [\(2.3\)](#page-2-1), we deduce

$$
\mathcal{N}_r(z) - (1+z)\mathcal{N}_{r-1}(z) = \frac{4(r-2)}{3}z\mathbb{E}[(1+z+2\sqrt{z}X)^{r-3}(1-X^2)].
$$

This gives us the following

<span id="page-2-2"></span>
$$
z\mathbb{E}[(1+z+2\sqrt{z}X)^{r-3}X^2] = -\frac{3}{4(r-2)}\left(\mathcal{N}_r(z) - (1+z)\mathcal{N}_{r-1}(z)\right) + z\mathcal{N}_{r-2}(z). \tag{2.4}
$$

Once again we use the representation [\(2.2\)](#page-1-2) to get

$$
\mathcal{N}_r(z) = \mathbb{E}[(1+z+2\sqrt{z}X)^{r-3}(1+z+2\sqrt{z}X)^2]
$$
  
=  $(1+z)^2 \mathcal{N}_{r-2}(z) + 4(1+z)\sqrt{z}\mathbb{E}[(1+z+2\sqrt{z}X)^{r-3}X] + 4z\mathbb{E}[(1+z+2\sqrt{z}X)^{r-3}X^2],$ 

which, together with [\(2.3\)](#page-2-1) and [\(2.4\)](#page-2-2), yields

$$
\mathcal{N}_r(z) = (1+z)^2 \mathcal{N}_{r-2}(z) + 2(1+z) \left( \mathcal{N}_{r-1}(z) - (1+z) \mathcal{N}_{r-2}(z) \right)
$$

$$
- \frac{3}{r-2} \left( \mathcal{N}_r(z) - (1+z) \mathcal{N}_{r-1}(z) \right) + 4z \mathcal{N}_{r-2}(z).
$$

 $\Box$ 

So it holds that

$$
\frac{r+1}{r-2}\mathcal{N}_r(z) = \frac{2r-1}{r-2}(1+z)\mathcal{N}_{r-1}(z) - (1-z)^2\mathcal{N}_{r-2}(z)
$$

and [\(1.3\)](#page-0-0) follows.

*Proof of*  $(1.4)$ *.* It follows from the representation  $(2.2)$  that

$$
\mathcal{N}'_r(z) = (r-1)\mathbb{E}\left[ (1+z+2\sqrt{z}X)^{r-2} \left( 1+\frac{X}{\sqrt{z}} \right) \right],
$$

which implies that

<span id="page-3-0"></span>
$$
\mathcal{N}'_r(z) - (r-1)\mathcal{N}_{r-1}(z) = \frac{r-1}{\sqrt{z}} \mathbb{E}\left[ (1+z+2\sqrt{z}X)^{r-2} X \right]. \tag{2.5}
$$

Combining [\(2.3\)](#page-2-1) and [\(2.5\)](#page-3-0) yields

$$
\mathcal{N}'_r(z) - (r-1)\mathcal{N}_{r-1}(z) = \frac{r-1}{2z} \left( \mathcal{N}_r(z) - (1+z)\mathcal{N}_{r-1}(z) \right).
$$

So [\(1.4\)](#page-0-1) follows.

*Proof of*  $(1.5)$ *.* We have

$$
N_r''(z) = (r-1)(r-2)\mathbb{E}\left[(1+z+2\sqrt{z}X)^{r-3}\left(1+\frac{X}{\sqrt{z}}\right)^2\right]
$$

$$
-\frac{r-1}{2}\mathbb{E}\left[(1+z+2\sqrt{z}X)^{r-2}\frac{X}{z\sqrt{z}}\right]
$$

$$
= (r-1)(r-2)\mathbb{E}\left[(1+z+2\sqrt{z}X)^{r-3}\left(1+\frac{2X}{\sqrt{z}}+\frac{X^2}{z}\right)\right]
$$

$$
-\frac{r-1}{2}\mathbb{E}\left[(1+z+2\sqrt{z}X)^{r-2}\frac{X}{z\sqrt{z}}\right].
$$

Hence, recalling the relations  $(2.3)$  and  $(2.4)$ , we obtain

$$
\mathcal{N}_r''(z) = (r-1)(r-2)\left(\mathcal{N}_{r-2}(z) + \frac{1}{z}(\mathcal{N}_{r-1}(z) - (1+z)\mathcal{N}_{r-2}(z))\right)
$$

$$
-\frac{3}{4(r-2)z^2}(\mathcal{N}_r(z) - (1+z)\mathcal{N}_{r-1}(z)) + \frac{1}{z}\mathcal{N}_{r-2}(z)\right)
$$

$$
-\frac{r-1}{4z^2}(\mathcal{N}_r(z) - (1+z)\mathcal{N}_{r-1}(z)).
$$

Rearranging the terms we get

$$
\mathcal{N}_r''(z) = -\frac{r-1}{z^2} \mathcal{N}_r(z) + \left(\frac{(r-1)^2}{z} + \frac{r-1}{z^2}\right) \mathcal{N}_{r-1}(z).
$$

Thus the proof of [\(1.5\)](#page-0-2) is complete.
