Based on our previous work about the role of $a_0(1710)$ in the $D_s^+ \to \pi^+ K_S^0 K_S^0$ decay [Phy. Rev. D 105, 116010 (2022)], we perform a further theoretical study of $a_0(1710)^+$ in the process $D_s^+ \to \pi^0 a_0(1710)^+ \to$ $\pi^0 K^+ K_S^0$. In addition to $a_0(1710)$, the contributions of K^* and $a_0(980)$ are also taken into account. Firstly, we consider the contributions from the tree diagrams of $K^{*+} \to K^+ \pi^0$ and $\bar{K}^{*0} \to \pi^0 \bar{K}^0$. Secondly, we describe the final state interaction of $K\bar{K}$ in the chiral unitary approach to study the contribution of $a_0(980)$, while the $a_0(1710)$ state is dynamically generated from the $K^*\bar{K}^*$ interaction, and then decays into $K^+\bar{K}^0$ Since the final $K^+K^0_S$ state is in pure isospin I = 1, the $D^+_s \to \pi^0 K^+ K^0_s$ decay is an ideal process to study the $a_0(1710)^+$ and $a_0(980)^+$ resonances. Based on our theoretical calculations, it is found that the recent experimental measurements on the $K^+ K^0_S$, $\pi^0 K^+$, and $\pi^0 K^0_S$ invariant mass distributions can be well reproduced, which supports the molecular $K^*\bar{K}^*$ nature of the scalar $a_0(1710)$ resonance.

I. INTRODUCTION

The $a_0(1710)$ resonance, an isospin partner of the scalar meson $f_0(1710)$, may have properties and structure similar to $f_0(1710)$ [1–7]. The $f_0(1710)$ resonance, with quantum numbers $J^{PC} = 0^{++}$, has been investigated in many previous theoretical works [8-18], where its structure has been studied from various perspectives. For example, in Ref. [19] it was shown that the $f_0(1710)$ resonance has a large component of $s\bar{s}$ in its wave function. In Refs. [20–22] it was considered as a scalar glueball. On the other hand, the $f_0(1710)$ can be viewed as a molecular state dynamically generated in the vector-vector coupled channel interactions [9-17]. Meanwhile, the $a_0(1710)$ with negative G-parity is also dynamically generated in the isospin I = 1 sector [3–5], which couples mostly to the $K^*\bar{K}^*$ channel, as well as to the $\rho\omega$ and $\rho\phi$ channels. In Ref. [7], after extending the coupled channel vector meson-vector meson interactions to include the pseudoscalar meson-pseudoscalar meson interactions, a pole near the K^*K^* threshold identified as the $a_0(1710)$ state is also found.

In the molecular picture, the $f_0(1710)$ and $a_0(1710)$ states couple mostly to the $K^*\bar{K}^*$ channel and their dominant decay channel is $K\bar{K}$ [3, 7]. This is very similar to the case of scalar mesons $f_0(980)$ and $a_0(980)$ [23–25], which are dynamically generated in the coupled $K\bar{K}$, $\pi\eta$, and $\pi\pi$ channels. The dominant decay channel of $f_0(980)$ is $\pi\pi$, while it

is the $\pi\eta$ channel for $a_0(980)$.

On the experimental side, the BESIII experiment reported the first evidence for the interference between $f_0(1710)$ and $a_0(1710)$ in the amplitude analyses of the $D_s^+ \to \pi^+ K_S^0 K_S^0$ and $D_s^+ \to \pi^+ K^+ K^-$ decays [26, 27]. It is found that there is a clear enhancement in the $K_S^0 K_S^0$ invariant mass distributions around 1.7 GeV, which indicates the contribution from hte $a_0(1710)$ state. However, it is not seen in the K^+K^- invariant spectrum. In fact, the $a_0(1710)^+$ state was previously reported by the BABAR experiment [28] in the process of $\eta_c \to a_0(1710)^+ \pi^-$ with the decay $a_0(1710)^+ \to \pi^+ \eta$. Its measured mass and width are $M_{a_0(1710)} = 1704 \pm 5 \pm 2 \,\mathrm{MeV}$ and $\Gamma_{a_0(1710)} = 110 \pm 15 \pm 11$ MeV, respectively [28].

On the theoretical side, within the chiral unitary approach, the productions of the $f_0(1710)$ and $a_0(1710)$ states in $D_s^+ \rightarrow$ $\pi^+ K^0_S K^0_S$ and $D^+_s \to \pi^+ K^+ K^-$ reactions can be well explained [2]. While in our previous work [1], for the decay $D_s^+ \to \pi^+ K_S^0 K_S^0$, we found that the contribution from the K^* meson is crucial to the $a_0(1710)$ peak region. Furthermore, within the proposed mechanisms in Refs. [1, 2] it is expected that the charged $a_0(1710)^+$ resonance will show up in the $K^+K_S^0$ invariant mass distribution of the $D_s^+ \rightarrow \pi^0 K^+ K_S^0$ decay. Recently, the BESIII Collaboration has performed an amplitude analysis of the process $D_s^+ \rightarrow \pi^0 \hat{K}^+ K_S^0$ [29], where the $a_0^+(1710)$ state was indeed observed in the $K^+K^0_S$ invariant mass distribution, and presented the fitted Breit-Wigner mass and width as,

$$M_{a_0(1710)} = 1817 \pm 8 \pm 20 \text{ MeV},$$

$$\Gamma_{a_0(1710)} = 97 \pm 22 \pm 15 \text{ MeV}.$$
(1)

Here, the fitted mass is close to the boundary region of the

[§]Electronic address: xiejujun@impcas.ac.cn

 $K^+\bar{K}^0$ invariant mass spectrum.¹ On the other hand, the contribution from the K^* meson is also significant to the $a_0(1710)$ peak region. In the low energy region of the $K^+\bar{K}^0$ line shape, there is a clear enhancement due to the scalar meson $a_0(980)$.

Based on the BESIII experimental measurements [29], Ref. [30] has systematically studied these isovector scalar mesons, and suggested that the $a_0(1710)$ [denoted as $a_0(1817)$], $a_0(1450)$, and $a_0(980)$ states are in the same isovector scalar meson family since they form a Regge trajectory. In addition, the $a_0(1710)$ state could also be regarded as a good isovector partner of the X(1812) [30]. In a word, the nature of $a_0(1710)$ is still unclear, and the further analysis of the experimental data is necessary.

In this work, following these previous theoretical works in Refs. [1, 31–35] we investigate the roles of the scalar mesons $a_0(980)^+$ and $a_0(1710)^+$ in the $D_s^+ \to \pi^0 K^+ K_S^0$ decay, where their contributions are included by taking into account the $K\bar{K}$ and $K^*\bar{K}^*$ final-state interactions within the chiral unitary approach. In addition, we also consider the contributions of the intermediate states K^{*+} and \bar{K}^{*0} in the processes $D_s^+ \to \bar{K}^0 K^{*+} \to \pi^0 K^+ K_S^0$ and $D_s^+ \to K^+ \bar{K}^{*0} \to \pi^0 K^+ K_S^0$.

This article is organized as follows. In Sec. II, we present the theoretical formalism for the $D_s^+ \rightarrow \pi^0 K^+ K_S^0$ decay, and in Sec. III, we show our theoretical numerical results and discussions, followed by a short summary in the last section.

II. FORMALISM AND INGREDIENTS

In this section, we present the formalism and ingredients for the decay $D_s^+ \to \pi^0 K^+ K_S^0$, where we study the roles of the K^{*+} (\bar{K}^{*0}), $a_0(980)$, and $a_0(1710)$ states. The contribution of the $a_0(980)$ state is encoded in the S-wave $K\bar{K}$ final-state interactions, while the one of the $a_0(1710)^+$ state is in the S-wave $K^*\bar{K}^*$ final-state interactions.

A. The mechanism of $D^+_s \to \bar{K}^0 K^{*+}(K^+ \bar{K}^{*0}) \to \pi^0 K^+ K^0_S$ reaction

Firstly, we study the decay of $D_s^+ \to \pi^0 K^+ K_S^0$ via the intermediate resonance K^{*+} , with $K^{*+} \to \pi^0 K^+$ in *P*-wave. The vertex $D_s^+ \bar{K}^0 K^{*+}$ is also in *P*-wave to keep the angular momentum conserved, and the effective interaction is taken as used in Refs. [1, 32, 36]. The hadron level diagram for the process $D_s^+ \to \bar{K}^0 K^{*+} \to \pi^0 K^+ K_S^0$ is depicted in Fig. 1,

and the decay amplitude can be written as

$$\mathcal{M}_{K^{*+}} = \frac{g_{D_{s}^{+}\bar{K}^{0}K^{*+}}g_{K^{*+}K^{+}\pi^{0}}}{q_{K^{*+}}^{2} - m_{K^{*+}}^{2} + im_{K^{*+}}\Gamma_{K^{*+}}} \times \left[\left(m_{K^{+}}^{2} - m_{\pi^{0}}^{2} \right) \left(1 - \frac{q_{K^{*+}}^{2}}{m_{K^{*+}}^{2}} \right) + 2p_{1} \cdot p_{3} \frac{m_{\pi^{0}}^{2} - m_{K^{+}}^{2} - m_{K^{*+}}^{2}}{m_{K^{*+}}^{2}} + 2p_{2} \cdot p_{3} \frac{m_{\pi^{0}}^{2} - m_{K^{+}}^{2} + m_{K^{*+}}^{2}}{m_{K^{*+}}^{2}} \right], \qquad (2)$$

where $q_{K^{*+}}^2 = (p_1 + p_2)^2 = M_{\pi^0 K^+}^2$ is the four momenta square of the virtual K^{*+} meson, and $M_{\pi^0 K^+}$ is the invariant mass of the $\pi^0 K^+$ system.

FIG. 1: The decay of $D_s^+ \to \pi^0 K^+ K_S^0$ via the intermediate vector K^{*+} .

On the other hand, as shown in Fig. 2, the decay of $D_s^+ \to \pi^0 K^+ K_S^0$ can also occur via the intermediate meson \bar{K}^{*0} . The corresponding decay amplitude for the process of $D_s^+ \to \pi^0 K^+ K_S^0$ of Fig. 2 can be easily obtained just by applying the substitution to $\mathcal{M}_{K^{*+}}$ with $p_2 \leftrightarrow p_3, K^{*+} \to \bar{K}^{*0}$, and $q_{K^{*+}} \to q_{\bar{K}^{*0}}$.

FIG. 2: The decay of $D_s^+ \to \pi^0 K^+ K_S^0$ via the intermediate vector \bar{K}^{*0} .

The coupling constants $g_{D_s^+\bar{K}^0K^{*+}}$, $g_{K^{*+}K^+\pi^0}$, $g_{D_s^+\bar{K}^{*0}K^+}$, and $g_{\bar{K}^{*0}\bar{K}^{0}\pi^0}$ are determined from the experimental partial decay widths of $D_s^+ \rightarrow \bar{K}^0K^{*+}$, $K^{*+} \rightarrow K^+\pi^0$, $D_s^+ \rightarrow K^+\bar{K}^{*0}$, and $\bar{K}^{*0} \rightarrow \bar{K}^0\pi^0$, respectively. The results are listed in Table I. The coupling constants are taken as real and positive as done in Refs. [1, 32]. In our study, the partial decay width of $K^* \rightarrow K\pi$ is taken from the review of particle physics (RPP) [8]. While for the $D_s^+ \rightarrow K^{*+}\bar{K}^0$ decay, we take $\operatorname{Br}(D_s^+ \rightarrow \bar{K}^0K^{*+}) = (5.4 \pm 1.2)\%$ from Ref. [8], then one can easily obtain $\operatorname{Br}(D_s^+ \rightarrow K^+\bar{K}^{*0}) = (12.7 \pm 2.8)\%$ with the recent BESIII measurement of $\frac{\operatorname{Br}(D_s^+ \rightarrow \bar{K}^{*0}K^{*+})}{\operatorname{Br}(D_s^+ \rightarrow \bar{K}^0K^{*+})} = 2.35^{+0.42}_{-0.23_{\mathrm{stat.}}} \pm 0.10_{\mathrm{syst.}}$ [29].

 $^{^1}$ If we take $M_{D_s^+}=1968.34$ MeV, and $m_{\pi^0}=134.98$ MeV, we get the maximum value of the $K^+\bar{K}^0$ invariant mass $(M_{K^+\bar{K}^0})_{\rm max}=1833.36$ MeV.

TABLE I: Four two-body decays and the corresponding coupling constants.

Decay process	Partial decay width (MeV)	Coupling constant	Value
$D_s^+ \to \bar{K}^0 K^{*+}$	$(0.71 \pm 0.16) \times 10^{-10}$	$g_{D_s^+ \bar{K}^0 K^{*+}}$	$(1.05 \pm 0.12) \times 10^{-6}$
$K^{*+} \to K^+ \pi^0$	16.9 ± 0.3	$g_{K^*+K^+\pi^0}$	3.23 ± 0.03
$D_s^+ \to K^+ \bar{K}^{*0}$	$(1.66 \pm 0.37) \times 10^{-10}$	$g_{D_s^+ \bar{K}^{*0} K^+}$	$(1.62 \pm 0.18) \times 10^{-6}$
$\bar{K}^{*0} \to \bar{K}^0 \pi^0$	15.8 ± 0.2	$g_{\bar{K}^{*0}\bar{K}^{0}\pi^{0}}$	3.13 ± 0.02

B. The mechanism of $D_s^+ \to \pi^0 a_0 (980)^+ \to \pi^0 K^+ K_S^0$ reaction

The Cabibbo-favored process $D_s^+ \to \pi^0 K^+ \bar{K}^0$ can happen via the weak decay of the c quark into a W^+ boson and an squark, followed by the W^+ boson decaying into a u quark and a \bar{d} quark. In order to generate the states $\pi^0 K^{(*)+} \bar{K}^{(*)0}$, the $u\bar{s}$ $(s\bar{d})$ hadronize into $K^{(*)+}$ $[\bar{K}^{(*)0}]$, and the $s\bar{d}$ $(u\bar{s})$, together with the $q\bar{q}(=u\bar{u}+d\bar{d}+s\bar{s})$ pair created from the vacuum, hadronize into $\pi^0 \bar{K}^{(*)0}$ $[\pi^0 K^{(*)+}]$. Then the scalar meson $a_0(980)$ $[a_0(1710)]$ could be dynamically generated from the S-wave $K^{(*)+}\bar{K}^{(*)0}$ interaction.

For the production of the $a_0(980)$ resonance, we need to produce the $\pi^0 K^+ \bar{K}^0$ in the first step, and then the $K^+ \bar{K}^0$ final-state interaction generates the $a_0(980)$ state. Following Ref. [34], for the hadronization of $s\bar{d}$ and $u\bar{s}$ into a pair of pseudoscalar mesons, we can write:

$$\sum_{i=u,d,s} s\bar{q}_i q_i \bar{d} = M_{3i} M_{i2} = (M^2)_{32}, \tag{3}$$

$$\sum_{i=u,d,s} u\bar{q}_i q_i \bar{s} = M_{1i} M_{i3} = (M^2)_{13}, \tag{4}$$

where M is the SU(3) quark pair $q_i \bar{q}_j$ matrix, and it is defined as [11, 37]

$$M = \begin{pmatrix} u\bar{u} & u\bar{d} & u\bar{s} \\ d\bar{u} & d\bar{d} & d\bar{s} \\ s\bar{u} & s\bar{d} & s\bar{s} \end{pmatrix}.$$
 (5)

Accordingly, at the hadron level, if we consider the η and η' mixing as in Ref. [38], we can write the matrix M in terms of the pseudoscalar (P) mesons,

$$P = \begin{pmatrix} \frac{\eta}{\sqrt{3}} + \frac{\pi^{0}}{\sqrt{2}} + \frac{\eta'}{\sqrt{6}} & \pi^{+} & K^{+} \\ \pi^{-} & \frac{\eta}{\sqrt{3}} - \frac{\pi^{0}}{\sqrt{2}} + \frac{\eta'}{\sqrt{6}} & K^{0} \\ K^{-} & \bar{K}^{0} & -\frac{\eta}{\sqrt{3}} + \frac{\sqrt{6}\eta'}{3} \end{pmatrix}.$$
(6)

Then, the hadronization processes at the quark level in Eqs. (3) and (4) can be expressed at the hadron level as,

$$(M^{2})_{32} \to (P \cdot P)_{32} = \pi^{+}K^{-} - \frac{1}{\sqrt{2}}\pi^{0}\bar{K}^{0}, \qquad (7)$$
$$(M^{2})_{13} \to (P \cdot P)_{13} = \pi^{+}K^{0} + \frac{1}{\sqrt{2}}\pi^{0}K^{+}. \qquad (8)$$

Together with the other final state K^+ (hadronizatized directly from $u\bar{s}$) or \bar{K}^0 (hadronizatized directly from $s\bar{d}$), we

obtain the $D_s^+ \to \pi^0 K^+ \bar{K}^0$ reaction at tree level [shown in Fig. 3 (a)] with the above mechanism as:

$$M_{\pi^0 K^+ \bar{K}^0}^{\text{tree}} = \frac{V_{\pi^0 K^+ \bar{K}^0}}{\sqrt{2}},\tag{9}$$

where we take $V_{\pi^0 K^+ \bar{K}^0}$ as a constant, as in most previous theoretical works [39–44].

FIG. 3: The mechanisms of the $D_s^+ \to \pi^0 K^+ K_S^0$ decay. (a): tree diagram and (b): the final-state interaction of $K^+ \bar{K}^0$ to produce the $a_0(980)^+$ state.

Next, the final-state interaction of $K^+\bar{K}^0$ will produce the $a_0(980)$ state. The corresponding diagram is shown in Fig. 3 (b). Thus, the decay amplitude for the $D_s^+ \to \pi^0 K^+ K_S^0$ reaction shown in Fig 3 can be easily obtained as follows, ²

$$\mathcal{M}_{a_0(980)} = \frac{V_{\pi^0 K^+ \bar{K}^0}}{\sqrt{2}} \left[1 + G_{K\bar{K}}(M_{K^+ \bar{K}^0}) \times t_{K^+ \bar{K}^0 \to K^+ \bar{K}^0}(M_{K^+ \bar{K}^0}) \right], \quad (10)$$

with $M_{K^+\bar{K}^0}$ the invariant mass of the $K^+\bar{K}^0$ system.

² It is worth mentioning that we have neglected the the πK final-state interactions, where the scalar meson $\kappa(700)$ appears. This is because that its contribution is very small compared with the dominant contribution from the K^* meson.

In Eq. (10), $G_{K\bar{K}}$ is the $K\bar{K}$ loop function, which is given by,

$$G_i = i \int \frac{d^4q}{(2\pi)^4} \frac{1}{(P-q)^2 - m_1^2 + i\epsilon} \frac{1}{q^2 - m_2^2 + i\epsilon}, \quad (11)$$

where m_1 and m_2 are the masses of the two mesons in the loop of the *i*th channel, and P and q are the four-momenta of the two-meson system and the second meson, respectively. The loop function of Eq. (11) is logarithmically divergent. There are two methods to solve this singular integral, either using the three-momentum cut-off method, or the dimensional regularization method. In our work, we adopt the cut-off method, and perform the integral for q in Eq. (11) with a cutoff $|\vec{q}_{\rm max}| = 903$ MeV to regularize the loops (see Ref. [45] for more details).

On the other hand, the transition amplitude $t_{K^+\bar{K}^0 \to K^+\bar{K}^0}$, which is dependent on the invariant mass $M_{K^+\bar{K}^0}$, can be obtained in the chiral unitary approach by solving the Bethe-Salepter equation [25],

$$T = [1 - VG]^{-1}V, (12)$$

where V is a 2×2 matrix with the transition potential between the isospin channels $K\bar{K}$ and $\pi\eta$. With the isospin multiplets $K = (K^+, K^0), \bar{K} = (\bar{K}^0, -K^-)$, and $\pi = (-\pi^+, \pi^0, \pi^-)$, the 2×2 matrix V can be easily obtained as follows,

$$V_{K\bar{K}\to K\bar{K}} = -\frac{1}{4f^2}s,$$

$$V_{K\bar{K}\to\pi\eta} = \frac{\sqrt{6}}{12f^2}(3s - \frac{8}{3}m_K^2 - \frac{1}{3}m_\pi^2 - m_\eta^2),$$

$$V_{\pi\eta\to K\bar{K}} = V_{K\bar{K}\to\pi\eta},$$

$$V_{\pi\eta\to\pi\eta} = -\frac{1}{3f^2}m_\pi^2,$$
(13)

where f = 93 MeV is the pion decay constant, and s is the invariant mass squared of the pseduoscalar-psedudoscalar system. Then the transition amplitudes $t_{K^+\bar{K}^0 \to K^+\bar{K}^0}$ in particle basis can be related to the ones in isospin basis,

$$t_{K^{+}\bar{K}^{0}\to K^{+}\bar{K}^{0}} = t_{K\bar{K}\to K\bar{K}}.$$
(14)

In Fig. 4, we show the real and imaginary parts of the transition amplitudes $t_{K^+\bar{K}^0 \to K^+\bar{K}^0}$ as a function of the invariant mass of the $K^+\bar{K}^0$ system. One can see that there is a clear structure around 980 MeV, which is associated to the $a_0(980)$ resonance.

C. The mechanism of $D_s^+ \to \pi^0 (K^* \bar{K}^*)^+ \to K_S^0 K^+ \pi^0$ reaction

Following Ref. [1], after the π^0 and $K^{*+}\bar{K}^{*0}$ pair produced, the final-state interactions of K^{*+} and \bar{K}^{*0} will lead to the dynamical generation of the $a_0(1710)^+$ state, which then decays into K^+ and K^0_S in the final state. The rescattering diagram for the $D^+_s \to \pi^0(K^*\bar{K}^*)^+ \to \pi^0a_0(1710)^+ \to$

1.0

 $\pi^0 K^+ K^0_S$ decay is shown in Fig. 5. The decay amplitude can be written as

$$\mathcal{M}_{a_0(1710)} = \frac{V_{\pi^0 K^{*+} \bar{K}^{*0}}}{2} \tilde{G}_{K^* \bar{K}^*} (M_{K^+ K_S^0}) \times \frac{g_{K^* \bar{K}^*} g_{K\bar{K}}}{M_{K^+ K_S^0}^2 - M_{a_0(1710)^+}^2 + i M_{a_0(1710)^+} \Gamma_{a_0(1710)^+}}.$$
 (15)

It is worth mentioning that, in the present work, all the model parameters for the intermediate $a_0(1710)$ are determined in Ref. [1]. Since the parameters of both Set I and II can be used to reproduce the experimental data on the $D_s^+ \rightarrow \pi^+ K_S^0 K_S^0$ decay in Ref. [1], we will use the values of Set I in this work.

FIG. 5: Feynman diagramm for the $D_s^+ \to \pi^0 (K^* \bar{K}^*)^+ \to \pi^0 a_0(1710)^+ \to \pi^0 K^+ K_S^0$ decay, where $a_0(1710)$ is dynamically generated by the $K^* \bar{K}^*$ final-state interaction.

D. Invariant mass distributions of the $D_s^+ \rightarrow \pi^0 K^+ K_S^0$ decay

With the above formalism and ingredients, we can write the total decay amplitude of $D_s^+ \to \pi^0 K^+ K_S^0$ as follows,

$$\mathcal{M} = \mathcal{M}_{K^{*+}} + \mathcal{M}_{\bar{K}^{*0}} + \mathcal{M}_{a_0(980)} + \mathcal{M}_{a_0(1710)}.$$
 (16)

The amplitude of Eq. (16) depends on two invariant masses $M_{K^+K_c^0}$ and $M_{\pi^0K^+}$.

Then, the double differential decay width for $D_s^+ \to \pi^0 K^+ K_S^0$ is given by ³

$$\frac{d^{2}\Gamma}{dM_{K^{+}K_{S}^{0}}dM_{\pi^{0}K^{+}}} = \frac{M_{K^{+}K_{S}^{0}}M_{\pi^{0}K^{+}}}{128\pi^{3}m_{D_{s}^{+}}^{3}}\left(|\mathcal{M}_{K^{*+}}|^{2} + |\mathcal{M}_{\bar{K}^{*0}}|^{2} + |\mathcal{M}_{a_{0}}(980)}|^{2} + |\mathcal{M}_{a_{0}}(1710)}|^{2}\right), \quad (17)$$

where their interference terms are neglected, since all these coupling constants are assumed to be real and positive, as discussed above.

Finally, one can easily obtain the invariant mass distributions $d\Gamma/dM_{K^+K_S^0}$ and $d\Gamma/dM_{\pi^0K^+}$, by integrating Eq. (17) over each of the invariant mass variables. For example, for a given value of $M_{K^+K_S^0}$, the upper and lower limits for $M_{\pi^0K^+}$ are fixed as [8],

$$\begin{split} \left(M_{\pi^0K^+}^2\right)_{\max} &= \left(E_{\pi^0}^* + E_{K^+}^*\right)^2 - \\ & \left(\sqrt{E_{\pi^0}^{*2} - m_{\pi^0}^2} - \sqrt{E_{K^+}^{*2} - m_{K^+}^2}\right)^2 \\ \left(M_{\pi^0K^+}^2\right)_{\min} &= \left(E_{\pi^0}^* + E_{K^+}^*\right)^2 - \\ & \left(\sqrt{E_{\pi^0}^{*2} - m_{\pi^0}^2} + \sqrt{E_{K^+}^{*2} - m_{K^+}^2}\right)^2, \end{split}$$

here $E^*_{\pi^0}$ and $E^*_{K^+}$ are the energies of π^0 and K^+ in the $K^+K^0_S$ rest frame, respectively,

$$E_{\pi^0}^* = \frac{m_{D_s^+}^2 - M_{K^+ K_S^0}^2 - m_{\pi^0}^2}{2M_{K^+ K_S^0}},$$

$$E_{K^+}^* = \frac{M_{K^+ K_S^0}^2 - m_{K_S^0}^2 + m_{K^+}^2}{2M_{K^+ K_S^0}}.$$
 (18)

III. RESULTS AND DISCUSSION

With these above ingredients, we calculate the invariant mass distributions of the $D_s^+ \rightarrow \pi^0 K^+ K_S^0$ decay. In the numerical analysis, we have three free parameters: (1) the factor $V_{\pi^0 K^* + \bar{K}^{*0}}$ of Eq. (15) for the weak and hadronization strength related to the production of intermediate $\pi^0(K^*\bar{K}^*)^+$ at tree level; (2) $V_{\pi^0 K^+\bar{K}^0}$ for the weight of the contribution from the intermediate $a_0(980)^+$ state; (3) a global normalization factor C, which is needed to normalize the theoretical invariant mass distributions to the events obtained by the BESIII Collaboration.

For the parameter $V_{\pi^0 K^{*+} \overline{K}^{*0}}$ (V_P in Ref. [1]), we have two choices. One (Set I) is just taking the value from the previous work in Ref. [1], which is determined from the contribution

of $a_0(1710)$ to the $D_s^+ \to \pi^+ K_S^0 K_S^0$ reaction. The other one (Set II) is determined from the new experimental data on the $D_s^+ \to \pi^0 K^+ K_S^0$ reaction. While for $V_{\pi^0 K^+ \bar{K}^0}$ and C, they will be determined from the current $D_s^+ \to \pi^0 K^+ K_S^0$ data. These above model parameters are shown in Table II.

TABLE II: Model parameters.

Parameters	Set I	Set II
C	3.62×10^{14}	3.21×10^{14}
$V_{\pi^0 K^{*+} \bar{K}^{*0}}$	1.69×10^{-4} (Ref. [1])	2.4×10^{-4}
$V_{\pi^0 K^+ \bar{K}^0}$	7.5×10^{-5}	8.0×10^{-5}

FIG. 6: Invariant mass distributions of $\pi^0 K^+$ for the $D_s^+ \rightarrow \pi^0 K^+ K_S^0$ decay, compared with the experimental data taken from Fig. 2(c) of Ref. [29]. (a) the results of Set I, and (b) the results of Set II.

We firstly show the theoretical results in Fig. 6 for the $\pi^0 K^+$ invariant mass distributions, where the red-solid curves stand for the total contributions. While the blue-dashed, green-dotted, pink-dot dashed, and purple-dot dashed curves correspond to the contributions from the intermediate states

³ We take $|K^0\rangle = \frac{1}{\sqrt{2}}(|K^0_S\rangle + |K^0_L\rangle)$ and $|\bar{K}^0\rangle = \frac{1}{\sqrt{2}}(|K^0_S\rangle - |K^0_L\rangle)$, where we have neglected the effect of CP violation.

 $a_0(1710)^+$, K^{*+} , \bar{K}^{*0} , and $a_0(980)^+$, respectively. The total results have been normalized in both cases to the peak of the $\pi^0 K^+$ invariant mass distributions. The corresponding values of C are 3.62×10^{14} and 3.21×10^{14} for Set I and Set II, respectively. It is shown that our results can describe well the experimental data. Once again, as for the $D_s^+ \to \pi^+ K_S^0 K_S^0$ reaction [1], one can see that the contribution of the $a_0(1710)$ state is crucial to a satisfactory description of the $\pi^0 K^+$ invariant mass distributions. Furthermore, the higher tail of the $\pi^0 K^+$ line shape is mostly from the reflection of the $a_0(980)$ resonance, which implies that the contribution from the vector meson $K^{*+}(1410)$ should be small and negligible.

Next, in Fig. 7, we show the theoretical results on the $K^+K^0_S$ invariant mass distributions. From Fig. 7 (a), one can see that with the value 1.69×10^{-4} of $V_{\pi^0 K^{*+} \bar{K}^{*0}}$ determined in Ref. [1], the peak of $a_0(1710)^+$ can not be well reproduced, and the theoretical results are lower than the experimental data. However, by adjusting the value of $V_{\pi^0 K^{*+} \bar{K}^{*0}}$, we can reproduce the $a_0(1710)^+$ peak very well, which is shown in Fig. 7 (b). In both cases, the bump for the $a_0(980)^+$ state can be well explained, and the corresponding values for $V_{\pi^0 K^+ \bar{K}^0}$ are 7.5×10^{-5} and 8.0×10^{-5} , respectively. These two values are very similar to each other. In addition, the K^{*+} and \bar{K}^{*0} mesons contribute significantly to the peak reagion of the $a_0(1710)^+$ resonance.

Finally, in Fig. 8, the theoretical results for the $\pi^0 K_S^0$ invariant mass distributions are shown. It is easily seen that the experimental data can be well reproduced in both cases. Again, the higher tail of the $\pi^0 K_S^0$ line shape is from the $a_0(980)$ resonance, rather than the vector meson $\bar{K}^{*0}(1410)$, which is needed in the analysis by the BESIII Collaboration [29].

It is worth mentioning that, in the present work, we do not consider the interference effects among the $\mathcal{M}_{K^{*+}}$, $\mathcal{M}_{\bar{K}^{*0}}, \mathcal{M}_{a_0(980)},$ and $\mathcal{M}_{a_0(1710)}$ amplitudes. We note that in Ref. [32] the $a_0(980)$ state was studied in the $D_s^+ \rightarrow$ $\pi^0 K^+ \bar{K}^0$ decay by including the contributions from the triangle diagrams involving the intermediate K^* and ρ resonances, and then the KK and $\pi\eta$ pairs fuse to generate the $a_0(980)$ state. It is found that the signal of the $a_0(980)$ state is also clearly seen [32]. In this work, for the production of $a_0(980)$, we rely on the production of the $\pi^0 K^+ \bar{K}^0$, where all particles are produced in S-wave. Yet, it is easy to see that the mechanism proposed in Ref. [32] should be suppressed due to the highly off-shell effect of the K^* propagator when the $K^+\bar{K}^0$ invariant mass is close to the $a_0(980)^+$ mass. Furthermore, to include such contributions more free parameters are needed. In addition, we have checked the S-wave final-state interactions of π^0 and K^+ (\bar{K}^0), and found that these two contributions are much smaller compared with the contributions of the K^{*+} and \bar{K}^{*0} . Nevertheless, the model proposed in the present work can give a reasonable description of the experimental data for the $D_s^+ \rightarrow \pi^0 K^+ K_S^0$ decay and constitutes a further theoretical effort in studying the roles of the $a_0(980)$ and $a_0(1710)$ states in the relevant reaction.

FIG. 7: Invariant mass distributions of $K^+K_S^0$ for the $D_s^+ \rightarrow \pi^0 K^+K_S^0$ decay, compared with the experimental data taken from Fig. 2(a) of Ref. [29]. (a) the results of Set I, and (b) the results of Set II.

IV. SUMMARY

In the present work, we investigated the Cabibbo-favored process $D_s^+ \to \pi^0 K^+ K_S^0$, taking into account the *S*-wave $(K^*\bar{K}^*)^+$ final-state interaction within the chiral unitary approach, where the $a_0(1710)^+$ state is dynamically generated. In addition, the contributions from the tree diagrams of $K^{*+} \to \pi^0 K^+$ and $\bar{K}^{*0} \to \pi^0 K_S^0$ were also considered. While for the $K\bar{K}$ final-state interaction, we took into account the $a_0(980)^+$ state, which is a dynamically generated resonance from the coupled-channel pseudoscalar-pseudoscalar interaction. Considering all these contributions, we calculated the three invariant mass distributions of $K^+K_S^0$, $\pi^0 K^+$, and $\pi^0 K_S^0$, to which $a_0(1710)^+$, $a_0(980)^+$, K^{*+} and \bar{K}^{*0} contribute, respectively.

We showed that the new experimental data on the invariant mass distributions of $d\Gamma/dM_{\pi^0K^+}$, $d\Gamma/dM_{K^+K^0_S}$, and $d\Gamma/dM_{\pi^0K^0_S}$ measured by the BESIII Collaboration [29] can

FIG. 8: Invariant mass distributions of $\pi^0 K_S^0$ for the $D_s^+ \rightarrow \pi^0 K^+ K_S^0$ decay, compared with the experimental data taken from Fig. 2(b) of Ref. [29]. (a) the results of Set I, and (b) the results of Set II.

be well reproduced. We found that the vector meson $K^*(892)$ plays a crucial role in the $a_0(1710)^+$ peak region. On the other hand, the contributions from $K^*(1410)$ were not needed. The higher tail of the πK line shapes can be well reproduced due to the reflection effect of the $a_0(980)$ resonance.

We would like to stress that the decay of $D_s^+ \to \pi^0 K^+ K_S^0$ is a good platform to study the isospin one scalar mesons, since the final $K^+K_S^0$ system is in pure isospin I = 1. The experimental measurements on the $D_s^+ \to \pi^0 K^+ K_S^0$ reaction by the BESIII Collaboration support the $K^*\bar{K}^*$ nature of the $a_0(1710)$ state, and the $a_0(980)$ state is a dynamically generated state from the coupled-channel interactions of psedudoscalar meson and pseudo-scalar meson. Furthermore, thanks to the important role played by the scalar mesons $a_0(980)$ and $a_0(1710)$ in the $D_s^+ \to \pi^0 K^+ K_S^0$ reaction, the accurate data on this reaction can be used to improve our knowledge about these scalar mesons.
