

# A Proof Without Words: Triangles in the Triangular Grid

Peter Kagey

November 2, 2022

### Abstract

This proof without words demonstrates that there are  $\binom{n+2}{4}$  equilateral triangles in the regular  $n$ -vertices-per-side triangular grid by describing a map from four-element subsets of  $\{1, 2, \dots, n+2\}$  into the set of equilateral triangles in this grid. Specifically, we illustrate the triangle that corresponds to the subset  $\{4, 5, 8, 11\}$  under this bijection when  $n = 10$ .

**Theorem 1.** *There are exactly  $\binom{n+2}{4}$  equilateral triangles with vertices in a triangular region of the regular triangular grid with  $n > 2$  vertices on each side.*

*Proof.*
