

# DESCENT DISTRIBUTION ON CATALAN WORDS AVOIDING ORDERED PAIRS OF RELATIONS

JEAN-LUC BARIL AND JOSÉ L. RAMÍREZ

**ABSTRACT.** This work is a continuation of some recent articles presenting enumerative results for Catalan words avoiding one or a pair of consecutive or classical patterns of length 3. More precisely, we provide systematically the bivariate generating function for the number of Catalan words avoiding a given pair of relations with respect to the length and the number of descents. We also present several constructive bijections preserving the number of descents. As a byproduct, we deduce the generating function for the total number of descents on all Catalan words of a given length and avoiding a pair of ordered relations.

## 1. INTRODUCTION

A word  $w = w_1w_2 \cdots w_n$  over the set of non-negative integers is called a *Catalan word* if  $w_1 = 0$  and  $0 \leq w_i \leq w_{i-1} + 1$  for  $i = 2, \dots, n$ . Let  $\mathcal{C}_n$  denote the set of the Catalan words of length  $n$ . The cardinality of the set  $\mathcal{C}_n$  is given by the Catalan number  $C_n = \frac{1}{n+1} \binom{2n}{n}$ , see [16, Exercise 80]. A *Dyck path* of semilength  $n$  is a lattice path of  $\mathbb{Z} \times \mathbb{Z}$  running from  $(0, 0)$  to  $(2n, 0)$  that never passes below the  $x$ -axis and whose permitted steps are  $U = (1, 1)$  and  $D = (1, -1)$ . For a Dyck path of semilength  $n$ , we associate a Catalan word in  $\mathcal{C}_n$  formed by the  $y$ -coordinate of each initial point of the up steps. This construction is a bijection. For example, in Figure 1 we show the Dyck path associated to the Catalan word  $00123223401011 \in \mathcal{C}_{14}$ .

FIGURE 1. Dyck path of the Catalan word  $00123223401011$ .

Catalan words have already been studied in the context of exhaustive generation of Gray codes for growth-restricted words [11]. More recently, Baril et al. [5, 6] study the distribution of descents on restricted Catalan words avoiding a pattern or a pair of patterns of length at most three. Ramírez and Rojas [13] also study the distribution of descents for

Catalan words avoiding consecutive patterns of length at most three. Baril, González, and Ramírez [3] enumerate Catalan words avoiding a classical pattern of length at most three according to the length and the value of the last symbol. They also give the exact value or an asymptotic for the expectation of the last symbol. Also, we refer to [7, 10], where the authors study several combinatorial statistics on the polyominoes associated with words in  $\mathcal{C}_n$ . The goal of this work is to complement all these studies by providing enumerative results for Catalan words avoiding a set of consecutive patterns defined from a pair of relations (see below for a formal definition), with respect to the length and the number of descents.

The remaining of this paper is structured as follows. In Section 2, we introduce the notation that will be used in this work. In Section 3, we provide enumerative results for the number of Catalan words avoiding a pattern defined by an ordered pairs of relations. More precisely, in Section 3.1, we focus on the *constant cases*, i.e., pattern avoidances inducing a finite number of Catalan words independently of the length. All other sections handle exhaustively the remaining cases, by providing bivariate generating functions with respect to the length and the number of descents. We also deduce the generating function with respect to the length for the total number of descents in Catalan words avoiding a given pattern. Below, Table 1 and 2 present an exhaustive list of the sequences counting Catalan words that avoid an ordered pair of relations. Notice that the avoidance of an ordered pairs of relation can be equivalent to the avoidance of a consecutive pattern of length three (for instance,  $(<, <)$  is equivalent to 012). In this case, the patterns were already studied in [13].

TABLE 1. Number of Catalan words avoiding an ordered pair of relations: the constant cases.

## 2. NOTATIONS

For an integer  $r \geq 2$ , a *consecutive pattern*  $p = \underline{p_1 p_2 \dots p_r}$  is a word (of length  $r$ ) over the set  $\{0, 1, \dots, r-1\}$  satisfying the condition: if  $j > 0$  appears in  $p$ , then  $j-1$  also appears in  $p$ . A Catalan word  $w = w_1 w_2 \dots w_n$  *contains* the consecutive pattern  $p = \underline{p_1 p_2 \dots p_r}$  if there exists a subsequence  $w_i w_{i+1} \dots w_{i+r-1}$  (for some  $i \geq 1$ ) of  $w$  which is order-isomorphic to  $p_1 p_2 \dots p_r$ . We say that  $w$  *avoids* the consecutive pattern  $p$  whenever  $w$  does not contain the consecutive pattern  $p$ . For example, the Catalan word 0123455543 avoids the consecutive pattern 001 and contains one subsequence isomorphic to the pattern 210. More generally, we consider pattern  $p$  as an ordered pair  $p = (X, Y)$  of relations  $X$  and  $Y$  lying into the set  $\{<, >, \leq, \geq, =, \neq\}$  (see for instance, Corteel et al. [8], Martinez and Savage [12], and Auli and Elizalde [1]). We will say that a Catalan word  $w$  contains the pattern  $p = (X, Y)$

TABLE 2. Number of Catalan words avoiding an ordered pair of relations.

if there exists  $i \geq 1$  such that  $w_i X w_{i+1}$  and  $w_{i+1} Y w_{i+2}$ . As an example, the pattern  $(\neq, \geq)$  appears twice in the Catalan word 0123112 on the triplets 231 and 311. Notice that the avoidance of  $(\neq, \geq)$  on Catalan words is equivalent to the avoidance of the four consecutive patterns 010, 011, 100, and 210. On the other hand, the avoidance of  $(<, <)$  is equivalent to the consecutive pattern 012.

For  $n \geq 0$  and for a given consecutive pattern  $p$  or an ordered pair of relations  $p = (X, Y)$ . Let  $\mathcal{C}_n(p)$  denote the set of Catalan words of length  $n$  avoiding the consecutive pattern  $p$ . We denote by  $\mathbf{c}_p(n)$  the cardinality of  $\mathcal{C}_n(p)$ , and we set  $\mathcal{C}(p) := \bigcup_{n \geq 0} \mathcal{C}_n(p)$ . We

denote by  $\text{des}(w)$  the number of descents in  $w$ , i.e., the number of indices  $i \geq 1$  such that  $w_i > w_{i+1}$ . Let  $\mathcal{C}_{n,k}(p)$  denote the set of Catalan words  $w \in \mathcal{C}_n(p)$  such that  $\text{des}(w) = k$ , and let  $\mathbf{c}_p(n, k) := |\mathcal{C}_{n,k}(p)|$ . Obviously, we have  $\mathbf{c}_p(n) = \sum_{k=0}^{n-1} \mathbf{c}_p(n, k)$ . We introduce the bivariate generating function

$$\mathbf{C}_p(x, y) := \sum_{w \in \mathcal{C}(p)} x^{|w|} y^{\text{des}(w)} = \sum_{n, k \geq 0} \mathbf{c}_p(n, k) x^n y^k,$$

and we set

$$\mathbf{C}_p(x) := \sum_{w \in \mathcal{C}(p)} x^{|w|} = \mathbf{C}_p(x, 1).$$

The generating function for the total number of descents over all words in  $\mathcal{C}_n(p)$  is given by

$$\mathbf{D}_p(x) := \left. \frac{\partial \mathbf{C}_p(x, y)}{\partial y} \right|_{y=1}.$$

Throughout this work, we will often use the first return decomposition of a Catalan word  $w$ , which is  $w = 0(w'+1)w''$ , where  $w'$  and  $w''$  are Catalan words, and where  $(w'+1)$  is the word obtained from  $w'$  by adding 1 at all these symbols (for instance if  $w' = 012012$  then  $(w'+1) = 123123$ ). As an example, the first return decomposition of  $w = 0122123011201$  is given by setting  $w' = 011012$  and  $w'' = 011201$ .

### 3. ENUMERATION

Section 3.1 handles pattern avoidances inducing a finite number of Catalan words independently of the length. Section 3.1 to 3.17 handle exhaustively the other patterns.

#### 3.1. Constant cases.

The avoidance of  $(\leq, \geq)$  on Catalan words is equivalent to the avoidance of 000, 010, 011, 110, and 120. So, Catalan words in  $\mathcal{C}_n(\leq, \geq)$  are necessarily of the form  $01 \cdots n$  or  $001 \cdots (n-1)$ . Therefore  $\mathbf{c}_{(\leq, \geq)}(n) = 2$  for all  $n \geq 2$ .

The avoidance of  $(\leq, \neq)$  on Catalan words is equivalent to the avoidance of 001, 010, 012, 110, and 120. So, we necessarily have  $\mathcal{C}_1(\leq, \neq) = \{0\}$  and  $\mathcal{C}_n(\leq, \neq) = \{0^n, 01^{n-1}\}$  for  $n \geq 2$ . Therefore  $\mathbf{c}_{(\leq, \neq)}(n) = 2$  for all  $n \geq 2$ .

The avoidance of  $(\leq, \leq)$  on Catalan words is equivalent to the avoidance of 000, 001, 011, and 012. So, Catalan words in  $\mathcal{C}_n(\leq, \leq)$  are words made up of alternating zeros and ones except, possibly, for the last symbol, that is

$$\mathcal{C}_n(\leq, \leq) = \begin{cases} (01)^{n/2} \text{ or } (01)^{(n-1)/2}00, & \text{if } n \text{ is even;} \\ (01)^{(n-1)/2}0, & \text{if } n \text{ is odd.} \end{cases}$$

Therefore we obtain

$$\mathbf{c}_{(\leq, \leq)}(n) = \begin{cases} 2, & \text{if } n \text{ is even;} \\ 1, & \text{if } n \text{ is odd.} \end{cases}$$

Finally, the avoidance of  $(\neq, \leq)$  on Catalan words is equivalent to the avoidance of 011, 012, 100, 101, and 201. So, we have  $\mathcal{C}_1(\neq, \leq) = \{0\}$ ,  $\mathcal{C}_2(\neq, \leq) = \{00, 01\}$ , and for  $n \geq 3$   $\mathcal{C}_n(\neq, \leq) = \{0^n, 0^{n-1}1, 0^{n-2}10\}$ . Therefore,

$$\mathbf{c}_{(\neq, \leq)}(n) = \begin{cases} 1, & \text{if } n = 1; \\ 2, & \text{if } n = 2; \\ 3, & \text{if } n \geq 3. \end{cases}$$

We refer to Table 1 for a summary of the results obtained in this part.

### 3.2. Cases $\mathcal{C}(=, \geq)$ and $\mathcal{C}(\geq, =)$ .

The avoidance of  $(=, \geq)$  (resp.  $(\geq, =)$ ) on Catalan words is equivalent to the avoidance of 000 and 110 (resp. 000 and 100). In [2], the authors established a bijection between Catalan words avoiding 100 and those avoiding 110: from left to right, we replace each maximal factor  $k^j(k-\ell)$ ,  $j \geq 2$ ,  $\ell \geq 1$ , with the factor  $k(k-\ell)^j$ . This bijection preserves the number of descents and the avoidance of 000. For example, for  $w = 0122123300 \in \mathcal{C}_{10}(\geq, =)$ , we have the transformation

$$01\mathbf{22}123300 \rightarrow 01211\mathbf{233}00 \rightarrow 0121123000 \in \mathcal{C}_{10}(=, \geq).$$

Therefore, we necessarily have  $\mathbf{C}_{(\geq, =)}(x, y) = \mathbf{C}_{(=, \geq)}(x, y)$ , and below, we focus on the pattern  $(=, \geq)$ .

**Theorem 3.1.** *We have*

$$\mathbf{C}_1(x, y) := \mathbf{C}_{(=, \geq)}(x, y) = \frac{1 - x - x^2 + 2xy - \sqrt{(1 - x - x^2 + 2xy)^2 - 4xy(1 + xy)}}{2xy}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(=, \geq) = \mathcal{C}(\mathbf{000}, \mathbf{110})$ , and let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(\mathbf{000}, \mathbf{110})$ . If  $w'' = \epsilon$ , then  $w = 0(w' + 1)$  with  $w'$  possibly empty. The generating function for this case is  $x\mathbf{C}_1(x, y)$ . If  $w''$  is non-empty and  $w' = \epsilon$ , then  $w''$  cannot start with 00. The corresponding generating function is  $xA(x, y)$ , where  $A(x, y)$  is the bivariate generating function for non-empty Catalan words in  $\mathcal{C}(\mathbf{000}, \mathbf{110})$  that do not start with 00. Counting using the complement we have

$$A(x, y) = \mathbf{C}_1(x, y) - 1 - [x^2\mathbf{C}_1(x, y) + x^2y(\mathbf{C}_1(x, y) - 1 - B(x, y))(\mathbf{C}_1(x, y) - 1)],$$

where  $B(x, y)$  is the bivariate generating function for Catalan words in  $\mathcal{C}(=, \geq)$  that end with  $aa$  for any  $a \geq 0$  (we have to subtract this generating function to ensure the avoidance of 110). Since any word counted by  $B(x, y)$  is obtained from a non-empty Catalan word in  $\mathcal{C}(=, \geq)$  duplicating the last symbol unless the word ends with two repeated symbols, so this last generating function satisfies  $B(x, y) = x(\mathbf{C}_1(x, y) - 1 - B(x, y))$ .

If  $w'$  and  $w''$  are non-empty, then the generating function of this case is

$$E(x, y) := xy(\mathbf{C}_1(x, y) - 1 - B(x, y))(\mathbf{C}_1(x, y) - 1).$$

Therefore, we have the functional equation

$$\mathbf{C}_1(x, y) = 1 + x\mathbf{C}_1(x, y) + xA(x, y) + E(x, y).$$

Solving this system of equations we obtain the desired result.  $\square$

The series expansion of the generating function  $\mathbf{C}_1(x, y)$  is

$$1 + x + 2x^2 + (3 + y)x^3 + (\mathbf{5} + \mathbf{5}y)x^4 + (8 + 16y + 2y^2)x^5 + (13 + 43y + 16y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(=, \geq) = \mathcal{C}_4(\underline{000}, \underline{110}) = \{00\mathbf{10}, 0011, 0012, \mathbf{0100}, \mathbf{0101}, 0112, \mathbf{0120}, \mathbf{0121}, 0122, 0123\}.$$

**Corollary 3.2.** *The g.f. for the cardinality of  $\mathcal{C}(=, \geq)$  with respect to the length is*

$$\mathbf{C}_{(=, \geq)}(x) = \frac{1 + x - x^2 - \sqrt{1 - 2x - 5x^2 - 2x^3 + x^4}}{2x}.$$

Using the bijection given in Introduction between Catalan words and Dyck path, it is clear that the sequence  $\mathbf{c}_{(=, \geq)}(n) = \mathbf{c}_{\underline{000}, \underline{110}}(n)$  also counts the number of all Dyck paths of semilength  $n$  that avoid  $DUDU$  (sequence [A102407](#)). Then, using [14] we have the combinatorial expression

$$\mathbf{c}_{(=, \geq)}(n) = \mathbf{c}_{\underline{000}, \underline{110}}(n) = \sum_{j=0}^{\lfloor \frac{n}{2} \rfloor} \frac{1}{n-j} \binom{n-j}{j} \sum_{i=0}^{n-2j} \binom{n-2j}{i} \binom{j+i}{n-2j-i+1}, \quad n \geq 1.$$

**Corollary 3.3.** *The g.f. for the total number of descents on  $\mathcal{C}(=, \geq)$  is*

$$\mathbf{D}_{(=, \geq)}(x) = \frac{1 - 2x - 3x^2 + x^4 - (1 - x - x^2)\sqrt{1 - 2x - 5x^2 - 2x^3 + x^4}}{2x\sqrt{1 - 2x - 5x^2 - 2x^3 + x^4}}.$$

The series expansion of  $\mathbf{D}_{(=, \geq)}(x)$  is

$$x^3 + 5x^4 + 20x^5 + 75x^6 + 271x^7 + 964x^8 + 3397x^9 + O(x^{10})$$

where the coefficient sequence does not appear in [15].

### 3.3. Cases $\mathcal{C}(=, \leq)$ and $\mathcal{C}(\leq, =)$ .

The avoidance of  $(=, \leq)$  (resp.  $(\leq, =)$ ) on Catalan words is equivalent to the avoidance of  $\underline{000}$  and  $\underline{001}$  (resp.  $\underline{000}$  and  $\underline{011}$ ). In [13] (see Theorem 2.4), the authors established a bijection between Catalan words avoiding  $\underline{011}$  and those avoiding  $\underline{001}$ . From left to right, they replace each factor  $k^j(k+1)$  with the factor  $k(k+1)^j$  ( $j \geq 2$ ). This bijection preserves the number of descents and the avoidance of  $\underline{000}$ . Therefore, we necessarily have  $\mathbf{C}_2(x, y) := \mathbf{C}_{(\leq, =)}(x, y) = \mathbf{C}_{(=, \leq)}(x, y)$ .

**Theorem 3.4.** *We have*

$$\mathbf{C}_2(x, y) := \mathbf{C}_{(=, \leq)}(x, y) = \frac{1 - x + 2xy - \sqrt{1 - 2x + x^2 - 4x^2y - 4x^3y}}{2xy}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(=, \leq) = \mathcal{C}(\underline{000}, \underline{001})$ , and let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(=, \leq)$ . If  $w'' = \epsilon$ , then  $w = 0(w' + 1)$  with  $w'$  possibly empty. The generating function for this case is  $x\mathbf{C}_2(x, y)$ . If  $w''$  is non-empty and  $w' = \epsilon$ , then  $w''$  cannot start with  $00$  or  $01$ , so  $w'' = 0$ . The

corresponding generating function is  $x^2$ . If  $w'$  and  $w''$  are non-empty, then the generating function is  $xy(\mathbf{C}_2(x, y) - 1)^2$ . Therefore, we have the functional equation

$$\mathbf{C}_2(x, y) = 1 + x\mathbf{C}_2(x, y) + x^2 + xy(\mathbf{C}_2(x, y) - 1)^2.$$

Solving this equation we obtain the desired result.  $\square$

The series expansion of the generating function  $\mathbf{C}_2(x, y)$  is

$$1 + x + 2x^2 + (2 + y)x^3 + (\mathbf{2} + \mathbf{5}y)x^4 + (2 + 13y + 2y^2)x^5 + (2 + 25y + 16y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(=, \leq) = \{\mathbf{0100}, \mathbf{0101}, \mathbf{0110}, \mathbf{0120}, \mathbf{0121}, \mathbf{0122}, \mathbf{0123}\}.$$

**Corollary 3.5.** *The g.f. for the cardinality of  $\mathcal{C}(=, \leq)$  with respect to the length is*

$$\mathbf{C}_{(=, \leq)}(x) = \frac{1 + x - \sqrt{1 - 2x - 3x^2 - 4x^3}}{2x}.$$

This generating function coincides with those of the sequence [A143013](#), that is

$$\mathbf{c}_{(=, \leq)}(n) = \mathbf{c}_{\mathbf{000}, \mathbf{001}}(n) = \sum_{i=0}^n \sum_{k=1}^{n-i+1} \frac{1}{k} \binom{i-1}{k-1} \binom{k}{n-k-i+1} \binom{k+i-2}{i-1}, \quad n \geq 1.$$

Notice that sequence [A143013](#) counts also the number of Motzkin paths with two kinds of level steps one of which is a final step.

**Corollary 3.6.** *The g.f. for the total number of descents on  $\mathcal{C}(=, \leq)$  is*

$$\mathbf{D}_{(=, \leq)}(x) = \frac{1 - 2x - x^2 - 2x^3 - (1-x)\sqrt{1 - 2x - 3x^2 - 4x^3}}{2x\sqrt{1 - 2x - 3x^2 - 4x^3}}.$$

The series expansion of  $\mathbf{D}_{(=, \leq)}(x)$  is

$$x^3 + 5x^4 + 17x^5 + 57x^6 + 188x^7 + 610x^8 + 1971x^9 + O(x^{10}),$$

where the coefficient sequence does not appear in [\[15\]](#).

### 3.4. Cases $(=, <)$ , $(<, =)$ , and $(<, >)$ .

Obviously, we have  $\mathcal{C}(=, <) = \mathcal{C}(\mathbf{001})$ ,  $\mathcal{C}(<, =) = \mathcal{C}(\mathbf{011})$ , and  $\mathcal{C}(<, >) = \mathcal{C}(\mathbf{010}, \mathbf{120})$ . With the same bijection used at the beginning of Section [3.3](#), we have  $\mathbf{C}_{(=, <)}(x, y) = \mathbf{C}_{(<, =)}(x, y)$ , and we refer to [\[13\]](#) to see an expression of this generating function. On the other hand, a non-empty Catalan word in  $\mathcal{C}(<, >)$  is either of the form (i)  $0\alpha$  with  $\alpha \in \mathcal{C}(<, >)$ , (ii)  $0(\alpha + 1)$  with  $\alpha \in \mathcal{C}(<, >)$ ,  $\alpha \neq \epsilon$ , or (iii)  $0(\alpha + 1)\beta$  where  $\alpha$  ends with  $a(a + 1)$  and  $\beta \in \mathcal{C}(<, >)$ ,  $\beta \neq \epsilon$ . We deduce the functional equation

$$\begin{aligned} \mathbf{C}_{(<, >)}(x) &= 1 + x\mathbf{C}_{(<, >)}(x) + x(\mathbf{C}_{(<, >)}(x) - 1) \\ &\quad + x(\mathbf{C}_{(<, >)}(x) - 1)(\mathbf{C}_{(<, >)}(x) - 1 - x - x(\mathbf{C}_{(<, >)}(x) - 1)), \end{aligned}$$

which proves that  $\mathbf{C}_{(<, >)}(x) = \mathbf{C}_{(=, <)}(x) = \mathbf{C}_{(<, =)}(x)$ . Then, the sets  $\mathcal{C}(\mathbf{011}) = \mathcal{C}(<, =)$  and  $\mathcal{C}(<, >) = \mathcal{C}(\mathbf{010}, \mathbf{120})$  are in one-to-one correspondence, but the number of descents cannot be preserved (see for instance the list of Catalan words of length 3).

Below, we focus on the descent distribution over  $\mathcal{C}(<, >)$ .

**Theorem 3.7.** *We have*

$$\mathbf{C}_3(x, y) := \mathbf{C}_{(<, >)}(x, y) = \frac{1 - 2x + 2xy - x^2y - \sqrt{1 - 4x + 4x^2 - 2x^2y + x^4y^2}}{2xy(1 - x)}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(<, >) = \mathcal{C}(\underline{010}, \underline{120})$ . Let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(<, >)$ . If  $w'' = \epsilon$ , then  $w = 0(w' + 1)$  with  $w'$  possibly empty. The generating function for this case is  $x\mathbf{C}_3(x, y)$ . If  $w''$  is non-empty and  $w' = \epsilon$ , then  $w''$  is any word of  $\mathcal{C}(<, >)$ , and the corresponding generating function is  $x(\mathbf{C}_3(x, y) - 1)$ . If  $w'$  and  $w''$  are non-empty, then  $w' \neq 0$  or  $w'$  does not end with an ascent  $a(a + 1)$ , where  $a \geq 0$ . The generating function is

$$E(x, y) := xy(\mathbf{C}_3(x, y) - 1 - x - B(x, y))(\mathbf{C}_3(x, y) - 1),$$

where  $B(x, y)$  is the generating function for the Catalan words in  $\mathcal{C}(<, >)$  ending with an ascent. Since any word counted by  $B(x, y)$  is obtained from a non-empty Catalan word duplicating the last symbol plus 1, this generating function is given by  $B(x, y) = x(\mathbf{C}_3(x, y) - 1)$ . Therefore, we have the functional equation

$$\mathbf{C}_3(x, y) = 1 + x\mathbf{C}_3(x, y) + x(\mathbf{C}_3(x, y) - 1) + E(x, y).$$

Solving this system of equations we obtain the desired result.  $\square$

The series expansion of the generating function  $\mathbf{C}_3(x, y)$  is

$$1 + x + 2x^2 + 4x^3 + (\mathbf{8} + \mathbf{y})x^4 + (16 + 6y)x^5 + (32 + 24y + y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(<, >) = \{0000, 0001, 0011, 0012, 01\mathbf{10}, 0111, 0112, 0122, 0123\}.$$

**Corollary 3.8.** *The g.f. for the cardinality of  $\mathcal{C}(<, >)$  with respect to the length is*

$$\mathbf{C}_{(<, >)}(x) = \frac{1 - x^2 - \sqrt{1 - 4x + 2x^2 + x^4}}{2(1 - x)x}.$$

This generating function coincides with the generating function of the sequence [A105633](#), and

$$\mathbf{c}_{(<, >)}(n) = \mathbf{c}_{\underline{010}, \underline{120}}(n) = \sum_{k=0}^{\lfloor (n-1)/2 \rfloor} \frac{(-1)^k}{n-k} \binom{n-k}{k} \binom{2n-3k}{n-2k-1}, \quad n \geq 1.$$

Using the bijection given in Introduction between Catalan words and Dyck path, the sequence  $\mathbf{c}_{(<, =)}(n) = \mathbf{c}_{\underline{011}}(n)$  counts the Dyck paths of semilength  $n$  avoiding  $UUUDU$  and  $\mathbf{c}_{(=, <)}(n) = \mathbf{c}_{\underline{001}}(n)$  counts the Dyck paths of semilength  $n$  avoiding  $UDUU$  (cf. [14]). Notice that the sequence [A105633](#) also counts the number of Dyck paths of semilength  $n + 1$  with no pairs of consecutive valleys at the same height. More generally, it is proved in [9] that the generating function of the sequence

$$\mathbf{c}_{\gamma=\underline{012\dots k\ell(\ell+1)\dots(\ell+s)}}(n), \quad 0 \leq \ell \leq k \text{ and } s \geq 1,$$

satisfies the functional equation

$$\mathbf{C}_\gamma(x) = 1 + x\mathbf{C}_\gamma(x)^2 - x^M\mathbf{C}_\gamma(x)^{M-(k+1-\ell)} \left( \mathbf{C}_\gamma(x) - \frac{1 - (x\mathbf{C}_\gamma(x))^m}{1 - x\mathbf{C}_\gamma(x)} \right),$$

where  $M = \max\{k+1, s\}$  and  $m = \min\{k+1, s\}$  (when  $k = 0$ ,  $\ell = 0$  and  $s = 1$  we retrieve the generating function  $\mathbf{C}_{(=, <)}(x) = \mathbf{C}_{(<, >)}(x)$ ).

**Corollary 3.9.** *The g.f. for the total number of descents on  $\mathcal{C}(<, >)$  is*

$$\mathbf{D}_{(<, >)}(x) = \frac{1 - 4x + 3x^2 - (1 - 2x)\sqrt{1 - 4x + 2x^2 + x^4}}{2(1 - x)x\sqrt{1 - 4x + 2x^2 + x^4}}.$$

The series expansion of  $\mathbf{D}_{(<, >)}(x)$  is

$$x^4 + 6x^5 + 26x^6 + 100x^7 + 363x^8 + 1277x^9 + O(x^{10}),$$

where the coefficient sequence does not appear in [15].

### 3.5. Cases $\mathcal{C}(=, \neq)$ and $\mathcal{C}(\neq, =)$ .

The avoidance of  $(=, \neq)$  (resp.  $(\neq, =)$ ) on Catalan words is equivalent to the avoidance of 001 and 110 (resp. 100 and 011). The following map is a bijection from  $\mathcal{C}(=, \neq)$  to  $\mathcal{C}(\neq, =)$  and it preserves the number of descents: crossing  $\sigma \in \mathcal{C}(=, \neq)$  from right to left, we replace each factor  $k(k+1)^j$  with the factor  $k^j(k+1)$ ,  $j \geq 2$ , and we replace each factor  $k(k-\ell)^j$  with the factor  $k^j(k-\ell)$ . Therefore, we necessarily have  $\mathbf{C}_{(=, \neq)}(x, y) = \mathbf{C}_{(\neq, =)}(x, y)$ . For example, for the word  $01012323412300 \in \mathcal{C}_{14}(=, \neq)$ , we have the transformation:

$$\begin{aligned} 01012323412300 &\rightarrow 01012323412330 \rightarrow 01012323412230 \\ &\rightarrow 01012323411230 \rightarrow 01012323441230 \rightarrow 01012323341230 \\ &\rightarrow 01012322341230 \rightarrow 01012332341230 \rightarrow 01012232341230 \rightarrow 01011232341230 \\ &\rightarrow 01001232341230 \rightarrow 01101232341230 \rightarrow 00101232341230 \in \mathcal{C}_{14}(\neq, =). \end{aligned}$$

**Theorem 3.10.** *We have*

$$\mathbf{C}_4(x, y) := \mathbf{C}_{(=, \neq)}(x, y) = \frac{1 - x + 2xy - 2x^2y - \sqrt{1 - 2x + x^2 - 4x^2y}}{2xy(1 - x)}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(=, \neq) = \mathcal{C}(\underline{001}, \underline{110})$ , and let  $w = 0(w'+1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(=, \neq)$ . If  $w'' = \epsilon$ , then  $w = 0(w'+1)$  with  $w'$  possibly empty. The generating function for this case is  $x\mathbf{C}_4(x, y)$ . If  $w''$  is non-empty and  $w' = \epsilon$ , then  $w'' = 0^j$  for any  $j \geq 1$  (to avoid 001). The corresponding generating function is  $x(x/(1-x))$ . If  $w'$  and  $w''$  are non-empty, then the generating function is

$$E(x, y) := xy(\mathbf{C}_4(x, y) - 1 - B(x, y))(\mathbf{C}_4(x, y) - 1),$$

where  $B(x, y)$  is the bivariate generating function for Catalan words in  $\mathcal{C}(=, \neq)$  that do not end with  $aa$  ( $a \geq 0$ ). It is clear that  $B(x, y) = x(\mathbf{C}_4(x, y) - 1)$ . Therefore, we have the

functional equation

$$\mathbf{C}_4(x, y) = 1 + x\mathbf{C}_4(x, y) + \frac{x^2}{1-x} + E(x, y).$$

Solving this system of equations we obtain the desired result.  $\square$

The series expansion of the generating function  $\mathbf{C}_4(x, y)$  is

$$1 + x + 2x^2 + (3 + y)x^3 + (4 + 4y)x^4 + (5 + 10y + 2y^2)x^5 + (6 + 20y + 12y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(=, \neq) = \{0000, \mathbf{0100}, \mathbf{0101}, 0111, \mathbf{0120}, \mathbf{0121}, 0122, 0123\}.$$

**Corollary 3.11.** *The g.f. for the cardinality of  $\mathcal{C}(=, \neq)$  with respect to the length is*

$$\mathbf{C}_{(=, \neq)}(x) = \frac{1 + x - 2x^2 - \sqrt{1 - 2x - 3x^2}}{2(1-x)x}.$$

This generating function coincides with the generating function of the sequence of partial sums of the Motzkin numbers  $m_n$  (see sequence [A086615](#)), that is

$$\mathbf{c}_{(=, \neq)}(n) = \mathbf{c}_{\underline{001}, \underline{110}}(n) = \mathbf{c}_{\underline{100}, \underline{011}}(n) = \sum_{j=0}^{n-1} m_j, \quad n \geq 1,$$

where  $m_n$  is the  $n$ -th Motzkin number.

**Corollary 3.12.** *The g.f. for the total number of descents on  $\mathcal{C}(=, \neq)$  is*

$$\mathbf{D}_{(=, \neq)}(x) = \frac{1 - 2x - x^2 - (1-x)\sqrt{1 - 2x - 3x^2}}{2(1-x)x\sqrt{1 - 2x - 3x^2}}.$$

The series expansion of  $\mathbf{D}_{(=, \neq)}(x)$  is

$$x^3 + 4x^4 + 14x^5 + 44x^6 + 134x^7 + 400x^8 + 1184x^9 + O(x^{10}),$$

where the coefficient sequence corresponds to [A097894](#) in [15], which counts the number of peaks at even height in all Motzkin paths of length  $n + 1$ .

### 3.6. Cases $\mathcal{C}(\geq, \geq)$ and $\mathcal{C}(<, <)$ .

The avoidance of  $(\geq, \geq)$  (resp.  $(<, <)$ ) on Catalan words is equivalent to the avoidance of 000, 100, 110, and 210 (resp. 012). For the pattern  $(<, <) = \underline{012}$ , we refer to [13] to see an expression of  $\mathbf{C}_{(<, <)}(x, y)$ . Below, we prove that

$$\mathbf{C}_5(x, y) := \mathbf{C}_{(\geq, \geq)}(x, y) = \mathbf{C}_{(<, <)}(x, y),$$

by exhibiting a bijection between  $\mathcal{C}(\geq, \geq)$  and  $\mathcal{C}(<, <)$  that preserves the length and the number of descents. Let  $w$  be a word in  $\mathcal{C}(\geq, \geq)$ , we distinguish four cases:

$$\phi(w) = \begin{cases} \epsilon & \text{if } w = \epsilon \\ 0\phi(u) & \text{if } w = 0(u+1) \\ 01(\phi(u)+1) & \text{if } w = 00(u+1) \\ 01(\phi(v)+1)\phi(v') & \text{if } w = 0(va+1)v' \end{cases},$$

where  $u$ ,  $va$ , and  $v'$  are Catalan words in  $\mathcal{C}(\geq, \geq)$ , such that  $u$  and  $v$  are possibly empty,  $v'$  is not empty,  $v$  ends with  $(a-1)$  when  $v$  is not empty, and  $v'$  does not start with  $00$ . Clearly, this map is a bijection from  $\mathcal{C}(\geq, \geq)$  to  $\mathcal{C}(<, <)$  that preserves the descent number. For instance, the image by  $\phi$  of  $w = 0123010122 \in \mathcal{C}_{11}(\geq, \geq)$  is

$$\begin{aligned}\phi(w) &= 01\phi(01) \cdot \phi(010122) = 0111 \cdot 01 \cdot \phi(0122) \\ &= 0111010\phi(011) = 0111010001 \in \mathcal{C}(<, <).\end{aligned}$$

So, we deduce directly the following.

**Theorem 3.13.** *We have*

$$\mathbf{C}_5(x, y) := \mathbf{C}_{(\geq, \geq)}(x, y) = \frac{1 - x - x^2 + x^2y - \sqrt{(1 - x - x^2(1 + y))^2 - 4x^3(1 + x)y}}{2x^2y}.$$

The series expansion of the generating function  $\mathbf{C}_5(x, y)$  is

$$1 + x + 2x^2 + (3 + y)x^3 + (\mathbf{5} + \mathbf{4}y)x^4 + (8 + 12y + y^2)x^5 + (13 + 31y + 7y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_5(\geq, \geq) = \{00\mathbf{10}, 0011, 0012, \mathbf{0101}, 0112, \mathbf{0120}, \mathbf{0121}, 0122, 0123\}.$$

The coefficients of the bivariate generating function  $\mathbf{C}_5(x, y)$  coincide with the array [A114690](#), which counts the number of Motzkin paths of length  $n$  having  $k$  weak ascents.

**Corollary 3.14.** *The g.f. for the cardinality of  $\mathcal{C}(\geq, \geq)$  with respect to the length is*

$$\mathbf{C}_{(\geq, \geq)}(x) = \frac{1 - x - \sqrt{1 - 2x - 3x^2}}{2x^2}.$$

This generating function coincides with the generating function of the Motzkin numbers (sequence [A001006](#))  $m_n = \sum_{k=0}^{\lfloor n/2 \rfloor} \binom{2n}{k} C_k$ , where  $C_k$  is the  $k$ -th Catalan number, that is

$$\mathbf{c}_{(\geq, \geq)}(n) = \mathbf{c}_{000,100,110,210}(n) = m_n, \quad n \geq 0.$$

**Corollary 3.15.** *The g.f. for the total number of descents on  $\mathcal{C}(\geq, \geq)$  is*

$$\mathbf{D}_{(\geq, \geq)}(x) = \frac{1 - 2x - 2x^2 + x^3 - (1 - x - x^2)\sqrt{1 - 2x - 3x^2}}{2x^2\sqrt{1 - 2x - 3x^2}}.$$

The series expansion of  $\mathbf{D}_{(\geq, \geq)}(x)$  is

$$x^3 + 4x^4 + 14x^5 + 45x^6 + 140x^7 + 427x^8 + 1288x^9 + O(x^{10}),$$

where the coefficients correspond to the sequence [A005775](#) which counts triangular polyominoes of a given number of cells.

### 3.7. Cases $\mathcal{C}(\geq, >)$ , $\mathcal{C}(>, \geq)$ , and $\mathcal{C}(>, <)$ .

The avoidance of  $\mathcal{C}(\geq, >)$  (resp.  $\mathcal{C}(>, \geq)$ , resp.  $\mathcal{C}(>, <)$ ) on Catalan words is equivalent to the avoidance  $\underline{110}$  and  $\underline{210}$  (resp.  $\underline{100}$  and  $\underline{210}$ , resp.  $\underline{201}$  and  $\underline{101}$ ).

From the bijection described in Section 3.2, the sets  $\mathcal{C}(\geq, >) = \mathcal{C}(\underline{110}, \underline{210})$  and  $\mathcal{C}(>, \geq) = \mathcal{C}(\underline{100}, \underline{210})$  are in one-to-one correspondence (the bijection preserves also the descent number), which implies that  $\mathbf{C}_{(\geq, >)}(x, y) = \mathbf{C}_{(>, \geq)}(x, y)$ .

On the other hand, let us prove that  $\mathbf{C}_{(\geq, >)}(x, y) = \mathbf{C}_{(>, <)}(x, y)$  by exhibiting a bijection  $\psi$  preserving the descent number. Let  $w$  be a word in  $\mathcal{C}(\geq, >)$ , then we distinguish five cases:

$$\psi(w) = \begin{cases} \epsilon & \text{if } w = \epsilon \\ 0\psi(u) & \text{if } w = 0u \\ 0(\psi(u) + 1) & \text{if } w = 0(u + 1) \\ 0(\psi(ua) + 1)0\psi(v) & \text{if } w = 0(ua(a + 1) + 1)v \\ 0(\psi(v) + 1)0 & \text{if } w = 01v \end{cases},$$

where  $u$ ,  $ua(a + 1)$ , and  $v$  are Catalan words in  $\mathcal{C}(\geq, >)$ , such that  $u$  is possibly empty and  $v$  is not empty. Clearly, this map is a bijection from  $\mathcal{C}(\geq, >)$  to  $\mathcal{C}(>, <)$  that preserves the descent number. For example, for the word  $01234012343454 \in \mathcal{C}_{14}(\geq, >)$ , we have the transformation:

$$\begin{aligned} 0 \cdot 1234 \cdot 012343454 &\rightarrow 0(\psi(01 \cdot 2) + 1)0 \cdot \psi(012343454) \rightarrow 01(\psi(01) + 2)0 \cdot 0(\psi(01232343) + 1) \\ &\rightarrow 01 \cdot 22 \cdot 00 \cdot 1(\psi(0121232) + 2) \rightarrow 0122001 \cdot 2(\psi(010121) + 3) \\ &\rightarrow 01220012 \cdot 3(\psi(0121) + 4)3 \rightarrow 012200123 \cdot 4(\psi(010) + 5)3 \\ &\rightarrow 0122001234 \cdot 5(\psi(0) + 6)5 \cdot 3 \rightarrow 01220012345653 \in \mathcal{C}_{14}(>, <). \end{aligned}$$

**Theorem 3.16.** *We have*

$$\mathbf{C}_6(x, y) := \mathbf{C}_{(\geq, >)}(x, y) = \frac{1 - 2x + x^2y - \sqrt{1 - 4x + 4x^2 - 2x^2y + x^4y^2}}{2x^2y}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(\geq, >) = \mathcal{C}(\underline{110}, \underline{210})$ , and let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(\geq, >)$ . If  $w'' = \epsilon$ , then  $w = 0(w' + 1)$  with  $w'$  possibly empty. The generating function for this case is  $x\mathbf{C}_6(x, y)$ . If  $w''$  is non-empty and  $w' = \epsilon$ , then  $w''$  is any non-empty word in  $\mathcal{C}(\geq, >)$ , so the generating function is  $x(\mathbf{C}_6(x, y) - 1)$ . If  $w'$  and  $w''$  are non-empty, then  $w' = 0$  or  $w'$  has to finish with an ascent  $a(a + 1)$  ( $a \geq 0$ ). Then the generating function is

$$E(x, y) := xy(x(\mathbf{C}_6(x, y) - 1)) + xy(x(\mathbf{C}_6(x, y) - 1))(\mathbf{C}_6(x, y) - 1).$$

Therefore, we have the functional equation

$$\mathbf{C}_6(x, y) = 1 + x\mathbf{C}_6(x, y) + x(\mathbf{C}_6(x, y) - 1) + E(x, y).$$

Solving this system of equations we obtain the desired result.  $\square$

The series expansion of the generating function  $\mathbf{C}_6(x, y)$  is

$$1 + x + 2x^2 + (4 + y)x^3 + (8 + 5y)x^4 + (16 + 18y + y^2)x^5 + (32 + 56y + 9y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(\geq, >) = \{0000, 0001, 00\mathbf{10}, 0011, 0012, \mathbf{0100}, \mathbf{0101}, 0111, 0112, \mathbf{0120}, \mathbf{0121}, 0122, 0123\}.$$

The coefficient sequence of the bivariate generating function  $\mathbf{C}_6(x, y)$  coincides with [A273717](#), which counts the number of bargraphs of semiperimeter  $n$  having  $k$   $L$ -shaped corners ( $n \geq 2, k \geq 0$ ).

**Corollary 3.17.** *The g.f. for the cardinality of  $\mathcal{C}(\geq, >)$  with respect to the length is*

$$\mathbf{C}_{(\geq, >)}(x) = \frac{1 - 2x + x^2 - \sqrt{1 - 4x + 2x^2 + x^4}}{2x^2}.$$

This generating function coincides with the generating function of the sequence [A082582](#), that is

$$\mathbf{c}_{(\geq, >)}(n) = \mathbf{c}_{\underline{110}, \underline{210}}(n) = \sum_{k=0}^n \sum_{j=0}^{n-k} \frac{1}{j+1} \binom{n-k-1}{j} \binom{k}{j} \binom{k+j+2}{j}, \quad n \geq 1.$$

Notice that this sequence counts also Dyck paths of semilength  $n+1$  avoiding  $UUDD$ .

**Corollary 3.18.** *The g.f. for the total number of descents on  $\mathcal{C}(\geq, >)$  is*

$$\mathbf{D}_{(\geq, >)}(x) = \frac{1 - 4x + 3x^2 - (1 - 2x)\sqrt{1 - 4x + 2x^2 + x^4}}{2x^2\sqrt{1 - 4x + 2x^2 + x^4}}.$$

The series expansion of  $\mathbf{D}_{(\geq, >)}(x)$  is

$$x^3 + 5x^4 + 20x^5 + 74x^6 + 263x^7 + 914x^8 + 3134x^9 + O(x^{10}),$$

where the coefficients correspond to the sequence [A273718](#), which counts also the total number of descents in all bargraphs of semiperimeter  $n-1$ .

### 3.8. Cases $\mathcal{C}(\geq, \leq)$ , $\mathcal{C}(\leq, <)$ , and $\mathcal{C}(<, \leq)$ .

The avoidance of  $(\geq, \leq)$  (resp.  $(\leq, <)$ , resp.  $(<, \leq)$ ) on Catalan words is equivalent to the avoidance of 000, 001, 100, 101, and 201 (resp. 001 and 012, resp. 011 and 012).

From the bijection described in Section 3.3,  $\mathcal{C}(\leq, <) = \mathcal{C}(\underline{001}, \underline{012})$  and  $\mathcal{C}(<, \leq) = \mathcal{C}(\underline{011}, \underline{012})$  are in one-to-one correspondence by preserving the descent number, which implies that  $\mathbf{C}_{(\leq, <)}(x, y) = \mathbf{C}_{(<, \leq)}(x, y)$ .

**Theorem 3.19.** *We have*

$$\mathbf{C}_7(x, y) := \mathbf{C}_{(\leq, <)}(x, y) = \frac{1 + x^2 - x^2y}{1 - x - x^2y}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(\leq, <) = \mathcal{C}(\underline{001}, \underline{012})$ . From the conditions we have the decomposition  $00^j$ ,  $011^j$  or  $011^jw'$ , where  $j \geq 0$  and  $w'$  is a non-empty word in  $\mathcal{C}(\leq, <)$ . Therefore, we have the functional equation

$$\mathbf{C}_7(x, y) = 1 + \frac{x}{1-x} + \frac{x^2}{1-x} + \frac{x^2y}{1-x} \mathbf{C}_7(x, y).$$

Solving this equation we obtain the desired result.  $\square$

The series expansion of the generating function  $\mathbf{C}_7(x, y)$  is

$$1 + x + 2x^2 + (2 + y)x^3 + (\mathbf{2} + \mathbf{3}y)x^4 + (2 + 5y + y^2)x^5 + (2 + 7y + 4y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(\leq, <) = \{0000, \mathbf{0100}, \mathbf{0101}, \mathbf{0110}, \mathbf{0111}\}.$$

The coefficients of the generating function  $\mathbf{C}_7(x, y)$  coincide with the table [A129710](#).

**Corollary 3.20.** *The g.f. for the cardinality of  $\mathcal{C}(\leq, <)$  with respect to the length is*

$$\mathbf{C}_{(\leq, <)}(x) = \frac{1}{1 - x - x^2}.$$

This generating function coincides with that of the Fibonacci sequence  $F_{n+1}$ , that is

$$\mathbf{c}_{(\leq, <)}(n) = \mathbf{c}_{\underline{001}, \underline{012}}(n) = F_{n+1}, \quad n \geq 0.$$

**Corollary 3.21.** *The g.f. for the total number of descents on  $\mathcal{C}(\leq, <)$  is*

$$\mathbf{D}_{(\leq, <)}(x) = \frac{x^3(1+x)}{(1-x-x^2)^2}.$$

The series expansion is

$$x^3 + 3x^4 + 7x^5 + 15x^6 + 30x^7 + 58x^8 + 109x^9 + O(x^{10}),$$

where the coefficient sequence corresponds to [A023610](#).

Finally, we can prove easily that  $\mathbf{C}_{(\geq, \leq)}(x, y) = \mathbf{C}_{(\leq, <)}(x, y)$  by exhibiting a bijection  $\phi$  preserving the descent number. Let  $w$  be a word in  $\mathcal{C}(\leq, <)$ , then we distinguish three cases: (i)  $\phi(\epsilon) = \epsilon$ ; (ii) if  $w = 0^j$ ,  $j \geq 1$ , then we set  $\phi(w) = 01^{j-1}$ ; and (iii) if  $w = 01^j$ ,  $j \geq 1$ , then  $\phi(w) = 012 \cdots (j-1)(j-1)$ ; (iv) if  $w = 01^j w'$ ,  $j \geq 1$ , then  $\phi(w) = 01 \cdots (j-1)(\phi(w') + j)0$ . For example, for the word  $01101101111011 \in \mathcal{C}_{14}(\leq, <)$ , we have the transformation:

$$\begin{aligned} \phi(01^2 01101111011) &= 01(\phi(01^2 01111011) + 2)0 \\ &= 0123(\phi(01^4 011) + 4)20 = 01234567(\phi(01^2) + 8)420 \\ &= 01234557899(\phi(\epsilon) + 8)420 = 01234567899420 \in \mathcal{C}_{14}(\geq, \leq). \end{aligned}$$

### 3.9. Cases $\mathcal{C}(\geq, <)$ and $\mathcal{C}(\leq, >)$ .

The avoidance of  $\mathcal{C}(\geq, <)$  (resp.  $\mathcal{C}(\leq, >)$ ) on Catalan words is equivalent to the avoidance of 001, 101, and 201 (resp. 010, 110, and 120). Below, we will see that for all  $n \geq 1$ , the cardinalities of  $\mathcal{C}_n(\geq, <)$  resp.  $\mathcal{C}_n(\leq, >)$  are the same, but the distributions of the number of descents do not coincide.

**Theorem 3.22.** *We have*

$$\mathbf{C}_8(x, y) := \mathbf{C}_{(\geq, <)}(x, y) = \frac{1 - x + x^2 - x^2 y}{1 - 2x + x^2 - x^2 y}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(\geq, <) = \mathcal{C}(\underline{101}, \underline{110}, \underline{201})$  and let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(\geq, <)$ . If  $w'$  is empty, then we have  $w = 0^j$ ,  $j \geq 0$ . Otherwise, we have  $w = 0(w' + 1)0^j$ ,  $j \geq 0$ . The generating function  $\mathbf{C}_8(x, y)$  satisfies the functional equation

$$\mathbf{C}_8(x, y) = \frac{1}{1-x} + x(\mathbf{C}_8(x, y) - 1) + \frac{x^2y}{1-x}(\mathbf{C}_8(x, y) - 1),$$

which gives the result.  $\square$

The series expansion of the generating function  $\mathbf{C}_8(x, y)$  is

$$1 + x + 2x^2 + (3 + y)x^3 + (4 + 4y)x^4 + (5 + 10y + y^2)x^5 + (6 + 20y + 6y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(\geq, <) = \{0000, 01\mathbf{10}, 0111, 0\mathbf{100}, 01\mathbf{20}, 01\mathbf{21}, 0122, 0123\}.$$

The coefficient sequence of the bivariate generating function  $\mathbf{C}_8(x, y)$  coincides with [A034867](#), then

$$[x^n y^k] \mathbf{C}_8(x, y) = \binom{n}{2k+1}.$$

**Corollary 3.23.** *The g.f. for the cardinality of  $\mathcal{C}(\geq, <)$  with respect to the length is*

$$\mathbf{C}_{(\geq, <)}(x) = \frac{1-x}{1-2x},$$

where the  $n$ th term is  $2^{n-1}$ .

**Corollary 3.24.** *The g.f. for the total number of descents on  $\mathcal{C}(\geq, <)$  is*

$$\mathbf{D}_{(\geq, <)}(x) = \frac{x^3}{(1-2x)^2}.$$

The series expansion is

$$x^3 + 4x^4 + 12x^5 + 32x^6 + 80x^7 + 192x^8 + 448x^9 + O(x^{10}),$$

where the coefficient sequence corresponds to [A001787](#), i.e., the  $n$ -th term is  $(n-2)2^{n-3}$ .

**Theorem 3.25.** *We have*

$$\mathbf{C}_{(\leq, >)}(x, y) = \frac{1-x}{1-2x}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(\leq, >) = \mathcal{C}(\underline{010}, \underline{110}, \underline{120})$  and let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(\geq, <)$ . If  $w'$  is empty, then we have  $w = 0w''$ . Otherwise, we have  $w = 0(w' + 1)$ . The generating function  $\mathbf{C}_{(\leq, >)}(x, y)$  satisfies the functional equation

$$\mathbf{C}_{(\leq, >)}(x, y) = 1 + x\mathbf{C}_{(\leq, >)}(x, y) + x(\mathbf{C}_{(\leq, >)}(x, y) - 1),$$

which gives the result.  $\square$

### 3.10. Case $\mathcal{C}(\geq, \neq)$ .

The avoidance of  $\mathcal{C}(\geq, \neq)$  on Catalan words is equivalent to the avoidance of 001, 102, 201, 110, and 210. This means that any Catalan word of length  $n$  in  $\mathcal{C}(\geq, \neq)$  is either of the form  $w = 01 \dots (k-1)k^{n-k}$ ,  $k \geq 0$ , or  $w = 01 \dots (k-1)m^{n-k}$  where  $0 \leq m < k-1$  and  $k \geq 1$ . Therefore, we can deduce easily that

$$\mathbf{C}_9(x, y) := \mathbf{C}_{(\geq, \neq)}(x, y) = 1 + \frac{x}{(1-x)^2} + \frac{yx^3}{(1-x)^3},$$

which implies the following.

**Theorem 3.26.** *We have*

$$\mathbf{C}_{(\geq, \neq)}(x, y) = \frac{1 - 2x + 2x^2 - x^3 + x^3y}{(1-x)^3}.$$

The series expansion of the generating function  $\mathbf{C}_{(\geq, \neq)}(x, y)$  is

$$1 + x + 2x^2 + (3 + y)x^3 + (\mathbf{4} + \mathbf{3}y)x^4 + (5 + 6y)x^5 + (6 + 10y)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathbf{C}_4(\geq, \neq) = \{0000, 0\mathbf{1}00, 0111, 0\mathbf{1}20, 0\mathbf{1}2\mathbf{1}, 0122, 0123\}.$$

**Corollary 3.27.** *The g.f. for the cardinality of  $\mathcal{C}(\geq, \neq)$  with respect to the length is*

$$\mathbf{C}_{(\geq, \neq)}(x) = \frac{1 - 2x + 2x^2}{(1-x)^3},$$

where the  $n$ th term is  $1 + \binom{n}{2}$ .

**Corollary 3.28.** *The g.f. for the total number of descents on  $\mathcal{C}(\geq, \neq)$  is*

$$\mathbf{D}_{(\geq, \neq)}(x) = \frac{x^3}{(1-x)^3}.$$

The series expansion is

$$x^3 + 3x^4 + 6x^5 + 10x^6 + 15x^7 + 21x^8 + 28x^9 + O(x^{10}),$$

where the coefficient sequence corresponds to A000217, i.e., the  $n$ -th term is  $\binom{n-1}{2}$ .

### 3.11. Case $\mathcal{C}(>, \leq)$ .

The avoidance of  $\mathcal{C}(>, \leq)$  on Catalan words is equivalent to the avoidance of 100, 101, and 201.

**Theorem 3.29.** *We have*

$$\mathbf{C}_{10}(x, y) := \mathbf{C}_{(>, \leq)}(x, y) = \frac{1 - x - x^2y}{1 - 2x - x^2y}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(>, \leq) = \mathcal{C}(\underline{100}, \underline{101}, \underline{201})$ , and let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(>, \leq)$ . If  $w'' = \epsilon$ , then  $w = 0(w' + 1)$  with  $w'$  possibly empty. The generating function for this case is  $x\mathbf{C}_{10}(x, y)$ . If  $w''$  is non-empty and  $w' = \epsilon$ , then  $w''$  is any non-empty word in  $\mathcal{C}(>, \leq)$ , so the generating function is  $x(\mathbf{C}_{10}(x, y) - 1)$ . If  $w'$  and  $w''$  are non-empty, then  $w'$  does not start with the prefix  $01$  or  $00$ , otherwise  $w$  would contain the pattern  $\underline{100}$  or  $\underline{201}$ , respectively. Therefore,  $w'' = 0$  and the generating function is  $x^2y(\mathbf{C}_{10}(x, y) - 1)$ . Summarizing, we have the functional equation

$$\mathbf{C}_{10}(x, y) = 1 + x\mathbf{C}_{10}(x, y) + x(\mathbf{C}_{10}(x, y) - 1) + x^2y(\mathbf{C}_{10}(x, y) - 1).$$

Solving this equation we obtain the desired result.  $\square$

The series expansion of the generating function  $\mathbf{C}_{10}(x, y)$  is

$$1 + x + 2x^2 + (4 + y)x^3 + (\mathbf{8} + \mathbf{4}y)x^4 + (16 + 12y + y^2)x^5 + (32 + 32y + 6y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(>, \leq) = \{0000, 0001, 00\mathbf{10}, 0011, 0012, 01\mathbf{10}, 0111, 0112, 01\mathbf{20}, 01\mathbf{21}, 0122, 0123\}.$$

The coefficients of the above series coincide with the array [A207538](#). Notice that this array coincides with the coefficients of the Pell polynomials.

**Corollary 3.30.** *The g.f. for the cardinality of  $\mathcal{C}(\leq, <)$  with respect to the length is*

$$\mathbf{C}_{(>, \leq)}(x) = \frac{1 - x - x^2}{1 - 2x - x^2}.$$

This generating function coincides with the generating function of the Pell numbers  $P_{n+1}$ . The Pell sequence is defined by  $P_n = 2P_{n-1} + P_{n-2}$  for  $n \geq 2$ , with the initial values  $P_0 = 0$  and  $P_1 = 1$  (see sequence [A000129](#)).

**Corollary 3.31.** *The g.f. for the total number of descents on  $\mathcal{C}(>, \leq)$  is*

$$\mathbf{D}_{(>, \leq)}(x) = \frac{x^3}{(1 - 2x - x^2)^2}.$$

The series expansion of  $\mathbf{D}_{(>, \leq)}(x)$  is

$$x^3 + 4x^4 + 14x^5 + 44x^6 + 131x^7 + 376x^8 + 1052x^9 + O(x^{10}),$$

where the coefficients correspond to the sequence [A006645](#).

### 3.12. Case $\mathcal{C}(>, \neq)$ .

The avoidance of  $\mathcal{C}(>, \neq)$  on Catalan words is equivalent to the avoidance of  $\underline{101}$ ,  $\underline{201}$ , and  $\underline{210}$ , which means that  $\mathcal{C}(>, \neq)$  is the set of Catalan words without double successive descents and without valleys. Therefore, such a nonempty word is of the form  $0u$ , or  $0(u + 1)$ , or  $0(u + 1)u'0v$  where  $u, v \in \mathcal{C}(>, \neq)$  and  $u' = k(k + 1) \cdots \ell$  with  $\ell \geq k \geq 1$  and if  $u + 1$  ends with  $a$  then we set  $k = a$ , and if  $u$  is empty then we set  $k = 1$ . We deduce the following functional equation for  $\mathbf{C}_{11}(x, y) := \mathbf{C}_{(>, \neq)}(x, y)$ .

$$\mathbf{C}_{11}(x, y) = 1 + x\mathbf{C}_{11}(x, y) + x(\mathbf{C}_{11}(x, y) - 1) + yx^2 \frac{x}{1 - x} \mathbf{C}_{11}(x, y)^2.$$

Then, we have the following.

**Theorem 3.32.** *We have*

$$\mathbf{C}_{11}(x, y) := \mathbf{C}_{(>, \neq)}(x, y) = \frac{\left(1 - 2x - \sqrt{1 - 4x + 4x^2 - 4x^3y}\right) (1 - x)}{2x^3y}.$$

The series expansion of the generating function  $\mathbf{C}_{11}(x, y)$  is

$$1 + x + 2x^2 + (4 + y)x^3 + (8 + 5y)x^4 + (16 + 18y)x^5 + (32 + 56y + 2y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(>, \neq) = \{0000, 0001, 00\mathbf{10}, 0011, 0012, 0\mathbf{100}, 0\mathbf{110}, 0111, 0112, 0\mathbf{120}, 0\mathbf{121}, 0122, 0123\}$$

**Corollary 3.33.** *The g.f. for the cardinality of  $\mathcal{C}(>, \neq)$  with respect to the length is*

$$\mathbf{C}_{(>, \neq)}(x) = \frac{(1 - 2x - \sqrt{1 - 4x + 4x^2 - 4x^3}) (1 - x)}{2x^3}.$$

The coefficient sequence of the series expansion does not appear in [15].

**Corollary 3.34.** *The g.f. for the total number of descents on  $\mathcal{C}(>, \neq)$  is*

$$\mathbf{D}_{(>, \neq)}(x) = \frac{(1 - x) (1 - 4x + 4x^2 - 2x^3 - (1 - 2x)\sqrt{1 - 4x + 4x^2 - 4x^3})}{2x^3\sqrt{1 - 4x + 4x^2 - 4x^3}}.$$

The series expansion of  $\mathbf{D}_{(>, \neq)}(x)$  is

$$x^3 + 5x^4 + 18x^5 + 60x^6 + 196x^7 + 632x^8 + 2015x^9 + O(x^{10}),$$

where the coefficient sequence does not appear in [15].

### 3.13. Cases $\mathcal{C}(<, \geq)$ and $\mathcal{C}(\neq, \geq)$ .

The avoidance of  $\mathcal{C}(<, \geq)$  (resp.  $\mathcal{C}(\neq, \geq)$ ) on Catalan words is equivalent to the avoidance of 010, 120, and 011 (resp. 100, 011, 210, 010, and 120). A nonempty Catalan word in  $\mathcal{C}(<, \geq)$  is of the form  $0^k(u + 1)$ ,  $k \geq 1$  where  $u$  is either empty or  $u = 012 \dots k$ ,  $k \geq 1$ . Moreover, it is easy to check that  $\mathcal{C}(<, \geq) = \mathcal{C}(\neq, \geq)$ . Then, we deduce the following.

**Theorem 3.35.** *We have*

$$\mathbf{C}_{12}(x, y) := \mathbf{C}_{(<, \geq)}(x, y) = \mathbf{C}_{(\neq, \geq)}(x, y) = 1 + \frac{1}{1-x} \frac{x}{1-x} = \frac{1-x+x^2}{(1-x)^2}.$$

The  $n$ th term of the series expansion is  $n$ .

### 3.14. Case $\mathcal{C}(<, \neq)$ .

The avoidance of  $\mathcal{C}(<, \neq)$  on Catalan words is equivalent to the avoidance of 010, 012, and 120. We set  $\mathbf{C}_{13}(x, y) := \mathbf{C}_{(<, \neq)}(x, y)$ .

**Theorem 3.36.** *We have*

$$\mathbf{C}_{13}(x, y) = \frac{1 - 2x^2 - x^3 + 2x^2y - (1+x)\sqrt{1 - 2x - x^2 + 2x^3 + x^4 - 4x^3y}}{2x^2y}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(<, \neq) = \mathcal{C}(\underline{010}, \underline{012}, \underline{120})$ , and let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(<, \neq)$ . If  $w'$  is empty, then the generating function for these words is  $x\mathbf{C}_{13}(x, y)$ . If  $w''$  is empty, then  $w = 01(u + 1)$ , where  $u \in \mathcal{C}(<, \neq)$ , and the generating function for these words is  $x^2\mathbf{C}_{13}(x, y)$ . If  $w = 011u$ , where  $u$  is a nonempty word in  $\mathcal{C}(<, \neq)$ , then the generating function for these words is  $x^3y(\mathbf{C}_{13}(x, y) - 1)$ . If  $w = 01(u + 1)v$ , where  $u, v \in \mathcal{C}(<, \neq)$ ,  $u$  ending with  $aa$ ,  $a \geq 0$ , and  $v$  nonempty, then the generating function for these words is  $x^3y(\mathbf{C}_{13}(x, y) - 1)^2$ . If  $w = 01(u + 1)v$ , where  $u, v \in \mathcal{C}(<, \neq)$ ,  $u$  ending with a descent and  $v$  nonempty, then the generating function for these words is  $x^2yB(x, y)(\mathbf{C}_{13}(x, y) - 1)$ , where  $B(x, y)$  is the generating function for Catalan words in  $\mathcal{C}(<, \neq)$  ending by a descent. By considering the complement, we obtain easily that

$$B(x, y) = \mathbf{C}_{13}(x, y) - 1 - x - xB(x, y) - x(\mathbf{C}_{13}(x, y) - 1) - x^2\mathbf{C}_{13}(x, y).$$

Summarizing, we have the following functional equation

$$\begin{aligned} \mathbf{C}_{13}(x, y) = 1 + x\mathbf{C}_{13}(x, y) + x^2\mathbf{C}_{13}(x, y) + x^3y(\mathbf{C}_{13}(x, y) - 1) \\ + x^3y(\mathbf{C}_{13}(x, y) - 1)^2 + x^2yB(x, y)(\mathbf{C}_{13}(x, y) - 1), \end{aligned}$$

which gives the result.  $\square$

The series expansion of the generating function  $\mathbf{C}_{13}(x, y)$  is

$$1 + x + 2x^2 + 3x^3 + (5 + y)x^4 + (\mathbf{8} + \mathbf{4}y)x^5 + (13 + 12y)x^6 + O(x^7)$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\begin{aligned} \mathcal{C}_5(<, \neq) = \{00000, 00001, 00011, 001\mathbf{10}, 00111, 00112, \\ 01\mathbf{100}, 01\mathbf{101}, 011\mathbf{10}, 01111, 01112, 01122\} \end{aligned}$$

**Corollary 3.37.** *The g.f. for the cardinality of  $\mathcal{C}(<, \neq)$  with respect to the length is*

$$\mathbf{C}_{(<, \neq)}(x) = \frac{1 - x^3 - (1 + x)\sqrt{1 - 2x - x^2 - 2x^3 + x^4}}{2x^2}.$$

The coefficient sequence of the series expansion does not appear in [15].

**Corollary 3.38.** *The g.f. for the total number of descents on  $\mathcal{C}(<, \neq)$  is*

$$\mathbf{D}_{(<, \neq)}(x) = \frac{1 - 4x^2 - 4x^3 + 2x^5 - x^6 - (1 + x)(1 - 2x^2 - x^3)\sqrt{1 - 2x - x^2 - 2x^3 + x^4}}{2x^2(1 + x)\sqrt{1 - 2x - x^2 - 2x^3 + x^4}}.$$

The series expansion of  $\mathbf{D}_{(<, \neq)}(x)$  is

$$x^4 + 4x^5 + 12x^6 + 35x^7 + 97x^8 + 262x^9 + O(x^{10}),$$

where the coefficient sequence does not appear in [15].

### 3.15. Case $\mathcal{C}(\neq, >)$ .

The avoidance of  $\mathcal{C}(\neq, >)$  on Catalan words is equivalent to the avoidance of 010, 210, and 120.

**Theorem 3.39.** *We have*

$$\mathbf{C}_{14}(x, y) := \mathbf{C}_{(\neq, >)}(x, y) = \frac{1 - 2x + 2x^2y - \sqrt{1 - 4x + 4x^2 - 4x^3y}}{2x^2y}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(\neq, >) = \mathcal{C}(\underline{010}, \underline{120}, \underline{210})$ , and let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(\neq, >)$ . If  $w'' = \epsilon$ , then  $w = 0(w' + 1)$  with  $w'$  possibly empty. The generating function for this case is  $x\mathbf{C}_{14}(x, y)$ . If  $w''$  is non-empty and  $w' = \epsilon$ , then  $w''$  is any non-empty word in  $\mathcal{C}(\neq, >)$ , so the generating function is  $x(\mathbf{C}_{14}(x, y) - 1)$ . If  $w'$  and  $w''$  are non-empty, then  $w' \neq 0$  (to avoid 010),  $w'$  does not end with an ascent  $a(a + 1)$  ( $a \geq 0$ ) (to avoid 120) or  $w'$  does not end with a descent  $ab$  ( $a > b$ ) (to avoid 210). Then,  $w'$  ends with  $aa$  ( $a \geq 0$ ) and the generating function is  $x^2y(\mathbf{C}_{14}(x, y) - 1)^2$ . Summarizing, we have the functional equation

$$\mathbf{C}_{14}(x, y) = 1 + x\mathbf{C}_{14}(x, y) + x(\mathbf{C}_{14}(x, y) - 1) + x^2y(\mathbf{C}_{14}(x, y) - 1)^2.$$

Solving this equation we obtain the desired result.  $\square$

The series expansion of the generating function  $\mathbf{C}_{14}(x, y)$  is

$$1 + x + 2x^2 + 4x^3 + (\mathbf{8} + \mathbf{y})x^4 + (16 + 6y)x^5 + (32 + 24y)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(\neq, >) = \{0000, 0001, 0011, 0012, 01\mathbf{10}, 0111, 0112, 0122, 0123\}.$$

**Corollary 3.40.** *The g.f. for the cardinality of  $\mathcal{C}(\neq, >)$  with respect to the length is*

$$\mathbf{C}_{(\neq, >)}(x) = \frac{1 - 2x + 2x^2 - \sqrt{1 - 4x + 4x^2 - 4x^3}}{2x^2}.$$

This generating function coincides with the generating function of the sequence [A152225](#) that counts Dyck paths of a given length with no peaks at height 0 (mod 3) and no valleys at height 2 (mod 3).

**Corollary 3.41.** *The g.f. for the total number of descents on  $\mathcal{C}(\neq, >)$  is*

$$\mathbf{D}_{(\neq, >)}(x) = \frac{1 - 4x + 4x^2 - 2x^3 - (1 - 2x)\sqrt{1 - 4x + 4x^2 - 4x^3}}{2x^2\sqrt{1 - 4x + 4x^2 - 4x^3}}.$$

The series expansion of  $\mathbf{D}_{(\neq, >)}(x)$  is

$$x^4 + 6x^5 + 24x^6 + 84x^7 + 280x^8 + 912x^9 + O(x^{10}),$$

where the coefficient sequence does not appear in [\[15\]](#).

3.16. Case  $\mathcal{C}(\neq, <)$ .

The avoidance of  $\mathcal{C}(\neq, <)$  on Catalan words is equivalent to the avoidance of [012](#), [101](#), [102](#), and [201](#).

**Theorem 3.42.** *We have*

$$\mathbf{C}_{15}(x, y) := \mathbf{C}_{(\neq, <)}(x, y) = \frac{1 - x - x^2 - \sqrt{(1 - x - x^2)^2 - 4x^3y}}{2x^3y}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(\neq, <) = \mathcal{C}(\mathbf{012}, \mathbf{101}, \mathbf{201})$ , and let  $w = 0(w'+1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(\neq, <)$ . If  $w'' = \epsilon$ , then  $w = 0(w'+1)$  with  $w'$  possibly empty. For  $w' \neq \epsilon$  and to avoid [012](#), we have  $w' = 01(w'''+1)$ , where  $w''' \in \mathcal{C}(\neq, <)$ . The generating function for this case is  $x + x^2\mathbf{C}_{15}(x, y)$ . If  $w''$  is non-empty and  $w' = \epsilon$ , then  $w''$  is any non-empty word in  $\mathcal{C}(\neq, <)$ , so the generating function is  $x(\mathbf{C}_{15}(x, y) - 1)$ . If  $w'$  and  $w''$  are non-empty, then  $w' = 0u$  and  $w'' = 0v$ , where  $u, v \in \mathcal{C}(\neq, <)$ . Then the generating function for this case is  $x^3y\mathbf{C}_{15}(x, y)$ . Summarizing, we have the functional equation

$$\mathbf{C}_{15}(x, y) = 1 + x + x^2\mathbf{C}_{15}(x, y) + x(\mathbf{C}_{15}(x, y) - 1) + x^3y\mathbf{C}_{15}(x, y).$$

Solving this equation we obtain the desired result.  $\square$

The series expansion of the generating function  $\mathbf{C}_{15}(x, y)$  is

$$1 + x + 2x^2 + (3 + y)x^3 + (\mathbf{5} + \mathbf{3y})x^4 + (8 + 9y)x^5 + (13 + 22y + 2y^2)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathcal{C}_4(\neq, >) = \{0000, 0001, 00\mathbf{10}, 0011, 0\mathbf{100}, 01\mathbf{10}, 0111, 0112\}.$$

The coefficients of the generating function  $\mathbf{C}_{15}(x, y)$  coincide with the array [A114711](#).

**Corollary 3.43.** *The g.f. for the cardinality of  $\mathcal{C}(\neq, >)$  with respect to the length is*

$$\mathbf{C}_{(\neq, <)}(x) = \frac{1 - x - x^2 - \sqrt{1 - 2x - x^2 - 2x^3 + x^4}}{2x^3}.$$

This generating function coincides with the generating function of the sequence [A292460](#) that gives the number of  $U_k D$ -equivalence classes of Łukasiewicz paths (see [4]), which is a shift of the sequences [A292460](#), [A004148](#), and [A203019](#). Then we have

$$\mathbf{c}_{(\neq, <)}(n) = \mathbf{c}_{\mathbf{012}, \mathbf{101}, \mathbf{201}}(n) = \sum_{k=0}^{\lfloor \frac{n+1}{2} \rfloor} (-1)^k \binom{n-k-1}{k} m_{n+1-2k}, \quad n \geq 0.$$

**Corollary 3.44.** *The g.f. for the total number of descents on  $\mathcal{C}(\neq, <)$  is*

$$\mathbf{D}_{(\neq, <)}(x) = \frac{1 - 2x - x^2 + x^4 - (1 - x - x^2)\sqrt{1 - 2x - x^2 - 2x^3 + x^4}}{2x^3\sqrt{1 - 2x - x^2 - 2x^3 + x^4}}.$$

The series expansion of  $\mathbf{D}_{(\neq, <)}(x)$  is

$$x^3 + 3x^4 + 9x^5 + 26x^6 + 71x^7 + 191x^8 + 508x^9 + O(x^{10}),$$

where the coefficient sequence does not appear in [15].

### 3.17. Case $\mathcal{C}(\neq, \neq)$ .

The avoidance of  $\mathcal{C}(\neq, \neq)$  on Catalan words is equivalent to the avoidance of 010, 012, 101, 201, and 120.

**Theorem 3.45.** *We have*

$$\mathbf{C}_{16}(x, y) := \mathbf{C}_{(\neq, \neq)}(x, y) = \frac{1 - x - x^2 - \sqrt{(1 - x - x^2)^2 - 4x^4y}}{2x^4y}.$$

*Proof.* Let  $w$  denote a non-empty Catalan word in  $\mathcal{C}(\neq, \neq) = \mathcal{C}(\underline{010}, \underline{012}, \underline{101}, \underline{120}, \underline{201}, \underline{210})$ , and let  $w = 0(w' + 1)w''$  be the first return decomposition, where  $w', w'' \in \mathcal{C}(\neq, \neq)$ . If  $w'' = \epsilon$ , then  $w = 0(w' + 1)$  with  $w'$  possibly empty. For  $w' \neq \epsilon$  and to avoid 012, we have  $w' = 01(w''' + 1)$ , where  $w''' \in \mathcal{C}(\neq, \neq)$ . The generating function for this case is  $x + x^2\mathbf{C}_{16}(x, y)$ . If  $w''$  is non-empty and  $w' = \epsilon$ , then the generating function is  $x(\mathbf{C}_{16}(x, y) - 1)$ . If  $w'$  and  $w''$  are non-empty, then  $w'$  is a non-empty word in  $\mathcal{C}(\neq, \neq)$  such that the last two symbols are equal (to avoid 210 and 120) and  $w'' = 0w'''$ , where  $w''' \in \mathcal{C}(\neq, \neq)$  (to avoid 101 and 201). Then the generating function for this case is

$$E(x, y) := xy(x^2\mathbf{C}_{16}(x, y))(x\mathbf{C}_{16}(x, y)).$$

Summarizing, we have the functional equation

$$\mathbf{C}_{16}(x, y) = 1 + x + x^2\mathbf{C}_{16}(x, y) + x(\mathbf{C}_{16}(x, y) - 1) + E(x, y).$$

Solving this equation we obtain the desired result.  $\square$

Notice that  $\mathbf{C}_{16}(x, y) = \mathbf{C}_{15}(x, xy)$ . The series expansion of the generating function  $\mathbf{C}_{16}(x, y)$  is

$$1 + x + 2x^2 + 3x^3 + (\mathbf{5} + \mathbf{y})x^4 + (8 + 3y)x^5 + (13 + 9y)x^6 + O(x^7).$$

The Catalan words corresponding to the bold coefficients in the above series are

$$\mathbf{C}_4(\neq, \neq) = \{0000, 0001, 0011, 01\mathbf{10}, 0111, 0112\}.$$

**Corollary 3.46.** *The g.f. for the cardinality of  $\mathcal{C}(\neq, \neq)$  with respect to the length is*

$$\mathbf{C}_{(\neq, \neq)}(x) = \frac{1 - x - x^2 - \sqrt{1 - 2x - x^2 + 2x^3 - 3x^4}}{2x^4}.$$

This generating function coincides with the generating function of the sequence [A026418](#) that counts ordered trees with a given number of edges and having no branches of length 1. Then, we have

$$\mathbf{c}_{(\neq, \neq)}(n) = \mathbf{c}_{\underline{010}, \underline{012}, \underline{101}, \underline{120}, \underline{201}, \underline{210}}(n) = \sum_{k=0}^{\lfloor \frac{n+1}{2} \rfloor} \binom{n-k}{k} m_k, \quad n \geq 1.$$

**Corollary 3.47.** *The g.f. for the total number of descents on  $\mathcal{C}(\neq, \neq)$  is*

$$\mathbf{D}_{(\neq, \neq)}(x) = \frac{1 - 2x - x^2 + 2x^3 - x^4 - (1 - x - x^2)\sqrt{1 - 2x - x^2 + 2x^3 - 3x^4}}{2x^4\sqrt{1 - 2x - x^2 + 2x^3 - 3x^4}}.$$

The series expansion of  $D_{(\neq, <)}(x)$  is

$$x^4 + 3x^5 + 9x^6 + 22x^7 + 55x^8 + 131x^9 + O(x^{10}),$$

where the coefficient sequence does not appear in [15].
