# DEGRADABLE STRONGLY ENTANGLEMENT BREAKING MAPS 

REPANA DEVENDRA, GUNJAN SAPRA, AND K. SUMESH

#### Abstract

In this paper, we provide a structure theorem and various characterizations of degradable strongly entanglement breaking maps on separable Hilbert spaces. In the finite dimensional case, we prove that unital degradable entanglement breaking maps are precisely the $C^{*}$-extreme points of the convex set of unital entanglement breaking maps on matrix algebras. Consequently,

## 1. Introduction

In [DeSh05], Devtak and Shor introduced the notion of degradable channels via complementary channels. Holevo ([Hol07]) used complementary channels to develop a class of channels for which the multiplicativity/additivity problem (c.f. NiCh11]) has a positive solution. Cubitt et al. ([CRS08]) characterized all degradable qubit channels. In [WoPe07], M.M Wolf et al. introduced the notion of twisted diagonal channels and gave a simple criterion to check the degradability. A subclass of degradable channels, called self-complementary channels, was studied in [SRZ16]. It is known that entanglement breaking maps (on matrix algebras) are anti-degradable maps but the converse is not true in general (c.f. [DeSh05], [CRS08]). In this article, we investigate the mathematical structure of degradable (strongly) entanglement breaking maps and their connections with the notion of $C^{*}$-extreme points of unital entanglement breaking maps ([ $\overline{\mathrm{BDMS}}]$ ) on matrix algebras.

This article is organized as follows. Section 2 contains basic definitions and theorems helpful in understanding the main results. We give elaborated details about complementary and degradable maps as we could not find some of the mathematical details from the literature. In section 3, we present various characterizations (Theorem 3.2) of degradable strongly entanglement breaking (SEB) maps on Hilbert spaces (finite or infinite dimensions), which includes a structure theorem. Theorem 3.2 also answers the question of when a map complementary to a SEB-map is SEB. Theorem 3.2 and [MuSi22, Corollary 7] together characterizes all degradable PPT-maps on matrix algebras (See Remark 3.4). In Theorem 3.7, we provide a class of positive maps for which the notions of antidegradabilty and strongly entanglement breaking coincides. We concentrate on the finite-dimensional case in Section 4 and prove (Theorem4.1) that the class of unital degradable entanglement breaking maps coincide with the $C^{*}$-extreme points of all unital entanglement breaking maps introduced by Bhat et al. [BDMS], and they are in turn adjoints of extreme QC-channels ([HSR03]). In Theorem4.6, we characterize PPTchannels for which the associated Choi-matrix is a projection and their degradability property. Finally, we consider degradable completely positive maps too. Though $C^{*}$-extreme points of unital completely positive maps are degradable, we see in Example 4.13 that the converse is not generally true.

## 2. Preliminaries

Through out $\mathcal{H}$ and $\mathcal{K}$ (possibly with suffices) denote separable (finite or infinite dimensional) complex Hilbert spaces with inner products linear in the second variable and conjugate linear in the first variable. We let $\mathcal{B}(\mathcal{H}, \mathcal{K})$ denotes the space of all bounded linear operators from $\mathcal{H}$ to $\mathcal{K}$, and $\mathcal{B}(\mathcal{H})^{+}$denotes the cone of all positive operators in $\mathcal{B}(\mathcal{H}):=\mathcal{B}(\mathcal{H}, \mathcal{H})$. $\operatorname{Re}$ call that $A \in \mathcal{B}(\mathcal{H})^{+}$if and only if $A=B^{*} B$ for some $B \in \mathcal{B}(\mathcal{H})$ if and only if $\langle x, A x\rangle \geq 0$ for all $x \in \mathcal{H}$. We let $\mathcal{T}(\mathcal{H})$ denotes the space of all trace-class operators on $\mathcal{H}$, which is a Banach space w.r.t the trace-norm given by $\|T\|_{1}:=\operatorname{tr}(|T|)$, where $\operatorname{tr}(|T|)$ is the trace of $|T|:=\left(T^{*} T\right)^{\frac{1}{2}}$ for all $T \in \mathcal{T}(\mathcal{H})$. The space $(\mathcal{B}(\mathcal{H}),\|\cdot\|)$ is isometrically isomorphic to the dual space of $\left(\mathcal{T}(\mathcal{H}),\|\cdot\|_{1}\right)$ via the map $A \mapsto \phi_{A}$, where $\phi_{A}(T):=\operatorname{tr}(A T)$ for all $T \in \mathcal{T}(\mathcal{H})$ and $A \in \mathcal{B}(\mathcal{H})$. The elements of

$$
\mathcal{S}(\mathcal{H}):=\left\{\rho \in \mathcal{T}(\mathcal{H}): \rho \in \mathcal{B}(\mathcal{H})^{+},\|\rho\|_{1}=1\right\}
$$

are called states on $\mathcal{H}$. A state $\rho \in \mathcal{S}\left(\mathcal{H}_{1} \otimes \mathcal{H}_{2}\right)$ is said to be

$$
\left\{\rho^{(1)} \otimes \rho^{(2)}: \rho^{(j)} \in \mathcal{S}\left(\mathcal{H}_{j}\right), j=1,2\right\}
$$

(ii) countably decomposable separable ([KSW05]) if there exist states $\rho_{n}^{(j)} \in \mathcal{S}\left(\mathcal{H}_{j}\right), j=$ 1,2 such that ${ }^{1}$

$$
\begin{equation*}
\rho=\sum_{n=1}^{N} p_{n} \rho_{n}^{(1)} \otimes \rho_{n}^{(2)} \tag{2.1}
\end{equation*}
$$

where $p_{n} \in[0,1]$ with $\sum_{n} p_{n}=1$ and $N \in \mathbb{N} \cup\{\infty\}$.
Note that, by using spectral theorem for compact positive operators, we can replace states by rank-one states in the definition of separability and countably decomposable separability. Every countably decomposable separable state is separable, but the converse is not true in general ([KSW05]). If both $\mathcal{H}_{1}$ and $\mathcal{H}_{2}$ are finite-dimensional spaces, then separability and countably decomposable separability coincide; in such cases $N<\infty$ in 2.1 (c.f. [ChDo13]). We say that a positive operator $T \in \mathcal{T}\left(\mathcal{H}_{1} \otimes \mathcal{H}_{2}\right)$ is separable (resp, countably decomposable separable) if $\frac{1}{\operatorname{tr}(T)} T \in \mathcal{S}\left(\mathcal{H}_{1} \otimes \mathcal{H}_{2}\right)$ is separable (resp, countably decomposable separable).

A linear map $\Phi: \mathcal{B}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{B}\left(\mathcal{H}_{2}\right)$ is said to be positive if $\Phi\left(\mathcal{B}\left(\mathcal{H}_{1}\right)^{+}\right) \subseteq \mathcal{B}\left(\mathcal{H}_{2}\right)^{+}$; completely positive (CP) if the map $\operatorname{id}_{k} \otimes \Phi: \mathbb{M}_{k} \otimes \mathcal{B}\left(\mathcal{H}_{1}\right) \rightarrow \mathbb{M}_{k} \otimes \mathcal{B}\left(\mathcal{H}_{2}\right)$ is positive for all $k \in \mathbb{N}$, where $\mathrm{id}_{k}$ denotes the identity map on $\mathbb{M}_{k}=\mathcal{B}\left(\mathbb{C}^{k}\right)$; co-completely positive (co-CP) if the map $\mathrm{T} \otimes \Phi$ : $\mathbb{M}_{k} \otimes \mathcal{B}\left(\mathcal{H}_{1}\right) \rightarrow \mathbb{M}_{k} \otimes \mathcal{B}\left(\mathcal{H}_{2}\right)$ is positive for all $k \in \mathbb{N}$, where $T$ denotes the transpose map on $\mathbb{M}_{k}$. If $\Phi$ is both CP and co-CP, then it is called a positive partial transpose (PPT) map. Note that, given $V \in \mathcal{B}\left(\mathcal{H}_{2}, \mathcal{H}_{1}\right)$, the map $\operatorname{Ad}_{V}: \mathcal{B}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{B}\left(\mathcal{H}_{2}\right)$ defined by $\operatorname{Ad}_{V}(X):=V^{*} X V$ is a normal (i.e., ultra weak continuous) CP-map. It is well-known ([Sti55],[Kra71]) that given a positive linear map $\Phi: \mathcal{B}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{B}\left(\mathcal{H}_{2}\right)$ the following assertions are equivalent:
(i) $\Phi$ is a normal CP-map.

[^0](ii) (Kraus decomposition:) There exist a countable family $\left\{A_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{B}\left(\mathcal{H}_{2}, \mathcal{H}_{1}\right)$, called Kraus operators, such that $\bar{\sum}_{j \in \Lambda} A_{j}^{*} A_{j} \in \mathcal{B}\left(\mathcal{H}_{2}\right)$ and
\[

$$
\begin{equation*}
\Phi(X)=\overline{\sum_{j \in \Lambda}} A_{j}^{*} X A_{j}, \quad \forall X \in \mathcal{B}\left(\mathcal{H}_{1}\right) \tag{2.2}
\end{equation*}
$$

\]

(iii) (Stinespring representation:) There exist a pair $(\mathcal{K}, A)$ consisting of a separable Hilbert space $\mathcal{K}$ and a bounded linear operator $A: \mathcal{H}_{2} \rightarrow \mathcal{H}_{1} \otimes \mathcal{K}$ such that

$$
\begin{equation*}
\Phi(X)=A^{*}\left(X \otimes I_{\mathcal{K}}\right) A, \quad \forall X \in \mathcal{B}\left(\mathcal{H}_{1}\right) \tag{2.3}
\end{equation*}
$$

where $I_{\mathcal{K}}$ is the identity operator on $\mathcal{K}$.
The pair $(\mathcal{K}, A)$ in the Stinespring representation can be chosen to be minimal in the sense that $\overline{\operatorname{span}}\left\{\left(X \otimes I_{\mathcal{K}}\right) A h: h \in \mathcal{H}_{2}, X \in \mathcal{B}\left(\mathcal{H}_{1}\right)\right\}=\mathcal{H}_{1} \otimes \mathcal{K}$; such a pair is unique up to unitary equivalence. If $\Phi$ has Kraus decomposition (2.2), then by taking $\mathcal{K}$ to be a Hilbert space with an orthonormal basis $\left\{e_{j}: j \in \Lambda\right\}$ and by defining $A: \mathcal{H}_{2} \rightarrow \mathcal{H}_{1} \otimes \mathcal{K}$ as $A x:=\sum_{j \in \Lambda} A_{j} x \otimes e_{j}$ we get a Stinespring representation (2.3). Conversely, if $\Phi$ has a Stinespring representation (2.3), fixing an orthonormal basis $\left\{e_{j}\right\}_{j \in \Lambda}$ of $\mathcal{K}$, the operators $A_{j}: \mathcal{H}_{2} \rightarrow \mathcal{H}_{1}$ defined by $A_{j}^{*} x:=$ $A^{*}\left(x \otimes e_{j}\right), j \in \Lambda$, gives a Kraus decomposition (2.2) of $\Phi$.

Let $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ be a bounded (w.r.t. trace norm) linear map. Then there exists a bounded (w.r.t. operator norm) linear map $\Phi^{*}: \mathcal{B}\left(\mathcal{H}_{2}\right) \rightarrow \mathcal{B}\left(\mathcal{H}_{1}\right)$, called the dual of $\Phi$, uniquely determined by the identity $\operatorname{tr}\left(\Phi^{*}(X) T\right)=\operatorname{tr}(X \Phi(T))$ for $T \in \mathcal{T}(\mathcal{H}), X \in \mathcal{B}\left(\mathcal{H}_{2}\right)$. A bounded linear $\operatorname{map} \Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ is said to be a quantum operation if $\Phi^{*}$ is a normal CP-map. (In quantum information theory, one often assumes that $\operatorname{tr}(\Phi(T))=\operatorname{tr}(T)$ for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$ (equivalently $\Phi^{*}(I)=I$ ), and in such case $\Phi$ is called a quantum channel). Given a bounded linear map $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$, from the duality between the maps $\Phi$ and $\Phi^{*}$, it follows that the following assertions are equivalent:
(i) $\Phi$ is a quantum operation.
(ii) (Kraus decomposition:) There exist a countable family of bounded linear operators $\left\{A_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{B}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$ with $\bar{\sum}_{j \in \Lambda} A_{j}^{*} A_{j} \in \mathcal{B}\left(\mathcal{H}_{1}\right)$ such that ${ }^{2}$

$$
\begin{equation*}
\Phi(T)=\sum_{j \in \Lambda} A_{j} T A_{j}^{*}, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right) \tag{2.4}
\end{equation*}
$$

(iii) (Stinespring representation:) There exist a pair $(\mathcal{K}, A)$ consisting of a separable Hilbert space $\mathcal{K}$ and a bounded operator $A: \mathcal{H}_{1} \rightarrow \mathcal{H}_{2} \otimes \mathcal{K}$ such that

$$
\begin{equation*}
\Phi(T)=\operatorname{tr}_{\mathcal{K}}\left(A T A^{*}\right), \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right) \tag{2.5}
\end{equation*}
$$

where $\operatorname{tr}_{\mathcal{K}}$ is the partial trace w.r.t. the Hilbert space $\mathcal{K}$.
If $\Phi$ is a quantum channel, then in (ii) we get $\sum_{j} A_{j}^{*} A_{j}=I$; and in (iii) we have $A$ is an isometry. Observe that $(\mathcal{K}, A)$ is a Stinespring representation of a quantum operation $\Phi$ if and only if $(\mathcal{K}, A)$ is a Stinespring representation of $\Phi^{*}$.

Note that a bounded normal linear map $\Phi: \mathcal{B}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{B}\left(\mathcal{H}_{2}\right)$ is CP if and only if id ${ }_{\mathcal{K}} \otimes \Phi$ : $\mathcal{B}\left(\mathcal{K} \otimes \mathcal{H}_{1}\right) \rightarrow \mathcal{B}\left(\mathcal{K} \otimes \mathcal{H}_{2}\right)$ is positive for all separable Hilbert spaces $\mathcal{K}$.

Definition 2.1. A quantum operation $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ is said to be
(i) entanglement breaking (EB-)map if $\left(\operatorname{id}_{\mathcal{K}} \otimes \Phi\right)(\rho) \in \mathcal{T}\left(\mathcal{K} \otimes \mathcal{H}_{2}\right)$ is separable for all separable Hilbert space $\mathcal{K}$ and $\rho \in \mathcal{S}\left(\mathcal{K} \otimes \mathcal{H}_{1}\right)$.

[^1](ii) strong entanglement breaking (SEB-)map if ( id $\left._{\mathcal{K}} \otimes \Phi\right)(\rho) \in \mathcal{T}\left(\mathcal{K} \otimes \mathcal{H}_{2}\right)$ is countably decomposable separable for all separable Hilbert space $\mathcal{K}$ and $\rho \in \mathcal{S}\left(\mathcal{K} \otimes \mathcal{H}_{1}\right)$.
(iii) positive partial transpose (PPT) if its dual $\Phi^{*}: \mathcal{B}\left(\mathcal{H}_{2}\right) \rightarrow \mathcal{B}\left(\mathcal{H}_{1}\right)$ is a PPT-map.

Every SEB-map is an EB-map; the converse is true if $\mathcal{H}_{1}, \mathcal{H}_{2}$ are finite dimensional, but not true in general. See [Kho08, HSR03, KSW05, He13, LiDu15] for more details. We let $\operatorname{SEB}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$ denotes the set of all SEB-maps from $\mathcal{T}\left(\mathcal{H}_{1}\right)$ to $\mathcal{T}\left(\mathcal{H}_{2}\right)$. Note that if $\Phi \in$ $\operatorname{SEB}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$, then $\Gamma \circ \Phi$ is SEB for every quantum operation $\Gamma: \mathcal{T}\left(\mathcal{H}_{2}\right) \rightarrow \mathcal{T}(\mathcal{K})$. From the following theorem it follows that $\Phi \circ \Gamma$ is also SEB.

Theorem 2.2. Given a quantum operation $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ the following statements are equivalent:
(i) $\Phi$ is $S E B$.
(ii) (Kraus decomposition:) There exist rank-one Kraus operators $\left\{A_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{B}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$ with $\bar{\sum}_{j \in \Lambda} A_{j}^{*} A_{j} \in \mathcal{B}\left(\mathcal{H}_{1}\right)$ such that

$$
\begin{equation*}
\Phi(T)=\sum_{j \in \Lambda} A_{j} T A_{j}^{*}, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right) \tag{2.6}
\end{equation*}
$$

(iii) (Holevo form:) There exist $\left\{R_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{S}\left(\mathcal{H}_{2}\right)$ and $\left\{F_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{B}\left(\mathcal{H}_{1}\right)^{+}$with $\bar{\sum}_{j \in \Lambda} F_{j} \in$ $\mathcal{B}\left(\mathcal{H}_{1}\right)$ such that

$$
\begin{equation*}
\Phi(T)=\sum_{j \in \Lambda} \operatorname{tr}\left(T F_{j}\right) R_{j}, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right) \tag{2.7}
\end{equation*}
$$

For the finite-dimensional case of the above theorem we refer [HSR03]. See [KSW05, He13, LiDu15] for a proof of the above theorem for quantum channels on infinite-dimensional Hilbert spaces; the theorem is true even for quantum operations. See Appendix (Theorem A.3) for details.

Definition 2.3. Let $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ and $\Psi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{3}\right)$ be two quantum operations. Then $\Psi$ is said to be complementary to $\Phi$ If there exists a bounded operator $A: \mathcal{H}_{1} \rightarrow \mathcal{H}_{2} \otimes \mathcal{H}_{3}$ such that

$$
\begin{equation*}
\Phi(T)=\operatorname{tr}_{\mathcal{H}_{3}}\left(A T A^{*}\right) \quad \text { and } \quad \Psi(T)=\operatorname{tr}_{\mathcal{H}_{2}}\left(A T A^{*}\right) \tag{2.8}
\end{equation*}
$$

for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$. We let $\mathcal{C N}(\Phi)$ denotes the set of all quantum operations complementary to $\Phi$. We say that $\Phi$ is self-complementary if $\Phi$ is complementary to itself (i.e., $\Phi \in \mathcal{C M}(\Phi)$ ).

Let $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ and $\Psi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{3}\right)$ be two quantum operations. Assume $\Psi \in$ $\operatorname{C\mathcal {M}}(\Phi)$ and $A: \mathcal{H}_{1} \rightarrow \mathcal{H}_{2} \otimes \mathcal{H}_{3}$ be such that (2.8) holds. Then taking $\breve{A}=F A: \mathcal{H}_{1} \rightarrow \mathcal{H}_{3} \otimes \mathcal{H}_{2}$, where $F: \mathcal{H}_{2} \otimes \mathcal{H}_{3} \rightarrow \mathcal{H}_{3} \otimes \mathcal{H}_{2}$ is the unitary operator given by $F(x \otimes y)=y \otimes x$ for all $x \in \mathcal{H}_{2}, y \in \mathcal{H}_{3}$, we get $\Psi(T)=\operatorname{tr}_{\mathcal{H}_{2}}\left(\breve{\mathrm{~A}} T \breve{\mathrm{~A}}^{*}\right)$ and $\Phi(T)=\operatorname{tr}_{\mathcal{H}_{3}}\left(\breve{\mathrm{~A}} T \breve{\mathrm{~A}}^{*}\right)$ for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$. Thus $\Phi$ is complementary to $\Psi$. Thus $\Psi \in \mathcal{C N}(\Phi)$ if and only if $\Phi \in \mathcal{C N}(\Psi)$.

If the quantum operation $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ has a Stinespring representation $(\mathcal{K}, A)$, then the $\operatorname{map} \Phi^{c}: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}(\mathcal{K})$ defined by

$$
\begin{equation*}
\Phi^{c}(T):=\operatorname{tr}_{\mathcal{H}_{2}}\left(A T A^{*}\right), \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right) \tag{2.9}
\end{equation*}
$$

is a quantum operation and is complementary to $\Phi$. Note that the definition of the map $\Phi^{c}$ depends on the representation $(\mathcal{K}, A)$, so we may use the notation $\Phi_{(\mathcal{K}, A)}^{c}$ in place of $\Phi^{c}$. Letting $\breve{\mathrm{A}}=F A$, where $F: \mathcal{H}_{2} \otimes \mathcal{K} \rightarrow \mathcal{K} \otimes \mathcal{H}_{2}$ is the flip map as above, we have $\left(\mathcal{H}_{2}, \breve{\mathrm{~A}}\right)$ is a Stinespring representation for $\Psi:=\Phi^{c} \in \operatorname{C\mathcal {M}}(\Phi)$. So $\Psi_{\left(\mathcal{H}_{2}, \breve{\mathrm{~A}}\right)}^{c}: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ is given by

$$
\Psi_{\left(\mathcal{H}_{2}, \breve{\mathrm{~A}}\right)}^{c}(T)=\operatorname{tr}_{\mathcal{K}}\left(\breve{\mathrm{A}} T \breve{\mathrm{~A}}^{*}\right)=\operatorname{tr}_{\mathcal{K}}\left(A T A^{*}\right)=\Phi(T), \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right)
$$

Given a Stinespring representation $(\mathcal{K}, A)$ of a quantum operation $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ we always let $\left(\Phi^{c}\right)^{c}:=\left(\Phi_{(\mathcal{K}, A)}^{c}\right)_{\left(\mathcal{H}_{2}, \breve{\mathrm{~A}}\right)}^{c}$. Then from the above equation we have $\left(\Phi^{c}\right)^{c}=\Phi$. Now, suppose $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ has a Kraus decomposition as in (2.4). Let $\mathcal{K}$ be a separable complex Hilbert space with orthonormal basis $\left\{e_{j}\right\}_{j \in \Lambda}$. Note that $A: \mathcal{H}_{1} \rightarrow \mathcal{H}_{2} \otimes \mathcal{K}$ defined by $A(x)=\sum_{j \in \Lambda} A_{j} x \otimes e_{j}$ is a bounded operator such that $\Phi(T)=\operatorname{tr}_{\mathcal{K}}\left(A T A^{*}\right)$ so that $(\mathcal{K}, A)$ is a Stinespring representation for $\Phi$. Further, $\Phi^{c}$ defined in (2.9) is given by

$$
\begin{equation*}
\Phi^{c}(T):=\operatorname{tr}_{\mathcal{H}_{2}}\left(A T A^{*}\right)=\sum_{i, j \in \Lambda} \operatorname{tr}\left(A_{i} T A_{j}^{*}\right)\left|e_{i}\right\rangle\left\langle e_{j}\right| . \tag{2.10}
\end{equation*}
$$

(See Proposition A. 2 for details.)
Note that if $\Psi \in \mathcal{C \mathcal { M }}(\Phi)$, then $\operatorname{Ad}_{W} \circ \Psi \in \mathcal{C M}(\Phi)$ for all co-isometry $W$ between appropriate Hilbert spaces. This fact follows from the following identities:

$$
\begin{aligned}
& \operatorname{tr}_{\mathcal{H}_{3}}\left(\left(I_{\mathcal{H}_{2}} \otimes Y\right) A T A^{*}\left(I_{\mathcal{H}_{2}} \otimes Y^{*}\right)\right)=\operatorname{tr}_{\mathcal{K}}\left(\left(I_{\mathcal{H}_{2}} \otimes Y^{*} Y\right) A T A^{*}\right) \\
& \operatorname{tr}_{\mathcal{H}_{2}}\left(\left(I_{\mathcal{H}_{2}} \otimes Y\right) A T A^{*}\left(I_{\mathcal{H}_{2}} \otimes Y^{*}\right)\right)=Y \operatorname{tr}_{\mathcal{H}_{2}}\left(A T A^{*}\right) Y^{*}
\end{aligned}
$$

for every $A \in \mathcal{B}\left(\mathcal{H}_{1}, \mathcal{H}_{2} \otimes \mathcal{K}\right), T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$ and $Y \in \mathcal{B}\left(\mathcal{K}, \mathcal{H}_{3}\right)$. It follows now that $\left(\Phi \circ \operatorname{Ad}_{Z}\right)_{\left(\mathcal{K}, A Z^{*}\right)}^{c}=$ $\Phi_{(\mathcal{K}, A)}^{c} \circ \operatorname{Ad}_{Z}$ for all $Z \in \mathcal{B}\left(\mathcal{H}, \mathcal{H}_{1}\right)$ and $\left(A d_{V} \circ \Phi\right)_{\left(\mathcal{K},\left(V^{*} \otimes I \mathcal{K}\right) A\right)}^{c}=\Phi_{(\mathcal{K}, A)}^{c}$ for all co-isometry $V \in \mathcal{B}\left(\mathcal{H}_{3}, \mathcal{H}_{2}\right)$.

Remark 2.4. Let $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ be a quantum operation with a minimal Stinespring representation $(\widehat{\mathcal{K}}, \widehat{A})$.
(i) Suppose $(\widetilde{\mathcal{K}}, \widetilde{A})$ is another minimal Stinespring representation of $\Phi$ so that, by Theorem A.1, there is a unitary $U: \widehat{\mathcal{K}} \rightarrow \widetilde{\mathcal{K}}$ such that $\widetilde{A}=\left(I_{\mathcal{H}_{2}} \otimes U\right) \widehat{A}$. Then

$$
\Phi_{(\widetilde{\mathcal{K}}, \widetilde{A})}^{c}(T)=\operatorname{tr}_{\mathcal{H}_{2}}\left(\widetilde{A} T \widetilde{A}^{*}\right)=\operatorname{Ad}_{U} \circ \Phi_{(\widehat{\mathcal{K}}, \widehat{A})}^{c}(T), \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right)
$$

Thus the complement of $\Phi$ defined as in (2.9) from a minimal Stinespring representation is unique up to unitary conjugation, and we denote such a complementary map by $\Phi_{\text {min }}^{c}$.
(ii) Let $\Psi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}(\mathcal{K})$ be a quantum operation complementary to $\Phi$. So there exists $A \in \mathcal{B}\left(\mathcal{H}_{1}, \mathcal{H}_{2} \otimes \mathcal{K}\right)$ such that $\Phi(T)=\operatorname{tr}_{\mathcal{K}}\left(A T A^{*}\right)$ and $\Psi(T)=\operatorname{tr}_{\mathcal{H}_{2}}\left(A T A^{*}\right)$ for all $T \in$ $\mathcal{T}\left(\mathcal{H}_{1}\right)$. Since $(\mathcal{K}, A)$ is a Stinespring representation for $\Phi$, from Theorem A.1 there exists an isometry $V \in \mathcal{B}(\widehat{\mathcal{K}}, \mathcal{K})$ such that $A=\left(I_{\mathcal{H}_{2}} \otimes V\right) \widehat{A}$ and $\widehat{A}=\left(I_{\mathcal{H}_{2}} \otimes V^{*}\right) A$. Consequently, for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$ we have

$$
\Psi(T)=V \Phi_{\min }^{c}(T) V^{*} \quad \text { and } \quad \Phi_{\min }^{c}(T)=V^{*} \Psi(T) V .
$$

Thus we have

$$
\mathcal{C} \mathcal{M}(\Phi)=\left\{\operatorname{Ad}_{V^{*}} \circ \Phi_{\min }^{c}: V \in \mathcal{B}(\widehat{\mathcal{K}}, \mathcal{K}) \text { is an isometry and } \mathcal{K} \text { Hilbert space }\right\}
$$

In particular, $\Phi$ is self-complementary if and only if $\Phi=\operatorname{Ad}_{V^{*}} \circ \Phi_{\text {min }}^{c}$ for some isometry $V \in \mathcal{B}\left(\widehat{\mathcal{K}}, \mathcal{H}_{2}\right)$. Now suppose $\Psi_{1}: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{3}\right)$ and $\Psi_{2}: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{4}\right)$ are two quantum operations complementary to $\Phi$. Then there exist isometries $V_{1} \in \mathcal{B}\left(\widehat{\mathcal{K}}, \mathcal{H}_{3}\right)$ and $V_{2} \in \mathcal{B}\left(\widehat{\mathcal{K}}, \mathcal{H}_{4}\right)$ such that $\Phi_{\text {min }}^{c}=\operatorname{Ad}_{V_{j}} \circ \Psi_{j}$ and $\Psi_{j}=\operatorname{Ad}_{V_{j}^{*}} \circ \Phi_{\text {min }}^{c}$ for $j=1,2$. Note that $W:=V_{2} V_{1}^{*} \in \mathcal{B}\left(\mathcal{H}_{3}, \mathcal{H}_{4}\right)$ is a partial isometry such that

$$
\begin{equation*}
\Psi_{2}(T)=W \Psi_{1}(T) W^{*} \quad \text { and } \quad \Psi_{1}(T)=W^{*} \Psi_{2}(T) W, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right) \tag{2.11}
\end{equation*}
$$

Thus, maps complementary to a quantum operation is unique up to a partial isometry in the sense of (2.11). In finite-dimensional case uniqueness is up to an isometry. See Section 4 .

Definition 2.5. ([DeSh05] ) A quantum operation $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ is said to be
(i) degradable if there exists a quantum operation $\Gamma: \mathcal{T}\left(\mathcal{H}_{2}\right) \rightarrow \mathcal{T}(\mathcal{K})$ for some Hilbert space $\mathcal{K}$ such that $\Gamma \circ \Phi \in \mathcal{C M}(\Phi)$.
(ii) anti-degradable if there exists a $\Psi \in \operatorname{C\mathcal {M}}(\Phi)$ such that $\Psi$ is degradable.

Suppose ( $\mathcal{K}, A$ ) Stinespring representation for the quantum operation $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ and consider $\Phi^{c}: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}(\mathcal{K})$ as in (2.9). Then from the above remark it follows that $\Phi$ is degradable if and only if there exists a quantum operation $\Gamma: \mathcal{T}\left(\mathcal{H}_{2}\right) \rightarrow \mathcal{T}(\mathcal{K})$ such that $\Gamma \circ \Phi=\Phi^{c}$. Similarly, $\Phi$ is anti-degradable if and only if $\Phi^{c}$ is degradable if and only if there exists a quantum operation $\Gamma: \mathcal{T}(\mathcal{K}) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ such that $\Gamma \circ \Phi^{c}=\Phi$.

Example 2.6. Let $A \in \mathcal{B}(\mathcal{H})$ and consider $\Phi=\operatorname{Ad}_{A}: \mathcal{T}(\mathcal{H}) \rightarrow \mathcal{T}(\mathcal{H})$. Note that $\Phi^{c}(T)=$ $\operatorname{tr}\left(A^{*} T A\right)=\Gamma \circ \Phi(T)$ for all $T \in \mathcal{T}(\mathcal{H})$, where $\Gamma(\cdot)=\operatorname{tr}(\cdot)$. Thus $\Phi$ is degradable. But $\Phi$ anti-degradable if and only if $\Phi$ is SEB. For, if $\Phi$ is anti-degradable there exists a quantum operation $\Gamma^{\prime}: \mathbb{C} \rightarrow \mathcal{T}(\mathcal{H})$ such that $\Phi=\Gamma^{\prime} \circ \Phi^{c}$. So there exists a positive operator $R \in \mathcal{T}(H)$ such that $\Phi(T)=\operatorname{tr}\left(A^{*} T A\right) R=\operatorname{tr}\left(A A^{*} T\right) R$ for all $T \in \mathcal{T}(\mathcal{H})$. Thus $\Phi$ is SEB (so that $A$ is a rank-one operator). Converse follows from the following remark.

Remark 2.7. Let $\Phi \in \operatorname{SEB}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$. Assume $\Phi$ has a Kraus decomposition as in 2.6 with $A_{j}=\left|v_{j}\right\rangle\left\langle u_{j}\right|$, where $u_{j} \in \mathcal{H}_{1}$ and $v_{j} \in \mathcal{H}_{2}$. Let $\mathcal{K}$ be a separable complex Hilbert space with orthonormal basis $\left\{e_{j}: j \in \Lambda\right\}$ and let $B_{j}:=\left|\frac{v_{j}}{\left\|v_{j}\right\|}\right\rangle\left\langle e_{j}\right|$ for all $j \in \Lambda$. Define $\Gamma: \mathcal{T}(\mathcal{K}) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ by $\Gamma(T):=\sum_{j \in \Lambda} B_{j} T B_{j}^{*}$ for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$. Since $\sum_{j} B_{j}^{*} B_{j}=I$ the map $\Gamma$ is a quantum channel. Further,

$$
\Gamma \circ \Phi^{c}(T)=\sum_{i, j \in \Lambda}\left\langle u_{i}, T u_{j}\right\rangle\left\langle v_{j}, v_{i}\right\rangle \Gamma\left(\left|e_{i}\right\rangle\left\langle e_{j}\right|\right)=\sum_{i \in \Lambda}\left\langle u_{i}, T u_{i}\right\rangle\left|v_{i}\right\rangle\left\langle v_{i}\right|=\Phi(T)
$$

for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$, where $\Phi^{c}$ is given by (2.10). This concludes that every SEB-map is antidegradable. This fact was observed for the finite dimensional case in [CRS08].

## 3. Degradable SEB-maps

In this section, our aim is to determine all degradable SEB-maps. We begin with an example.

Example 3.1. Consider the map $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ defined by

$$
\Phi(T)=\langle u, T u\rangle R, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right),
$$

where $u \in \mathcal{H}_{1}$ is a non-zero vector and $R \in \mathcal{T}\left(\mathcal{H}_{2}\right)$ is positive. By spectral theorem of compact positive operators there exist orthogonal vectors $\left\{v_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{H}_{2}$ such that $R=\sum_{j \in \Lambda}\left|v_{j}\right\rangle\left\langle v_{j}\right|$. Then $\Phi(T)=\sum_{j \in \Lambda} A_{j} T A_{j}^{*}$ for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$, where $A_{j}=\left|v_{j}\right\rangle\langle u|$. Let $\mathcal{K}$ be a Hilbert space with an orthonormal basis $\left\{e_{j}\right\}_{j \in \Lambda}$ and consider $\Phi^{c}$ as in (2.10). Since $\widetilde{R}:=\sum_{j \in \Lambda}\left\langle v_{j}, v_{j}\right\rangle\left|e_{j}\right\rangle\left\langle e_{j}\right| \in$ $\mathcal{T}(\mathcal{K})$ is positive the complementary map

$$
\Phi^{c}(T)=\sum_{i, j \in \Lambda}\langle u, T u\rangle\left\langle v_{j}, v_{i}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right|=\langle u, T u\rangle \widetilde{R}, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right)
$$

is SEB. Hence $\Phi^{c}$ anti-degradable so that $\Phi$ is degradable.

Theorem 3.2. Given $\Phi \in \operatorname{SEB}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$ the following conditions are equivalent:
(i) $\Phi$ is degradable.
(ii) Any (and, hence all) of the elements of $\operatorname{CM}(\Phi)$ is $S E B$.
(iii) Any (and, hence all) of the elements of $\operatorname{C\mathcal {M}}(\Phi)$ is PPT.
(iv) There exist non-zero vectors $\left\{u_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{H}_{1}$ and unit vectors $\left\{v_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{H}_{2}$ with $\bar{\sum}_{j \in \Lambda}\left|u_{j}\right\rangle\left\langle u_{j}\right| \in$ $\mathcal{B}\left(\mathcal{H}_{1}\right)$ and $\left\langle v_{i}, v_{j}\right\rangle=0$ whenever $\left\{u_{i}, u_{j}\right\}$ is linearly independent such that

$$
\begin{equation*}
\Phi(T)=\sum_{j \in \Lambda}\left\langle u_{j}, T u_{j}\right\rangle\left|v_{j}\right\rangle\left\langle v_{j}\right|, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right) \tag{3.1}
\end{equation*}
$$

(v) There exist rank-one positive operators $\left\{F_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{T}\left(\mathcal{H}_{1}\right)$ with $\bar{\sum}_{j \in \Lambda} F_{j} \in \mathcal{B}\left(\mathcal{H}_{1}\right)$ and states $\left\{R_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{S}\left(\mathcal{H}_{2}\right)$ with $R_{i} R_{j}=0$ for all $i \neq j$ such that

$$
\Phi(T)=\sum_{j \in \Lambda} \operatorname{tr}\left(T F_{j}\right) R_{j}, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right) .
$$

(vi) $\Phi$ is self-complementary.

Proof. $(i) \Rightarrow(i i)$ Assume $\Phi$ is degradable so that $\Phi_{\min }^{c}=\Gamma \circ \Phi$ for some quantum operation $\Gamma$. Since $\Phi$ is SEB we have $\Phi_{\min }^{c}$ is also SEB. Now given any $\Psi \in \mathcal{C \mathcal { M }}(\Phi)$ by Remark 2.4 there exists an isometry $V$ such that $\Psi=\operatorname{Ad}_{V^{*}} \circ \Phi_{\min }^{c}$, hence $\Psi$ is also SEB.
(ii) $\Rightarrow$ (iii) Follows trivially.
(iii) $\Rightarrow$ (iv) Let $A_{j} \in \mathcal{B}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$ be rank-one operators with $\bar{\sum}_{j} A_{j}^{*} A_{j} \in \mathcal{B}\left(\mathcal{H}_{1}\right)$ such that $\Phi(\cdot)=\sum_{j \in \Lambda} A_{j}(\cdot) A_{j}^{*}$. Assume $A_{j}=\left|v_{j}\right\rangle\left\langle u_{j}\right|$ for some $u_{j} \in \mathcal{H}_{1}$ and unit vector $v_{j} \in \mathcal{H}_{2}$ for all $j \in \Lambda$. Then $\sum_{j}\left|u_{j}\right\rangle\left\langle u_{j}\right| \in \mathcal{B}\left(\mathcal{H}_{1}\right)$ and $\Phi(T)=\sum_{j \in \Lambda}\left\langle u_{j}, T u_{j}\right\rangle\left|v_{j}\right\rangle\left\langle v_{j}\right|$ for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$. Let $\mathcal{K}$ be a Hilbert space with orthonormal basis $\left\{e_{j}\right\}_{j \in \Lambda}$ and consider the complementary map $\Phi^{c}: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}(\mathcal{K})$ as in (2.10), i.e.,

$$
\Phi^{c}(T)=\sum_{i, j \in \Lambda}\left\langle v_{j}, v_{i}\right\rangle\left\langle u_{i}, T u_{j}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right|, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right)
$$

Fix $i \neq j \in \Lambda$ and assume that $\left\{u_{i}, u_{j}\right\}$ is linearly independent. Consider the standard orthonormal basis $\left\{e_{1}^{(2)}, e_{2}^{(2)}\right\}$ for $\mathbb{C}^{2}$. Let

$$
A_{i j}:=\left|e_{i}\right\rangle\left\langle e_{1}^{(2)}\right|+\left|e_{j}\right\rangle\left\langle e_{2}^{(2)}\right| \in \mathcal{B}\left(\mathbb{C}^{2}, \mathcal{K}\right)
$$

and $B_{i j} \in \mathcal{B}\left(\mathcal{H}_{1}, \mathbb{C}^{2}\right)$ be such that $B_{i j} u_{i}=e_{1}^{(2)}, B_{i j} u_{j}=e_{2}^{(2)}$ and $B_{i j}=0$ on the orthogonal complement of span $\left\{u_{i}, u_{j}\right\}$. Then for all $T \in \mathbb{M}_{2}$ we have

$$
\begin{aligned}
\operatorname{Ad}_{A_{i j}} \circ \Phi^{c} \circ \operatorname{Ad}_{B_{i j}}(T) & =\sum_{k, l \in \Lambda}\left\langle v_{l}, v_{k}\right\rangle\left\langle B_{i j} u_{k}, T B_{i j} u_{l}\right\rangle\left|A_{i j}^{*} e_{k}\right\rangle\left\langle A_{i j}^{*} e_{l}\right| \\
& =\sum_{k, l \in\{i, j\}}\left\langle v_{l}, v_{k}\right\rangle\left\langle B_{i j} u_{k}, T B_{i j} u_{l}\right\rangle\left|A_{i j}^{*} e_{k}\right\rangle\left\langle A_{i j}^{*} e_{l}\right| \\
& =\left[\begin{array}{cc}
\left\|v_{i}\right\|^{2}\left\langle e_{1}^{(2)}, T e_{1}^{(2)}\right\rangle & \left\langle v_{j}, v_{i}\right\rangle\left\langle e_{1}^{(2)}, T e_{2}^{(2)}\right\rangle \\
\left\langle v_{i}, v_{j}\right\rangle\left\langle e_{2}^{(2)}, T e_{1}^{(2)}\right\rangle & \left\|v_{j}\right\|^{2}\left\langle e_{1}^{(2)}, T e_{2}^{(2)}\right\rangle
\end{array}\right] \\
& =\left[\begin{array}{cc}
\left\|v_{i}\right\|^{2} & \left\langle v_{j}, v_{i}\right\rangle \\
\left\langle v_{i}, v_{j}\right\rangle & \left\|v_{j}\right\|^{2}
\end{array}\right] \odot T,
\end{aligned}
$$

where $\odot$ denotes the Schur product. Since $\Phi^{c}$ is PPT, the composition $\operatorname{Ad}_{A_{i j}} \circ \Phi^{c} \circ \operatorname{Ad}_{B_{i j}}$ : $\mathbb{M}_{2} \rightarrow \mathbb{M}_{2}$ is PPT. This is possible if and only if $\left[\begin{array}{cc}\left\|v_{i}\right\|^{2} & \left\langle v_{j}, v_{i}\right\rangle \\ \left\langle v_{i}, v_{j}\right\rangle\left\|v_{j}\right\|^{2}\end{array}\right]$ is a diagonal matrix (c.f. [KMP18, Proposition 4.1]). Therefore $\left\langle v_{i}, v_{j}\right\rangle=0$.
$(i v) \Rightarrow(v)$ Assume that there exist $\left\{u_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{H}_{1}$ and $\left\{v_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{H}_{2}$ as in (iv). For each $k \in \Lambda$,
let

$$
D_{k}:=\left\{j \mid\left\{u_{j}, u_{k}\right\} \text { is linearly dependent }\right\}
$$

Clearly, $k \in D_{k}$ for all $k \in \Lambda$. Further, given $i, j \in \Lambda$, we have either $D_{i} \cap D_{j}=\emptyset$ or $D_{i}=D_{j}$. Let $\Lambda_{0} \subset \Lambda$ be such that $D_{i}, D_{j}$ are mutually disjoint sets for every $i \neq j \in \Lambda_{0}$ and $\sqcup_{k \in \Lambda_{0}} D_{k}=$ $\cup_{k \in \Lambda} D_{k}=\Lambda$. Thus

$$
\Phi(T)=\sum_{j \in \Lambda}\left\langle u_{j}, T u_{j}\right\rangle\left|v_{j}\right\rangle\left\langle v_{j}\right|=\sum_{k \in \Lambda_{0}}\left(\sum_{j \in D_{k}}\left\langle u_{j}, T u_{j}\right\rangle\left|v_{j}\right\rangle\left\langle v_{j}\right|\right), \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right) .
$$

But, if $j \in D_{k}$, then $u_{j}=\lambda_{j, k} u_{k}$ for some scalar $\lambda_{j, k} \in \mathbb{C}$. Hence

$$
\begin{equation*}
\Phi(T)=\sum_{k \in \Lambda_{0}}\left\langle u_{k}, T u_{k}\right\rangle\left(\sum_{j \in D_{k}}\left|\lambda_{j, k}\right|^{2}\left|v_{j}\right\rangle\left\langle v_{j}\right|\right)=\sum_{k \in \Lambda_{0}} \operatorname{tr}\left(T \widetilde{F}_{k}\right) \widetilde{R}_{k} \tag{3.2}
\end{equation*}
$$

where $\widetilde{F}_{k}:=\left|u_{k}\right\rangle\left\langle u_{k}\right|$ and

$$
\widetilde{R}_{k}:=\sum_{j \in D_{k}}\left|\lambda_{j, k}\right|^{2}\left|v_{j}\right\rangle\left\langle v_{j}\right|=\frac{1}{\left\|u_{k}\right\|^{4}} \sum_{j \in D_{k}}\left\langle u_{j},\left(\left|u_{k}\right\rangle\left\langle u_{k}\right|\right) u_{j}\right\rangle\left|v_{j}\right\rangle\left\langle v_{j}\right|
$$

are non-zero positive operators. Let $R_{k}:=\frac{\widetilde{R}_{k}}{\operatorname{tr}\left(\widetilde{R}_{k}\right)} \in \mathcal{S}\left(\mathcal{H}_{2}\right)$ and $F_{k}:=\operatorname{tr}\left(\widetilde{R}_{k}\right) \widetilde{F}_{k} \in \mathcal{T}\left(\mathcal{H}_{1}\right)$ for all $k \in \Lambda_{0}$. Then
and $\Phi(T)=\sum_{k \in \Lambda_{0}} \operatorname{tr}\left(T F_{k}\right) R_{k}$ for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$. Since $\widetilde{R}_{k} \widetilde{R}_{l}=0$ we have $R_{k} R_{l}=0$ for all $k \neq l \in \Lambda_{0}$.
$(v) \Rightarrow(v i)$ Assume that $\Phi$ has a representation as in $(v)$. By spectral theorem, write $F_{j}=$ $\left|u_{j}\right\rangle\left\langle u_{j}\right|$ and $R_{j}=\sum_{i \in \Lambda_{j}}\left|v_{i, j}\right\rangle\left\langle v_{i, j}\right|$ for some non-zero vector $u_{j} \in \mathcal{H}_{1}$ and orthogonal set $\left\{v_{i, j}\right\}_{i \in \Lambda_{j}} \subseteq \mathcal{H}_{2}$ for every $j \in \Lambda$. Then,

$$
\Phi(T)=\sum_{j \in \Lambda} \operatorname{tr}\left(T F_{j}\right) R_{j}=\sum_{j \in \Lambda}\left\langle u_{j}, T u_{j}\right\rangle\left(\sum_{i \in \Lambda_{j}}\left|v_{i, j}\right\rangle\left\langle v_{i, j}\right|\right)=\sum_{j \in \Lambda} \sum_{i \in \Lambda_{j}} A_{i, j} T A_{i, j}^{*}
$$

for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$, where $A_{i, j}:=\left|v_{i, j}\right\rangle\left\langle u_{j}\right|$ for all $j \in \Lambda, i \in \Lambda_{j}$. Since $R_{k} R_{l}=0$ for $k \neq l \in \Lambda$, the set $\left\{v_{i, j}: i \in \Lambda_{j}, j \in \Lambda\right\} \subseteq \mathcal{H}_{2}$ is orthogonal. Let $\mathcal{K}=\overline{\operatorname{span}}\left\{e_{i, j}: j \in \Lambda, i \in \Lambda_{j}\right\} \subseteq \mathcal{H}_{2}$, where $e_{i, j}=\frac{v_{i, j}}{\left\|v_{i, j}\right\|}$, and $W \in \mathcal{B}\left(\mathcal{K}, \mathcal{H}_{2}\right)$ be the inclusion map. Then for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$,

$$
\begin{aligned}
\operatorname{Ad}_{W} \circ \Phi(T) & =\sum_{j \in \Lambda} \sum_{i \in \Lambda_{j}}\left\langle u_{j}, T u_{j}\right\rangle\left|W^{*} v_{i, j}\right\rangle\left\langle W^{*} v_{i, j}\right| \\
& =\sum_{j \in \Lambda} \sum_{i \in \Lambda_{j}}\left\|v_{i, j}\right\|^{2}\left\langle u_{j}, T u_{j}\right\rangle\left|e_{i, j}\right\rangle\left\langle e_{i, j}\right| \\
& =\sum_{j, l \in \Lambda} \sum_{i \in \Lambda_{j}, k \in \Lambda_{l}}\left\langle v_{k, l}, v_{i, j}\right\rangle\left\langle u_{j}, T u_{l}\right\rangle\left|e_{i, j}\right\rangle\left\langle e_{k, l}\right| \\
& =\sum_{j, l \in \Lambda} \sum_{i \in \Lambda_{j}, k \in \Lambda_{l}} \operatorname{tr}\left(A_{i, j} T A_{k, l}^{*}\right)\left|e_{i, j}\right\rangle\left\langle e_{k, l}\right| .
\end{aligned}
$$

From (2.10), it follows that $\operatorname{Ad}_{W} \circ \Phi \in \operatorname{C\mathcal {M}}(\Phi)$. Note that $\operatorname{Ad}_{W W^{*}}$ is the identity map on range $(\Phi)$ so that $\Phi=\operatorname{Ad}_{W^{*}} \circ\left(\operatorname{Ad}_{W} \circ \Phi\right)$. Since $W^{*} \in \mathcal{B}\left(\mathcal{H}_{2}, \mathcal{K}\right)$ is a co-isometry we conclude that $\Phi \in \mathcal{E} \mathcal{M}(\Phi)$.
$(v i) \Rightarrow(i)$ It follows trivially from the definition.

Remark 3.3. Let $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ be a SEB-map.
(i) Suppose $\Phi$ has a decomposition (3.1) for some non-zero vectors $u_{j} \in \mathcal{H}_{1}$ and $v_{j} \in \mathcal{H}_{2}$. With out loss of generality assume that $v_{j}$ 's are unit vectors. If $\Phi$ is degradable, then through a similar lines of proof of the above theorem we can see that $\left\langle v_{i}, v_{j}\right\rangle=0$ whenever $\left\{u_{i}, u_{j}\right\}$ is linearly independent.
(ii) Suppose $\Phi(T)=\sum_{j} \operatorname{tr}\left(T F_{j}\right) R_{j}$ for some rank-one $F_{j}$ and states $R_{j}$. If $\Phi$ is degradable and $\left\{F_{j}: j \in \Lambda\right\}$ is pairwise linearly independent, from $(i)$, it follows that $R_{i} R_{j}=0$ for all $i \neq j$.

Remark 3.4. From [MuSi22, Corollary 7] we have
$\left\{\Phi: \mathbb{M}_{d_{1}} \rightarrow \mathbb{M}_{d_{2}}\right.$ PPT and degradable maps $\}=\left\{\Phi: \mathbb{M}_{d_{1}} \rightarrow \mathbb{M}_{d_{2}}\right.$ EB and degradable maps $\}$.
Thus, in the finite-dimensional case Theorem 3.2 also characterizes degradable PPT-maps.
Let $\mathcal{H}$ be a separable Hilbert space with an orthonormal basis $\left\{e_{j}\right\}_{j \in \Lambda}$. Define an isometry $V: \mathcal{H} \rightarrow \mathcal{H} \otimes \mathcal{H}$ by $V(x)=\sum_{j}\left\langle e_{j}, x\right\rangle e_{j} \otimes e_{j}$ for all $x \in \mathcal{H}$. Then the Schur product (w.r.t. $\left.\left\{e_{j}\right\}_{j \in \Lambda}\right)$ of $A, B \in \mathcal{B}(\mathcal{H})$ is defined as $A \odot B:=V^{*}(A \otimes B) V$. Note that

$$
\left\langle x, V^{*}(A \otimes B) V y\right\rangle=\langle V x,(A \otimes B) V y\rangle=\sum_{i, j}\left\langle x,\left\langle e_{i}, A e_{j}\right\rangle\left\langle e_{i}, B e_{j}\right\rangle \mid e_{i}\right\rangle\left\langle e_{j} \mid y\right\rangle,
$$

for all $x, y \in \mathcal{H}$, so that

$$
A \odot B=\overline{\sum_{i, j}}\left\langle e_{i}, A e_{j}\right\rangle\left\langle e_{i}, B e_{j}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right| .
$$

(Thus, if $A, B \in \mathcal{B}(\mathcal{H})$ has its infinite matrix representations $\left[a_{i j}\right]_{i, j=1}^{\infty}$ and $\left[b_{i j}\right]_{i, j=1}^{\infty}$, respectively, then $A \odot B$ has matrix representation $\left[a_{i j} b_{i j}\right]_{i, j=1}^{\infty}$ w.r.t $\left\{e_{j}\right\}_{j \in \Lambda}$.) Clearly $A \odot B \in \mathcal{B}(\mathcal{H})$ with $\|A \odot B\| \leq\|A\|\|B\|$. Further if $A, B \in \mathcal{B}(\mathcal{H})^{+}$, then $A \otimes B \in \mathcal{B}(\mathcal{H} \otimes \mathcal{H})^{+}$so that $A \odot B \in \mathcal{B}(\mathcal{H})^{+}$and $\operatorname{tr}(A \odot B)=\sum_{j}\left\langle e_{j}, A e_{j}\right\rangle\left\langle e_{j}, B e_{j}\right\rangle$ is finite if $B \in \mathcal{T}(\mathcal{H})$.

Lemma 3.5. Let $A \in \mathcal{B}(\mathcal{H})^{+}$and $\left\{e_{j}\right\}_{j \in \Lambda}$ be an orthonormal basis for $\mathcal{H}$. Then the map $S_{A}: \mathcal{T}(\mathcal{H}) \rightarrow \mathcal{T}(\mathcal{H})$ defined by

$$
S_{A}(T):=A \odot T \quad \forall T \in \mathcal{T}(\mathcal{H})
$$

is a quantum operation.
Proof. Let $B \in \mathcal{B}(\mathcal{H})$ such that $A^{\top}=B^{*} B$, and for $k \in \Lambda$ let $A_{k} \in \mathcal{B}(\mathcal{H})$ be the diagonal operator given by $A_{k}\left(e_{j}\right)=\left\langle e_{k}, B e_{j}\right\rangle e_{j}$ for all $j \in \Lambda$. Then for $n \geq 1$ and $x \in \mathcal{H}$,

$$
\left\|\sum_{k=1}^{n} A_{k}^{*} A_{k} x\right\|^{2}=\sum_{j}\left|\left\langle e_{j}, x\right\rangle\right|^{2}\left(\sum_{k}\left|\left\langle e_{k}, B e_{j}\right\rangle\right|^{2}\right)^{2} \leq \sum_{j}\left|\left\langle e_{j}, x\right\rangle\right|^{2}\left\|B e_{j}\right\|^{4} \leq\|B\|^{4}\|x\|^{2}
$$

so that $\sum_{k} A_{k}^{*} A_{k} \in \mathcal{B}(\mathcal{H})$. Hence $\sum_{k} A_{k} T A_{k}^{*} \in \mathcal{T}(\mathcal{H})$ for every $T \in \mathcal{T}(\mathcal{H})$. Further (since trace norm convergence implies SOT convergence)

$$
\begin{aligned}
\sum_{k} A_{k} T A_{k}^{*}=\overline{\sum_{k}} A_{k} T A_{k}^{*} & =\overline{\sum_{k}}\left(\overline{\sum_{i}}\left\langle e_{k}, B e_{i}\right\rangle\left|e_{i}\right\rangle\left\langle e_{i}\right|\right) T\left(\overline{\sum_{j}}\left\langle B e_{j}, e_{k}\right\rangle\left|e_{j}\right\rangle\left\langle e_{j}\right|\right) \\
& =\overline{\sum_{i, j}} \sum_{k}\left\langle e_{k}, B e_{i}\right\rangle\left\langle B e_{j}, e_{k}\right\rangle\left\langle e_{i}, T e_{j}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right| \\
& =\overline{\sum_{i, j}}\left\langle\sum_{k}\left\langle e_{k}, B e_{j}\right\rangle e_{k}, B e_{i}\right\rangle\left\langle e_{i}, T e_{j}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right| \\
& =\overline{\sum_{i, j}\left\langle e_{j}, A^{\top} e_{i}\right\rangle\left\langle e_{i}, T e_{j}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right|}
\end{aligned}
$$

$$
\begin{equation*}
=\overline{\sum_{i, j}}\left\langle e_{i}, A e_{j}\right\rangle\left\langle e_{i}, T e_{j}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right|=S_{A}(T) \tag{3.3}
\end{equation*}
$$

Thus $S_{A}$ is a quantum operation.

Remark 3.6. Let $A \in \mathcal{B}(\mathcal{H})^{+}$, and $S_{A}$ be the Schur map given in the Lemma (3.5). Then any $\Psi \in \operatorname{CM}\left(S_{A}\right)$ is SEB. For, write $S_{A}()=.\sum_{k} A_{k}(.) A_{k}^{*}$ where $A_{k}^{\prime} s$ are as in the above proof. Now consider the complementary map $S_{A}^{c}$ given by the equation (2.10).i.e.,

$$
\begin{align*}
S_{A}^{c}(T) & =\sum_{i, j} \operatorname{tr}\left(A_{i} T A_{j}^{*}\right)\left|e_{i}\right\rangle\left\langle e_{j}\right| \\
& =\sum_{i, j}\left(\sum_{k}\left\langle A_{i}^{*} e_{k}, T A_{j}^{*} e_{k}\right\rangle\right)\left|e_{i}\right\rangle\left\langle e_{j}\right| \\
& =\sum_{i, j}\left(\sum_{k}\left\langle\left\langle B e_{k}, e_{i}\right\rangle e_{k}, T\left\langle B e_{k}, e_{j}\right\rangle e_{k}\right\rangle\right)\left|e_{i}\right\rangle\left\langle e_{j}\right| \\
& =\sum_{i, j} \sum_{k}\left\langle e_{i}, B e_{k}\right\rangle\left\langle B e_{k}, e_{j}\right\rangle\left\langle e_{k}, T e_{k}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right| \\
& =\sum_{k}\left\langle e_{k}, T e_{k}\right\rangle\left|z_{k}\right\rangle\left\langle z_{k}\right| \tag{3.4}
\end{align*}
$$

where $z_{k}=\sum_{j}\left\langle B e_{k}, e_{j}\right\rangle e_{j}$. Thus $S_{A}^{c}$ is SEB. Now given any $\Psi \in \mathcal{C \mathcal { M }}\left(S_{A}\right)$ by equation 2.11, there exists a partial isometry $V$ such that $\Psi=\operatorname{Ad}_{V} \circ S_{A}^{c}$, hence $\Psi$ is also SEB.

Theorem 3.7. Let $A \in \mathcal{B}(\mathcal{H})^{+}$, and $S_{A}$ be the Schur map given in the lemma (3.5). Then the following are equivalent
(i) Any element (and, hence all) of $\operatorname{C\mathcal {M}}\left(S_{A}\right)$ is degradable.
(ii) $A$ is a diagonal operator (i.e., $\left\langle e_{i}, A e_{j}\right\rangle=0, \forall i \neq j$ ).
(iii) $S_{A}$ is $S E B$.

Proof. $(i) \Rightarrow(i i)$ WLOG assume that $S_{A}^{c}$ is degradable, where $S_{A}^{c}$ given by the equation (3.4) (If $\Psi \in \mathcal{C \mathcal { M }}\left(S_{A}\right)$ is degradable, that is there is a quantum operation $\Gamma$ on $\mathcal{T}(\mathcal{H})$ such that $\Gamma \circ S_{A}=\Psi$. Now by equation 2.11 there exists a partial isometry $V$ such that $S_{A}^{c}=\operatorname{Ad}_{V} \circ \Psi$, hence $S_{A}^{c}=\operatorname{Ad}_{V} \circ \Gamma \circ S_{A}$ so that $S_{A}^{c}$ is degradable.). Then by Theorem (3.2) and Remark (3.3) we get $\left\langle z_{i}, z_{j}\right\rangle=0$ for all $i \neq j$. But

$$
\begin{aligned}
\left\langle z_{i}, z_{j}\right\rangle & =\left\langle\sum_{k}\left\langle B e_{i}, e_{k}\right\rangle e_{k}, \sum_{l}\left\langle B e_{j}, e_{l}\right\rangle e_{l}\right\rangle \\
& =\sum_{k, l}\left\langle e_{k}, B e_{i}\right\rangle\left\langle B e_{j}, e_{l}\right\rangle\left\langle e_{k}, e_{l}\right\rangle \\
& =\sum_{k}\left\langle e_{k}, B e_{i}\right\rangle\left\langle B e_{j}, e_{k}\right\rangle \\
& =\left\langle B e_{j}, B e_{i}\right\rangle=\left\langle e_{j}, A^{\top} e_{i}\right\rangle=\left\langle e_{i}, A e_{j}\right\rangle
\end{aligned}
$$

Thus $A$ is a diagonal operator.
(ii) $\Rightarrow($ iii $)$ Suppose $A$ is a diagonal operator, then

$$
A \odot T=\overline{\sum_{i, j}}\left\langle e_{i}, A e_{j}\right\rangle\left\langle e_{i}, T e_{j}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right|=\overline{\sum_{j}}\left\langle e_{j}, A e_{j}\right\rangle\left\langle e_{j}, T e_{j}\right\rangle\left|e_{j}\right\rangle\left\langle e_{j}\right| .
$$

Now, since the sequence $\| \sum_{j=1}^{n}\left\langle e_{j}, T e_{j}\right\rangle\left\langle e_{j}, A e_{j}\right\rangle\left|e_{j}\right\rangle\left\langle e_{j}\right| \|_{1}$ converges to $\|A \odot T\|_{1}$, from [Gru73, Theorem 2] we get

$$
S_{A}(T)=\sum_{j}\left\langle e_{j}, T e_{j}\right\rangle\left\langle e_{j}, A e_{j}\right\rangle\left|e_{j}\right\rangle\left\langle e_{j}\right|=\sum_{j}\left\langle u_{j}, T u_{j}\right\rangle\left|e_{j}\right\rangle\left\langle e_{j}\right|
$$

where $u_{j}=\sqrt{\left\langle e_{j}, A e_{j}\right\rangle} e_{j}$. Hence $S_{A}$ is SEB.
(iii) $\Rightarrow($ $i)$ Assume that $S_{A}$ is SEB, hence anti-degradable. Thus any $\Psi \in \operatorname{C\mathcal {M}}\left(S_{A}\right)$ is degradable.

## 4. Finite dimensional case

Through out this section $d, d_{1}, \cdots, d_{4} \in \mathbb{N}$. We let $\left\{e_{j}^{(d)}\right\}_{j=1}^{d} \subseteq \mathbb{C}^{d}$ denotes the standard orthonormal basis and $\operatorname{CP}\left(d_{1}, d_{2}\right)$ denotes the set of all CP-maps from $\mathbb{M}_{d_{1}}$ into $\mathbb{M}_{d_{2}}$. Recall that the Choi-rank of $\Phi \in \mathrm{CP}\left(d_{1}, d_{2}\right)$, denoted by $C R(\Phi)$, is the minimum number of Kraus operators required to represent $\Phi$. Given any $\Phi \in \mathrm{CP}\left(d_{1}, d_{2}\right)$ there always exists a complementary map $\Psi \in \mathrm{CP}\left(d_{1}, r\right)$ with $r=C R(\Phi) \leq d_{1} d_{2}$. In fact, if $\Phi$ has a Kraus decomposition $\Phi=\sum_{i=1}^{r} \operatorname{Ad}_{V_{i}}$, then the map $\Phi_{\min }^{c} \in \operatorname{CP}\left(d_{1}, r\right)$ defined by

$$
\begin{equation*}
\Phi_{\min }^{c}(X):=\sum_{i, j=1}^{r} \operatorname{tr}\left(V_{i}^{*} X V_{j}\right)\left|e_{i}^{(r)}\right\rangle\left\langle e_{j}^{(r)}\right|=\sum_{k=1}^{d_{2}} \widetilde{V}_{k}^{*} X \widetilde{V_{k}} \tag{4.1}
\end{equation*}
$$

is complementary to $\Phi$ (c.f Hol07]), where $\widetilde{V}_{k}=\sum_{i=1}^{d_{1}} \sum_{j=1}^{r}\left\langle e_{i}^{\left(d_{1}\right)}, V_{j} e_{k}^{\left(d_{2}\right)}\right\rangle\left|e_{i}^{\left(d_{1}\right)}\right\rangle\left\langle e_{j}^{(r)}\right| \in \mathbb{M}_{d_{1} \times r}$.
If $\Psi \in \mathrm{CP}\left(d_{1}, d_{3}\right)$ is complementary to $\Phi$, then so is $\operatorname{Ad}_{V^{*}} \circ \Psi \in \mathrm{CP}\left(d_{1}, d_{4}\right)$ for every isometry $V \in \mathbb{M}_{d_{4} \times d_{3}}$ and $d_{4} \geq d_{3}$. On the other hand, if $\Psi_{1} \in \mathrm{CP}\left(d_{1}, d_{3}\right)$ and $\Psi_{2} \in \mathrm{CP}\left(d_{1}, d_{4}\right)$ are two complementary maps of $\Phi$ and assume $d_{3} \leq d_{4}$, then there exists an isometry $V \in \mathbb{M}_{d_{4} \times d_{3}}$ such that

$$
\begin{equation*}
\Psi_{2}=\operatorname{Ad}_{V^{*}} \circ \Psi_{1} \quad \text { and } \quad \Psi_{1}=\operatorname{Ad}_{V} \circ \Psi_{2} \tag{4.2}
\end{equation*}
$$

In fact, if $A_{1}: \mathbb{C}^{d_{1}} \rightarrow \mathbb{C}^{d_{2}} \otimes \mathbb{C}^{d_{3}}$ and $A_{2}: \mathbb{C}^{d_{1}} \rightarrow \mathbb{C}^{d_{2}} \otimes \mathbb{C}^{d_{4}}$ are bounded linear such that

$$
\Phi(X)=(\mathrm{id} \otimes \operatorname{tr})\left(A_{j} X A_{j}^{*}\right) \quad \text { and } \quad \Psi_{j}(X)=(\operatorname{tr} \otimes \mathrm{id})\left(A_{j} X A_{j}^{*}\right), \quad j=1,2,
$$

then there exists an isometry $V \in \mathbb{M}_{d_{4} \times d_{3}}$ such that $A_{2}=\left(I_{d_{2}} \otimes V\right) A_{1}$ and $A_{1}=\left(I_{d_{2}} \otimes\right.$ $\left.V^{*}\right) A_{2}$. See [Wat18, Corollary 2.24] for details. From (4.2) it follows that maps that are complementary to $\Phi$ has the same Choi-rank. In fact, since $\operatorname{rank}\left(\Phi_{\min }^{c}(I)\right)=r=C R(\Phi)$, from (4.2) it follows that $C R(\Psi)=\operatorname{rank}(\Phi(I)) \leq d_{2}$ for all $\Psi \in \mathrm{CP}\left(d_{1}, d_{3}\right)$ is complementary to $\Phi$. Interchanging the role of $\Phi$ and $\Psi$ we get $r \leq d_{3}$. Thus, from the above discussions, we have

$$
\operatorname{CM}(\Phi)=\left\{\operatorname{Ad}_{V^{*}} \circ \Phi_{\min }^{c}: V \in \mathbb{M}_{d_{3} \times r}, V^{*} V=I_{r}\right\}
$$

where $\Phi_{\min }^{c}$ is as in 4.1).
Let $\operatorname{UEB}\left(d_{1}, d_{2}\right)$ denotes the set of unital EB-maps from $\mathbb{M}_{d_{1}}$ into $\mathbb{M}_{d_{2}}$. A linear map $\Phi \in$ $\operatorname{UEB}\left(d_{1}, d_{2}\right)$ is said to be a $C^{*}$-extreme point of $\operatorname{UEB}\left(d_{1}, d_{2}\right)$ if whenever $\Phi$ is written as $\Phi=$ $\sum_{i=1}^{n} \operatorname{Ad}_{T_{i}} \circ \Phi_{i}$, where $T_{i} \in \mathbb{M}_{d_{2}}$ are invertible with $\sum_{i=1}^{n} T_{i}^{*} T_{i}=I_{d_{2}}$ and $\Phi_{i} \in \operatorname{UEB}\left(d_{1}, d_{2}\right)$, then there exist unitaries $U_{i} \in \mathbb{M}_{d_{2}}$ such that $\Phi_{i}=\operatorname{Ad}_{U_{i}} \circ \Phi$ for all $1 \leq i \leq n$. In [BDMS], Bhat et al. proved that $\Phi$ is a $C^{*}$-extreme point of $\operatorname{UEB}\left(d_{1}, d_{2}\right)$ if and only if $C R(\Phi)=d_{2}$ if and only if $\Phi=\sum_{i=1}^{d_{2}} \operatorname{Ad}_{\left|u_{i}\right\rangle\left\langle v_{i}\right|}$ for some unit vectors $\left\{u_{i}\right\}_{i=1}^{d_{2}} \subseteq \mathbb{C}^{d_{1}}$ and an orthonormal basis $\left\{v_{i}\right\}_{i=1}^{d_{2}} \subseteq \mathbb{C}^{d_{2}}$.

Theorem 4.1. Given $\Phi \in \operatorname{UEB}\left(d_{1}, d_{2}\right)$ the following are equivalent:
(i) $\Phi$ is degradable.
(ii) $\Phi$ is a $C^{*}$-extreme point of $\operatorname{UEB}\left(d_{1}, d_{2}\right)$.

Proof. $(i) \Rightarrow(i i)$ Assume that $\Phi$ is degradable. Then from Theorem $3.2(\mathrm{v})$, there exist rank-one positive operators $\left\{F_{j}\right\}_{j=1}^{n} \subseteq \mathbb{M}_{d_{1}}$ and states $\left\{R_{j}\right\}_{j=1}^{n} \subseteq \mathbb{M}_{d_{2}}$ with $R_{i} R_{j}=0$ for all $i \neq j$ such that

$$
\Phi(X)=\sum_{j=1}^{n} \operatorname{tr}\left(X F_{j}\right) R_{j}, \quad \forall X \in \mathbb{M}_{d_{1}}
$$

Let $F_{k}=\left|u_{k}\right\rangle\left\langle u_{k}\right|$ and $P_{k}=\operatorname{tr}\left(F_{k}\right) R_{k}$ for all $1 \leq k \leq n$. Clearly $P_{k} P_{l}=0$ for all $k \neq l$ and $\sum_{k=1}^{n} P_{k}=\Phi(I)=I$. Now let $0 \neq \lambda \in \mathbb{C}$ and $0 \neq x \in \mathbb{C}^{d}$ be such that $P_{k} x=\lambda x$. Then for all $j \neq k$ we have $P_{j}(x)=P_{j}\left(\frac{1}{\lambda} P_{k}(x)\right)=0$. Hence $x=\sum_{j=1}^{n} P_{j}(x)=P_{k}(x)=\lambda x$ so that $\lambda=1$. Thus 0,1 are only possible eigenvalues of $P_{k}$. Since $P_{k}^{*}=P_{k}$ we conclude that $P_{k}$ 's are mutually orthogonal projections. Taking $\widetilde{u}_{j}=\frac{u_{j}}{\left\|u_{j}\right\|}$ we have

$$
\Phi(X)=\sum_{j=1}^{n}\left\langle\tilde{u}_{j}, X \tilde{u}_{j}\right\rangle P_{j}, \quad \forall X \in \mathbb{M}_{d_{1}}
$$

so that, from [BDMS, Theorem $5.3(\mathrm{v})], \Phi$ is a $C^{*}$-extreme point of $\operatorname{UEB}\left(d_{1}, d_{2}\right)$.
$(i i) \Rightarrow(i)$ Follows from BDMS, Theorem 5.3 (vi)] and Theorem 3.2(iv).
Corollary 4.2. Let $\Phi: \mathbb{M}_{d} \rightarrow \mathbb{M}_{d}$ be a unital trace-preserving EB-map. Then $\Phi$ is degradable if and only if $\Phi^{*}$ is degradable.

Proof. Given that $\Phi, \Phi^{*} \in \operatorname{UEB}(d)$. Since $C R(\Phi)=C R\left(\Phi^{*}\right)$, from [BDMS, Theorem 5.3 (iv)], we have $\Phi$ is a $C^{*}$-extreme point if and only if $\Phi^{*}$ is a $C^{*}$-extreme point. Hence, from Theorem 4.1, $\Phi$ is degradable if and only if $\Phi^{*}$ is degradable.

Example 4.3. Consider the EB-map $\Phi: \mathbb{M}_{d} \rightarrow \mathbb{M}_{d}$ defined by

$$
\Phi(X)=\left\langle e_{1}, X e_{1}\right\rangle I, \quad \forall X \in \mathbb{M}_{d}
$$

which is unital but not trace-preserving. Note that $\Phi$ is degradable but $\Phi^{*}$ is not degradable. (In other words, $\Phi^{*}(X)=\operatorname{tr}(X)\left|e_{1}\right\rangle\left\langle e_{1}\right|$ is a trace preserving non unital non-degradable EBmap with $\left(\Phi^{*}\right)^{*}=\Phi$ is degradable.)

Example 4.4. Consider the unital trace preserving EB-map $\Phi: \mathbb{M}_{3} \rightarrow \mathbb{M}_{2}$ defined by

$$
\Phi(X)=\sum_{j=1}^{3}\left\langle e_{j}, X e_{j}\right\rangle\left|v_{j}\right\rangle\left\langle v_{j}\right|,
$$

where $v_{1}=e_{1}, v_{2}=v_{3}=\frac{e_{2}}{\sqrt{2}} \in \mathbb{C}^{2}$. From, Theorem $3.2 \Phi$ is not degradable, but $\Phi^{*}$ is a $C^{*}$-extreme point, and hence degradable.

Example 4.5. Let $A \in \mathbb{M}_{d}^{+}$and $S_{A}: \mathbb{M}_{d} \rightarrow \mathbb{M}_{d}$ be the Schur map. Since $A \in \mathbb{M}_{d}^{+}$there exist $\left\{v_{j}\right\}_{j=1}^{d} \subseteq \mathbb{C}^{d}$ such that $A=\left[\left\langle v_{i}, v_{j}\right\rangle\right]$. Write $v_{j}=\left(v_{1 j}, v_{2 j}, \cdots, v_{d j}\right)^{\top} \in \mathbb{C}^{d}$ and let $A_{k}=$ $\sum_{j=1}^{d} v_{k j}\left|e_{j}\right\rangle\left\langle e_{j}\right|$ for all $1 \leq k \leq d$. Then $S_{A}=\sum_{k=1}^{d} \operatorname{Ad}_{A_{k}}$ so that

$$
S_{A}^{c}(X)=\sum_{k, l=1}^{d} \operatorname{tr}\left(A_{k}^{*} X A_{l}\right)\left|e_{k}\right\rangle\left\langle e_{l}\right|=\sum_{j=1}^{d}\left\langle e_{j}, X e_{j}\right\rangle\left|\overline{v_{j}}\right\rangle\left\langle\overline{v_{j}}\right|, \quad \forall X \in \mathbb{M}_{d}
$$

Clearly $S_{A}^{c}$ is EB. Note that the Choi-matrix $C_{S_{A}^{c}}=\sum_{j} E_{j j} \otimes\left|\overline{v_{j}}\right\rangle\left\langle\overline{v_{j}}\right|$ is a projection if and only if $v_{j}$ 's are unit vectors if and only if diagonals of $A$ are 1 . Further,

$$
\left(S_{A}^{c}\right)^{*}(X)=\sum_{j=1}^{d}\left\langle\overline{v_{j}}, X \overline{v_{j}}\right\rangle\left|e_{j}\right\rangle\left\langle e_{j}\right|, \quad \forall X \in \mathbb{M}_{d}
$$

is unital if and only if $v_{j}$ 's are unit vectors. Thus, from [BDMS], if follows that $\left(S_{A}^{c}\right)^{*}$ is a $C^{*}$ extreme point of $\operatorname{UEB}(d)$ if and only if diagonals of $A$ are 1 if and only if $C_{S_{A}^{c}}$ is a projection.

Given an EB-map $\Phi: \mathbb{M}_{d_{1}} \rightarrow \mathbb{M}_{d_{2}}$ the minimum number of rank-one Kraus operators required to represent $\Phi$ as in (2.6) is known as the entanglement breaking rank of $\Phi$, and we denoted it as $\operatorname{ER}(\Phi)$. From [Hor97, HSR03] we have the following:

- If $\Phi$ is unital then $d_{2} \leq C R(\Phi) \leq E R(\Phi) \leq\left(d_{1} d_{2}\right)^{2}$.
- If $\Phi$ is trace preserving then $d_{1} \leq C R(\Phi) \leq E R(\Phi) \leq\left(d_{1} d_{2}\right)^{2}$.

The following theorem is a stronger version of [KLPR22, Theorem 3.6].
Theorem 4.6. Let $\Phi: \mathbb{M}_{d_{1}} \rightarrow \mathbb{M}_{d_{2}}$ be a PPT-channel with $\operatorname{rank}(\Phi(I)) \leq d_{1}$ (this is the case if $d_{2} \leq d_{1}$ ). Then the following are equivalent:
(i) $C_{\Phi}$ is a projection.
(ii) $\Phi$ is $E B$ with $E R(\Phi)=d_{1}$ (and hence $C R(\Phi)=d_{1}$ ).
(iii) $\Phi^{*}$ is a $C^{*}$-extreme point of $\operatorname{UEB}\left(d_{2}, d_{1}\right)$.
(iv) There exist unit vectors $\left\{v_{j}\right\}_{j=1}^{d_{1}} \subseteq \mathbb{C}^{d_{2}}$ and an orthonormal basis $\left\{u_{j}\right\}_{j=1}^{d_{1}} \subseteq \mathbb{C}^{d_{1}}$ such that

$$
\begin{equation*}
\Phi(X)=\sum_{j=1}^{d_{1}}\left\langle u_{j}, X u_{j}\right\rangle\left|v_{j}\right\rangle\left\langle v_{j}\right|, \quad \forall X \in \mathbb{M}_{d_{1}} \tag{4.3}
\end{equation*}
$$

(v) There exist $A \in \mathbb{M}_{d_{1}}$ with diagonal entries equals 1 and a unitary $U \in \mathbb{M}_{d_{1}}$ such that

$$
\begin{equation*}
\Phi=S_{A}^{c} \circ \operatorname{Ad}_{U} \tag{4.4}
\end{equation*}
$$

Further, if $d_{1}=d_{2}$ and $\Phi$ is unital, then above conditions are equivalent to the following:
(vi) $\Phi$ is degradable.

Proof. $(i) \Rightarrow(i i)$ Assume that $C_{\Phi}$ is a projection so that $\operatorname{rank}\left(C_{\Phi}\right)=\operatorname{tr}\left(C_{\Phi}\right)$. But

$$
\operatorname{tr}\left(C_{\Phi}\right)=\operatorname{tr}\left((\operatorname{tr} \otimes \mathrm{id}) C_{\Phi}\right)=\operatorname{tr}\left(\sum_{i, j=1}^{d} \operatorname{tr}\left(\left|e_{i}\right\rangle\left\langle e_{j}\right|\right) \otimes \Phi\left(\left|e_{i}\right\rangle\left\langle e_{j}\right|\right)\right)=\operatorname{tr}(\Phi(I))=d_{1} .
$$

Since

$$
\max \left\{\operatorname{rank}\left((\mathrm{id} \otimes \operatorname{tr})\left(C_{\Phi}\right)\right), \operatorname{rank}\left((\operatorname{tr} \otimes \mathrm{id})\left(C_{\Phi}\right)\right)\right\}=\max \{\operatorname{rank}(I), \operatorname{rank}(\Phi(I))\}=d_{1},
$$

from [HSR03, Lemma 7\&8], $\Phi$ is EB and $d_{1} \leq \mathrm{CR}(\Phi) \leq \operatorname{ER}(\Phi) \leq d_{1}$.
(ii) $\Rightarrow$ (iii) Assume that $\Phi$ is $\operatorname{EB}$ and $\operatorname{ER}(\Phi)=d_{1}$. Then $\Phi^{*} \in \operatorname{UEB}\left(d_{2}, d_{1}\right)$ with $\operatorname{ER}\left(\Phi^{*}\right)=$ $\operatorname{ER}(\Phi)=d_{1}$, hence from [BDMS Theorem 5.3] we have $\Phi^{*}$ is a $C^{*}$-extreme point of $\operatorname{UEB}\left(d_{2}, d_{1}\right)$. (iii) $\Rightarrow$ (iv) Follows from BDMS, Theorem 5.3].
$(i v) \Rightarrow(v)$ Assume $\Phi$ is as in (4.3). Let $U \in \mathbb{M}_{d_{1}}$ be the unitary such that $U\left(e_{i}\right)=u_{i}$ for all $1 \leq i \leq d_{1}$ and $A=\left[\left\langle\overline{v_{i}}, \overline{v_{j}}\right\rangle\right] \in \mathbb{M}_{d_{1}}$. Then, from Example 4.5, it follows that $\Phi=S_{A}^{c} \circ \operatorname{Ad}_{U}$.
$(v) \Rightarrow(i)$ Suppose $\Phi$ is as in (4.4). Since diagonals of $A$ are 1, we have $C_{S_{A}^{c}}$ is a projection, and hence $C_{\Phi}=\left(U^{\top} \otimes I\right)^{*} C_{S_{A}^{c}}\left(U^{\top} \otimes I\right)$ is also a projection.
(iii) $\Leftrightarrow(v i)$ Let $\Phi: \mathbb{M}_{d} \rightarrow \mathbb{M}_{d}$ be a unital PPT-channel. Assume that $\Phi^{*} \in \operatorname{UEB}(d)$ is a $C^{*}$ extreme point. Then from the Theorem (4.1) and Corollary (4.2), $\Phi$ is degradable. Conversely assume that $\Phi$ is degradable. Then from [MuSi22, Corollary 7] we get $\Phi$ is EB, and hence from Theorem (4.1) and Corollary (4.2) it follows that $\Phi^{*}$ is a $C^{*}$-extreme point of $\operatorname{UEB}(d)$.

In the above Theorem, one may replace (4.4) by $\Phi=\operatorname{Ad}_{V^{*}} \circ\left(S_{A}\right)_{\text {min }}^{c} \circ \operatorname{Ad}_{U}$ where $U \in \mathbb{M}_{d_{1}}$ is a unitary, $V \in \mathbb{M}_{d_{3} \times r}$ is an isometry and $r=C R\left(S_{A}\right)$. Example 4.4 shows that, in Theorem 4.6. (vi) is not equivalent to any of the other statements when $d_{1} \neq d_{2}$.

Note that that if $\Phi \in \mathrm{CP}\left(d_{1}, d_{2}\right)$ is unital, then the CP-map $\Phi_{\text {min }}^{c}$ need not be unital. From [KLPR22, Lemma 2.4] we have $\Phi_{\min }^{c}$ is unital if and only if $C_{\Phi}$ is a projection. So we ask what are all CP-maps $\Phi$ for which $C_{\Phi}$ is a projection. If $d_{2} \leq d_{1}$, then Theorem4.6 says that
$\left\{\Phi: \mathbb{M}_{d_{1}} \rightarrow \mathbb{M}_{d_{2}}\right.$ PPT with $C_{\Phi}$ is projection $\}=\left\{\Phi: \mathbb{M}_{d_{1}} \rightarrow \mathbb{M}_{d_{2}}\right.$ EB with $C_{\Phi}$ is projection $\}$, and further characterize the elements of the first set.

Remark 4.7. Let $\Phi: \mathbb{M}_{d_{1}} \rightarrow \mathbb{M}_{d_{2}}$ be a PPT-channel with $\operatorname{rank}(\Phi(I)) \leq d_{1}$. If $\Phi$ is degradable, then $\left(\Phi^{c}\right)^{*}$ is a $C^{*}$-extreme point of $\operatorname{UEB}\left(d_{2}, d_{1}\right)$. For, since $\Phi$ is degradable, MuSi22, Corollary 7] we have both $\Phi$ and $\Phi^{c}$ are EB. As

$$
d_{1} \leq C R\left(\left(\Phi^{c}\right)^{*}\right)=C R\left(\Phi^{c}\right)=\operatorname{rank}(\Phi(I)) \leq d_{1}
$$

from [BDMS, Theorem 5.3] we get $\left(\Phi^{c}\right)^{*}$ is a $C^{*}$-extreme point.
Example 4.8. Given $\lambda \in[-1,1 / d]$ and $d>1$ consider the map $\mathcal{W}_{\lambda}: \mathbb{M}_{d} \rightarrow \mathbb{M}_{d}$ given by

$$
\mathcal{W}_{\lambda}(X)=\frac{1}{d-\lambda}\left(\operatorname{tr}(X) I-\lambda X^{\boldsymbol{\top}}\right)
$$

which is an unital trace preserving EB-map ([WeHo02]). Consider the Choi-matrix

$$
C_{\mathcal{W}_{\lambda}}=\frac{1}{d-\lambda}((I \otimes I)-\lambda F)
$$

where $F \in \mathcal{B}\left(\mathbb{C}^{d} \otimes \mathbb{C}^{d}\right)$ is the flip operator, and satisfies $F^{2}=I_{d} \otimes I_{d}$. Since $C_{\mathcal{W}_{\lambda}}$ is not a projection $\mathcal{W}_{\lambda}$ is not degradable.

Example 4.9. Given $\lambda \in\left[-\frac{1}{d+1}, 1\right]$ the map $\Phi_{\lambda, d}: \mathbb{M}_{d} \rightarrow \mathbb{M}_{d}$ defined by

$$
\begin{equation*}
\Phi_{\lambda, d}(X):=\frac{1}{2 \lambda+d}\left\{\operatorname{tr}(X) I+\lambda\left(X+X^{\top}\right)\right\} \tag{4.5}
\end{equation*}
$$

is an EB-map ([DMS23]). Note that

$$
C_{\Phi_{\lambda, d}}=\left(I_{d} \otimes I_{d}\right)+\lambda(P+F),
$$

where $P=\left|\sum_{j} e_{j} \otimes e_{i}\right\rangle\left\langle\sum_{j} e_{j} \otimes e_{j}\right| \in \mathcal{B}\left(\mathbb{C}^{d} \otimes \mathbb{C}^{d}\right)$. Since $C_{\Phi_{\lambda, d}}$ is not a projection, $\Phi_{\lambda, d}$ is not degradable.

In the rest of this section we discuss degradable CP-maps. Suppose $\Phi \in \mathrm{CP}(d, d)$ is of the form $\Phi=\operatorname{Ad}_{Y} \circ S_{A} \circ \operatorname{Ad}_{Z}$, where $A \in \mathbb{M}_{d}^{+}, Y, Z \in \mathbb{M}_{d}$. If both $Y, Z$ are invertible (in particular unitaries), then $\Phi$ is degradable. See [WoPe07, DeSh05] for details.

Example 4.10. Let $W \in \mathbb{M}_{d_{3} \times d_{2}}$ is a co-isometry, $A \in \mathbb{M}_{d_{3}}^{+}$and $Z \in \mathbb{M}_{d_{1} \times d_{3}}$. Consider $\Phi=$ $\operatorname{Ad}_{W} \circ S_{A} \circ \operatorname{Ad}_{Z} \in \operatorname{CP}\left(d_{1}, d_{2}\right)$. Now since $S_{A}^{c}$ is EB we have $\Phi^{c}=\left(\operatorname{Ad}_{W} \circ S_{A} \circ \operatorname{Ad}_{V}\right)^{c}=S_{A}^{c} \circ \operatorname{Ad}_{V}$ is also EB, hence anti-degradable. Thus $\Phi$ is degradable.

Proposition 4.11. Let $\Phi_{j}: \mathbb{M}_{d} \rightarrow \mathbb{M}_{d_{j}}, 1 \leq j \leq k$ be pure CP-maps. Then the map $\Phi:=\oplus_{i=1}^{k} \Phi_{i}$ is degradable.

Proof. We prove it only for the case $k=2$, and the general case can be proved similarly. So, assume $\Phi_{j}=\operatorname{Ad}_{V_{j}}$ for $j=1,2$. Letting $W_{1}=\left[\begin{array}{ll}V_{1} & 0\end{array}\right] \in \mathbb{M}_{d \times d_{1}+d_{2}}$ and $W_{2}=\left[\begin{array}{ll}0 & V_{2}\end{array}\right] \in$ $\mathbb{M}_{d \times d_{1}+d_{2}}$ we have $\Phi=\sum_{j=1}^{2} \operatorname{Ad}_{W_{j}}$. Note that $W_{j} W_{i}^{*}=0$ for $i \neq j \in\{1,2\}$ and hence

$$
\Phi^{c}(X)=\sum_{i, j=1}^{2} \operatorname{tr}\left(W_{i}^{*} X W_{j}\right)\left|e_{i}^{(2)}\right\rangle\left\langle e_{j}^{(2)}\right|=\sum_{j=1}^{2} \operatorname{tr}\left(W_{j}^{*} X W_{j}\right)\left|e_{j}^{(2)}\right\rangle\left\langle e_{j}^{(2)}\right|=\sum_{j=1}^{2} \operatorname{tr}\left(V_{j}^{*} X V_{j}\right)\left|e_{j}^{(2)}\right\rangle\left\langle e_{j}^{(2)}\right|
$$

for all $X \in \mathbb{M}_{d}$. Note that $\Gamma: \mathbb{M}_{d_{1}+d_{2}} \rightarrow \mathbb{C}$ given by

$$
\Gamma\left(\left[\begin{array}{ll}
A_{11} & A_{12} \\
A_{21} & A_{22}
\end{array}\right]\right):=\left[\begin{array}{cc}
\operatorname{tr}\left(A_{11}\right) & 0 \\
0 & \operatorname{tr}\left(A_{22}\right)
\end{array}\right]
$$

is a CP-map such that $\Phi^{c}=\Gamma \circ \Phi$ so that $\Phi$ is degradable.
Corollary 4.12. Let $\Phi \in \operatorname{UCP}\left(d_{1}, d_{2}\right)$. If $\Phi$ is a $C^{*}$-extreme point of $\operatorname{UCP}\left(d_{1}, d_{2}\right)$, then it is degradable.

Proof. Let $\Phi \in \operatorname{UCP}\left(d_{1}, d_{2}\right)$ be a $C^{*}$-extreme point. From [FaZh98, Theorem 2.1], there exist a unitary $U \in \mathbb{M}_{d_{2}}$ and positive integers $n_{1} \geq n_{2} \geq \cdots \geq n_{k}$ with $\sum_{i=1}^{k} n_{i}=d_{2}$ and isometries $V_{i} \in \mathbb{M}_{d_{1} \times n_{i}}$ such that $\operatorname{Ad}_{\mathrm{U}} \circ \Phi=\oplus_{i=1}^{k} \operatorname{Ad}_{V_{i}}$. From the above proposition it follows that $\Phi^{c}=$ $\left(\operatorname{Ad}_{U} \circ \Phi\right)^{c}=\Gamma \circ \operatorname{Ad}_{U} \circ \Phi$ for some CP-map $\Gamma$ concluding that $\Phi$ is degradable.

Example 4.13. Let $\Phi: \mathbb{M}_{d} \rightarrow \mathbb{M}_{d}$ be a unital EB map given by $\Phi=\sum_{i=1}^{d} \operatorname{Ad}_{A_{i}}$ where $A_{i}=$ $\left|e_{i}\right\rangle\left\langle e_{i}\right|$. Since $A_{i}^{*} A_{j}=0$ for all $i \neq j$, we have $\Phi=\Phi^{c}$. Thus From theorem 3.2, $\Phi$ is degradable. Note that $\Phi$ is not a linear extreme (hence not $C^{*}$-extreme) point of $\operatorname{UCP}(d)$.

## Appendix A.

The following theorem is a generalized version of [Hol07. Theorem 2] to infinite dimensional Hilbert spaces and we use the similar technique to prove this.

Theorem A.1. Let $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ be a quantum operation with the minimal Stinespring representation $(\widehat{\mathcal{K}}, \widehat{A})$. If $(\mathcal{K}, A)$ is a Stinespring representation of $\Phi$, then there exists an isometry $V: \widehat{\mathcal{K}} \rightarrow \mathcal{K}$ such that

$$
A=\left(I_{\mathcal{H}_{2}} \otimes V\right) \widehat{A} \quad \text { and } \quad \widehat{A}=\left(I_{\mathcal{H}_{2}} \otimes V^{*}\right) A
$$

(If $(\mathcal{K}, A)$ is also minimal then $V$ can be chosen to be a unitary). Consequently, given other Stinespring representation $\left(\mathcal{K}^{\prime}, A^{\prime}\right)$ of $\Phi$ there exist a partial isometry $W: \mathcal{K} \rightarrow \mathcal{K}^{\prime}$ such that

$$
A^{\prime}=\left(I_{\mathcal{H}_{2}} \otimes W\right) A \quad \text { and } \quad A=\left(I_{\mathcal{H}_{2}} \otimes W^{*}\right) A^{\prime}
$$

Proof. Let $(\widehat{\mathcal{K}}, \widehat{A})$ be the minimal Stinespring representation of $\Phi^{*}$. Then,

$$
\overline{\operatorname{span}}\left\{\left(X \otimes I_{\widehat{\mathcal{K}}}\right) \widehat{A} h: h \in \mathcal{H}_{1}, X \in \mathcal{B}\left(\mathcal{H}_{2}\right)\right\}=\mathcal{H}_{2} \otimes \widehat{\mathcal{K}}
$$

and $\Phi^{*}(X)=\widehat{A}^{*}\left(X \otimes I_{\widehat{\mathcal{K}}}\right) \widehat{A}$ for all $X \in \mathcal{B}\left(\mathcal{H}_{2}\right)$. Now since $(\mathcal{K}, A)$ is a Stinespring representation for $\Phi$ we have $\Phi^{*}(X)=A^{*}\left(X \otimes I_{\mathcal{K}}\right) A$ for all $X \in \mathcal{B}\left(\mathcal{H}_{2}\right)$. Define $S: \mathcal{H}_{2} \otimes \widehat{\mathcal{K}} \rightarrow \mathcal{H}_{2} \otimes \mathcal{K}$ by

$$
S\left(X \otimes I_{\widehat{\mathcal{K}}}\right) \widehat{A} h:=\left(X \otimes I_{\mathcal{K}}\right) A h, \quad \forall X \in \mathcal{B}\left(\mathcal{H}_{2}\right), h \in \mathcal{H}_{1}
$$

Then $S$ is an isometry satisfying $S \widehat{A}=A$ and $S\left(X \otimes I_{\widehat{\mathcal{K}}}\right)=\left(X \otimes I_{\mathcal{K}}\right) S$ for all $X \in \mathcal{B}\left(\mathcal{H}_{2}\right)$. Hence there exists an isometry $V \in \mathcal{B}(\widehat{\mathcal{K}}, \mathcal{K})$ such that $S=I_{\mathcal{H}_{2}} \otimes V$. Now $S \widehat{A}=A$ implies that $A=\left(I_{\mathcal{H}_{2}} \otimes V\right) \hat{A}$ and hence $\hat{A}=\left(I_{\mathcal{H}_{2}} \otimes V^{*}\right) A$. Similarly, one can have an isometry $V^{\prime}: \hat{\mathcal{K}} \rightarrow \mathcal{K}^{\prime}$
such that $A^{\prime}=\left(I_{\mathcal{H}_{2}} \otimes V^{\prime}\right) \hat{A}$ and $\hat{A}=\left(I_{\mathcal{H}_{2}} \otimes V^{\prime *}\right) A^{\prime}$. Note that $W:=V^{\prime} V^{*} \in \mathcal{B}\left(\mathcal{K}, \mathcal{K}^{\prime}\right)$ is the required partial isometry.

Proposition A.2. Let $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ be a quantum operation with Kraus decomposition $\Phi(T)=\sum_{j \in \Lambda} A_{j} T A_{j}^{*}$, where $\left\{A_{j}\right\}_{j \in \Lambda} \subseteq \mathcal{B}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$ is countable family with $\sum_{j \in \Lambda} A_{j}^{*} A_{j} \in$ $\mathcal{B}\left(\mathcal{H}_{2}\right)$. If $\mathcal{H}_{3}$ is any other separable complex Hilbert space with orthonormal basis $\left\{e_{j}: j \in \Lambda\right\}$, then the map $\Psi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{3}\right)$ given by

$$
\begin{equation*}
\Psi(T):=\sum_{i, j \in \Lambda} \operatorname{tr}\left(A_{i} T A_{j}^{*}\right)\left|e_{i}\right\rangle\left\langle e_{j}\right| \tag{A.1}
\end{equation*}
$$

is a well-defined quantum operation and complementary to $\Phi$.
Proof. Since $\sum_{j} A_{j}^{*} A_{j} \in \mathcal{B}\left(\mathcal{H}_{2}\right)^{+}$, we have

$$
\left\|\sum_{j \in \Lambda} A_{j} x \otimes e_{j}\right\|^{2}=\left\langle x, \sum_{j \in \Lambda} A_{j}^{*} A_{j} x\right\rangle \leq\left\|\overline{\sum_{j \in \Lambda}} A_{j}^{*} A_{j}\right\|\|x\|^{2}, \quad \forall x \in \mathcal{H}_{1}
$$

Hence $x \mapsto \sum_{j \in \Lambda} A_{j} x \otimes e_{j}$ defines an operator $A \in \mathcal{B}\left(\mathcal{H}_{1}, \mathcal{H}_{2} \otimes \mathcal{H}_{3}\right)$. Now fix an orthonormal basis $\left\{f_{j}\right\}_{j \in \Lambda^{\prime}}$ for $\mathcal{H}_{2}$. Then for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$, we have

$$
\begin{aligned}
\operatorname{tr}_{\mathcal{H}_{3}}\left(A T A^{*}\right) & =\sum_{i, j \in \Lambda^{\prime}} \sum_{k \in \Lambda}\left\langle f_{i} \otimes e_{k}, A T A^{*}\left(f_{j} \otimes e_{k}\right)\right\rangle\left|f_{i}\right\rangle\left\langle f_{j}\right| \\
& =\sum_{i, j \in \Lambda^{\prime}}\left\langle f_{i}, \sum_{k} A_{k} T A_{k}^{*} f_{j}\right\rangle\left|f_{i}\right\rangle\left\langle f_{j}\right| \\
& =\sum_{k} A_{k} T A_{k}^{*} \\
& =\Phi(T)
\end{aligned}
$$

and

$$
\begin{aligned}
\operatorname{tr}_{\mathcal{H}_{2}}\left(A T A^{*}\right) & =\sum_{k \in \Lambda^{\prime}} \sum_{i, j \in \Lambda}\left\langle f_{k} \otimes e_{i}, A T A^{*}\left(f_{k} \otimes e_{j}\right)\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right| \\
& =\sum_{i, j \in \Lambda} \sum_{k \in \Lambda^{\prime}}\left\langle f_{k}, A_{i} T A_{j}^{*} f_{k}\right\rangle\left|e_{i}\right\rangle\left\langle e_{j}\right| \\
& =\sum_{i, j \in \Lambda} \operatorname{tr}\left(A_{i} T A_{j}^{*}\right)\left|e_{i}\right\rangle\left\langle e_{j}\right| .
\end{aligned}
$$

Thus $\Psi(T):=\operatorname{tr}_{\mathcal{H}_{2}}\left(A T A^{*}\right)=\sum_{i, j \in \Lambda} \operatorname{tr}\left(A_{i} T A_{j}^{*}\right)\left|e_{i}\right\rangle\left\langle e_{j}\right|, \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$ is a well-defined quantum operation which is complementary to $\Phi$.

We used similar techniques of [He13, LiDu15] to prove the following theorem.
Theorem A.3. Let $\mathcal{H}_{1}, \mathcal{H}_{2}$ be two separable Hilbert spaces with $\operatorname{dim}\left(\mathcal{H}_{1}\right)=\infty$. Then for a quantum operation $\Phi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow \mathcal{T}\left(\mathcal{H}_{2}\right)$ the following are equivalent:
(i) $\Phi$ is $S E B$.
(ii) For every sequence of positive scalars $\left\{\lambda_{i}: i \in \mathbb{N}\right\} \subseteq \mathbb{R}$ with $\sum_{i \in \mathbb{N}} \lambda_{i}<\infty$, the operator $\sum_{i, j \in \mathbb{N}} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \otimes \Phi\left(E_{i j}\right) \in \mathcal{T}\left(\mathcal{H}_{1} \otimes \mathcal{H}_{2}\right)^{+}$is countably decomposable separable.
(iii) For one sequence of positive scalars $\left\{\lambda_{i}: i \in \mathbb{N}\right\} \subseteq \mathbb{R}$ with $\sum_{i \in \mathbb{N}} \lambda_{i}<\infty$, the operator $\sum_{i, j \in \mathbb{N}} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \otimes \Phi\left(E_{i j}\right) \in \mathcal{T}\left(\mathcal{H}_{1} \otimes \mathcal{H}_{2}\right)^{+}$is countably decomposable separable.
(iv) (Kraus decomposition:) There exist Kraus operators $\left\{A_{j}\right\}_{j \in \mathbb{N}} \subseteq \mathcal{B}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$ of rank at most one with $\bar{\sum}_{j \in \mathbb{N}} A_{j}^{*} A_{j} \in \mathcal{B}\left(\mathcal{H}_{1}\right)$ such that

$$
\Phi(T)=\sum_{j \in \mathbb{N}} A_{j} T A_{j}^{*}, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right)
$$

(v) (Holevo form:) There exist positive operators $\left\{F_{j}\right\}_{j \in \mathbb{N}} \subseteq \mathcal{B}\left(\mathcal{H}_{1}\right)$ with $\bar{\sum}_{k \in \mathbb{N}} F_{k} \in \mathcal{B}\left(\mathcal{H}_{1}\right)$ and states $\left\{R_{j}\right\}_{j \in \mathbb{N}} \subseteq \mathcal{S}\left(\mathcal{H}_{2}\right)$ such that

$$
\Phi(T)=\sum_{j \in \mathbb{N}} \operatorname{tr}\left(T F_{j}\right) R_{j}, \quad \forall T \in \mathcal{T}\left(\mathcal{H}_{1}\right)
$$

Proof. (i) $\Rightarrow$ (ii) Let $\left\{e_{j}\right\}_{j \in \mathbb{N}}$ be an orthonormal basis of $\mathcal{H}_{1}$ and let $\lambda_{j} \in \mathbb{R}$ be positive scalars such that $\sum_{j \in \mathbb{N}} \lambda_{j}<\infty$. Let $e:=\sum_{j \in \mathbb{N}} \sqrt{\lambda_{j}} e_{j} \otimes e_{j} \in \mathcal{H}_{1} \otimes \mathcal{H}_{1}$ and $\rho:=|e\rangle\langle e| \in \mathcal{T}\left(\mathcal{H}_{1} \otimes \mathcal{H}_{1}\right)$. Let $w_{n}:=\sum_{j=1}^{n} \sqrt{\lambda_{j}} e_{j} \otimes e_{j}$ and $\rho_{n}:=\left|w_{n}\right\rangle\left\langle w_{n}\right|$. Clearly, $\lim _{n} \operatorname{tr}\left(\rho_{n}\right)=\operatorname{tr}(\rho)$ and $\rho_{n} \rightarrow \rho$ in WOT, hence $\rho_{n} \rightarrow \rho$ in trace-norm ([Gru73, Theorem 2]). Note that $\sum_{i, j}\left\|\sqrt{\lambda_{i} \lambda_{j}} E_{i j} \otimes E_{i j}\right\|_{1}$ is convergent, hence (w.r.t trace norm topology)

$$
\begin{aligned}
\lim _{n} \rho_{n} & =\lim _{n \rightarrow \infty} \sum_{i, j=1}^{n} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \otimes E_{i j} \\
& =\lim _{n, m \rightarrow \infty} \sum_{i=1}^{n} \sum_{j=1}^{m} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \otimes E_{i j} \\
& =\sum_{i, j} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \otimes E_{i j}
\end{aligned}
$$

Since $\mathrm{id}_{\mathcal{H}_{1}} \otimes \Phi$ is continuous in trace norm we have

$$
\begin{equation*}
\left(\mathrm{id}_{\mathcal{H}_{1}} \otimes \Phi\right)(\rho)=\sum_{i, j} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \otimes \Phi\left(E_{i j}\right) \tag{A.2}
\end{equation*}
$$

As $\Phi$ is SEB, we have $\left(\mathrm{id}_{\mathcal{H}_{1}} \otimes \Phi\right)(\rho)$ is countably decomposable separable.
(ii) $\Rightarrow$ (iii) Clearly holds.
(iii) $\Rightarrow(i v)$ Let $\left\{\lambda_{i}: i \in \mathbb{N}\right\} \subseteq \mathbb{R}$ with $\sum_{i \in \mathbb{N}} \lambda_{i}<\infty$ be such that $\sum_{i, j \in \mathbb{N}} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \otimes \Phi\left(E_{i j}\right) \in$ $\mathcal{T}\left(\mathcal{H}_{1} \otimes \mathcal{H}_{2}\right)^{+}$is countably decomposable separable. Then there exist unit vectors $u_{k}, v_{k} \in \mathcal{H}_{1}$ and non-negative scalars $r_{k}$ such that

$$
\begin{equation*}
\sum_{i, j \in \mathbb{N}} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \otimes \Phi\left(E_{i j}\right)=\sum_{k \in \mathbb{N}} r_{k}\left|u_{k}\right\rangle\left\langle u_{k}\right| \otimes\left|v_{k}\right\rangle\left\langle v_{k}\right| . \tag{A.3}
\end{equation*}
$$

Then for all $x, y \in \mathcal{H}_{2}$

$$
\begin{aligned}
\sqrt{\lambda_{i} \lambda_{j}}\left\langle y, \Phi\left(E_{i j}\right) x\right\rangle & =\left\langle e_{i} \otimes y,\left(\sum_{s, t} \sqrt{\lambda_{s} \lambda_{t}} E_{s t} \otimes \Phi\left(E_{s t}\right)\right)\left(e_{j} \otimes x\right)\right\rangle \\
& =\left\langle e_{i} \otimes y,\left(\sum_{k} r_{k}\left|u_{k}\right\rangle\left\langle u_{k}\right| \otimes\left|v_{k}\right\rangle\left\langle v_{k}\right|\right)\left(e_{j} \otimes x\right)\right\rangle \\
& =\sum_{k} r_{k}\left\langle u_{k}, e_{j}\right\rangle\left\langle e_{i}, u_{k}\right\rangle\left\langle v_{k}, x\right\rangle\left\langle y, v_{k}\right\rangle \\
& =\left\langle y,\left(\sum_{k} r_{k}\left\langle u_{k}, e_{j}\right\rangle\left\langle e_{i}, u_{k}\right\rangle\left|v_{k}\right\rangle\left\langle v_{k}\right|\right) x\right\rangle
\end{aligned}
$$

Therefore,

$$
\begin{equation*}
\Phi\left(E_{i j}\right)=\frac{1}{\sqrt{\lambda_{i} \lambda_{j}}} \sum_{k} r_{k}\left\langle u_{k}, e_{j}\right\rangle\left\langle e_{i}, u_{k}\right\rangle\left|v_{k}\right\rangle\left\langle v_{k}\right|, \quad \forall i, j . \tag{A.4}
\end{equation*}
$$

Let $v=\sum_{j} \sqrt{\lambda_{j}} e_{j} \in \mathcal{H}_{1}$ and $A=|v\rangle\langle v|=\sum_{i, j} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \in \mathcal{T}\left(\mathcal{H}_{1}\right)^{+}$. Applying partial trace to (A.2) and (A.3) we get

$$
\begin{aligned}
\sum_{k} r_{k}\left|u_{k}\right\rangle\left\langle u_{k}\right| & =\sum_{i, j} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \operatorname{tr}\left(\Phi\left(E_{i j}\right)\right) \\
& =\sum_{i, j} \sqrt{\lambda_{i} \lambda_{j}} E_{i j} \operatorname{tr}\left(E_{i j} \Phi^{*}(I)\right)
\end{aligned}
$$

$$
\begin{align*}
& =\sum_{i j} \sqrt{\lambda_{i} \lambda_{j}}\left\langle e_{j}, \Phi^{*}(I) e_{i}\right\rangle E_{i j} \\
& =A \odot \Phi^{*}(I)^{\top} \\
& \leq A \odot\left\|\Phi^{*}(I)^{\top}\right\| I \\
& =\left\|\Phi^{*}(I)\right\| \sum_{j=1}^{\infty} \lambda_{j} E_{j j} . \tag{A.5}
\end{align*}
$$

Let $P_{n}=\sum_{j=1}^{n}\left|e_{j}\right\rangle\left\langle e_{j}\right|$ and $z_{k, n}:=\sum_{i=1}^{n} \frac{\sqrt{\mu_{k}}}{\sqrt{\lambda_{i}}}\left\langle u_{k}, e_{i}\right\rangle e_{i}$ for $k, n \geq 1$. From (A.5), we get $\sum_{k=1}^{\infty} r_{k}\left|P_{n} u_{k}\right\rangle\left\langle P_{n} u_{k}\right| \leq\left\|\Phi^{*}(I)\right\| \sum_{i=1}^{n} \lambda_{i} E_{i i}$ so that

$$
\begin{align*}
\sum_{k=1}^{m}\left|z_{k, n}\right\rangle\left\langle z_{k, n}\right| & =\sum_{k=1}^{m} \sum_{i, j=1}^{n} \frac{r_{k}}{\sqrt{\lambda_{i} \lambda_{j}}}\left\langle u_{k}, e_{i}\right\rangle\left\langle e_{j}, u_{k}\right\rangle E_{i j} \\
& =\sum_{k=1}^{m} \sum_{i, j=1}^{n} \frac{r_{k}}{\sqrt{\lambda_{i} \lambda_{j}}}\left\langle e_{j}, \mid u_{k}\right\rangle\left\langle u_{k} \mid e_{i}\right\rangle E_{i j} \\
& =\sum_{i, j=1}^{n} \sum_{k=1}^{m} \frac{r_{k}}{\sqrt{\lambda_{i} \lambda_{j}}}\left\langle P_{n} e_{j}, \mid u_{k}\right\rangle\left\langle u_{k} \mid P_{n} e_{i}\right\rangle E_{i j} \\
& =\sum_{i, j=1}^{n} \frac{1}{\sqrt{\lambda_{i} \lambda_{j}}}\left\langle e_{j}, \sum_{k=1}^{m} r_{k} \mid P_{n} u_{k}\right\rangle\left\langle P_{n} u_{k} \mid e_{i}\right\rangle E_{i j} \\
& \leq \sum_{i, j=1}^{n} \frac{1}{\sqrt{\lambda_{i} \lambda_{j}}}\left\langle e_{j}, \sum_{k=1}^{\infty} r_{k} \mid P_{n} u_{k}\right\rangle\left\langle P_{n} u_{k} \mid e_{i}\right\rangle E_{i j} \\
& \leq\left\|\Phi^{*}(I)\right\| P_{n}, \quad \forall m, n \geq 1 . \tag{A.6}
\end{align*}
$$

Since $\left|z_{k, n}\right\rangle\left\langle z_{k, n}\right| \leq \sum_{j=1}^{k+1}\left|z_{j, n}\right\rangle\left\langle z_{j, n}\right| \leq\left\|\Phi^{*}(I)\right\| P_{n}$ for all $k \geq 1$ we have

$$
\left\|z_{k, n}\right\|^{2}=\|\left|z_{k, n}\right\rangle\left\langle z_{k, n}\| \| \leq\left\|\Phi^{*}(I)\right\|, \quad \forall n, k \geq 1 .\right.
$$

Thus $z_{k, n}$ converges, say to $z_{k}=\sum_{i=1}^{\infty} \frac{\sqrt{\mu_{k}}}{\sqrt{\lambda_{i}}}\left\langle u_{k}, e_{i}\right\rangle e_{i} \in \mathcal{H}_{1}$. Now for every $m, n \geq 1$, from (A.6), we have

$$
\sum_{k=1}^{m}\left|z_{k, n}\right\rangle\left\langle z_{k, n}\right|=\sum_{k=1}^{m} P_{n}\left|z_{k}\right\rangle\left\langle z_{k}\right| P_{n} \leq\left\|\Phi^{*}(I)\right\| P_{n}
$$

i.e., $P_{n}\left(\left\|\Phi^{*}(I)\right\| I-\sum_{k=1}^{m}\left|z_{k}\right\rangle\left\langle z_{k}\right|\right) P_{n}$ is positive. From [LiDu15, Lemma 3.3], it follows that $\left\|\Phi^{*}(I)\right\| I-\sum_{k=1}^{m}\left|z_{k}\right\rangle\left\langle z_{k}\right|$ is positive for every $m \geq 1$. By letting $A_{k}:=\left|v_{k}\right\rangle\left\langle v_{k}\right| \in \mathcal{B}\left(\mathcal{H}_{1}, \mathcal{H}_{2}\right)$ we get $\bar{\sum}_{k} A_{k}^{*} A_{k}=\bar{\sum}_{k}\left|z_{k}\right\rangle\left\langle z_{k}\right| \leq\left\|\Phi^{*}(I)\right\| I_{\mathcal{H}_{1}}$. Consider the quantum operation $\Psi: \mathcal{T}\left(\mathcal{H}_{1}\right) \rightarrow$ $\mathcal{T}\left(\mathcal{H}_{2}\right)$ defined by $\Psi(\cdot)=\sum_{k} A_{k}(\cdot) A_{k}^{*}$. Then for every $i, j \geq 1$

$$
\Psi\left(E_{i j}\right)=\sum_{k}\left\langle z_{k}, e_{i}\right\rangle\left\langle e_{j}, z_{k}\right\rangle\left|v_{k}\right\rangle\left\langle v_{k}\right|=\sum_{k} \frac{r_{k}}{\sqrt{\lambda_{i} \lambda_{j}}}\left\langle e_{i}, u_{k}\right\rangle\left\langle u_{k}, e_{j}\right\rangle\left|v_{k}\right\rangle\left\langle v_{k}\right|=\Phi\left(E_{i j}\right)
$$

Now if $T=\sum_{i, j} t_{i j} E_{i j} \in \mathcal{T}\left(\mathcal{H}_{1}\right)$ for some $t_{i j} \in \mathbb{C}$, then since $\Phi, \Psi$ are continuous in trace norm we get

$$
\Phi(T)=\lim _{n \rightarrow \infty} \sum_{i, j=1}^{n} t_{i j} \Phi\left(E_{i j}\right)=\lim _{n \rightarrow \infty} \sum_{i, j=1}^{n} t_{i j} \Psi\left(E_{i j}\right)=\Psi(T) .
$$

Thus $\Phi(T)=\sum_{k} A_{k} T A_{k}^{*}$ for all $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$.
$(i v) \Rightarrow(v)$ Assume that $\Phi$ has a represenation as in (2.6). Let $\Lambda=\left\{j: A_{j} \neq 0\right\}$ and write $A_{j}=\left|v_{j}\right\rangle\left\langle u_{j}\right|$ for some $u_{j} \in \mathcal{H}_{1}$ and unit vector $v_{j} \in \mathcal{H}_{2}$. For every $j \in \Lambda$, let $F_{j}:=A_{j}^{*} A_{j}$ and
$R_{j}:=\left|v_{j}\right\rangle\left\langle v_{j}\right|$, then $\bar{\sum}_{j \in \Lambda} F_{j} \in \mathcal{B}\left(\mathcal{H}_{1}\right)$ and

$$
\begin{aligned}
\Phi(T) & =\sum_{j \in \Lambda} A_{j} T A_{j}^{*} \\
& =\sum_{j \in \Lambda}\left|v_{j}\right\rangle\left\langle u_{j}\right| T\left|u_{j}\right\rangle\left\langle v_{j}\right| \\
& =\sum_{j \in \Lambda} \operatorname{tr}\left(T\left|u_{j}\right\rangle\left\langle u_{j}\right|\right)\left|v_{j}\right\rangle\left\langle v_{j}\right| \\
& =\sum_{j \in \Lambda} \operatorname{tr}\left(T F_{j}\right) R_{j} \\
& =\sum_{j \in \mathbb{N}} \operatorname{tr}\left(T F_{j}\right) R_{j}
\end{aligned}
$$

where $F_{j}=0$ and $R_{j}=|v\rangle\langle v|$ for all $j \notin \Lambda$ and for some fixed unit vector $v \in \mathcal{H}_{2}$.
$(v) \Rightarrow(i)$ Assume that $\Phi$ has a Holevo form as in (2.7). Now let $\mathcal{K}$ be a separable Hilbert space and let $\rho \in \mathcal{T}\left(\mathcal{K} \otimes \mathcal{H}_{1}\right)^{+}$. Fixing an orthonormal basis $\left\{e_{j}: j \in \Lambda\right\}$ of $\mathcal{K}$ write $\rho=\sum_{i, j \in \Lambda} E_{i j} \otimes \mathbf{T}_{i j}$ for some $T_{i j} \in \mathcal{T}\left(\mathcal{H}_{1}\right)$, where $E_{i j}=\left|e_{i}\right\rangle\left\langle e_{j}\right|$. Then

$$
\begin{aligned}
\mathrm{id}_{\mathcal{K}} \otimes \Phi(\rho) & =\sum_{i j} E_{i j} \otimes \Phi\left(T_{i j}\right) \\
& =\sum_{i j} E_{i j} \otimes\left(\sum_{k} \operatorname{tr}\left(T_{i j} F_{k}\right) R_{k}\right) \\
& =\sum_{i j}\left(\sum_{k} \operatorname{tr}\left(T_{i j} F_{k}\right) E_{i j}\right) \otimes R_{k} \\
& =\sum_{k}\left(\sum_{i j} \operatorname{tr}\left(T_{i j} F_{k}\right) E_{i j}\right) \otimes R_{k} \\
& =\sum_{k} \operatorname{tr}_{\mathcal{H}_{2}}\left(\left(I_{\mathcal{K}} \otimes F_{k}\right) \rho\right) \otimes R_{k}
\end{aligned}
$$

Since $\operatorname{tr}_{\mathcal{H}_{2}}\left(\left(I_{\mathcal{K}} \otimes F_{k}\right) \rho\right)$ is positive $\left(\operatorname{id}_{\mathcal{K}} \otimes \Phi\right) \rho$ is countably decomposable separable. Since $\mathcal{K}$ and $\rho$ are arbitrary $\Phi$ is SEB.

[^0]:    ${ }^{1}$ Through out this article we let $\Lambda \subseteq \mathbb{N}$ denotes an index set. Given a family $\left\{A_{j}\right\}_{j \in \Lambda}$ of bounded linear operators on a Hilbert space $\bar{\sum}_{j \in \Lambda} A_{j}$ and $\sum_{j \in \Lambda} A_{j}$ denote the limit of the series in the strong operator topology (SOT) and trace-norm topology, respectively.

[^1]:    ${ }^{2}$ Whenever the series $\sum_{j} A_{j}^{*} A_{j}$ converges in weak operator topology the series $\sum_{j} A_{j} T A_{j}^{*}$ converges in trace norm for every $T \in \mathcal{T}\left(\mathcal{H}_{1}\right)$. (c.f. Att Proposition 6.3]).
