# Fermionic extensions of $W$-algebras via 3d $\mathcal{N}=4$ gauge theories with a boundary 

Yutaka Yoshida<br>Department of Current Legal Study, Faculty of Law, Meiji Gakuin University, Yokohama, Kanagawa.

#### Abstract

We study properties of vertex (operator) algebras associated with 3d H-twisted $\mathcal{N}=4$ supersymmetric gauge theories with a boundary. The vertex operator algebras (VOAs) are defined by BRST cohomologies of the currents with symplectic bosons, complex fermions, and bc-ghosts. We point out that VOAs for $3 \mathrm{~d} \mathcal{N}=4$ abelian gauge theories are fermionic extensions of VOAs associated with toric hyper-Kähler varieties. From this relation, it follows that the VOA associated with the 3d mirror of $N$-flavors $U(1)$ SQED is a fermionic extension of a $W$-algebra $W^{-N+1}\left(\mathfrak{s l}_{N}, f_{\text {sub }}\right)$. For $N=3$, we explicitly compute the OPE of elements in the BRST cohomology and find a new algebra which is a fermionic extension of a Bershadsky-Polyakov algebra $W^{-2}\left(\mathfrak{s l}_{3}, f_{\text {sub }}\right)$. We also suggest an expression of the vacuum character of the fermionic extension of $W^{-N+1}\left(\mathfrak{s l}_{N}, f_{\text {sub }}\right)$ predicted by $3 \mathrm{~d} \mathcal{N}=4$ mirror symmetry.

## 1 Introduction

The vertex operator algebras (VOAs) are important mathematical objects obtained by axiomatizing the properties of operator product expansion (OPE) in two-dimensional (2d) conformal field theory. It has applications not only in other areas of mathematics but also in various fields such as string theory and supersymmetric quantum field theory. In recent years, there has been growing interest in studying VOAs associated with four-dimensional (4d) $\mathcal{N}=2$ superconformal field theories [1, 2, 3].

Three-dimensional (3d) $\mathcal{N}=4$ supersymmetric gauge theories have received considerable attention due to their relevance in infrared dualities, superstring theory and other areas of mathematical physics such as AdS/CFT correspondence. Costello and Gaiotto [4] introduced a family of vertex (operator) algebras associated with $3 \mathrm{~d} \mathcal{N}=4$ supersymmetric gauge theories with the H-twist. These VOAs, denoted by $V_{H}(\mathcal{T})$, are defined using the data of a supersymmetric gauge theory $\mathcal{T}$ and living on the 2 d boundary of a 3d spacetime. The main idea behind the construction of $V_{H}(\mathcal{T})$ is to consider the space of observables of the supersymmetric gauge theory on the boundary of the spacetime. This space is equipped with a natural OPE that encodes the algebraic relations among the observables. In more detail, the VOA $V_{H}(\mathcal{T})$ is defined as a quotient of symplectic bosons, complex fermions and bc-ghosts. The symplectic bosons encode the algebra of hypermutilplet scalars. The fermions are identified with the fermions in the $\mathcal{N}=(0,2)$ fermi multiplets introduced to cancel the gauge anomaly by the anomaly inflow mechanism. The quotient is taken by a BRST cohomology with bc-ghosts associated with the 3d vector multiplet and corresponds to picking up gauge invariant operators.

VOAs associated with $3 \mathrm{~d} \mathcal{N}=4$ gauge theories offer new insights into the geometric and algebraic structure of these theories, including 3d mirror symmetry that exchange the Higgs branch and Coulomb branch between the dual theories. They would provide a new tool for studying the representation theory of these theories and their physical observables.

In this paper, we investigate the construction and properties of VOAs associated with $3 \mathrm{~d} \mathcal{N}=4$ supersymmetric abelian gauge theories with the H -twist. We explore the relation between the VOAs associated with $3 \mathrm{~d} \mathcal{N}=4$ abelian gauge theories and VOAs associated with toric hyper-Kähler varieties introduced by Kuwabara [5]. We also study algebraic structure for VOA associated with the 3d mirror of $U(1) N$-flavors SQED and show that the VOA is a fermionic extension of a $W$-algebra $W^{-N+1}\left(\mathfrak{s l}_{N}, f_{\text {sub }}\right)$.

The paper is organized as follows. In section 2, we review the basics of VOAs associated with $3 \mathrm{~d} \mathcal{N}=4$ supersymmetric abelian gauge theories and study relation with VOA associate with toric hyper-Kähler varieties. In section 3, we describe the construction of VOAs associated with the mirror of SQED and show that the VOA has $W$-algebra $W^{-N+1}\left(\mathfrak{s l}_{N}, f_{\text {sub }}\right)$ as a sub-algebra. For $N=3$, we compute the OPE of an expected generator of the BRST cohomology defining the VOA and show that the OPE is closed. In section 4 we discuss applications of supersymmetric indices on a solid torus $S^{1} \times D^{2}$ in understanding properties of the generator and the vacuum character of the VOA. Finally, in section 5, we summarize our results and discuss future directions of research.

## 2 VOA associated with $3 \mathrm{~d} \mathcal{N}=4$ abelian gauge theories

### 2.1 Definition

Costello-Gaiotto introduced VOAs associated with $3 \mathrm{~d} \mathcal{N}=4 \mathrm{H}$-twisted supersymmetric gauge theories on a spacetime $\mathbb{R}^{2} \times \mathbb{R}_{\leq 0}$. First we briefly review the construction of VOA for an abelian gauge theory with a gauge group $G=\prod_{a=1}^{L} U(1)_{a}$ [4, 6] and $N$ hypermultiplets. A $3 \mathrm{~d} \mathcal{N}=4$ hypermultiplet consists of two $3 \mathrm{~d} \mathcal{N}=2$ chiral multiplets. Let $\left(q_{i}, \tilde{q}_{i}\right)$ be the scalar component of two chiral multiplets in the $i$-th hypermultiplet which transform as $\left(q_{i}, \tilde{q}_{i}\right) \mapsto\left(e^{\mathrm{i} Q_{a, i} \alpha} q_{i}, e^{-\mathrm{i} Q_{a, i} \alpha} \tilde{q}_{i}\right)$ under the $U(1)_{a^{\prime}}$-gauge transformation, $a=1, \cdots, L$, and $i=1, \cdots, N$.

When the spacetime has a boundary, we have to specify boundary conditions for the fields. We impose the $\mathcal{N}=(0,2)$ Neumann boundary conditions for two $3 \mathrm{~d} \mathcal{N}=2$ chiral multiplets in each hypermultiplet, and impose the $\mathcal{N}=(0,2)$ Neumann (resp. Dirichlet) boundary conditions for $3 \mathrm{~d} \mathcal{N}=2$ vector (resp. adjoint chiral) multiplet in the $3 \mathrm{~d} \mathcal{N}=4 G$ vector multiplet. Then the $3 \mathrm{~d} \mathcal{N}=(0,4)$ supersymmetry are preserved at the boundary. Here "Neumann" and "Dirichlet" are a terminology used in [7, 8]. The above boundary condition preserves $\mathfrak{s u}(2)_{H} \mathrm{R}$-symmetry in the $3 \mathrm{~d} \mathcal{N}=4$ supersymmetry algebra. In particular, the H twist, which is a twist by $\mathfrak{u}(1)_{\text {rot }} \times \mathfrak{u}(1)_{H} \subset \mathfrak{s u}(2)_{\text {rot }} \times \mathfrak{s u}(2)_{H}$, makes sense. Here $\mathfrak{s u}(2)_{\text {rot }}$ (resp.
$\left.\mathfrak{u}(1)_{\text {rot }}\right)$ is the Lie algebra of the rotation group acting on a spacetime $\mathbb{R}^{3}$ (resp. $\mathbb{R}^{2} \times \mathbb{R}_{\leq 0}$ ).
In $3 \mathrm{~d} \mathcal{N}=4$ gauge theories with the H -twist, the gauge and flavor Chern-Simons terms are generated by the one-loop fermion effects. When the spacetime has a boundary, the gauge symmetry is broken by the boundary term generated by the gauge transformation of the Chern-Simons term. In order to cancel the boundary term by the anomaly inflow, we introduce $\mathcal{N}=(0,2)$ fermi multiplets which coupled to the $G$ gauge field in three dimensions at the boundary. Then fermions in the fermi multiplets are identified with the complex fermions in the VOA. For the abelian gauge group $G$, there is a canonical gauge charge assignment for the fermi multiplets 1 . To see this, we introduce $\tilde{N}$-flavors fermi multiplets with gauge charges $\tilde{Q}_{a, i}, a=1, \cdots, L$ and $i=1, \cdots, \tilde{N}$.

The BRST cohomology is defined as follows. First we associate symplectic bosons ( $X_{i}, Y_{i}$ ) with the hypermultiplet scalars $\left(q_{i}, \tilde{q}_{i}\right)$ having the following OPE:

$$
\begin{equation*}
X_{i}(z) Y_{j}(0) \sim \frac{\delta_{i j}}{z} \tag{2.1}
\end{equation*}
$$

A current $J_{\mathrm{sb}}^{a}$ of the symplectic bosons $\left(X_{i}, Y_{i}\right), i=1, \cdots, N$ is defined by the complex moment map $\mu_{\mathbb{C}}^{a}$ for the superpotential of the $3 \mathrm{~d} \mathcal{N}=4$ abelian gauge theory:

$$
\begin{equation*}
J_{\mathrm{sb}}^{a}=\mu_{\mathbb{C}}^{a}(X, Y)=\sum_{i=1}^{N} Q_{a, i} X_{i} Y_{i} . \tag{2.2}
\end{equation*}
$$

We associate complex fermions $\left(\psi_{i}, \chi_{i}\right), i=1, \cdots, \tilde{N}$ with the fermi multiplets and define the OPE by

$$
\begin{equation*}
\psi_{i}(z) \chi_{j}(0) \sim \frac{\delta_{i j}}{z} \tag{2.3}
\end{equation*}
$$

and define the current $J_{f}^{a}$ of the fermions by

$$
\begin{equation*}
J_{\mathrm{f}}^{a}:=\sum_{j=1}^{\tilde{N}} \tilde{Q}_{a, i} \psi_{j} \chi_{j} \tag{2.4}
\end{equation*}
$$

Note that the OPE of the fermion currents is given by

$$
\begin{equation*}
J_{\mathrm{f}}^{a}(z) J_{\mathrm{f}}^{b}(0) \sim \frac{\sum_{i=1}^{N} \tilde{Q}_{a, i} \tilde{Q}_{b, i}}{z^{2}} \tag{2.5}
\end{equation*}
$$

In this paper, we used a Mathemtica package OPEdefs [9] to calculate OPE. We introduce $\oplus_{a=1}^{L} \mathfrak{u}(1)_{a}$ bc-ghost $\left(\mathrm{b}_{a}, \mathrm{c}_{a}\right), a=1, \cdots, L$ associated with the $\prod_{a=1}^{L} U(1)_{a}$ vector multiplet, which have the following OPE:

$$
\begin{equation*}
\mathrm{b}_{a}(z) \mathrm{c}_{b}(0) \sim \frac{\delta_{a b}}{z} . \tag{2.6}
\end{equation*}
$$

[^0]The BRST charge $Q_{\mathrm{BRST}}$ and BRST current $J_{\mathrm{BRST}}$ are defined by

$$
\begin{equation*}
Q_{\mathrm{BRST}}=\oint \frac{d z}{2 \pi \mathrm{i}} J_{\mathrm{BRST}}(z), \quad J_{\mathrm{BRST}}(z):=\sum_{a=1}^{L} \mathrm{c}_{a}\left(J_{\mathrm{sb}}^{a}(z)+J_{\mathrm{f}}^{a}(z)\right) . \tag{2.7}
\end{equation*}
$$

To define the BRST cohomology, the BRST charge has to be nilpotent $Q_{\mathrm{BRST}}^{2}=0$. The OPE of the BRST current is given by

$$
\begin{equation*}
J_{\mathrm{BRST}}(z) J_{\mathrm{BRST}}(0) \sim \frac{1}{z} \sum_{a=1}^{L}\left(\sum_{i=1}^{N}\left(Q_{a, i}\right)^{2}-\sum_{i=1}^{\tilde{N}}\left(\tilde{Q}_{a, i}\right)^{2}\right) \tag{2.8}
\end{equation*}
$$

Here the OPE coefficient of the BRST current: $\sum_{i=1}^{N}\left(Q_{a, i}\right)^{2}-\sum_{i=1}^{\tilde{N}}\left(\tilde{Q}_{a, i}\right)^{2}$ is same as the coefficient of the boundary $U(1)_{a}$-gauge anomaly induced by the 3d fermions in the hypermultiplets and the boundary fermi multiplets. When the gauge anomalies cancel out, the BRST charge becomes nilpotent. For the abelian gauge theories, there is a canonical choice of the charges and the number of the fermi multiplets:

$$
\begin{equation*}
\tilde{Q}_{a, i}=Q_{a, i}, \quad \tilde{N}=N . \tag{2.9}
\end{equation*}
$$

From now on, the gauge charge of the fermi multiplets are taken as (2.9).
Then the vertex (operator) algebra $V_{H}(\mathcal{T})$ associated with a 3 d H-twisted $\mathcal{N}=4$ gauge theory $\mathcal{T}$ is defined by the BRST cohomology as

$$
\begin{equation*}
V_{H}(\mathcal{T}):=H^{*}\left(Q_{\mathrm{BRST}}\right)=\operatorname{Ker} Q_{\mathrm{BRST}} / \operatorname{Im} Q_{\mathrm{BRST}} . \tag{2.10}
\end{equation*}
$$

Here we give comments on properties of the BRST cohomology. The above construction of VOA also works for non-abelian gauge theories. In this case, the current for the bc-ghost $J_{b c}$ enters the definition of the BRST current. Specifically, if a $3 \mathrm{~d} \mathcal{N}=4$ supersymmetric gauge theory is the dimensional reduction of a $4 \mathrm{~d} \mathcal{N}=2$ superconformal gauge theory, the BRST charge is nilpotent without introducing the fermion current. Then the definition of VOAs for the dimensional reduction of the 4d gauge theories are same as the one for the 4 d superconformal gauge theory in [1]. For example, the VOA associated with 3d $\mathcal{N}=4 S U(2)$ gauge theory with four fundamental hypermultiplets is a current algebra $\widehat{\mathfrak{s o}}(8)_{-2}$.

### 2.2 Relation with VOA associated with toric hyper-Kähler varieties

In this section, we point out the relation between the VOAs associated with $3 \mathrm{~d} \mathcal{N}=4$ abelian gauge theories defined in the pervious section and the VOAs associated with toric hyper-Kähler varieties in [5]. From the physics view point, a toric hyper-Kähler variety is the moduli space of the Higgs branch vacua of a $3 \mathrm{~d} \mathcal{N}=4$ abelian gauge theory given by
$\mu_{\mathbb{R}}^{-1}(0) \cap \mu_{\mathbb{C}}^{-1}(0) / G$, where $\mu_{\mathbb{R}}$ is the real moment map associated with the D-term potential. The VOA in [5] is defined by a BRST cohomology associated with the current for symplectic bosons $\left(X_{i}, Y_{i}\right)$ and a Heisenberg vertex algebra, where the OPE of $\left(X_{i}, Y_{i}\right)$ is same as (2.1) in the previous section. The OPE of the Heisenberg vertex algebra is defined by

$$
\begin{equation*}
h_{a}(z) h_{b}(0) \sim \frac{C_{a b}}{z^{2}} \tag{2.11}
\end{equation*}
$$

where $C_{a b}$ is defined by

$$
\begin{equation*}
C_{a b}:=\sum_{i=1}^{L} Q_{a, i} Q_{b, i} \tag{2.12}
\end{equation*}
$$

The BRST charge $Q_{\text {BRST }}^{\prime}$ for the VOA associated with a toric hyper-Kähler variety is defined by

$$
\begin{equation*}
Q_{\mathrm{BRST}}^{\prime}=\sum_{a=1}^{L} \oint \frac{d z}{2 \pi \mathrm{i}} \mathrm{c}_{a}\left(J_{\mathrm{sb}}^{a}(z)+h_{a}(z)\right) . \tag{2.13}
\end{equation*}
$$

Here the $J_{\mathrm{sb}}^{a}$ and $\mathrm{c}_{a}$ are given by (2.2) and (2.6), respectively. Since the OPE of Heisenberg vertex algebra (2.11) has the same as the fermion current $J_{F}$ with $\tilde{Q}_{a, i}=Q_{a, i}$ in (2.5), the BRST charge $Q_{\text {BRST }}^{\prime}$ is nilpotent. Then the VOA associated with a toric hyperKähler variety is defined by the BRST cohomology of $Q_{\mathrm{BRST}}^{\prime}$. Therefore we can regard the VOAs associated with $3 \mathrm{~d} \mathcal{N}=4 \mathrm{H}$-twisted abelian gauge theories as fermionic extensions of the VOAs associated with toric hyper-Kähler varieties with the identification $h_{a}=J_{f}^{a}$ :

$$
\begin{equation*}
V_{H}(\mathcal{T})=\left.H^{*}\left(Q_{\mathrm{BRST}}\right) \supset H^{*}\left(Q_{\mathrm{BRST}}^{\prime}\right)\right|_{h_{a} \mapsto J_{f}^{a}} \tag{2.14}
\end{equation*}
$$

## 3 Fermionic extensions of $W$-algebras and the mirror of SQED

In this section, we consider a $G=\prod_{a=1}^{N-1} U(1)_{a}$ linear quiver gauge theory $\widetilde{\mathcal{T}}_{\text {SQED }}^{N}$ specified by the gauge charges

$$
\begin{equation*}
Q_{a, i}=\delta_{a, i}-\delta_{a, i-1}, \tag{3.1}
\end{equation*}
$$

with $i=1, \cdots, N$ and $a=1, \cdots, N-1$. The theory $\widetilde{\mathcal{T}}_{\text {SQED }}^{N}$ is the 3 d mirror dual of $N$-flavors $U(1)$ SQED $\mathcal{T}_{\text {SQED }}^{N}$ [10]. The moduli space of the Higgs branch vacua of $\widetilde{\mathcal{T}}_{\text {SQED }}^{N}$ is an orbifold $\mathbb{C}^{2} / \mathbb{Z}_{N}$. The currents of symplectic bosons $\left(X_{i}, Y_{i}\right)$ and fermions $\left(\psi_{i}, \chi_{i}\right)$ associated with $\widetilde{\mathcal{T}}_{\text {SQED }}^{N}$ are given by

$$
\begin{align*}
J_{\mathrm{sb}}^{i} & =X_{i} Y_{i}-X_{i+1} Y_{i+1},  \tag{3.2}\\
J_{\mathrm{f}}^{i} & =\psi_{i} \chi_{i}-\psi_{i+1} \chi_{i+1}, \tag{3.3}
\end{align*}
$$

with $i=1, \cdots, N-1$. The OPE of the fermion current is given by

$$
\begin{equation*}
J_{\mathrm{f}}^{i}(z) J_{\mathrm{f}}^{j}(0) \sim \frac{C_{i j}}{z^{2}}, \tag{3.4}
\end{equation*}
$$

where $C_{i j}$ is the Cartan matrix for $\mathfrak{s u}(N)$.
Motivated by the VOA associated with $\mathbb{C}^{2} / \mathbb{Z}_{N}$, we define a total energy momentum tensor by

$$
\begin{equation*}
T:=T_{\mathrm{sb}}+T_{\mathrm{f}}+T_{\mathrm{bc}} \tag{3.5}
\end{equation*}
$$

where $T_{\mathrm{sb}}, T_{\mathrm{f}}$ and $T_{\mathrm{bc}}$ are defined by

$$
\begin{align*}
& T_{\mathrm{sb}}:=\frac{1}{2} \sum_{i=1}^{N}\left(X_{i} \partial Y_{i}-Y_{i} \partial X_{i}\right)  \tag{3.6}\\
& T_{\mathrm{f}}:=\frac{1}{2} \sum_{i, j=1}^{N-1} C^{i j} J_{\mathrm{f}}^{i} J_{\mathrm{f}}^{j}  \tag{3.7}\\
& T_{\mathrm{bc}}:=-\sum_{i=1}^{N-1} \mathrm{~b}_{i} \partial \mathrm{c}_{i} \tag{3.8}
\end{align*}
$$

Here $C^{i j}$ is the inverse matrix of the Cartan matrix $C_{i j}$. Then the total energy-momentum tensor $T$ becomes BRST closed by $Q_{\mathrm{BRST}}$. Note that $T_{\mathrm{f}}$ is related to the canonical energymomentum tensor of the fermions by

$$
\begin{equation*}
T_{\mathrm{f}}+\frac{N}{2} J_{F}^{2}=\frac{1}{2} \sum_{i=1}^{N}\left(\partial \psi_{i} \cdot \chi_{i}-\psi_{i} \partial \chi_{i}\right) \tag{3.9}
\end{equation*}
$$

Here $J_{F}$ is a BRST closed operator defined below (3.13).
The energy-momentum tensor $T^{\prime}$ in the VOA associated with $\mathbb{C}^{2} / \mathbb{Z}_{N}$ is defined by the replacement $J_{f}^{i} \mapsto h^{i}$ in (3.7) as

$$
\begin{equation*}
T^{\prime}:=T_{\mathrm{sb}}+T_{\mathrm{h}}+T_{\mathrm{bc}}, \quad T_{\mathrm{h}}:=\frac{1}{2} \sum_{i, j=1}^{N-1} C^{i j} h_{i} h_{j} \tag{3.10}
\end{equation*}
$$

$T^{\prime}$ is closed by $Q_{\mathrm{BRST}}^{\prime}$. We define operators $G^{ \pm}, J_{S B}$ by

$$
\begin{equation*}
G^{+}=\prod_{i=1}^{N} X_{i}, \quad G^{-}=\prod_{i=1}^{N} Y_{i}, \quad J_{\mathrm{SB}}:=\frac{-1}{N} \sum_{i=1}^{N} X_{i} Y_{i} \tag{3.11}
\end{equation*}
$$

Kuwabara [5] has shown that the VOA $H^{*}\left(Q_{\text {BRST }}^{\prime}\right)$ associate with the orbifold $\mathbb{C}^{2} / \mathbb{Z}_{N}$ is isomorphic to a $W$-algebra $W^{-N+1}\left(\mathfrak{s l}_{N}, f_{\text {sub }}\right)$ with $N \geq 3$, which is defined by a quantized

Drinfeld-Sokolov reduction by a sub-regular nilpotent element $f_{\text {sub }}$ of $\mathfrak{s l}_{N}$ with a level $k=$ $-N+1$. Moreover $W^{-N+1}\left(\mathfrak{s l}_{N}, f_{\text {sub }}\right)$ is generated by operators $\left(T^{\prime}, G^{ \pm}, J_{S B}\right)$. From the discussion in Section 2.2, we conclude that the $W$-algebra $W^{-N+1}\left(\mathfrak{s l}_{N}, f_{\text {sub }}\right)$ is a sub-algebra of $V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{N}\right)$. In other words, $V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{N}\right)$ is a fermionic extension of the $W$-algebra:

$$
\begin{equation*}
V_{H}\left(\widetilde{\mathcal{T}}_{\mathrm{SQED}}^{N}\right) \supset W^{-N+1}\left(\mathfrak{s l}_{N}, f_{\mathrm{sub}}\right) \tag{3.12}
\end{equation*}
$$

Since elements of the BRST cohomology are expected to be associated with gauge invariant operators, we conjecture that the VOA $V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{N}\right)$ with $N \geq 3$ is generated by operators $\left(J_{S B}, J_{F}, M_{i}^{ \pm}, G_{I}^{ \pm}\right)$. Here $\left(J_{F}, M_{i}^{ \pm}, G_{I}^{ \pm}\right)$are defined by

$$
\begin{align*}
J_{F} & :=-\frac{1}{N} \sum_{i=1}^{N} \psi_{i} \chi_{i}  \tag{3.13}\\
G_{I}^{+} & :=\prod_{i \in I^{c}} X_{i} \prod_{j \in I} \chi_{j}  \tag{3.14}\\
G_{I}^{-} & :=\prod_{i \in I^{c}} Y_{i} \prod_{j \in I} \psi_{j}  \tag{3.15}\\
M_{i}^{+} & :=X_{i} \psi_{i}  \tag{3.16}\\
M_{i}^{-} & :=Y_{i} \chi_{i} \tag{3.17}
\end{align*}
$$

where $I=\left\{i_{1}, \cdots, i_{\ell}\right\} \subset\{1, \cdots, N\}$ with $|I|=\ell$, and $I^{c}$ is the complement of $I$ in $\{1, \cdots, N\}$. For $N=3$, the total energy-momentum tensor is expressed by $\left(J_{S B}, J_{F}, M_{i}^{ \pm}\right)$ as

$$
\begin{equation*}
T=-\frac{1}{2}\left(3 J_{S B}^{2}+\left(J_{S B}+J_{F}\right)^{2}+\sum_{i=1}^{3}\left[M_{+}^{i}, M_{i}^{-}\right]\right) \tag{3.18}
\end{equation*}
$$

Note that if we identify the symplectic bosons with the scalars $\left(q_{i}, \tilde{q}_{i}\right)$ in the hypermultiplets and identify the complex fermions $\left(\psi_{i}, \chi_{i}\right)$ with the boundary fermions in the $\mathcal{N}=(0,2)$ fermi multiplets, $M_{i}^{ \pm}$and $G_{I}^{ \pm}$are same as gauge invariant operators in $\widetilde{\mathcal{T}}_{\text {SQED }}^{N}$ at the boundary. In particular, BRST closed operators $G_{\varnothing}^{+}=G^{+}=\prod_{i=1}^{N} X_{i}$ and $G_{\phi}^{-}=G^{-}=\prod_{i=1}^{N} Y_{i}$ are identified with baryons $q_{1} q_{2} \cdots q_{N}$ and $\tilde{q}_{1} \tilde{q}_{2} \cdots \tilde{q}_{N}$, respectively. On the other hand, operators $X_{i} Y_{i}, i=1, \cdots, N$ associated the meson $q_{1} \tilde{q}_{1}=\cdots=q_{N} \tilde{q}_{N}$ are not BRST closed. An analog of the meson in the VOA is given by

$$
\begin{equation*}
X_{1} Y_{1}+\psi_{1} \chi_{1}=X_{2} Y_{2}+\psi_{2} \chi_{2}=\cdots=X_{N} Y_{N}+\psi_{N} \chi_{N}=-\left(J_{S B}+J_{F}\right) \tag{3.19}
\end{equation*}
$$

where the equalities hold up to BRST exact terms.
In general, although it is difficult to determine a generator of BRST cohomologies by elementary methods, we explicitly computed the OPE between ( $T, J_{S B}, J_{F}, M_{i}^{ \pm}, G_{I}^{ \pm}$) for $N=3$ and have shown that the OPE is closed, which supports our conjecture. The OPE of elements in the BRST cohomology is written in appendix A. Note that a sub-algebra generated by $\left(T, G^{ \pm}, J_{S B}\right)$ in $V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{3}\right)$ is a Bershadsky-Polyakov algebra with the central charge $c=-5$.

## 4 SUSY indices on $S^{1} \times D^{2}$ and the vacuum character of VOA

In $4 \mathrm{~d} / 2 \mathrm{~d}$ correspondence, the superconformal indices [11, 12] for $4 \mathrm{~d} \mathcal{N}=2$ SCFTs in the Schur limit [13, 14] conjecturally agree with the vacuum characters of the corresponding VOAs [1]. Similarly, 3d-2d coupled supersymmetric indices $Z_{S^{1} \times D^{2}}^{(H)}$ on $S^{1} \times D^{2}$ with the Htwist conjecturally agree with the vacuum characters of the corresponding VOAs appearing at the boundary. When a $3 \mathrm{~d} \mathcal{N}=4$ gauge theory is a dimensional reduction of a $4 \mathrm{~d} \mathcal{N}=2$ superconformal gauge theory, the index on $S^{1} \times D^{2}$ with the H-twist agrees with the Schur index. For example, the H-twisted index $Z_{S^{1} \times D^{2}}$ of the $3 \mathrm{~d} \mathcal{N}=4 S U(2)$ gauge theory with four hypermultiplets in the fundamental representation is given by

$$
\begin{align*}
Z_{S^{1} \times D^{2}}^{(H), S U(2)+4 \mathrm{hyp}} & =\frac{(q ; q)_{\infty}^{2}}{2} \oint \frac{d x}{2 \pi \mathrm{i} x} \frac{\left(x^{2} ; q\right)_{\infty}^{2}\left(x^{-2} ; q\right)_{\infty}^{2}}{\left(x q^{\frac{1}{2}} ; q\right)_{\infty}^{8}\left(x^{-1} q^{\frac{1}{2}} ; q\right)_{\infty}^{8}}  \tag{4.1}\\
& =1+28 q+329 q^{2}+2632 q^{3}+16380 q^{4}+\cdots .
\end{align*}
$$

The above expression is actually same as the $4 \mathrm{~d} \mathcal{N}=2$ superconformal index (for example see [15]) in the Schur limit and agrees with the expansion of the vacuum character of an affine current algebra $\widehat{\mathfrak{s o}}(8)_{-2}$ [1].

This observation suggests that the vacuum character of $V_{H}(\widetilde{\mathcal{T}})$ is given by the $3 \mathrm{~d} \mathrm{H}-$ twisted index $Z_{S^{1} \times D^{2}}^{(H)}$ of 3d theory $\widetilde{\mathcal{T}}$ on $S^{1} \times D^{2}$ including the elliptic genus of $2 \mathrm{~d} \mathcal{N}=(0,2)$ fermi multiplets at the boundary torus. Moreover, in $3 \mathrm{~d} \mathcal{N}=4$ mirror symmetry, the Ctwisted index $Z_{S^{1} \times D^{2}}^{(C)} \widetilde{\mathcal{T}}$ of the theory $\mathcal{T}$ mirror dual to $\widetilde{\mathcal{T}}$ is expected to agree with the index $Z_{S^{1} \times D^{2}}^{(H), \widetilde{\mathcal{T}}}$, where two theories: $\mathcal{T}$ with $2 \mathrm{~d} \mathcal{N}=(0,2)$ fermi multiplets and $\widetilde{\mathcal{T}}$ have to satisfy the 't Hooft anomaly matching condition [8].

Let us compare the supersymmetric indices on $S^{1} \times D^{2}$ and elements of BRST cohomology at low dimensions. First we fix the charge assignments of the mirror pair by the anomaly matching condition. To see anomaly matching, it is convenient to introduce anomaly polynomials [8]. The anomaly polynomial of 3d theory $\widetilde{\mathcal{T}}_{\text {SQED }}^{N}$ with H-twist is given by

$$
\begin{equation*}
\mathcal{I}_{\text {mirror }}^{(H)}=-\left(\mathbf{f}_{1}-\mathbf{y}_{1}\right)^{2}-\sum_{a=2}^{N-2}\left(\mathbf{f}_{a}-\mathbf{f}_{a-1}\right)^{2}-\left(-\mathbf{f}_{N-1}+\mathbf{y}_{2}\right)^{2} . \tag{4.2}
\end{equation*}
$$

Here $\mathbf{f}_{a}$ is the field strength of the $U(1)_{a}$ gauge group with $a=1, \cdots, N-1 . \mathbf{y}_{1}=-\mathbf{y}_{2}=2 \mathbf{y}$ is the field strength of the background gauge field of $U(1)_{y}$ flavor symmetry acting on the first and the $N$-th hypermultiplets as $\left(q_{1}, \tilde{q}_{1}\right) \mapsto\left(e^{-\mathrm{i} \frac{\theta}{2}} q_{1}, e^{\mathrm{i} \frac{\theta}{2}} \tilde{q}_{1}\right)$ and $\left(q_{N}, \tilde{q}_{N}\right) \mapsto\left(e^{-\mathrm{i} \frac{\theta}{2}} q_{N}, e^{\mathrm{i} \frac{\theta}{2}} \tilde{q}_{N}\right)$. The boundary fermi multiplets contribute to the anomaly polynomial as

$$
\begin{equation*}
\mathcal{I}_{\text {fermi }}=\left(-\mathbf{f}_{1}+\mathbf{y}_{1}+\mathbf{s}\right)^{2}+\sum_{i=2}^{N-2}\left(-\mathbf{f}_{a}+\mathbf{f}_{a-1}+s\right)^{2}+\left(-\mathbf{y}_{2}+\mathbf{f}_{N-1}+\mathbf{s}\right)^{2} \tag{4.3}
\end{equation*}
$$

Here $\mathbf{s}$ is the background field strength of $U(1)_{s}$ flavor symmetric acting on fermi multiplets as $\left(\chi_{i}, \psi_{i}\right) \mapsto\left(e^{\mathrm{i} \theta} \chi_{i}, e^{-\mathrm{i} \theta} \psi_{i}\right)$. The anomaly polynomial of the $3 \mathrm{~d}-2 \mathrm{~d}$ system is given by

$$
\begin{equation*}
\mathcal{I}_{\text {mirror }}^{(H)}+\mathcal{I}_{\text {fermi }}=N \mathbf{s}^{2}+2 \mathbf{s}\left(\mathbf{y}_{2}-\mathbf{y}_{1}\right) \tag{4.4}
\end{equation*}
$$

Since the $\mathbf{f}_{i}$ 's cancel out between the 3 d and 2 d fermions, the gauge anomaly is absent.
In the C-twisted $N$-flavors SQED, the $U(1)$ gauge symmetry at the boundary survives as a global symmetry, which is identified with $U(1)_{s}$-symmetry in the mirror side. The topological $U(1)$ symmetry acting on Coulomb branch operators is identified with the flavor $U(1)_{y}$ symmetry in the mirror side. Then the anomaly polynomial of C-twisted $N$-flavors SQED is given by

$$
\begin{equation*}
\mathcal{I}_{\mathrm{SQED}}^{(C)}=N \mathbf{s}^{2}-2 \mathbf{s y} \tag{4.5}
\end{equation*}
$$

Here the first term in (4.5) is the effective $U(1)_{s}$ CS-term generated by $N$-hypermultiplets with the Dirichlet boundary condition. The second term is the $U(1)_{s}-U(1)_{y}$ mixed CS-term. We find the agreement $\mathcal{I}_{\text {mirror }}^{(H)}+\mathcal{I}_{\text {fermi }}=\mathcal{I}_{\text {SQED }}^{(C)}$.

Now we write down formulas of indices on $S^{1} \times D^{2}$ of the mirror pair. Supersymmetric indies of $3 \mathrm{~d} \mathcal{N} \geq 2$ theory on $S^{1} \times D^{2}$ is defined by

$$
\begin{equation*}
Z_{S^{1} \times D^{2}}=\operatorname{Tr}_{\mathcal{H}\left(D^{2}\right)}(-1)^{F} q^{J_{3}+\frac{R}{2}} \prod_{f} y_{f}^{F_{f}} \tag{4.6}
\end{equation*}
$$

Here $\mathcal{H}\left(D^{2}\right)$ is the Hilbert space on 2 d hemisphere $D^{2}$ with appropriate boundary conditions for the fields at the boundary $\partial\left(S^{1} \times D^{2}\right)=\mathbb{T}^{2} . F, J_{3}, R$ and $F_{f}$ are the fermion number, the rotation of $D^{2}$, an R-charge and the flavor charges of the $3 \mathrm{~d} \mathcal{N}=2$ theory. The parameters $q$ and $w_{f}$ are fugacities for these charges. The indices have been first studied in [7] in detail for the Neumann boundary condition of the $\mathcal{N}=2$ vector multiplet, and later studied in [8] by operator counting arguments. The indices with the Dirichlet boundary condition for the $\mathcal{N}=$ 2 vector multiplet has been proposed in [8], and later derived by supersymmetric localization in [16]. From formulas of $Z_{S^{1} \times D^{2}}$ in [7, 8, 16], the H/C-twisted indices of $\prod_{a=1}^{N-1} U(1)_{a}$ linear quiver gauge theory and its mirror dual i.e., $U(1) N$-flavors SQED are written as

$$
\begin{align*}
Z_{S^{1} \times D^{2}}^{(H), \tilde{\mathcal{T}}_{\text {SED }}^{N}} & =(q ; q)_{\infty}^{2(N-1)} \oint \prod_{i=1}^{N-1} \frac{d x_{i}}{2 \pi \mathrm{i} x_{i}} \prod_{i=1}^{N} \frac{\left(x_{i}^{-1} x_{i-1} s q^{\frac{1}{2}} ; q\right)_{\infty}\left(x_{i} x_{i-1}^{-1} s^{-1} q^{\frac{1}{2}} ; q\right)_{\infty}}{\left(x_{i} x_{i-1}^{-1} q^{\frac{1}{2}} ; q\right)_{\infty}\left(x_{i}^{-1} x_{i-1} q^{\frac{1}{2}} ; q\right)_{\infty}}  \tag{4.7}\\
Z_{S^{1} \times D^{2}}^{(C), \tau_{\text {SED }}^{N}} & =\frac{1}{(q ; q)_{\infty}^{2}} \sum_{m \in \mathbb{Z}} q^{N m^{2}}(-s)^{N m} y^{m}\left(s q^{1+m} ; q\right)_{\infty}^{N}\left(s^{-1} q^{1-m} ; q\right)_{\infty}^{N} \tag{4.8}
\end{align*}
$$

Here $y^{\frac{1}{2}}=x_{0}=x_{N}^{-1}$ is the fugacity of the $U(1)_{y}$ flavor symmetry. The numerator of the integrand of (4.7) is the elliptic genus of the boundary $\mathcal{N}=(0,2)$ fermi multiplets.

The 3d mirror symmetry predicts that the two indices of the mirror pair agree each other:

$$
\begin{equation*}
Z_{S^{1} \times D^{2}}^{(H), \tilde{\tau}_{\text {SQED }}^{N}}=Z_{S^{1} \times D^{2}}^{(C), \mathcal{T}_{\text {SQD }}^{N}} \tag{4.9}
\end{equation*}
$$

We can check (4.9) in an order-by-order computation of $q^{\frac{1}{2}}$. For example, $N=3$ case:

$$
\begin{align*}
& Z_{S^{1} \times D^{2}}^{(H), \widetilde{\mathcal{T}}_{\text {SQED }}^{3}}=Z_{S^{1} \times D^{2}}^{(C), \mathcal{T}_{\text {IQED }}^{3}}= \\
& =1+\left[2-3\left(s+\frac{1}{s}\right)\right] q+\left[\left(y+\frac{1}{y}\right)-3\left(y s+\frac{1}{y s}\right)+3\left(y s^{2}+\frac{1}{y s^{2}}\right)-\left(y s^{3}+\frac{1}{y s^{3}}\right)\right] q^{\frac{3}{2}} \\
& +\left[14-6\left(s+\frac{1}{s}\right)+3\left(s^{2}+\frac{1}{s^{2}}\right)\right] q^{2}+O\left(q^{\frac{5}{2}}\right) \tag{4.10}
\end{align*}
$$

In order to relate the indices on $S^{1} \times D^{2}$ with the VOA, we define a canonical total energy-momentum tensor $\tilde{T}$ by

$$
\begin{equation*}
\tilde{T}:=T+\frac{N}{2} J_{F} J_{F}=T_{s b}+T_{b c}+\frac{1}{2} \sum_{i=1}^{N}\left(\partial \psi_{i} \cdot \chi_{i}-\psi_{i} \partial \chi_{i}\right) \tag{4.11}
\end{equation*}
$$

Then the canonical energy-momentum tensor $\tilde{T}$ and $\mathcal{O} \in\left\{J_{S B}, J_{F}, M_{i}^{ \pm}, G_{I}^{ \pm}\right\}$satisfy the following OPE:

$$
\begin{equation*}
\tilde{T}(z) \mathcal{O}(0) \sim \frac{h_{\mathcal{O}} \mathcal{O}}{z^{2}}+\frac{\partial \mathcal{O}}{z} \tag{4.12}
\end{equation*}
$$

Here the dimensions of primary fields are $\left(h_{J_{S B}}, h_{J_{F}}, h_{M_{i}^{ \pm}}, h_{G_{I}^{ \pm}}\right)=(1,1, N / 2, N / 2)$. We define $L_{n}, J_{F, n}$ and $J_{B, n}$ by

$$
\begin{align*}
L_{n} & =\oint \frac{d z}{2 \pi \mathrm{i} z} z^{n+2} \tilde{T}(z)  \tag{4.13}\\
J_{F, n} & =3 \oint \frac{d z}{2 \pi \mathrm{i} z} z^{n+1} J_{F}(z)  \tag{4.14}\\
J_{B, n} & =\oint \frac{d z}{2 \pi \mathrm{i} z} z^{n+1}\left(J_{S B}(z)+J_{F}(z)\right) \tag{4.15}
\end{align*}
$$

where $n \in \mathbb{Z}$. Note that $J_{F, 0}$ is the fermion number operator which counts the number of $\chi_{i}$ minus the number of $\psi_{i}$. A charge $J_{B, 0}$ is thought as an analog of the $U(1)_{y}$-flavor symmetry in the VOA. We consider a refinement of the vacuum character $\operatorname{Tr}(-1)^{J_{F, 0}} q^{L_{0}}$ of $V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{N}\right)$ by $J_{F, 0}, J_{B, 0}$ :

$$
\begin{equation*}
\chi_{V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{N}\right)}(q, y, s)=\operatorname{Tr}(-1)^{J_{F}, 0} q^{L_{0}} y^{J_{B, 0} S^{J_{F, 0}}} \tag{4.16}
\end{equation*}
$$

We conjecture that the character $\chi_{V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{N}\right)}$ agrees with the H-twisted index of $\widetilde{\mathcal{T}}_{\text {SQED }}^{N}$ : $Z_{S^{1} \times D^{2}}^{(H), \widetilde{\mathcal{T}}_{\text {SED }}^{N}}$ and the C-twisted index of $\mathcal{T}_{\text {SQED }}^{N}: Z_{S^{1} \times D^{2}}^{(C), \mathcal{T}_{\text {SED }}^{N}}$, namely

$$
\begin{equation*}
\chi_{V_{H}\left(\widetilde{\mathcal{T}}_{\mathrm{SQED}}^{N}\right)}=Z_{S^{1} \times D^{2}}^{\left(H, \widetilde{\mathcal{T}}^{N} N\right.}=Z_{S^{1} \times D^{2}}^{(C), \mathcal{T}_{\mathrm{SED}}^{N}} \tag{4.17}
\end{equation*}
$$

The series expansions of $Z_{S^{1} \times D^{2}}$ in the various order of $q^{\frac{1}{2}}$ and $N=3,4,5,6, \cdots$, suggest that the indices are given by
$N$ :even number

$$
Z_{S^{1} \times D^{2}}^{(H), \widetilde{T}_{Q E D}^{N=\text { even }}}=Z_{S^{1} \times D^{2}}^{(C), \mathcal{T}_{\text {SQD }}^{N=\text { even }}}=1+\sum_{n=2}^{\infty}\left\{\begin{array}{ll}
c_{n} q^{\frac{n}{2}} & (n=\text { even })  \tag{4.18}\\
0 & (n=\text { odd })
\end{array}\right\}
$$

$N$ :odd number

$$
\begin{align*}
Z_{S^{1} \times D^{2}}^{(H), \tilde{\mathcal{T}}_{\text {SED }}^{N=\text { odd }}} & =Z_{S^{1} \times D^{2}}^{(C), \mathcal{T}_{\text {SQD }}^{N=\text { odd }}}=1+\sum_{n=2}^{N} c_{\frac{n}{2}} q^{\frac{n}{2}} \\
& +\sum_{n=N+1}^{2 N-1}\left\{\begin{array}{ll}
c_{\frac{n}{2}}(y, s) q^{\frac{n}{2}} & (n=\text { odd }) \\
c_{\frac{n}{2}}(s) q^{\frac{n}{2}} & (n=\text { even })
\end{array}\right\}+\sum_{n=2 N}^{\infty} c_{\frac{n}{2}} q^{\frac{n}{2}} \tag{4.19}
\end{align*}
$$

Here $\sum_{n=2}^{N} c_{\frac{n}{2}} q^{\frac{n}{2}}$ agrees with the $q^{\frac{1}{2}}$-expansion of the plethystic exponential of the single letter index $f(y, s, q)$ of $J_{S B}, J_{F}, M_{i}^{ \pm}, G_{I}^{ \pm}$with $\partial$ 's:

$$
\begin{equation*}
c_{\frac{n}{2}} q^{\frac{n}{2}}=\left.\exp \left(\sum_{n=1}^{\infty} \frac{f\left(y^{n}, s^{n}, q^{n}\right)}{n}\right)\right|_{q^{\frac{n}{2}}}, \quad(2 \leq n \leq N) \tag{4.20}
\end{equation*}
$$

with

$$
\begin{equation*}
f(y, s, q)=\frac{1}{1-q}\left[\left(2-N\left(s+\frac{1}{s}\right)\right) q+\left(y+\frac{1}{y}+\sum_{\substack{l=-N \\ l \neq 0}}^{N}(-1)^{l} y^{\operatorname{sign}(l)}\binom{N}{l} s^{l}\right) q^{\frac{N}{2}}\right] . \tag{4.21}
\end{equation*}
$$

The expansion of the $\mathrm{H} / \mathrm{C}$-twisted indices has the following properties on the VOA. First, $\sum_{n=2}^{N} c_{\frac{n}{2}} q^{\frac{n}{2}}$ in (4.18) and (4.19) agree with in the plethystic exponential of the single letter index of $J_{S B}, J_{F}, M_{i}^{ \pm}, G_{I}^{ \pm}$. This agreement suggests that any operator $\mathcal{O}$ with $\operatorname{dim} \mathcal{O} \leq N / 2$ is freely generated by $J_{S B}, J_{F}, M_{i}^{ \pm}, G_{I}^{ \pm}$. On the other hand, higher order terms in the H/Ctwisted index do not coincide with the the plethystic exponential, which imply null operators should exist. When $N=$ even, the half-integer power of $q$ does not appear in the expansion. This suggests that there are no operators consisting of an odd number of $X_{i}, Y_{i}, \chi_{i}$, and $\psi_{i}$. For $N=$ odd, the coefficients of the first term in the second line of (4.19) are consistent with the charges and dimensions of operators consisting of $\left(J_{S B}, J_{F}, M_{i}^{ \pm}, G_{I}\right)$. These observations may provide an evidence that the VOA $V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{N}\right)$ is generated by operators $\left(J_{S B}, J_{F}, M_{i}^{ \pm}, G_{I}\right)$, and that the H/C-twisted indices are the vacuum character of the VOA.

## 5 Summary and discussion

In this paper, we have studied properties of the vertex operator algebras associated with 3d $\mathcal{N}=4$ abelian gauge theories. We have pointed out that these VOAs are fermionic extensions
of the VOAs associated with toric hyper-Kähler varieties. Specifically, we have focused on the 3d mirror of $N$-flavors $U(1)$ SQED and analyzed the structure of the VOA, which is a fermionic extension of a $W$-algebra $W^{-N+1}\left(\mathfrak{s l}_{N}, f_{\text {sub }}\right)$. For $N=3$, we have demonstrated that the OPE of the generator are closed. We conjectured that the VOA is generated by $\left(J_{S B}, J_{F}, M_{i}^{ \pm}, G_{I}^{ \pm}\right)$and proposed expressions for the vacuum character of the VOA in terms of the $\mathrm{H} / \mathrm{C}$-twisted indices. Additionally, we have studied the relationship between the generator and the $\mathrm{H} / \mathrm{C}$-twisted indices of the $3 \mathrm{~d} \mathcal{N}=4$ mirror pair.

We comment on future directions of our research. In recent years, VOAs associated with $3 \mathrm{~d} \mathcal{N} \geq 2$ theories have been studied in [17, 18, 19, 20, 21, 22, 23]. On an interval $\mathbb{R}^{2} \times I$, VOAs living on the boundaries are enriched by introducing line operators [23]. Characters of VOAs associated 3d $\mathcal{N}=2$ theories have interesting modular properties such as mock modular form [17]. It is interesting to study these properties in the fermionic extension of the $W$-algebra.

In this paper we have studied properties of the VOA $V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{N}\right)$ by elementary methods. There are many important examples of VOAs obtained by quantized Drinfeld-Sokolov reduction of Lie algebra, such as superconformal algebras and $W$-algebras. Since the VOA $V_{H}\left(\widetilde{\mathcal{T}}_{\mathrm{SQED}}^{N}\right)$ contains a $W$-algebra, we expect that the VOA $V_{H}\left(\widetilde{\mathcal{T}}_{\mathrm{SQED}}^{N}\right)$ itself can be obtained by a quantized Drinfeld-Sokolov reduction of a Lie superalgebra.

As mentioned in previous sections, a 4d superconformal gauge theory and its 3d reduction have the same VOA. On the other hand the situation is more subtle for non-Lagrangian cases. For example, let us consider $\left(A_{1}, A_{3}\right)$ Argyres-Douglas(AD) theory which is a nonLagrangian theory. The 3d reduction of $\left(A_{1}, A_{3}\right) \mathrm{AD}$ theory is the $T[S U(2)$ ] [24], same as 2-flavor SQED and its mirror dual: $\mathcal{T}_{\text {SQED }}^{2} \simeq \widetilde{\mathcal{T}}_{\text {SQED }}^{2}$. In our analysis, the VOA $V_{H}\left(\widetilde{\mathcal{T}}_{\text {SQED }}^{2}\right)$ contains Grassmann odd generators $X_{i} \psi_{i}, Y_{i} \chi_{i}, X_{i} \chi_{j}$, and $Y_{i} \psi_{j}$ with $1 \leq i \neq j \leq 2$, (see appendix). On the other hand, the VOA for $\left(A_{1}, A_{3}\right) \mathrm{AD}$ theory is an affine current algebra $\widehat{\mathfrak{s u}}(2)_{-\frac{4}{3}}$ [25]. In this case, VOAs associated with $4 \mathrm{~d} \mathcal{N}=2$ non-Lagrangian SCFTs and its 3 d reduction appear to be unrelated each other. It would be interesting to study VOAs associated with 4d non-Lagrangian theories with a boundary and to study the 3d reductions of them.

Another interesting direction is to study VOAs associated with the C-twist. Although a VOA associated with the C-twist is believed to agrees with the VOA associated its mirror dual with the H-twist, it is difficult to analyze elements in VOAs with the C-twist associated with boundary monopole operators. Since baryons are dual to monopole operators, $G^{ \pm}$ should be dual to elements associated with two monopole operators with minimal charges. It is interesting to study monopole operators in the VOA associated with the C-twisted $N$-flavors SQED and show that the isomorphism between VOAs associated with the H/Ctwisted mirror pair.

## Acknowledgements

The author would like to thank Tomoyuki Arakawa, Hiraku Nakajima, and Takahiro Nishinaka for their discussions. He would also like to thank Mykola Dedushenko for his comments. This work is supported by Grant-in-Aid for Scientific Research 21K03382, JSPS.

## A OPE of elements in BRST cohomologies

In this appendix we calculate OPE of elements of BRST cohomologies for $N=2,3$. For $N=3$, in order to compactly express the OPE, we define $F_{i}^{ \pm}, G_{i}^{ \pm}, i=1,2,3$ and $F^{ \pm}$by

$$
\begin{align*}
& F^{+}=\prod_{i=1}^{3} \chi_{i}:, \quad F^{-}=\prod_{i=1}^{3} \psi_{i}, \\
& F_{1}^{+}:=X_{3} X_{2} \chi_{1}, \quad F_{2}^{+}:=X_{3} X_{1} \chi_{2}, \quad F_{3}^{+}:=X_{1} X_{2} \chi_{3}, \\
& F_{1}^{-}:=Y_{3} Y_{2} \psi_{1}, \quad F_{2}^{-}:=Y_{3} Y_{1} \psi_{2}, \quad F_{3}^{-}:=Y_{1} Y_{2} \psi_{3}, \\
& G_{1}^{+}:=X_{1} \chi_{2} \chi_{3}, \quad G_{2}^{+}:=X_{2} \chi_{3} \chi_{1}, \quad G_{3}^{+}:=X_{3} \chi_{1} \chi_{2}, \\
& G_{1}^{-}:=Y_{1} \psi_{2} \psi_{3}, \quad G_{2}^{-}:=Y_{2} \psi_{3} \psi_{1}, \quad G_{3}^{-}:=Y_{3} \psi_{1} \psi_{2} . \tag{A.1}
\end{align*}
$$

Note that $G_{i}^{ \pm}, F_{i}^{ \pm}, i=1,2,3$ and $F^{ \pm}$are same as (3.14) and (3.15) up to the sign factor. The OPE of $\left(T, J_{S B}, G^{ \pm}, J_{F}, F^{ \pm}, M_{i}^{ \pm}, F_{i}^{ \pm}, G_{i}^{ \pm}\right), i=1,2,3$ are given by

$$
\begin{align*}
T(z) T(0) & \sim \frac{-5}{2 z^{4}}+\frac{2 T}{z^{2}}+\frac{\partial T}{z},  \tag{A.2}\\
T(z) J_{S B}(0) & \sim \frac{J_{S B}}{z^{2}}+\frac{\partial J_{S B}}{z},  \tag{A.3}\\
T(z) G^{ \pm}(0) & \sim \frac{3 G^{ \pm}}{2 z^{2}}+\frac{\partial G^{ \pm}}{z},  \tag{A.4}\\
T(z) J_{F}(0) & \sim 0,  \tag{A.5}\\
T(z) F^{ \pm}(0) & \sim 0,  \tag{A.6}\\
T(z) M_{i}^{ \pm}(0) & \sim \frac{5 M_{i}^{ \pm}}{6 z^{2}}+\frac{1}{z}\left( \pm J_{F} M_{i}^{ \pm}+\partial M_{i}^{ \pm}\right),  \tag{A.7}\\
T(z) F_{i}^{ \pm}(0) & \sim \frac{4 F_{i}^{ \pm}}{3 z^{2}}+\frac{1}{z}\left(\frac{-1}{3} \varepsilon_{i j k} M_{j}^{ \pm} G_{k}^{ \pm}+\frac{2}{3} \partial F_{i}^{ \pm}\right),  \tag{A.8}\\
T(z) G_{i}^{ \pm}(0) & \sim \frac{5 G_{i}^{ \pm}}{6 z^{2}}+\frac{1}{z}\left(\frac{2}{3} M_{i}^{ \pm} F^{ \pm}+\frac{1}{3} \partial G_{i}^{ \pm}\right),  \tag{A.9}\\
J_{S B}(z) J_{S B}(0) & \sim \frac{-1}{3 z^{2}},  \tag{A.10}\\
J_{S B}(z) G^{ \pm}(0) & \sim \frac{ \pm G^{ \pm}}{z},  \tag{A.11}\\
J_{S B}(z) J_{F}(0) & \sim 0,  \tag{A.12}\\
J_{S B}(z) F^{ \pm}(0) & \sim 0,  \tag{A.13}\\
J_{S B}(z) M_{i}^{ \pm}(0) & \sim \frac{ \pm M_{i}^{ \pm}}{3 z}, \tag{A.14}
\end{align*}
$$

$$
\begin{align*}
& J_{S B}(z) F_{i}^{ \pm}(0) \sim \frac{ \pm 2 F_{i}^{ \pm}}{3 z},  \tag{A.15}\\
& J_{S B}(z) G_{i}^{ \pm}(0) \sim \frac{ \pm G_{i}^{ \pm}}{3 z},  \tag{A.16}\\
& G^{ \pm}(z) G^{ \pm}(0) \sim 0,  \tag{A.17}\\
& G^{+}(z) G^{-}(0) \sim \frac{1}{z^{3}}+\frac{-3 J_{S B}}{z^{2}}+\frac{1}{z}\left(3 J_{S B}^{2}-\frac{3}{2} \partial J_{S B}-T\right),  \tag{A.18}\\
& G^{ \pm}(z) J_{F}(0) \sim 0,  \tag{A.19}\\
& G^{ \pm}(z) F^{ \pm}(0) \sim 0,  \tag{A.20}\\
& G^{ \pm}(z) F^{\mp}(0) \sim 0,  \tag{A.21}\\
& G^{ \pm}(z) M_{i}^{ \pm}(0) \sim 0,  \tag{A.22}\\
& G^{ \pm}(z) M_{i}^{\mp}(0) \sim \pm \frac{F_{i}^{ \pm}}{z},  \tag{A.23}\\
& G^{ \pm}(z) F_{i}^{ \pm}(0) \sim 0,  \tag{A.24}\\
& G^{ \pm}(z) F_{i}^{\mp}(0) \sim \frac{M_{i}^{ \pm}}{z^{2}}+\frac{1}{z}\left(\mp 2 J_{S B} M_{i}^{ \pm} \pm J_{F} M_{i}^{ \pm}+\partial M_{i}^{ \pm}\right),  \tag{A.25}\\
& G^{ \pm}(z) G_{i}^{ \pm}(0) \sim 0,  \tag{A.26}\\
& G^{ \pm}(z) G_{i}^{\mp}(0) \sim \pm \frac{\varepsilon_{i j k} M_{i}^{ \pm} M_{j}^{ \pm}}{2 z},  \tag{A.27}\\
& J_{F}(z) J_{F}(0) \sim \frac{1}{3 z^{2}},  \tag{A.28}\\
& J_{F}(z) F^{ \pm}(0) \sim \frac{ \pm F^{ \pm}}{z},  \tag{A.29}\\
& J_{F}(z) M_{i}^{ \pm}(0) \sim \frac{\mp M_{i}^{ \pm}}{3 z},  \tag{A.30}\\
& J_{F}(z) F_{i}^{ \pm}(0) \sim \frac{ \pm F_{i}^{ \pm}}{3 z},  \tag{A.31}\\
& J_{F}(z) G_{i}^{ \pm}(0) \sim \frac{ \pm 2 G_{i}^{ \pm}}{3 z},  \tag{A.32}\\
& F^{ \pm}(z) F^{ \pm}(0) \sim 0,  \tag{A.33}\\
& F^{+}(z) F^{-}(0) \sim \frac{-1}{z^{3}}+\frac{-3 J_{F}}{z^{2}}-\frac{1}{z}\left(\frac{9}{2} J_{F}^{2}+\frac{3}{2} \partial J_{F}\right),  \tag{A.34}\\
& F^{ \pm}(z) M_{i}^{ \pm}(0) \sim \frac{G_{i}^{ \pm}}{z},  \tag{A.35}\\
& F^{ \pm}(z) M_{i}^{\mp}(0) \sim 0,  \tag{A.36}\\
& F^{ \pm}(z) F_{i}^{ \pm}(0) \sim 0,  \tag{A.37}\\
& F^{ \pm}(z) F_{i}^{\mp}(0) \sim \frac{\varepsilon_{i j k} M_{j}^{\mp} M_{k}^{\mp}}{2 z},  \tag{A.38}\\
& F^{ \pm}(z) G_{i}^{ \pm}(0) \sim 0,  \tag{A.39}\\
& F^{ \pm}(z) G_{i}^{\mp}(0) \sim \frac{-M_{i}^{\mp}}{z^{2}}+\frac{\mp 3 J_{F} M_{i}^{\mp}}{z}  \tag{A.40}\\
& M_{i}^{ \pm}(z) M_{j}^{ \pm}(0) \sim 0,  \tag{A.41}\\
& M_{i}^{+}(z) M_{j}^{-}(0) \sim \frac{\delta_{i j}}{z^{2}}-\frac{\delta_{i j}}{z}\left(J_{S B}+J_{F}\right), \tag{A.42}
\end{align*}
$$

$$
\begin{align*}
M_{i}^{ \pm}(z) F_{j}^{ \pm}(0) & \sim \delta_{i j} \frac{G^{ \pm}}{z}  \tag{A.43}\\
M_{i}^{ \pm}(z) F_{j}^{\mp}(0) & \sim \frac{ \pm \varepsilon_{i j k} G_{k}^{\mp}}{z},  \tag{A.44}\\
M_{i}^{ \pm}(z) G_{j}^{ \pm}(0) & \sim \frac{-\varepsilon_{i j k} F_{k}^{ \pm}}{z},  \tag{A.45}\\
M_{i}^{ \pm}(z) G_{j}^{\mp}(0) & \sim \pm \delta_{i j} \frac{F^{\mp}}{z},  \tag{A.46}\\
F_{i}^{ \pm}(z) F_{j}^{ \pm}(0) & \sim 0,  \tag{A.47}\\
F_{i}^{+}(z) F_{j}^{-}(0) & \sim \frac{M_{i}^{-} M_{j}^{+}}{z}, \quad(i \neq j),  \tag{A.48}\\
F_{i}^{+}(z) F_{i}^{-}(0) & \sim \frac{1}{z^{3}}+\frac{1}{z^{2}}\left(J_{F}-2 J_{S B}\right)+\frac{1}{z}\left(J_{S B}^{2}+J_{F}^{2}-J_{S B} J_{F}-M_{i}^{+} M_{i}^{-}-\frac{3}{2} \partial J_{S B}-T\right),  \tag{A.49}\\
F_{i}^{ \pm}(z) G_{i}^{ \pm}(0) & \sim 0,  \tag{A.50}\\
F_{i}^{ \pm}(z) G_{j}^{\mp}(0) & \sim \mp \frac{\varepsilon_{i j k} M_{k}^{ \pm}}{z^{2}}-\frac{1}{z} \varepsilon_{i j k} M_{k}^{ \pm}\left(2 J_{F}-J_{S B}\right),  \tag{A.51}\\
G_{i}^{ \pm}(z) G_{j}^{ \pm}(0) & \sim 0,  \tag{A.52}\\
G_{i}^{+}(z) G_{j}^{-}(0) & \sim-\frac{M_{i}^{+} M_{j}^{-}}{z}, \quad(i \neq j),  \tag{A.53}\\
G_{i}^{+}(z) G_{i}^{-}(0) & \sim \frac{-1}{z^{3}}+\frac{1}{z^{2}}\left(J_{S B}-2 J_{F}\right)+\frac{1}{z}\left(-\frac{3}{2} J_{F}^{2}+3 J_{F} J_{S B}-M_{i}^{+} M_{i}^{-}-\frac{3}{2} \partial J_{F}\right) . \tag{A.54}
\end{align*}
$$

For $N=2$, in order to express the OPE, we define $F_{i}^{ \pm}, i=1,2$ and $F^{ \pm}$by

$$
\begin{array}{ll}
F^{+}=\chi_{1} \chi_{2}:, & F^{-}=\psi_{1} \psi_{2} \\
F_{1}^{+}:=X_{2} \chi_{1}, & F_{2}^{+}:=X_{1} \chi_{2} \\
F_{1}^{-}:=Y_{2} \psi_{1}, & F_{2}^{-}:=Y_{1} \psi_{2}, \tag{A.55}
\end{array}
$$

Then OPE of elements for 2-flavors SQED ( $T[S U(2)]$ theory) is given by

$$
\begin{align*}
T(z) T(0) & \sim \frac{-3}{2 z^{4}}+\frac{2 T}{z^{2}}+\frac{\partial T}{z},  \tag{A.56}\\
T(z) J_{S B}(0) & \sim \frac{J_{S B}}{z^{2}}+\frac{\partial J_{S B}}{z},  \tag{A.57}\\
T(z) G^{ \pm}(0) & \sim \frac{G^{ \pm}}{z^{2}}+\frac{\partial G^{ \pm}}{z},  \tag{A.58}\\
T(z) J_{F}(0) & \sim 0,  \tag{A.59}\\
T(z) F^{ \pm}(0) & \sim 0,  \tag{A.60}\\
T(z) M_{i}^{ \pm}(0) & \sim \frac{3 M_{i}^{ \pm}}{4 z^{2}}+\frac{1}{z}\left( \pm J_{F} M_{i}^{ \pm}+\partial M_{i}^{ \pm}\right),  \tag{A.61}\\
T(z) F_{i}^{ \pm}(0) & \sim \frac{3 F_{i}^{ \pm}}{4 z^{2}}+\frac{1}{2 z}\left(-\varepsilon_{i j} M_{j}^{ \pm} F^{ \pm}+\partial F_{i}^{ \pm}\right),  \tag{A.62}\\
J_{S B}(z) J_{S B}(0) & \sim \frac{-1}{2 z^{2}},  \tag{A.63}\\
J_{S B}(z) G^{ \pm}(0) & \sim \frac{ \pm G^{ \pm}}{z}, \tag{A.64}
\end{align*}
$$

$$
\begin{align*}
