

Vanishing dissipation limit for non-isentropic Navier-Stokes equations with shock data

Feimin Huang*, Teng Wang[†]

Abstract

This paper is concerned with the vanishing dissipation limiting problem of one-dimensional non-isentropic Navier-Stokes equations with shock data. The limiting problem was solved in 1989 by Hoff-Liu in [13] for isentropic gas with single shock, but was left open for non-isentropic case. In this paper, we solve the non-isentropic case, i.e., we first establish the global existence of solutions to the non-isentropic Navier-Stokes equations with initial discontinuous shock data, and then show these solutions converge in L^∞ norm to a single shock wave of the corresponding Euler equations away from the shock curve in any finite time interval, as both the viscosity and heat-conductivity tend to zero.

Different from [13] in which an integrated system was essentially used, motivated by [21, 22], we introduce a time-dependent shift $\mathbf{X}^\varepsilon(t)$ to the viscous shock so that a weighted Poincaré inequality can be applied to overcome the difficulty generated from the “bad” sign of the derivative of viscous shock velocity, and the anti-derivative technique is not needed. We also obtain an intrinsic property of non-isentropic viscous shock, see Lemma 2.2 below. With the help of Lemma 2.2, we can derive the desired uniform a priori estimates of solutions, which can be shown to converge in L^∞ norm to a single inviscid shock in any given finite time interval away from the shock, as the vanishing dissipation limit. Moreover, the shift $\mathbf{X}^\varepsilon(t)$ tends to zero in any finite time as viscosity tends to zero. The proof consists of a scaling argument, L^2 -contraction technique with time-dependent shift to the shock, and relative entropy method.

Key words and phrases: vanishing dissipation limit, compressible Navier-Stokes equations, shock wave

1 Introduction

In this paper, we are concerned with the one-dimensional non-isentropic compressible Navier-Stokes system in Lagrangian coordinates:

$$\begin{cases} v_t - u_x = 0, \\ u_t + p_x = \varepsilon \left(\frac{u_x}{v} \right)_x, \\ \left(e + \frac{u^2}{2} \right)_t + (pu)_x = \left(\kappa \frac{\theta_x}{v} + \varepsilon \frac{uu_x}{v} \right)_x \end{cases} \quad (1.1)$$

for $t > 0$, $x \in \mathbb{R} = (-\infty, +\infty)$, where the unknown functions $v = v(t, x) > 0$, $u = u(t, x)$ and $\theta = \theta(t, x) > 0$ represent the specific volume, fluid velocity and an absolute temperature, respectively. Here we consider the polytropic gas, that is, the pressure p and the internal energy e are explicitly given as functions of the specific volume v and the absolute temperature θ :

$$p = \frac{R\theta}{v} = Av^{-\gamma} \exp\left(\frac{\gamma-1}{R}S\right), \quad e = \frac{R\theta}{\gamma-1} + \text{constant},$$

where S is the entropy, $\gamma > 1$ is the adiabatic exponent, and A and R are both positive constants. In addition, $\varepsilon > 0$ is the viscosity constant and $\kappa > 0$ is the coefficient of heat-conductivity. We consider the following Riemann initial data

$$(v, u, \theta)(0, x) = \begin{cases} (v_-, u_-, \theta_-), & x < 0, \\ (v_+, u_+, \theta_+), & x > 0, \end{cases} \quad (1.2)$$

where $v_{\pm}(> 0)$, u_{\pm} and $\theta_{\pm}(> 0)$ are given constants.

As in [20], we assume the viscosity ε and the heat-conductive coefficient κ satisfy

$$\begin{cases} \kappa = O(\varepsilon), & \text{as } \varepsilon \rightarrow 0; \\ \frac{\kappa(\varepsilon)}{\varepsilon} \geq c > 0, & \text{as } \varepsilon \rightarrow 0, \end{cases} \quad (1.3)$$

for some positive constant c . Then the non-isentropic compressible Navier-Stokes system (1.1) formally converges to the corresponding non-isentropic compressible Euler system as $\varepsilon \rightarrow 0+$,

$$\begin{cases} v_t - u_x = 0, \\ u_t + p_x = 0, \\ \left(e + \frac{u^2}{2} \right)_t + (pu)_x = 0. \end{cases} \quad (1.4)$$

A fundamental and challenging problem in mathematics is whether the vanishing dissipation limit of the solution of the Navier-Stokes equations to the Euler equations could be proved rigorously. Because the inviscid Euler system (1.4) usually contains discontinuities, such as shock waves and contact discontinuities, it is difficult to show the limit in the general setting, especially for the discontinuous initial data. Essential new ideas and methods are needed to handle this problem. Therefore, any attempt on this problem that involves the singularity in the inviscid solution can be viewed as progress towards this general program.

There is an extensive literature on the vanishing viscosity limit to the inviscid compressible flow in one space dimension. For a system of hyperbolic conservation laws with artificial viscosity, Goodman-Xin [11] studied the limit to the piecewise smooth solutions having a finite number of noninteracting shocks. Later, Yu [37] improved the results of [11] to allow initial layers by a detailed pointwise analysis. As a breakthrough result, Bianchini-Bressan [1] proved the vanishing viscosity limit to a strictly hyperbolic $n \times n$ system with small BV initial data. It is noted that the work of [1] essentially depends on the viscosity matrix $\varepsilon \mathbb{I}$. There are other interesting works on the inviscid limit for small BV solution, see [2, 3, 4] and the references therein. For L^∞ entropy solution, which is less regular than the BV solution, the vanishing artificial viscosity limit to the isentropic Euler equations with large L^∞ initial data has been established by DiPerna [9], Chen [5, 6, 7], Lions-Perthame-Souganidis [27], Lions-Perthame-Tadmor [28], Huang-Wang [19], Schrecker-Schulz [31] via the method of compensated compactness. See also Ding-Chen-Luo [8] for numerical approximation limit. However, little information on the L^∞ entropy solutions is known through the compensated compactness.

The study on the vanishing physical viscosity was initiated by Stokes [32]. The first rigorous limit of viscous shock layer from the Navier-Stokes system to the Euler system was obtained by Gilbarg [10]. Hoff-Liu [13] in 1989 first proved the vanishing viscosity limit for piecewise constant shock. Indeed, they showed that the solution of the isentropic Navier-Stokes system with initial shock data exists all the time and converges to the inviscid single shock as the viscosity vanishes, uniformly away from the shock. Zhang-Pan-Tan [38] extended the result of [13] to a composite wave consisting of two shocks. However, the limiting problem toward a single shock was left open for non-isentropic case until now.

In the present paper, we solve the limiting problem mentioned above, that is, the vanishing dissipation limit to a single shock for non-isentropic Navier-Stokes system (1.1) with initial shock data (1.2). More precisely, we prove that the solution of the system (1.1) exists for all time with discontinuous initial data (1.2), and converges in L^∞ norm to a single inviscid shock on any given finite time interval away from the shock, as the viscosity and heat-conductive coefficients tend to zero. This gives a rigorous mathematical

justification of the limit for the non-isentropic compressible Navier-Stokes system in the presence of single shock wave.

We now introduce some preliminary notations and give some background materials before stating the main theorem. The inviscid system (1.4) has three distinct eigenvalues for positive v and θ

$$\lambda_1(v, \theta) = -\frac{\sqrt{\gamma R \theta}}{v}, \quad \lambda_2 = 0, \quad \lambda_3(v, \theta) = \frac{\sqrt{\gamma R \theta}}{v},$$

which implies the first and third characteristic fields are genuinely nonlinear and the second field is linearly degenerate. In this paper, we focus our attention on the single shock case, that is, the entropy solution of inviscid system (1.4) with (1.2) is a single shock wave.

We firstly recall the shock wave curve in the phase plane (v, u, θ) . Given the right end state (v_+, u_+, θ_+) , the i -shock wave curve of the Euler equations (1.4) for the left end state (v, u, θ) is defined as follows:

- i -shock wave curve ($i = 1, 3$),

$$S_i(v_+, u_+, \theta_+) := \left\{ (v, u, \theta) \left| \begin{array}{l} -s_i(v_+ - v) - (u_+ - u) = 0, \\ -s_i(u_+ - u) + (p_+ - p) = 0, \quad \text{and} \quad \lambda_i^+ < s_i < \lambda_i^-, \\ -s_i \left[e_+ + \frac{u_+^2}{2} - \left(e + \frac{u^2}{2} \right) \right] + (p_+ u_+ - pu) = 0, \end{array} \right. \right\},$$

where $e_+ = \frac{R\theta_+}{\gamma-1} + \text{constant}$, $p_+ = \frac{R\theta_+}{v_+}$, $\lambda_i^\pm = \lambda_i(v_\pm, \theta_\pm)$, and s_i is the i -shock speed.

It is known that the solution to the Riemann problem (1.4), (1.2) admits a 3-shock wave if $(v_-, u_-, \theta_-) \in S_3(v_+, u_+, \theta_+)$ (cf. [26]) and the explicit formula of 3-shock wave is given as

$$(v^S, u^S, \theta^S)(t, x) := \begin{cases} (v_-, u_-, \theta_-), & x < s_3 t, \\ (v_+, u_+, \theta_+), & x > s_3 t, \end{cases} \quad (1.5)$$

where (v_-, u_-, θ_-) , (v_+, u_+, θ_+) and the shock speed s_3 are constants satisfying the Rankine-Hugoniot (R-H) condition

$$\begin{cases} -s_3(v_+ - v_-) - (u_+ - u_-) = 0, \\ -s_3(u_+ - u_-) + (p_+ - p_-) = 0, \\ -s_3 \left[e_+ + \frac{u_+^2}{2} - \left(e_- + \frac{(u_-)^2}{2} \right) \right] + (p_+ u_+ - p_- u_-) = 0, \end{cases} \quad (1.6)$$

and Lax' shock condition that

$$\lambda_3^+ < s_3 < \lambda_3^- \quad (1.7)$$

with $\lambda_3^+ = \lambda_3(v_+, \theta_+)$ and $\lambda_3^- = \lambda_3(v_-, \theta_-)$. Note that (1.7) is equivalent to

$$u_+ < u_- \quad (\text{or } s_3(v_+ - v_-) > 0).$$

We denote the strength of 3-shock wave by $\delta = |p_- - p_+|$, where $p_\pm = \frac{R\theta_\pm}{v_\pm}$. It follows from the R-H condition (1.6) that δ is equivalent to $|v_- - v_+| + |u_- - u_+| + |\theta_- - \theta_+|$.

We are ready to state our main theorem on the vanishing dissipation limit of solution for the non-isentropic compressible Navier-Stokes equations (1.1) with initial shock data (1.2).

Theorem 1.1 *For any given (v_+, u_+, θ_+) , suppose $(v_-, u_-, \theta_-) \in S_3(v_+, u_+, \theta_+)$. Let $(v^S, u^S, \theta^S)(t, x)$ be the 3-shock wave defined in (1.5) and the viscosity and heat-conductivity satisfy (1.3). Then there exist positive constants δ_0, ε_0 independent of time t , such that if $\varepsilon \leq \varepsilon_0$ and the wave strength $\delta \leq \delta_0$, the initial value problem (1.1), (1.2) admits a unique global piecewise smooth solution $(v^\varepsilon, u^\varepsilon, \theta^\varepsilon)(t, x)$, for each $\varepsilon > 0$, satisfying the following properties:*

- u^ε and θ^ε are continuous for $t > 0$; $u_x^\varepsilon, \theta_x^\varepsilon, v^\varepsilon, v_x^\varepsilon$ and v_t^ε are uniformly Hölder continuous in the sets $\{(t, x) | t \geq \tau, x < 0\}$ and $\{(t, x) | t \geq \tau, x > 0\}$ for any $\tau > 0$; $u_t^\varepsilon, u_{xx}^\varepsilon, v_{xt}^\varepsilon, \theta_t^\varepsilon$ and θ_{xx}^ε are Hölder continuous on compact set in $\{(t, x) | t > 0, x \neq 0\}$. Moreover, the jumps in $v^\varepsilon(t, x)$, $u_x^\varepsilon(t, x)$ and $\theta_x^\varepsilon(t, x)$ at $x = 0$ satisfy

$$[[v^\varepsilon(t, 0)]], \quad [[u_x^\varepsilon(t, 0)]], \quad [[\theta_x^\varepsilon(t, 0)]] \leq C e^{-\frac{ct}{\varepsilon}},$$

where C and c are positive constants independent of t and ε .

• Let T be a positive constant, then the solutions $(v^\varepsilon, u^\varepsilon, \theta^\varepsilon)(t, x)$ converge to the 3-shock wave $(v^S, u^S, \theta^S)(t, x)$ up to time T , as $\varepsilon \rightarrow 0$, uniformly away from $t = 0$ and the shock, i.e., for any positive number h , we have

$$\lim_{\varepsilon \rightarrow 0} \sup_{h \leq t \leq T} \sup_{|x - s_3 t| \geq h} |(v^\varepsilon, u^\varepsilon, \theta^\varepsilon)(t, x) - (v^S, u^S, \theta^S)(t, x)| = 0. \quad (1.8)$$

Remark 1 Hoff-Liu [13] in 1989 first investigated the inviscid limit to a single shock for isentropic Navier-Stokes equations. However, the corresponding result for non-isentropic case remains open until now. Our main result in Theorem 1.1 solves the limiting problem to a single shock for non-isentropic case.

Remark 2 Our result still holds for the case 1-shock, since the proof for 1-shock is identical.

Before sketching our strategy to prove Theorem 1.1, we give a brief recall of the interesting work of Hoff-Liu [13]. Since the anti-derivative technique is used, the initial perturbation in the anti-derivative form $\|\int_{-\infty}^x (U - \Phi)(y, 0) dy\|_{L^2}$ is around $\delta^{-1/2}$, which is large as δ is small, and this brings new challenge in the small perturbation framework. Here U is the solution of Navier-Stokes equations and Φ is the traveling wave. A key observation in [13] is that $\|\int_{-\infty}^x (U - \Phi)(y, t) dy\|_{L^2}^2$ is of the order $\delta^{a_1}(t+1)^{b_1}$ (where $a_1 - 2b_1 \geq 0$) and $\|U - \Phi\|_{L^2}^2$ is of the order $\delta^{a_2}(t+1)^{b_2}$ (where $a_2 - 2b_2 \geq 1$), and this leads to the desired smallness of the L^∞ -norm of $\int_{-\infty}^x (U - \Phi)(y, t) dy$ at $t = \delta^{-2-\vartheta}$ so that the small perturbation framework is still available on $t > \delta^{-2-\vartheta}$.

However, the above method in [13] can not be applied directly to the non-isentropic flow (1.1) since $\int_{-\infty}^x (U - \Phi)(t, y) dy$ may not belong to L^2 space. In fact, the vanishing dissipation limit problem to a single shock for the non-isentropic Navier-Stokes system has been open for long time. In this paper, we solve this open problem. Motivated by the L^2 contraction method developed in [21, 22], we study the limiting problem in the original H^1 -perturbation framework instead of the anti-derivative technique. Different from [21, 22, 23] for the isentropic system, it is hard to introduce the new effective velocity for the non-isentropic system (1.1) since the pressure p is a function of both the specific volume v and the absolute temperature θ . Instead, we decompose the “bad” term in (4.7) in form of the velocity u by Taylor expansion with small viscosity and wave strength (see (4.7)). Then, we derive a uniform estimate in the new variable on the variable transformation. The key point is to establish Lemma 2.2 based on the underlying structure of non-isentropic viscous shock wave, which is quite different from the isentropic case, where the pressure is a function only in the specific volume v . Thus, with the help of the inequality (2.4), we can obtain the L^2 -contraction around viscous shock profile for non-isentropic case by introducing a suitable shift $\mathbf{X}^\varepsilon(t)$ and a weighted Poincaré inequality (2.11). Moreover, the shift $\mathbf{X}^\varepsilon(t)$ is shown to tend to zero in any finite time interval as the viscosity tends to zero. Thus we can prove that the solutions of the non-isentropic Navier-Stokes equations (1.1) converge to a single inviscid shock as the viscosity and heat-conductive coefficients tend to zero, away from the shock.

There are other interesting works on the inviscid limit of compressible Navier-Stokes equations in the presence of basic wave patterns, see [15, 16, 17, 18, 20, 22, 29, 34, 35, 36, 39], and the references cited therein. In particular, Kang-Vasseur [22] proved the stability and uniqueness of inviscid shock in the relative entropy form for p -system in the weak sense through the vanishing viscosity limit from the Navier-Stokes system.

Recently, the L^2 -contraction method is also employed in [23] to prove the time asymptotic stability of composite waves with a viscous shock and a rarefaction wave to the isentropic Navier-Stokes equations, which solves an important open problem proposed by Matsumura-Nishihara [30] in 1992. We refer to [24] for the case of a viscous shock, a viscous contact wave, and an inviscid rarefaction wave to the non-isentropic Navier-Stokes system (1.1).

The rest part of the paper is organized as follows. In Sect. 2, we construct the smooth viscous shock wave and show its properties. In Sect. 3, we prove our main vanishing dissipation limit result by continuation arguments. In Sect. 4, we prove a-priori estimates in Proposition 3.3.

Notation. In the paper, we always use the notation $f_{\mathbb{R}} = \int_{\mathbb{R}_-} + \int_{\mathbb{R}_+}$, $\|\cdot\|$ to denote the usual $L^2(\mathbb{R})$ norm, $\|\cdot\|$ to denote the piecewise $L^2(\mathbb{R}_\pm)$ norm, that is, $\|f\|^2 = \int_{\mathbb{R}} f^2 dx$. $\|\cdot\|_{H^1}$ and $\|\cdot\|_{H^1}$ represent

the $H^1(\mathbb{R})$ and $H^1(\mathbb{R}_\pm)$ norm, respectively. And the notation $[f]$ represents the jump of the function f at $x = 0$ or $y = 0$ if without confusion.

2 Viscous shock wave

Now we recall the definitions of viscous shock waves of (1.1) which correspond to the shock wave (1.5). We see that the 3–viscous shock wave which corresponds to the 3–shock wave is a traveling wave solution of (1.1) with the formula $(V^\varepsilon, U^\varepsilon, \Theta^\varepsilon)(\xi)$ which is determined by

$$\begin{cases} -s_3(V^\varepsilon)' - (U^\varepsilon)' = 0, \\ -s_3(U^\varepsilon)' + (P^\varepsilon)' = \varepsilon \left(\frac{(U^\varepsilon)'}{V^\varepsilon} \right)', & ' := \frac{d}{d\xi}, \quad \xi = x - s_3t, \\ -s_3 \left(\frac{R\Theta^\varepsilon}{\gamma-1} + \frac{(U^\varepsilon)^2}{2} \right)' + (P^\varepsilon U^\varepsilon)' = \kappa \left(\frac{(\Theta^\varepsilon)'}{V^\varepsilon} \right)' + \varepsilon \left(\frac{(U^\varepsilon)'U^\varepsilon}{V^\varepsilon} \right)', \end{cases} \quad (2.1)$$

and

$$(V^\varepsilon, U^\varepsilon, \Theta^\varepsilon)(-\infty) = (v_-, u_-, \theta_-), \quad (V^\varepsilon, U^\varepsilon, \Theta^\varepsilon)(+\infty) = (v_+, u_+, \theta_+), \quad (2.2)$$

where $P^\varepsilon = P(V^\varepsilon, \Theta^\varepsilon) = \frac{R\Theta^\varepsilon}{V^\varepsilon}$, and $(v_\pm, u_\pm, \theta_\pm)$ satisfy the R-H condition (1.6) and Lax entropy condition (1.7), and the shock speed s_3 is uniquely determined by (1.6). The existence and uniqueness (up to a shift in ξ) of the solution of (2.1), (2.2) can be found in [25].

The property of the 3–viscous shock wave $(V^\varepsilon, U^\varepsilon, \Theta^\varepsilon)(x - s_3t)$ are summarized in the following lemma, which can be found in [14, 25].

Lemma 2.1 ([14, 25]) *Let $(V^\varepsilon, U^\varepsilon, \Theta^\varepsilon)$ be the smooth 3–viscous shock wave with the strength $\delta = |p_- - p_+|$*

$$(i) \quad U_x^\varepsilon = -s_3 V_x^\varepsilon < 0, \quad s_3 \Theta_x^\varepsilon < 0, \quad x \in \mathbb{R}, \quad t \geq 0,$$

(ii) *There exist positive constants c and C which depend only on (v_-, u_-, θ_-) and (v_+, u_+, θ_+) such that*

$$\begin{aligned} |(V^\varepsilon - v_-, U^\varepsilon - u_-, \Theta^\varepsilon - \theta_-)| &\leq C\delta e^{-c\delta \frac{|x-s_3t|}{\varepsilon}}, \quad x < s_3t, \quad t \geq 0, \\ |(V^\varepsilon - v_+, U^\varepsilon - u_+, \Theta^\varepsilon - \theta_+)| &\leq C\delta e^{-c\delta \frac{|x-s_3t|}{\varepsilon}}, \quad x > s_3t, \quad t \geq 0, \\ |(V_x^\varepsilon, U_x^\varepsilon, \Theta_x^\varepsilon)| &\leq C \frac{\delta^2}{\varepsilon} e^{-c\delta \frac{|x-s_3t|}{\varepsilon}}, \quad x \in \mathbb{R}, \quad t \geq 0, \\ |(V_{xx}^\varepsilon, U_{xx}^\varepsilon, \Theta_{xx}^\varepsilon)| &\leq C \frac{\delta}{\varepsilon} |(V_x^\varepsilon, U_x^\varepsilon, \Theta_x^\varepsilon)|, \quad x \in \mathbb{R}, \quad t \geq 0. \end{aligned}$$

(iii) *There exist positive constants c and C which depend only on (v_-, u_-, θ_-) and (v_+, u_+, θ_+) such that*

$$\left| s_3^2 - \frac{\gamma p_-}{v_-} \right| \leq C\delta, \quad \left| s_3^2 - \frac{\gamma p_+}{v_+} \right| \leq C\delta.$$

Proof: The estimates in (i) and (ii) can be shown by direct calculations, we omit the proof. In the following, we prove (iii). Integrating (2.1) over \mathbb{R} , we have

$$\begin{aligned} 0 &= -\frac{R}{\gamma-1}(\theta_+ - \theta_-) - p_-(v_+ - v_-) + \frac{s_3^2}{2}(v_+ - v_-)^2 \\ &= -\frac{R\theta_-}{\gamma-1} \left(\frac{\theta_+}{\theta_-} - 1 \right) - R\theta_- \left(\frac{v_+}{v_-} - 1 \right) + \frac{s_3^2 v_-^2}{2} \left(\frac{v_+}{v_-} - 1 \right)^2, \end{aligned}$$

which leads to

$$\frac{\theta_+}{\theta_-} - 1 = -(\gamma-1) \left(\frac{v_+}{v_-} - 1 \right) + \frac{\gamma-1}{R\theta_-} \frac{s_3^2 v_-^2}{2} \left(\frac{v_+}{v_-} - 1 \right)^2. \quad (2.3)$$

Note that the R-H condition (1.6) and (2.3) give

$$\begin{aligned} s_3^2 &= -\frac{p_+ - p_-}{v_+ - v_-} = -\frac{p_-}{v_+} \left(\frac{\theta_+}{\theta_-} - \frac{v_+}{v_-} \right) / \left(\frac{v_+}{v_-} - 1 \right) = \frac{p_-}{v_+} \left[1 - \left(\frac{\theta_+}{\theta_-} - 1 \right) / \left(\frac{v_+}{v_-} - 1 \right) \right] \\ &= \frac{p_-}{v_+} \left[1 - \left(-(\gamma - 1) + \frac{\gamma - 1}{R\theta_-} \frac{s_3^2 v_-^2}{2} \left(\frac{v_+}{v_-} - 1 \right) \right) \right] = \frac{\gamma p_-}{v_+} - \frac{\gamma - 1}{2v_+} s_3^2 (v_+ - v_-), \end{aligned}$$

which yields (iii). \square

Remark 3 In [14, 25], it requires $1 < \gamma \leq 2$. In fact, as pointed in [14], this condition might be removed by more careful and complicated estimates.

The following lemma plays a crucial role to obtain the extra weak dissipation effect along the shock propagation direction, which fully used the compressible structure of the non-isentropic viscous shock wave.

Lemma 2.2 Let $(V^\varepsilon, U^\varepsilon, \Theta^\varepsilon)$ be the 3-viscous shock wave with strength $\delta = |p_- - p_+|$, then there exists positive constant C such that

$$\left| \frac{V^\varepsilon - v_-}{P^\varepsilon - p_-} - \frac{V^\varepsilon - v_+}{P^\varepsilon - p_+} - \frac{\gamma + 1}{2\gamma p_+} \frac{R\varepsilon\gamma}{\kappa(\gamma - 1)^2 + R\varepsilon\gamma} (v_+ - v_-) \right| \leq C\delta^2, \quad (2.4)$$

where $p_\pm = \frac{R\theta_\pm}{v_\pm}$ and $P^\varepsilon = P(V^\varepsilon, \Theta^\varepsilon) = \frac{R\Theta^\varepsilon}{V^\varepsilon}$.

Proof: Integrating (2.1) over $[\xi, +\infty)$ or $(-\infty, \xi]$, we have

$$\begin{aligned} \frac{\kappa\Theta_x^\varepsilon}{s_3V} &= -\frac{R}{\gamma - 1} (\Theta^\varepsilon - \theta_\pm) - p_\pm (V^\varepsilon - v_\pm) + \frac{s_3^2}{2} (V^\varepsilon - v_\pm)^2 \\ &= -\frac{R\theta_\pm}{\gamma - 1} \left(\frac{\Theta^\varepsilon}{\theta_\pm} - 1 \right) - R\theta_\pm \left(\frac{V^\varepsilon}{v_\pm} - 1 \right) + \frac{s_3^2 v_\pm^2}{2} \left(\frac{V^\varepsilon}{v_\pm} - 1 \right)^2, \end{aligned} \quad (2.5)$$

which together with (iii) in Lemma 2.1 gives

$$\begin{aligned} \frac{\Theta^\varepsilon}{\theta_\pm} - 1 &= -(\gamma - 1) \left(\frac{V^\varepsilon}{v_\pm} - 1 \right) + \frac{\gamma - 1}{R\theta_\pm} \frac{s_3^2 v_\pm^2}{2} \left(\frac{V^\varepsilon}{v_\pm} - 1 \right)^2 - \frac{\gamma - 1}{R\theta_\pm} \frac{\kappa\Theta_x^\varepsilon}{s_3V^\varepsilon} \\ &= -(\gamma - 1) \left(\frac{V^\varepsilon}{v_\pm} - 1 \right) + \frac{\gamma(\gamma - 1)}{2} \left(\frac{V^\varepsilon}{v_\pm} - 1 \right)^2 - \frac{\gamma - 1}{R\theta_\pm} \frac{\kappa\Theta_x^\varepsilon}{s_3V^\varepsilon} + O(\delta^3). \end{aligned} \quad (2.6)$$

Then, using (2.6), we have

$$\begin{aligned} \frac{V^\varepsilon - v_-}{P^\varepsilon - p_-} - \frac{V^\varepsilon - v_+}{P^\varepsilon - p_+} &= \frac{V^\varepsilon}{p_-} \left(\frac{V^\varepsilon}{v_-} - 1 \right) / \left(\frac{\Theta^\varepsilon}{\theta_-} - \frac{V^\varepsilon}{v_-} \right) - \frac{V^\varepsilon}{p_+} \left(\frac{V^\varepsilon}{v_+} - 1 \right) / \left(\frac{\Theta^\varepsilon}{\theta_+} - \frac{V^\varepsilon}{v_+} \right) \\ &= \frac{V^\varepsilon}{p_-} \frac{1}{\left(\frac{\Theta^\varepsilon}{\theta_-} - 1 \right) / \left(\frac{V^\varepsilon}{v_-} - 1 \right) - 1} - \frac{V^\varepsilon}{p_+} \frac{1}{\left(\frac{\Theta^\varepsilon}{\theta_+} - 1 \right) / \left(\frac{V^\varepsilon}{v_+} - 1 \right) - 1} \\ &= \left(\frac{V^\varepsilon}{p_-} - \frac{V^\varepsilon}{p_+} \right) \frac{1}{\left(\frac{\Theta^\varepsilon}{\theta_-} - 1 \right) / \left(\frac{V^\varepsilon}{v_-} - 1 \right) - 1} \\ &\quad + \frac{V^\varepsilon}{p_+} \left[\frac{1}{\left(\frac{\Theta^\varepsilon}{\theta_-} - 1 \right) / \left(\frac{V^\varepsilon}{v_-} - 1 \right) - 1} - \frac{1}{\left(\frac{\Theta^\varepsilon}{\theta_+} - 1 \right) / \left(\frac{V^\varepsilon}{v_+} - 1 \right) - 1} \right] \\ &=: I_1 + I_2. \end{aligned} \quad (2.7)$$

It follows from (2.3) that

$$\begin{aligned} p_- - p_+ &= R \left(\frac{\theta_-}{v_-} - \frac{\theta_+}{v_+} \right) = \frac{R\theta_-}{v_+} \left(\frac{v_+}{v_-} - \frac{\theta_+}{\theta_-} \right) = \frac{R\theta_-}{v_+} \left[\left(\frac{v_+}{v_-} - 1 \right) - \left(\frac{\theta_+}{\theta_-} - 1 \right) \right] \\ &= \frac{R\theta_-}{v_+} \gamma \left(\frac{v_+}{v_-} - 1 \right) + O(\delta^2) = \frac{\gamma p_+}{v_+} (v_+ - v_-) + O(\delta^2). \end{aligned} \quad (2.8)$$

Then, using (2.6) and (2.8), we have

$$\begin{aligned} I_1 &= \frac{V^\varepsilon(p_+ - p_-)}{p_- p_+} \left/ \left(-\gamma + \frac{\gamma(\gamma-1)}{2} \left(\frac{V^\varepsilon}{v_-} - 1 \right) - \frac{\gamma-1}{p_-} \frac{\kappa\Theta_x^\varepsilon}{s_3 V^\varepsilon} \frac{1}{V^\varepsilon - v_-} + O(\delta^2) \right) \right. \\ &= \frac{v_+}{\gamma p_+^2} (p_- - p_+) + O(\delta^2) = \frac{1}{p_+} (v_+ - v_-) + O(\delta^2). \end{aligned} \quad (2.9)$$

It follows from (2.6) and (2.8) that

$$\begin{aligned} I_2 &= \frac{V^\varepsilon}{p_+} \left[1 / \left(-\gamma + \frac{\gamma(\gamma-1)}{2} \left(\frac{V^\varepsilon}{v_-} - 1 \right) - \frac{\gamma-1}{p_-} \frac{\kappa\Theta_x^\varepsilon}{s_3 V^\varepsilon} \frac{1}{V^\varepsilon - v_-} + O(\delta^2) \right) \right. \\ &\quad \left. - 1 / \left(-\gamma + \frac{\gamma(\gamma-1)}{2} \left(\frac{V^\varepsilon}{v_+} - 1 \right) - \frac{\gamma-1}{p_+} \frac{\kappa\Theta_x^\varepsilon}{s_3 V^\varepsilon} \frac{1}{V^\varepsilon - v_+} + O(\delta^2) \right) \right] \\ &= \frac{V^\varepsilon}{\gamma^2 p_+} \left[\frac{\gamma(\gamma-1)}{2} V^\varepsilon \left(\frac{1}{v_+} - \frac{1}{v_-} \right) + \frac{\gamma-1}{p_+} \frac{\kappa\Theta_x^\varepsilon}{s_3 V^\varepsilon} \left(\frac{1}{V^\varepsilon - v_-} - \frac{1}{V^\varepsilon - v_+} \right) \right. \\ &\quad \left. + (\gamma-1) \left(\frac{1}{p_-} - \frac{1}{p_+} \right) \frac{\kappa\Theta_x^\varepsilon}{s_3 V^\varepsilon} \frac{1}{V^\varepsilon - v_-} \right] + O(\delta^2) \\ &= -\frac{\gamma-1}{2\gamma p_+} (v_+ - v_-) + \frac{(\gamma-1)v_+}{\gamma^2 p_+^2} \frac{\kappa\Theta_x^\varepsilon}{s_3 V^\varepsilon} \left(\frac{1}{V^\varepsilon - v_-} - \frac{1}{V^\varepsilon - v_+} \right) + O(\delta^2), \end{aligned}$$

using (2.5), (2.8) and (iii) in Lemma 2.1, we have

$$\begin{aligned} &\frac{\kappa\Theta_x^\varepsilon}{s_3 V^\varepsilon} \left(\frac{1}{V^\varepsilon - v_-} - \frac{1}{V^\varepsilon - v_+} \right) \\ &= \frac{R}{\gamma-1} \left(\frac{\Theta^\varepsilon - \theta_+}{V^\varepsilon - v_+} - \frac{\Theta^\varepsilon - \theta_-}{V^\varepsilon - v_-} \right) + (p_+ - p_-) + \frac{s_3^2}{2} (v_+ - v_-) \\ &= \frac{R\varepsilon\gamma^2 - 2\kappa\gamma(\gamma-1)}{\kappa(\gamma-1)^2 + R\varepsilon\gamma} \frac{p_-}{2v_-} (v_+ - v_-) - \frac{\gamma p_+}{v_+} (v_+ - v_-) + \frac{\gamma p_+}{2v_+} (v_+ - v_-) + O(\delta^2) \\ &= \frac{R\varepsilon\gamma^2 - 2\kappa\gamma(\gamma-1)}{\kappa(\gamma-1)^2 + R\varepsilon\gamma} \frac{p_+}{2v_+} (v_+ - v_-) - \frac{\gamma p_+}{2v_+} (v_+ - v_-) + O(\delta^2), \end{aligned}$$

where we have used the fact (see formula (B.5) of [24]) that

$$\frac{\Theta^\varepsilon - \theta_+}{V^\varepsilon - v_+} - \frac{\Theta^\varepsilon - \theta_-}{V^\varepsilon - v_-} = \frac{\gamma-1}{2R} \frac{R\varepsilon\gamma^2 - 2\kappa\gamma(\gamma-1)}{\kappa(\gamma-1)^2 + R\varepsilon\gamma} \frac{p_-}{v_-} (v_+ - v_-) + O(\delta^2).$$

Thus we have

$$I_2 = -\frac{\gamma-1}{\gamma p_+} (v_+ - v_-) + \frac{\gamma-1}{2\gamma p_+} \frac{R\varepsilon\gamma^2 - 2\kappa\gamma(\gamma-1)}{\kappa(\gamma-1)^2 + R\varepsilon\gamma} (v_+ - v_-) + O(\delta^2). \quad (2.10)$$

Finally, we substitute (2.9) and (2.10) into (2.7) to obtain the desired inequality (2.4), and the proof of Lemma 2.2 is completed. \square

Finally, we introduce a one-dimensional weighted sharp Poincaré type inequality, whose proof can be found in [21] and plays a very important role in our stability analysis.

Lemma 2.3 (Lemma 2.9 [21]) *For any $f : [0, 1] \rightarrow \mathbb{R}$ satisfying $\int_0^1 z(1-z)|f'|^2 dz < \infty$, it holds*

$$\int_0^1 \left| f - \int_0^1 f dz \right|^2 dz \leq \frac{1}{2} \int_0^1 z(1-z)|f'|^2 dz. \quad (2.11)$$

3 Proof of the main result

In this section, we will prove our main result, Theorem 1.1. Introduce the following scaled variables

$$y = \frac{x}{\varepsilon}, \quad \tau = \frac{t}{\varepsilon}, \quad (3.1)$$

and set

$$(v^\varepsilon, u^\varepsilon, \theta^\varepsilon)(t, x) = (v, u, \theta)(\tau, y).$$

Then the new unknown function $(v, u, \theta)(\tau, y)$ satisfies the system

$$\begin{cases} v_\tau - u_y = 0, \\ u_\tau + p_y = \left(\frac{u_y}{v}\right)_y, \\ \frac{R}{\gamma-1}\theta_\tau + pu_y = \nu \left(\frac{\theta_y}{v}\right)_y + \frac{u_y^2}{v} \end{cases} \quad (3.2)$$

with initial data

$$(v, u, \theta)(0, y) = \begin{cases} (v_-, u_-, \theta_-), & y < 0, \\ (v_+, u_+, \theta_+), & y > 0, \end{cases} \quad (3.3)$$

where $\nu = \frac{\underline{\nu}}{\varepsilon}$ denotes the coefficient of scaled heat conductivity and satisfies $\underline{\nu} \leq \nu \leq \bar{\nu}$, uniformly in $\varepsilon \rightarrow 0+$, for some positive constants $\underline{\nu}$ and $\bar{\nu}$.

3.1 Construction of the shift

Here and in what follows, we introduce the notation: for any function $f : \mathbb{R}^+ \times \mathbb{R} \rightarrow \mathbb{R}$ and the shift $\mathbf{X}(\tau)$,

$$f^{-\mathbf{X}} := f(\tau, y - \mathbf{X}(\tau)).$$

The shift $\mathbf{X}(\tau)$ is defined as a solution to the ODE:

$$\begin{cases} \dot{\mathbf{X}}(\tau) = -\frac{M}{\delta} \int_{\mathbb{R}} a^{-\mathbf{X}} \left(-\frac{P^{-\mathbf{X}} V_y^{-\mathbf{X}}}{s_3 V^{-\mathbf{X}}} + U_y^{-\mathbf{X}} + \frac{p_+ \Theta_y^{-\mathbf{X}}}{s_3 \Theta^{-\mathbf{X}}} \right) (u - U^{-\mathbf{X}}) dy, \\ \mathbf{X}(0) = 0 \end{cases} \quad (3.4)$$

with the constant $M = \frac{(\gamma+1)^2}{2\alpha_+ v_+^2} \frac{2\nu(\gamma-1)^2 + R\gamma}{\nu(\gamma-1)^2 + R\gamma}$. Here $a(\cdot) : \mathbb{R} \rightarrow \mathbb{R}$ is a weight function defined by

$$a(y - s_3\tau) = 1 + \frac{p_- - P(y - s_3\tau)}{\sqrt{\delta}} = 1 + \frac{p(v_-, \theta_-) - P(V, \Theta)(y - s_3\tau)}{\sqrt{\delta}}. \quad (3.5)$$

Obviously, the weight function a satisfies

$$1 \leq a \leq 1 + \sqrt{\delta}, \quad a_y = -\frac{P_y}{\sqrt{\delta}} > 0. \quad (3.6)$$

Let $F(\tau, \mathbf{X}(\tau))$ be the right-hand side of the ODE (3.4)₁. By Lemma 2.1 and (3.6), we know that a , a_y , U are bounded, and V , Θ are bounded from below and above. Indeed, from the Propositions 3.2, 3.3, we can also show u is bounded. Thanks to these facts, there is some constant $C > 0$ such that

$$\sup_{\mathbf{X} \in \mathbb{R}} |F(\tau, \mathbf{X})| \leq \frac{C}{\delta} \|a\|_{L^\infty} (\|u\|_{L^\infty} + \|U^{-\mathbf{X}}\|_{L^\infty}) \|(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})\|_{L^1} \leq C, \quad (3.7)$$

and

$$\begin{aligned} \sup_{\mathbf{X} \in \mathbb{R}} |\partial_{\mathbf{X}} F(\tau, \mathbf{X})| &\leq \frac{C}{\delta} \|a_y\|_{L^\infty} (\|u\|_{L^\infty} + \|U^{-\mathbf{X}}\|_{L^\infty}) \|(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})\|_{L^1} \\ &\quad + \frac{C}{\delta} \|a\|_{L^\infty} (\|u\|_{L^\infty} + \|U^{-\mathbf{X}}\|_{L^\infty}) \|(V_{yy}^{-\mathbf{X}}, U_{yy}^{-\mathbf{X}}, \Theta_{yy}^{-\mathbf{X}})\|_{L^1} \\ &\quad + \frac{C}{\delta} \|a\|_{L^\infty} \|(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}}) U_y^{-\mathbf{X}}\|_{L^1} \leq C. \end{aligned} \quad (3.8)$$

Then ODE (3.4) has a unique absolutely continuous solution $\mathbf{X}(\tau)$ defined on any interval in time $[0, T]$ by the well-known Cauchy-Lipschitz theorem. In particular, since $|\dot{\mathbf{X}}(\tau)| \leq C$ by (3.7), we can obtain

$$|\mathbf{X}(\tau)| \leq C\tau, \quad \forall \tau \in [0, T].$$

3.2 Reformulation of the problem

Setting

$$\begin{aligned} (\phi, \psi, \zeta)(\tau, y) &= (v, u, \theta)(\tau, y) - (V^{-\mathbf{X}}, U^{-\mathbf{X}}, \Theta^{-\mathbf{X}})(\tau, y) \\ &= (v, u, \theta)(\tau, y) - (V, U, \Theta)(y - s_3\tau - \mathbf{X}(\tau)), \end{aligned}$$

where (V, U, Θ) satisfies (2.1) with $\varepsilon = 1$ and $\kappa = \nu$. Then, it follows from (3.2), (3.3) and (2.1) with $\varepsilon = 1$ and $\kappa = \nu$ that

$$\begin{cases} \phi_\tau - \dot{\mathbf{X}}(\tau)V_y^{-\mathbf{X}} - \psi_y = 0, \\ \psi_\tau - \dot{\mathbf{X}}(\tau)U_y^{-\mathbf{X}} + (p - P^{-\mathbf{X}})_y = \left(\frac{u_y}{v} - \frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right)_y, \\ \frac{R\zeta_\tau}{\gamma - 1} - \dot{\mathbf{X}}(\tau)\frac{R\Theta_y^{-\mathbf{X}}}{\gamma - 1} + p\psi_y + (p - P^{-\mathbf{X}})U_y^{-\mathbf{X}} \\ = \nu \left(\frac{\theta_y}{v} - \frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right)_y + \frac{\psi_y^2}{v} + 2\frac{\psi_y U_y^{-\mathbf{X}}}{v} + (U_y^{-\mathbf{X}})^2 \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right), \end{cases} \quad (3.9)$$

and the initial value

$$(\phi, \psi, \zeta)(0, y) = (\phi_0, \psi_0, \zeta_0)(y) = \begin{cases} (v_- - V(y), u_- - U(y), \theta_- - \Theta(y)), & y < 0, \\ (v_+ - V(y), u_+ - U(y), \theta_+ - \Theta(y)), & y > 0. \end{cases} \quad (3.10)$$

We can see that the initial data $(\phi_0, \psi_0, \zeta_0)(y)$ and its derivatives are sufficiently smooth away from but up to $y = 0$ and

$$(\phi_0, \psi_0, \zeta_0)(y) \in L^2(\mathbb{R}), \quad \phi_{0y} \in L^2(\mathbb{R}_\pm).$$

For simplicity, we denote

$$\mathcal{N}_0 := \|(\phi_0, \psi_0, \zeta_0)\| + \|\phi_{0y}\|.$$

We show that the initial value problem (3.9), (3.10) has a unique global solution $(\phi, \psi, \zeta)(\tau, y)$, with regularity as in Theorem 1.1, which approaches zero uniformly as $\tau \rightarrow \infty$.

Proposition 3.1 *There exists a positive constant δ_0 such that if the initial data and the wave strength δ satisfies*

$$\mathcal{N}_0 + \delta \leq \delta_0,$$

then the problem (3.9), (3.10) admits a unique global solution $(\phi, \psi, \zeta)(\tau, y)$ satisfying

(i) *There exists a positive constant C independent of τ such that*

$$\sup_{\tau \geq 0} (\|(\phi, \psi, \zeta)(\tau, \cdot)\|^2 + \|\phi_y(\tau, \cdot)\|^2) + \int_0^\infty (\|(\psi_y, \zeta_y)(\tau, \cdot)\|^2 + \|\phi_y(\tau, \cdot)\|^2) d\tau \leq C(\mathcal{N}_0^2 + \delta). \quad (3.11)$$

(ii) *For any $\tau_* > 0$, there exists a positive constant $C = C(\tau_*)$ depending on τ_* , such that*

$$\sup_{\tau \geq \tau_*} \|(\psi_y, \zeta_y, \psi_\tau, \zeta_\tau)(\tau, \cdot)\|^2 + \int_{\tau_*}^\infty \|(\psi_{yy}, \zeta_{yy}, \psi_{\tau y}, \zeta_{\tau y})(\tau, \cdot)\|^2 d\tau \leq C(\tau_*)(\mathcal{N}_0^2 + \delta). \quad (3.12)$$

(iii) *The jump condition of $\phi(\tau, y)$ at $y = 0$ admits the bound*

$$|[\phi](\tau)| \leq C\delta e^{-c\tau}, \quad (3.13)$$

where the positive constants C and c are independent of $\tau \in (0, \infty)$.

Assume the Proposition 3.1 holds, then for any $\tau_* > 0$, we have from the inequalities (3.11), (3.12), and equations (3.9) that

$$\int_{\tau_*}^{\infty} \left(\|(\phi_y, \psi_y, \zeta_y)\|^2 + \left| \frac{d}{d\tau} \|(\phi_y, \psi_y, \zeta_y)\|^2 \right| \right) d\tau < \infty,$$

which leads to

$$\lim_{\tau \rightarrow \infty} \|(\phi_y, \psi_y, \zeta_y)\|^2 = 0,$$

from which and Gagliardo-Nirenberg inequality, it holds

$$\begin{aligned} \limsup_{\tau \rightarrow \infty} \sup_{y \neq 0} \|(\phi, \psi, \zeta)(\tau)\|_{L^\infty} &\leq C \lim_{\tau \rightarrow \infty} \|(\phi, \psi, \zeta)(\tau)\|^{\frac{1}{2}} \|(\phi_y, \psi_y, \zeta_y)(\tau)\|^{\frac{1}{2}} \\ &\leq C \lim_{\tau \rightarrow \infty} \|(\phi_y, \psi_y, \zeta_y)(\tau)\|^{\frac{1}{2}} = 0. \end{aligned}$$

This together with the estimate (3.13) gives

$$\limsup_{\tau \rightarrow \infty} \sup_{y \in \mathbb{R}} |(v - V^{-\mathbf{X}}, u - U^{-\mathbf{X}}, \theta - \Theta^{-\mathbf{X}})(\tau, y)| = 0. \quad (3.14)$$

Next, it follows from (3.4) and Lemma 2.1 that

$$|\dot{\mathbf{X}}(\tau)| \leq \frac{C}{\delta} \|\psi\|_{L^\infty} \|(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})\|_{L^1} \leq C \|\psi\|_{L^\infty},$$

which with $\mathbf{X}(0) = 0$ and Hölder inequality yield

$$\begin{aligned} |\mathbf{X}(\tau)| &\leq C \int_0^\tau \|\psi\|_{L^\infty} d\tau \leq C \int_0^\tau \|\psi\|^{\frac{1}{2}} \|\psi_y\|^{\frac{1}{2}} d\tau \leq C \left(\int_0^\tau \|\psi_y\|^2 d\tau \right)^{\frac{1}{4}} \left(\int_0^\tau \|\psi\|^{\frac{2}{3}} d\tau \right)^{\frac{3}{4}} \\ &\leq C \left(\int_0^\tau \|\psi_y\|^2 d\tau \right)^{\frac{1}{4}} \sup_{\tau > 0} \|\psi\|^{\frac{1}{2}} \tau^{\frac{3}{4}}. \end{aligned}$$

Recalling the scaled variable (3.1), the above inequality indicates

$$\left| \varepsilon \mathbf{X} \left(\frac{t}{\varepsilon} \right) \right| \leq C \varepsilon^{\frac{1}{4}} T^{\frac{3}{4}},$$

for $t \in [0, T]$ with any finite positive number T . Then, for any positive number h , there exists sufficient small ε such that

$$\left| \varepsilon \mathbf{X} \left(\frac{t}{\varepsilon} \right) \right| \leq \frac{h}{2}. \quad (3.15)$$

Therefore, we have

$$\begin{aligned} &(v^\varepsilon, u^\varepsilon, \theta^\varepsilon)(t, x) - (v^S, u^S, \theta^S)(t, x) \\ &= (v, u, \theta)(\tau, y) - (v^S, u^S, \theta^S)(\tau, y) \\ &= (v, u, \theta)(\tau, y) - (V^{-\mathbf{X}}, U^{-\mathbf{X}}, \Theta^{-\mathbf{X}})(\tau, y) + (V^{-\mathbf{X}}, U^{-\mathbf{X}}, \Theta^{-\mathbf{X}})(\tau, y) - (v^S, u^S, \theta^S)(\tau, y), \end{aligned} \quad (3.16)$$

where the second last term in the last line of (3.16) vanishes as $\tau \rightarrow +\infty$ due to the large time behavior (3.14), which means it vanishes as $\varepsilon \rightarrow 0+$, uniformly with $t \geq h$ for any positive number h due to a straightforward scaling argument $\tau = \frac{t}{\varepsilon}$.

Then for the last term in the last line of (3.16), using Lemma 2.1 and (3.15), for any $h > 0$, it holds

$$\begin{aligned} &\lim_{\varepsilon \rightarrow 0} \sup_{|y - s_3 \tau| \geq \frac{h}{\varepsilon}} |(V^{-\mathbf{X}}, U^{-\mathbf{X}}, \Theta^{-\mathbf{X}})(\tau, y) - (v^S, u^S, \theta^S)(\tau, y)| \\ &= \lim_{\varepsilon \rightarrow 0} \sup_{|y - s_3 \tau| \geq \frac{h}{\varepsilon}} |(V, U, \Theta)(y - s_3 \tau - \mathbf{X}(\tau)) - (v^S, u^S, \theta^S)(\tau, y)| \\ &= \lim_{\varepsilon \rightarrow 0} \sup_{|x - s_3 t| \geq h} \left| (V^\varepsilon, U^\varepsilon, \Theta^\varepsilon) \left(\frac{x - s_3 t}{\varepsilon} - \mathbf{X} \left(\frac{t}{\varepsilon} \right) \right) - (v^S, u^S, \theta^S)(t, x) \right| \\ &\leq \lim_{\varepsilon \rightarrow 0} \sup_{|x - s_3 t| \geq h} C \delta \exp \left(-\frac{c\delta}{\varepsilon} \left| x - s_3 t - \varepsilon \mathbf{X} \left(\frac{t}{\varepsilon} \right) \right| \right) \leq \lim_{\varepsilon \rightarrow 0} C \delta \exp \left(-\frac{c\delta h}{2\varepsilon} \right) = 0. \end{aligned} \quad (3.17)$$

Thus combination of (3.16) and (3.17) gives the dissipation limit behavior (1.8) of the solutions $(v^\varepsilon, u^\varepsilon, \theta^\varepsilon)$. Then the proof of Theorem 1.1 can be finished with the regularity results from Proposition 3.1. \square

Denote

$$N(\tau_*, \tau^*) = \sup_{\tau \in [\tau_*, \tau^*]} \left(\|(\phi, \psi, \zeta)(\tau, \cdot)\| + \|(\phi_y, \psi_y, \zeta_y)(\tau, \cdot)\| + \|(\psi_\tau, \zeta_\tau)(\tau, \cdot)\| \right),$$

$$N(\tau_*) = N(\tau_*, \tau^*),$$

and define the solution space of the problem (3.9), (3.10), as follows

$$\mathcal{X}[\tau_*, \tau^*] = \left\{ (\phi, \psi, \zeta) \mid (\phi, \psi, \zeta) \in C([\tau_*, \tau^*]; H^1(\mathbb{R}_\pm)), \phi_y \in L^2(\tau_*, \tau^*; L^2(\mathbb{R}_\pm)), \right. \\ \left. (\psi_y, \zeta_y) \in L^2(\tau_*, \tau^*; H^1(\mathbb{R}_\pm)), \right. \\ \left. (\psi_\tau, \zeta_\tau) \in L^\infty(\tau_*, \tau^*; L^2(\mathbb{R}_\pm)) \cap L^2(\tau_*, \tau^*; H^1(\mathbb{R}_\pm)) \right\}.$$

In order to prove Proposition 3.1 for our purpose, we shall combine a local existence result in Proposition 3.2, together with a-priori estimates in Proposition 3.3 by continuation arguments. To state the local existence result precisely, we set

$$(\bar{\phi}, \bar{\psi}, \bar{\zeta})(\tau, y) = (v, u, \theta)(\tau, y) - (V, U, \Theta)(y - s_3\tau),$$

then $(\bar{\phi}, \bar{\psi}, \bar{\zeta})$ satisfies (3.9) without time shift function $\mathbf{X}(\tau)$, and has the same initial value with $(\phi_0, \psi_0, \zeta_0)$ since $\mathbf{X}(0) = 0$. The local existence of a small solution $(\bar{\phi}, \bar{\psi}, \bar{\zeta})$ has been established by [12], we just state it and omit its proof for brevity.

Proposition 3.2 (Local existence) *For any $\Xi > 0$, suppose the initial data and the wave strength satisfy $\mathcal{N}_0 + \delta \leq \Xi$. Then there exists a positive constant time τ_0 depending on Ξ such that problem (3.9), (3.10) with $\mathbf{X}(\tau) = 0$ has a unique solution $(\bar{\phi}, \bar{\psi}, \bar{\zeta})(\tau, y) \in \mathcal{X}(0, \tau_0)$ satisfying*

$$A(\tau_0) + B(\tau_0) + F(\tau_0) \leq 4(\mathcal{N}_0 + \delta)^2,$$

where

$$A(\tau_0) = \sup_{0 \leq \tau \leq \tau_0} \left(\|(\bar{\phi}, \bar{\psi}, \bar{\zeta})(\tau, \cdot)\|^2 + \|\bar{\phi}_y(\tau, \cdot)\|^2 \right) + \int_0^{\tau_0} \|(\bar{\psi}_y, \bar{\zeta}_y)\|^2 d\tau,$$

$$B(\tau_0) = \sup_{0 \leq \tau \leq \tau_0} \left(g(\tau)^{\frac{1}{2}} \|\bar{\psi}_y(\tau, \cdot)\|^2 + g(\tau) \|\bar{\zeta}_y(\tau, \cdot)\|^2 \right) + \int_0^{\tau_0} g(\tau)^{\frac{1}{2} + \vartheta} \left(\|\bar{\psi}_\tau\|^2 + \left\| \left(\frac{\bar{\psi}_y}{v} \right)_y \right\|^2 \right) d\tau \\ + \int_0^{\tau_0} g(\tau) \left(\|\bar{\psi}_y^2\|^2 + \|\bar{\zeta}_\tau\|^2 + \left\| \left(\frac{\bar{\zeta}_y}{v} \right)_y \right\|^2 \right) d\tau,$$

$$F(\tau_0) = \sup_{0 \leq \tau \leq \tau_0} \left\{ g(\tau)^{\frac{3}{2} + \vartheta} \left(\|\bar{\psi}_\tau(\tau, \cdot)\|^2 + \left\| \left(\frac{\bar{\psi}_y}{v} \right)_y (\tau, \cdot) \right\|^2 \right) + g(\tau)^3 \left(\|\bar{\zeta}_\tau(\tau, \cdot)\|^2 + \left\| \left(\frac{\bar{\zeta}_y}{v} \right)_y (\tau, \cdot) \right\|^2 \right) \right\} \\ + \int_0^{\tau_0} \left(g(\tau)^{\frac{3}{2} + \vartheta} \|\bar{\psi}_{\tau y}\|^2 + g(\tau)^3 \|\bar{\zeta}_{\tau y}\|^2 \right) d\tau,$$

where $g(\tau) = \tau \wedge 1 = \min\{\tau, 1\}$ and $\vartheta \in (0, 1)$. Moreover, v, u, θ have the same regularity as in Theorem 1.1. Thus, v, u_y, θ_y have one-side limit at $y = 0$ and satisfy the jump conditions

$$\left[p - \frac{u_y}{v} \right] = \left[\frac{\theta_y}{v} \right] = 0.$$

Finally, one has the following estimate on the jump at $y = 0$,

$$|[v](\tau)| \leq C\delta e^{-c\tau}, \quad \tau > 0$$

for some positive constants C and c independent of time τ .

Next, we show the following (uniform) a-priori estimates.

Proposition 3.3 (A-priori estimates) *Let $(\phi, \psi, \zeta) \in \mathcal{X}[\tau_1, \tau_2]$ be a solution to the problem (3.9), (3.10) for $0 < \tau_1 \leq \tau_2$. Then there exist positive constants $\chi_0 \leq 1$ and C_0 independent of τ_1, τ_2 , such that if*

$$N(\tau_1, \tau_2) + \delta \leq \chi_0, \quad (3.18)$$

then it holds

$$\begin{aligned} N^2(\tau_1, \tau_2) + \int_{\tau_1}^{\tau_2} \left(\delta |\dot{\mathbf{X}}(\tau)|^2 + \left\| \sqrt{|U_y^{-\mathbf{X}}|} \psi \right\|^2 + \|\phi_y\|^2 + \|(\psi_y, \zeta_y)\|_{H^1}^2 + \|(\psi_{\tau y}, \zeta_{\tau y})\|^2 \right) d\tau \\ \leq C_0(N^2(\tau_1) + \delta). \end{aligned} \quad (3.19)$$

In addition, if the shift function $\mathbf{X}(\tau)$ is an absolutely continuous solution to (3.4), then it holds for $\tau \in [\tau_1, \tau_2]$,

$$|\dot{\mathbf{X}}(\tau)| \leq C_0 \|\psi(\tau, \cdot)\|_{L^\infty}. \quad (3.20)$$

The proof of Proposition 3.3 will be given in Sect. 4. Then we can demonstrate Proposition 3.1 by the continuation arguments based on Propositions 3.2 and 3.3, the detailed proof can be found in [33].

4 A-priori estimates

Throughout this section, C denotes a positive constant which may change from line to line, but which stays independent of the wave strength δ . From now on until the end of this paper, we always assume that $\chi_0 \leq 1$.

4.1 Relative entropy method

The following lemma is derived by the relative entropy method.

Lemma 4.1 *Let $a(\tau, y)$ be the weighted function defined by (3.5), and $\mathbf{X}(\tau)$ be the shift defined by (3.4). Then it holds*

$$\frac{d}{d\tau} \int_{\mathbb{R}} a^{-\mathbf{X}} \mathcal{E} dy + \mathbf{G}_1(\tau) + \mathbf{G}_2(\tau) + \mathbf{D}_1(\tau) + \mathbf{D}_2(\tau) + \frac{\delta}{M} |\dot{\mathbf{X}}(\tau)|^2 = \dot{\mathbf{X}}(\tau) \sum_{i=1}^3 \mathbf{Y}_i(\tau) + \sum_{i=1}^7 \mathbf{B}_i(\tau), \quad (4.1)$$

where $\mathbf{X}(\tau)$ has been defined in (3.4), and

$$\mathcal{E} = R\Theta^{-\mathbf{X}} \Phi\left(\frac{v}{V-\mathbf{X}}\right) + \frac{\psi^2}{2} + \frac{R\Theta^{-\mathbf{X}}}{\gamma-1} \Phi\left(\frac{\theta}{\Theta-\mathbf{X}}\right), \quad \Phi(z) = z - \ln z - 1,$$

$$\mathbf{G}_1(\tau) = \int_{\mathbb{R}} a_y^{-\mathbf{X}} \frac{s_3 p_+}{2v_+} \left(\phi + \frac{\psi}{s_3}\right)^2 dy,$$

$$\mathbf{G}_2(\tau) = \int_{\mathbb{R}} a_y^{-\mathbf{X}} \frac{R}{\gamma-1} \frac{s_3}{2\theta_+} \left(\zeta - \frac{\gamma-1}{R} \frac{p_+\psi}{s_3}\right)^2 dy,$$

$$\mathbf{D}_1(\tau) = \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{\Theta^{-\mathbf{X}}}{v\theta} \psi_y^2 dy, \quad \mathbf{D}_2(\tau) = \nu \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{\Theta^{-\mathbf{X}}}{v\theta^2} \zeta_y^2 dy,$$

$$\mathbf{Y}_1(\tau) = \int_{\mathbb{R}} a^{-\mathbf{X}} \left(\frac{P-\mathbf{X}}{V-\mathbf{X}} \left(\phi + \frac{\psi}{s_3}\right) V_y^{-\mathbf{X}} + \frac{R}{\gamma-1} \left(\zeta - \frac{\gamma-1}{R} \frac{p_+\psi}{s_3}\right) \frac{\Theta_y^{-\mathbf{X}}}{\Theta-\mathbf{X}} \right) dy,$$

$$\mathbf{Y}_2(\tau) = - \int_{\mathbb{R}} a^{-\mathbf{X}} \Theta_y^{-\mathbf{X}} \left(R\Phi\left(\frac{v}{V-\mathbf{X}}\right) + \frac{R}{\gamma-1} \Phi\left(\frac{\theta}{\Theta-\mathbf{X}}\right) \right) dy,$$

$$\mathbf{Y}_3(\tau) = - \int_{\mathbb{R}} a_y^{-\mathbf{X}} \mathcal{E} dy,$$

and

$$\begin{aligned}
\mathbf{B}_1(\tau) &= \int_{\mathbb{R}} -a^{-\mathbf{X}} U_y^{-\mathbf{X}} P^{-\mathbf{X}} \left(\Phi\left(\frac{V^{-\mathbf{X}}\theta}{\Theta^{-\mathbf{X}}v}\right) + \gamma\Phi\left(\frac{v}{V^{-\mathbf{X}}}\right) \right) dy \\
&\quad + \int_{\mathbb{R}} a^{-\mathbf{X}} \left(\nu\left(\frac{\Theta^{-\mathbf{X}}}{V^{-\mathbf{X}}}\right)_y + \frac{(U_y^{-\mathbf{X}})^2}{V^{-\mathbf{X}}} \right) \left((\gamma-1)\Phi\left(\frac{v}{V^{-\mathbf{X}}}\right) - \Phi\left(\frac{\Theta^{-\mathbf{X}}}{\theta}\right) \right) dy \\
&\quad + \int_{\mathbb{R}} -\frac{a_y^{-\mathbf{X}}}{2s_3} \left(s_3^2 - \frac{\gamma p_+}{v_+} \right) \psi^2 dy =: \sum_{i=1}^3 \mathbf{B}_{1,i}(\tau), \\
\mathbf{B}_2(\tau) &= O(1)(N(\tau_1, \tau_2) + \delta) \int_{\mathbb{R}} a_y^{-\mathbf{X}} \left| \left(\phi + \frac{\psi}{s_3}, \zeta - \frac{\gamma-1}{R} \frac{p_+\psi}{s_3} \right) \right|^2 dy, \\
\mathbf{B}_3(\tau) &= O(1) \int_{\mathbb{R}} a_y^{-\mathbf{X}} (|\phi, \zeta| + \delta) \psi^2 dy, \\
\mathbf{B}_4(\tau) &= \int_{\mathbb{R}} a^{-\mathbf{X}} \left(\frac{U_y^{-\mathbf{X}}\phi}{V^{-\mathbf{X}}v} \psi_y + 2\frac{U_y^{-\mathbf{X}}\zeta}{v\theta} \psi_y + \nu\frac{\Theta_y^{-\mathbf{X}}\zeta}{v\theta^2} \zeta_y + \nu\frac{\Theta^{-\mathbf{X}}}{V^{-\mathbf{X}}} \frac{\Theta_y^{-\mathbf{X}}\phi}{v\theta^2} \zeta_y \right) dy, \\
\mathbf{B}_5(\tau) &= - \int_{\mathbb{R}} a^{-\mathbf{X}} \left(\frac{(U_y^{-\mathbf{X}})^2}{V^{-\mathbf{X}}} \frac{\phi\zeta}{v\theta} + \nu\frac{(\Theta_y^{-\mathbf{X}})^2}{V^{-\mathbf{X}}} \frac{\phi\zeta}{v\theta^2} \right) dy, \\
\mathbf{B}_6(\tau) &= - \int_{\mathbb{R}} a_y^{-\mathbf{X}} \left(\frac{\psi\psi_y}{v} + \nu\frac{\zeta\zeta_y}{v\theta} \right) dy, \\
\mathbf{B}_7(\tau) &= \int_{\mathbb{R}} a_y^{-\mathbf{X}} \left(\frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \frac{\phi\psi}{v} + \nu\frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \frac{\phi\zeta}{v\theta} \right) dy.
\end{aligned}$$

Remark 4 Since $s_3 a_y^{-\mathbf{X}} > 0$, thus $\mathbf{G}_i(\tau)$ ($i = 1, 2$) consists of terms with good sign, while $\mathbf{B}_i(\tau)$ ($i = 1, \dots, 7$) consists of bad terms.

Proof: It follows from (3.5) that

$$\begin{aligned}
a^{-\mathbf{X}} &:= 1 + \frac{p_- - P^{-\mathbf{X}}}{\sqrt{\delta}} = 1 + \frac{p_- - P(V^{-\mathbf{X}}, \Theta^{-\mathbf{X}})}{\sqrt{\delta}} \\
&= 1 + \frac{p_- - P(V, \Theta)(y - s_3\tau - \mathbf{X}(\tau))}{\sqrt{\delta}}.
\end{aligned} \tag{4.2}$$

Then it holds

$$|a^{-\mathbf{X}} - 1| \leq \sqrt{\delta}, \quad a_{\tau}^{-\mathbf{X}} = -s_3 a_y^{-\mathbf{X}} - \dot{\mathbf{X}}(\tau) a_y^{-\mathbf{X}}.$$

First, we multiply (3.9)₁ by $-a^{-\mathbf{X}} R \Theta^{-\mathbf{X}} (1/v - 1/V^{-\mathbf{X}})$ to have

$$\begin{aligned}
&-a^{-\mathbf{X}} R \Theta^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \phi_{\tau} + \dot{\mathbf{X}}(\tau) a^{-\mathbf{X}} R \Theta^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) V_y^{-\mathbf{X}} \\
&\quad + a^{-\mathbf{X}} R \Theta^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \psi_y = 0,
\end{aligned} \tag{4.3}$$

where

$$\begin{aligned}
&-a^{-\mathbf{X}} R \Theta^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \phi_{\tau} = \left(a^{-\mathbf{X}} R \Theta^{-\mathbf{X}} \Phi\left(\frac{v}{V^{-\mathbf{X}}}\right) \right)_{\tau} + s_3 a_y^{-\mathbf{X}} R \Theta^{-\mathbf{X}} \Phi\left(\frac{v}{V^{-\mathbf{X}}}\right) \\
&\quad + \dot{\mathbf{X}}(\tau) a_y^{-\mathbf{X}} R \Theta^{-\mathbf{X}} \Phi\left(\frac{v}{V^{-\mathbf{X}}}\right) + a^{-\mathbf{X}} V_{\tau}^{-\mathbf{X}} \frac{P^{-\mathbf{X}} \phi^2}{V^{-\mathbf{X}} v} - a^{-\mathbf{X}} R \Theta_{\tau}^{-\mathbf{X}} \Phi\left(\frac{v}{V^{-\mathbf{X}}}\right).
\end{aligned}$$

Next, we multiply (3.9)₂ by $a^{-\mathbf{X}} \psi$ to have

$$\left(a^{-\mathbf{X}} \frac{\psi^2}{2} \right)_{\tau} + s_3 a_y^{-\mathbf{X}} \frac{\psi^2}{2} + \dot{\mathbf{X}}(\tau) a_y^{-\mathbf{X}} \frac{\psi^2}{2} - \dot{\mathbf{X}}(\tau) a^{-\mathbf{X}} \psi U_y^{-\mathbf{X}}$$

$$\begin{aligned}
& + (a^{-\mathbf{X}}(p - P^{-\mathbf{X}})\psi)_y - a^{-\mathbf{X}}(p - P^{-\mathbf{X}})\psi_y - a_y^{-\mathbf{X}}(p - P^{-\mathbf{X}})\psi \\
& = \left(a^{-\mathbf{X}} \left(\frac{u_y}{v} - \frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \psi \right)_y - a^{-\mathbf{X}} \frac{\psi_y^2}{v} - a^{-\mathbf{X}} U_y^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \psi_y \\
& - a_y^{-\mathbf{X}} \frac{\psi \psi_y}{v} - a_y^{-\mathbf{X}} U_y^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \psi.
\end{aligned} \tag{4.4}$$

Third, we multiply (3.9)₃ by $a^{-\mathbf{X}}\zeta/\theta$ to have

$$\begin{aligned}
& a^{-\mathbf{X}} \frac{R}{\gamma-1} \frac{\zeta \zeta_\tau}{\theta} - \dot{\mathbf{X}}(\tau) a^{-\mathbf{X}} \frac{\zeta}{\theta} \frac{R \Theta_y^{-\mathbf{X}}}{\gamma-1} + a^{-\mathbf{X}} \frac{R \zeta}{v} \psi_y + a^{-\mathbf{X}} (p - P^{-\mathbf{X}}) U_y^{-\mathbf{X}} \frac{\zeta}{\theta} \\
& = \nu \left(a^{-\mathbf{X}} \left(\frac{\theta_y}{v} - \frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \frac{\zeta}{\theta} \right)_y - \nu a^{-\mathbf{X}} \frac{\Theta^{-\mathbf{X}} \zeta_y^2}{v \theta^2} + \nu a^{-\mathbf{X}} \frac{\Theta_y^{-\mathbf{X}} \zeta}{v \theta^2} \zeta_y \\
& - \nu a^{-\mathbf{X}} \frac{\Theta^{-\mathbf{X}} \Theta_y^{-\mathbf{X}}}{\theta^2} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \zeta_y + \nu a^{-\mathbf{X}} \frac{(\Theta_y^{-\mathbf{X}})^2}{\theta^2} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \zeta - \nu a_y^{-\mathbf{X}} \frac{\zeta \zeta_y}{v \theta} \\
& - \nu a_y^{-\mathbf{X}} \Theta_y^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \frac{\zeta}{\theta} + a^{-\mathbf{X}} \frac{\psi_y^2 \zeta}{v \theta} + 2 a^{-\mathbf{X}} \frac{\psi_y U_y^{-\mathbf{X}} \zeta}{v \theta} + a^{-\mathbf{X}} (U_y^{-\mathbf{X}})^2 \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \frac{\zeta}{\theta},
\end{aligned} \tag{4.5}$$

where

$$\begin{aligned}
a^{-\mathbf{X}} \frac{R}{\gamma-1} \frac{\zeta \zeta_\tau}{\theta} & = \left(a^{-\mathbf{X}} \frac{R \Theta^{-\mathbf{X}}}{\gamma-1} \Phi \left(\frac{\theta}{\Theta^{-\mathbf{X}}} \right) \right)_\tau + s_3 a_y^{-\mathbf{X}} \frac{R \Theta^{-\mathbf{X}}}{\gamma-1} \Phi \left(\frac{\theta}{\Theta^{-\mathbf{X}}} \right) \\
& + \dot{\mathbf{X}}(\tau) a_y^{-\mathbf{X}} \frac{R \Theta^{-\mathbf{X}}}{\gamma-1} \Phi \left(\frac{\theta}{\Theta^{-\mathbf{X}}} \right) + a^{-\mathbf{X}} \frac{R \Theta_\tau^{-\mathbf{X}}}{\gamma-1} \Phi \left(\frac{\theta}{\Theta^{-\mathbf{X}}} \right).
\end{aligned}$$

Direct calculation yields

$$\begin{aligned}
& V_\tau^{-\mathbf{X}} \frac{P^{-\mathbf{X}} \phi^2}{V^{-\mathbf{X}} v} - R \Theta_\tau^{-\mathbf{X}} \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) + \frac{R \Theta_\tau^{-\mathbf{X}}}{\gamma-1} \Phi \left(\frac{\Theta^{-\mathbf{X}}}{\theta} \right) + (p - P^{-\mathbf{X}}) U_y^{-\mathbf{X}} \frac{\zeta}{\theta} \\
& = U_y^{-\mathbf{X}} P^{-\mathbf{X}} \left(\Phi \left(\frac{V^{-\mathbf{X}} \theta}{\Theta^{-\mathbf{X}} v} \right) + \gamma \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) \right) \\
& - \left(\nu \left(\frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right)_y + \frac{(U_y^{-\mathbf{X}})^2}{V^{-\mathbf{X}}} \right) \left((\gamma-1) \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) - \Phi \left(\frac{\Theta^{-\mathbf{X}}}{\theta} \right) \right) \\
& - \dot{\mathbf{X}}(\tau) \left(\frac{P^{-\mathbf{X}} \phi^2}{V^{-\mathbf{X}} v} V_y^{-\mathbf{X}} - \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) R \Theta_y^{-\mathbf{X}} + \Phi \left(\frac{\Theta^{-\mathbf{X}}}{\theta} \right) \frac{R \Theta_y^{-\mathbf{X}}}{\gamma-1} \right).
\end{aligned}$$

We add (4.3), (4.4), (4.5) and use the above equality to have

$$\begin{aligned}
& (a^{-\mathbf{X}} \mathcal{E})_\tau + a_y^{-\mathbf{X}} (s_3 \mathcal{E} - (p - P^{-\mathbf{X}})\psi) + (a^{-\mathbf{X}}(p - P^{-\mathbf{X}})\psi)_y \\
& + \dot{\mathbf{X}}(\tau) a_y^{-\mathbf{X}} \mathcal{E} - \dot{\mathbf{X}}(\tau) a^{-\mathbf{X}} \left(\frac{P^{-\mathbf{X}}}{v} \phi V_y^{-\mathbf{X}} + \psi U_y^{-\mathbf{X}} + \frac{\zeta}{\theta} \frac{R \Theta_y^{-\mathbf{X}}}{\gamma-1} \right) \\
& - \dot{\mathbf{X}}(\tau) a^{-\mathbf{X}} \left(\frac{P^{-\mathbf{X}} \phi^2}{V^{-\mathbf{X}} v} V_y^{-\mathbf{X}} - \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) R \Theta_y^{-\mathbf{X}} + \Phi \left(\frac{\Theta^{-\mathbf{X}}}{\theta} \right) \frac{R \Theta_y^{-\mathbf{X}}}{\gamma-1} \right) \\
& + a^{-\mathbf{X}} U_y^{-\mathbf{X}} P^{-\mathbf{X}} \left(\Phi \left(\frac{V^{-\mathbf{X}} \theta}{\Theta^{-\mathbf{X}} v} \right) + \gamma \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) \right) \\
& - a^{-\mathbf{X}} \left(\nu \left(\frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right)_y + \frac{(U_y^{-\mathbf{X}})^2}{V^{-\mathbf{X}}} \right) \left((\gamma-1) \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) - \Phi \left(\frac{\Theta^{-\mathbf{X}}}{\theta} \right) \right) \\
& = \left(a^{-\mathbf{X}} \left(\frac{u_y}{v} - \frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \psi + \nu a^{-\mathbf{X}} \left(\frac{\theta_y}{v} - \frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \frac{\zeta}{\theta} \right)_y - a^{-\mathbf{X}} \frac{\Theta^{-\mathbf{X}} \psi_y^2}{v \theta} - \nu a^{-\mathbf{X}} \frac{\Theta^{-\mathbf{X}} \zeta_y^2}{v \theta^2}
\end{aligned} \tag{4.6}$$

$$\begin{aligned}
& + a^{-\mathbf{X}} \left(\frac{U_y^{-\mathbf{X}} \phi}{V^{-\mathbf{X}} v} \psi_y + 2 \frac{U_y^{-\mathbf{X}} \zeta}{v \theta} \psi_y + \nu \frac{\Theta_y^{-\mathbf{X}} \zeta}{v \theta^2} \zeta_y + \nu \frac{\Theta^{-\mathbf{X}} \Theta_y^{-\mathbf{X}} \phi}{V^{-\mathbf{X}} v \theta^2} \zeta_y \right) \\
& - a^{-\mathbf{X}} \left(\frac{(U_y^{-\mathbf{X}})^2 \phi \zeta}{V^{-\mathbf{X}} v \theta} + \nu \frac{(\Theta_y^{-\mathbf{X}})^2 \phi \zeta}{V^{-\mathbf{X}} v \theta^2} \right) - a_y^{-\mathbf{X}} \left(\frac{\psi \psi_y}{v} + \nu \frac{\zeta \zeta_y}{v \theta} \right) \\
& + a_y^{-\mathbf{X}} \left(\frac{U_y^{-\mathbf{X}} \phi \psi}{V^{-\mathbf{X}} v} + \nu \frac{\Theta_y^{-\mathbf{X}} \phi \zeta}{V^{-\mathbf{X}} v \theta} \right).
\end{aligned}$$

We directly calculate to have

$$\begin{aligned}
& s_3 \mathcal{E} - (p - P^{-\mathbf{X}}) \psi \\
& = s_3 \left(R \Theta^{-\mathbf{X}} \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) + \frac{\psi^2}{2} + \frac{R \Theta^{-\mathbf{X}}}{\gamma - 1} \Phi \left(\frac{\theta}{\Theta^{-\mathbf{X}}} \right) \right) - R \left(\frac{\theta}{v} - \frac{\Theta^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \psi \\
& = \frac{s_3 p_+}{2 v_+} \left(\phi + \frac{\psi}{s_3} \right)^2 + \frac{R}{\gamma - 1} \frac{s_3}{2 \theta_+} \left(\zeta - \frac{\gamma - 1}{R} \frac{p_+ \psi}{s_3} \right)^2 + \left(s_3^2 - \frac{\gamma p_+}{v_+} \right) \frac{\psi^2}{2 s_3} \\
& + O(1)(N(\tau_1, \tau_2) + \delta) \left| \left(\phi + \frac{\psi}{s_3}, \zeta - \frac{\gamma - 1}{R} \frac{p_+ \psi}{s_3} \right) \right|^2 + O(1)(|\phi, \zeta| + \delta) \psi^2,
\end{aligned} \tag{4.7}$$

and

$$\begin{aligned}
& - \dot{\mathbf{X}}(\tau) a^{-\mathbf{X}} \left(\frac{P^{-\mathbf{X}}}{v} \phi V_y^{-\mathbf{X}} + \psi U_y^{-\mathbf{X}} + \frac{\zeta}{\theta} \frac{R \Theta_y^{-\mathbf{X}}}{\gamma - 1} \right) \\
& - \dot{\mathbf{X}}(\tau) a^{-\mathbf{X}} \left(\frac{P^{-\mathbf{X}} \phi^2}{V^{-\mathbf{X}} v} V_y^{-\mathbf{X}} - \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) R \Theta_y^{-\mathbf{X}} + \Phi \left(\frac{\Theta^{-\mathbf{X}}}{\theta} \right) \frac{R \Theta_y^{-\mathbf{X}}}{\gamma - 1} \right) \\
& = - \dot{\mathbf{X}}(\tau) a^{-\mathbf{X}} \left(\frac{P^{-\mathbf{X}}}{V^{-\mathbf{X}}} \phi V_y^{-\mathbf{X}} + \psi U_y^{-\mathbf{X}} + \frac{\zeta}{\Theta^{-\mathbf{X}}} \frac{R \Theta_y^{-\mathbf{X}}}{\gamma - 1} \right) \\
& + \dot{\mathbf{X}}(\tau) a^{-\mathbf{X}} \Theta_y^{-\mathbf{X}} \left(R \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) + \frac{R}{\gamma - 1} \Phi \left(\frac{\theta}{\Theta^{-\mathbf{X}}} \right) \right).
\end{aligned} \tag{4.8}$$

Integrating (4.6) with respect to y over \mathbb{R}_\pm , the jump term in (4.6) across $y = 0$ vanishes, i.e.,

$$\begin{aligned}
& \left[a^{-\mathbf{X}} (p - P^{-\mathbf{X}}) \psi - a^{-\mathbf{X}} \left(\frac{u_y}{v} - \frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \psi - \nu a^{-\mathbf{X}} \left(\frac{\theta_y}{v} - \frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \frac{\zeta}{\theta} \right] (\tau) \\
& = \left[a^{-\mathbf{X}} \left(p - \frac{u_y}{v} \right) \psi \right] (\tau) - \left[a^{-\mathbf{X}} \left(P - \frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \psi \right] (\tau) - \nu \left[a^{-\mathbf{X}} \left(\frac{\theta_y}{v} - \frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \frac{\zeta}{\theta} \right] (\tau) \\
& = \left[p - \frac{u_y}{v} \right] a^{-\mathbf{X}} \psi(\tau, 0) - \left[P - \frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right] a^{-\mathbf{X}} \psi(\tau, 0) - \nu \left(\left[\frac{\theta_y}{v} \right] - \left[\frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right] \right) a^{-\mathbf{X}} \frac{\zeta(\tau, 0)}{\theta(\tau, 0)} = 0.
\end{aligned}$$

Using the above equality and (4.7), (4.8), we have

$$\frac{d}{d\tau} \int_{\mathbb{R}} a^{-\mathbf{X}} \mathcal{E} dy + \mathbf{G}_1(\tau) + \mathbf{G}_2(\tau) + \mathbf{D}_1(\tau) + \mathbf{D}_2(\tau) = \dot{\mathbf{X}}(\tau) \mathbf{Y}(\tau) + \sum_{i=1}^7 \mathbf{B}_i(\tau), \tag{4.9}$$

where

$$\begin{aligned}
\mathbf{Y}(\tau) & = \int_{\mathbb{R}} a^{-\mathbf{X}} \left(\frac{P^{-\mathbf{X}}}{V^{-\mathbf{X}}} \phi V_y^{-\mathbf{X}} + \psi U_y^{-\mathbf{X}} + \frac{\zeta}{\Theta^{-\mathbf{X}}} \frac{R \Theta_y^{-\mathbf{X}}}{\gamma - 1} \right) dy \\
& - \int_{\mathbb{R}} a^{-\mathbf{X}} \Theta_y^{-\mathbf{X}} \left(R \Phi \left(\frac{v}{V^{-\mathbf{X}}} \right) + \frac{R}{\gamma - 1} \Phi \left(\frac{\theta}{\Theta^{-\mathbf{X}}} \right) \right) dy - \int_{\mathbb{R}} a_y^{-\mathbf{X}} \mathcal{E} dy \\
& = -\frac{\delta}{M} \dot{\mathbf{X}}(\tau) + \sum_{i=1}^3 \mathbf{Y}_i(\tau),
\end{aligned}$$

by using the definition of $\dot{\mathbf{X}}(\tau)$ in (3.4) and the definition of $\mathbf{Y}_i(\tau)$ ($i = 1, 2, 3$). Thus, it holds

$$\dot{\mathbf{X}}(\tau)\mathbf{Y}(\tau) = -\frac{\delta}{M}|\dot{\mathbf{X}}(\tau)|^2 + \dot{\mathbf{X}}(\tau)\sum_{i=1}^3\mathbf{Y}_i(\tau). \quad (4.10)$$

Combination of (4.9) and (4.10) gives (4.1). The proof of Lemma 4.1 is completed. \square

4.2 Contraction property

The contraction property is expressed in the following Lemma.

Lemma 4.2 *Under the hypotheses of Proposition 3.3, there exists constant $C > 0$, such that for any $\tau \in [\tau_1, \tau_2]$, it holds*

$$\mathbf{B}_1(\tau) - \frac{7}{8}(\mathbf{D}_1(\tau) + \mathbf{D}_2(\tau)) - \frac{\delta}{2M}|\dot{\mathbf{X}}(\tau)|^2 \leq -\frac{\alpha_+}{3}\int_{\mathbb{R}}|P_y^{-\mathbf{X}}|\psi^2 dy + C\delta^{\frac{1}{4}}(\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)), \quad (4.11)$$

where $\alpha_+ := \frac{\gamma+1}{2\gamma}\frac{s_3}{p_+}$.

Proof: We introduce a new variable

$$z = \frac{p_- - P^{-\mathbf{X}}}{\delta}, \quad (4.12)$$

which maps $y \in \mathbb{R}$ to $z \in [0, 1]$. Then it follows from (4.2) and (4.12) that

$$\frac{dz}{dy} = -\frac{1}{\delta}P_y^{-\mathbf{X}} = \frac{1}{\sqrt{\delta}}a_y^{-\mathbf{X}}. \quad (4.13)$$

We can deduce from the viscous shock equations (2.1) that

$$\begin{cases} V_y^{-\mathbf{X}} = -\frac{1}{s_3^2}P_y^{-\mathbf{X}} + R_1^s, \\ U_y^{-\mathbf{X}} = \frac{1}{s_3}P_y^{-\mathbf{X}} + R_2^s, \\ \Theta_y^{-\mathbf{X}} = \frac{\gamma-1}{Rs_3^2}P_y^{-\mathbf{X}}P_y^{-\mathbf{X}} + R_3^s, \end{cases} \quad (4.14)$$

where $|R_i^s| \leq C\delta|P_y^{-\mathbf{X}}|$ ($i = 1, 2, 3$).

• **Change of variable for $\mathbf{B}_1(\tau)$:** We first treat each term $\mathbf{B}_{1,i}(\tau)$ ($i = 1, \dots, 3$) by using a new variable (4.12). By Taylor expansion and (4.14), it holds

$$\begin{aligned} \mathbf{B}_{1,1}(\tau) &\leq \int_{\mathbb{R}} -U_y^{-\mathbf{X}}P^{-\mathbf{X}} \left[\frac{1}{2} \left(\frac{V^{-\mathbf{X}}\theta}{\Theta^{-\mathbf{X}}v} - 1 \right)^2 + \frac{\gamma}{2} \left(\frac{v}{V^{-\mathbf{X}}} - 1 \right)^2 \right] dy + C(N(\tau_1, \tau_2) + \sqrt{\delta}) \int_{\mathbb{R}} |U_y^{-\mathbf{X}}| |(\phi, \zeta)|^2 dy \\ &\leq \int_{\mathbb{R}} -U_y^{-\mathbf{X}}p_+ \left[\frac{1}{2} \left(\frac{\zeta}{\theta_+} - \frac{\phi}{v_+} \right)^2 + \frac{\gamma}{2} \frac{\phi^2}{v_+^2} \right] dy + C(N(\tau_1, \tau_2) + \sqrt{\delta}) \int_{\mathbb{R}} |U_y^{-\mathbf{X}}| |(\phi, \zeta)|^2 dy \\ &\leq \int_{\mathbb{R}} -P_y^{-\mathbf{X}} \frac{p_+}{s_3} \left(\frac{\gamma+1}{2} \frac{\phi^2}{v_+^2} + \frac{1}{2} \frac{\zeta^2}{\theta_+^2} - \frac{\phi\zeta}{v_+\theta_+} \right) dy + C(N(\tau_1, \tau_2) + \sqrt{\delta}) \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| |(\phi, \zeta)|^2 dy. \end{aligned}$$

Using inequality $m^2 \leq (1+\eta)n^2 + (1+1/\eta)(m-n)^2$ for $\eta > 0$, and (4.14), it holds

$$\begin{aligned} &\int_{\mathbb{R}} -P_y^{-\mathbf{X}} \frac{p_+}{s_3} \left(\frac{\gamma+1}{2} \frac{\phi^2}{v_+^2} + \frac{1}{2} \frac{\zeta^2}{\theta_+^2} \right) dy \\ &\leq (1+\eta) \int_{\mathbb{R}} -P_y^{-\mathbf{X}} \frac{p_+}{s_3} \left(\frac{\gamma+1}{2v_+^2} \frac{\psi^2}{s_3^2} + \frac{(\gamma-1)^2}{2R^2} \frac{p_+^2 \psi^2}{\theta_+^2 s_3^2} \right) dy \\ &\quad + \frac{C}{\eta} \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| \left\{ \left(\phi + \frac{\psi}{s_3} \right)^2 + \left(\zeta - \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} \right)^2 \right\} dy \\ &= \int_{\mathbb{R}} -P_y^{-\mathbf{X}} \frac{\gamma^2 - \gamma + 2}{2} \frac{p_+ \psi^2}{s_3^3 v_+^2} dy + \frac{C}{\eta} \sqrt{\delta} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)) + C\eta \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| \psi^2 dy, \end{aligned}$$

and

$$\begin{aligned} \int_{\mathbb{R}} P_y^{-\mathbf{X}} \frac{p_+}{s_3} \frac{\phi \zeta}{v_+ \theta_+} dy &= \int_{\mathbb{R}} P_y^{-\mathbf{X}} \frac{R}{s_3 v_+^2} \left(\phi + \frac{\psi}{s_3} - \frac{\psi}{s_3} \right) \left(\zeta - \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} + \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} \right) dy \\ &\leq \int_{\mathbb{R}} -P_y^{-\mathbf{X}} (\gamma-1) \frac{p_+ \psi^2}{s_3^3 v_+^2} dy + C\eta \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| \psi^2 dy + \frac{C}{\eta} \sqrt{\delta} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)). \end{aligned}$$

We combine the above two estimates, and use (iii) in Lemma 2.1 and (4.13) to have

$$\begin{aligned} \mathbf{B}_{1,1}(\tau) &\leq \int_{\mathbb{R}} -P_y^{-\mathbf{X}} \frac{\gamma(\gamma+1)}{2} \frac{p_+ \psi^2}{s_3^3 v_+^2} dy + C(\eta + N(\tau_1, \tau_2) + \sqrt{\delta}) \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| \psi^2 dy \\ &\quad + \frac{C}{\eta} \sqrt{\delta} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)) \\ &\leq \int_{\mathbb{R}} -P_y^{-\mathbf{X}} \frac{\gamma(\gamma+1)}{2} \frac{s_3 \psi^2}{\gamma^2 p_+} dy + C(\eta + N(\tau_1, \tau_2) + \sqrt{\delta}) \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| \psi^2 dy \\ &\quad + \frac{C}{\eta} \sqrt{\delta} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)) \\ &= \delta \int_0^1 \frac{\gamma+1}{2\gamma} \frac{s_3}{p_+} \psi^2 dz + C(\eta + N(\tau_1, \tau_2) + \sqrt{\delta}) \delta \int_0^1 \psi^2 dz + \frac{C}{\eta} \sqrt{\delta} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)). \end{aligned} \tag{4.15}$$

Likewise, $\mathbf{B}_{1,i}(\tau)$ ($i = 2, 3$) can be controlled as

$$\begin{aligned} \sum_{i=2}^3 \mathbf{B}_{1,i}(\tau) &\leq C\delta \int_{\mathbb{R}} a_y^{-\mathbf{X}} \psi^2 dy + C\delta \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| |(\phi, \zeta)|^2 dy \\ &\leq C\delta^{\frac{3}{2}} \int_0^1 \psi^2 dz + C\delta^{\frac{3}{2}} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)). \end{aligned} \tag{4.16}$$

Set

$$\alpha_+ := \frac{\gamma+1}{2\gamma} \frac{s_3}{p_+}, \quad \text{with } s_3 = \sqrt{\frac{p_- - p_+}{v_- - v_+}}. \tag{4.17}$$

Hence, combination of (4.15) and (4.16) gives

$$\mathbf{B}_1(\tau) \leq \alpha_+ \delta \int_0^1 \psi^2 dz + C(\eta + N(\tau_1, \tau_2) + \sqrt{\delta}) \delta \int_0^1 \psi^2 dz + \frac{C}{\eta} \sqrt{\delta} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)). \tag{4.18}$$

• **Change of variable for $\mathbf{D}_i(\tau)$ ($i=1,2$):** To deal with the diffusion term $\mathbf{D}_i(\tau)$ ($i = 1, 2$), we need a uniform in z estimate on $\frac{dz}{dy}$ with the help of Lemma 2.2. First, using $a^{-\mathbf{X}} > 1$ and the change of variable (4.13), it holds

$$\begin{aligned} \mathbf{D}_1(\tau) + \mathbf{D}_2(\tau) &\geq \int_{\mathbb{R}} \frac{\Theta^{-\mathbf{X}}}{v\theta} \psi_y^2 dy + \nu \int_{\mathbb{R}} \frac{\Theta^{-\mathbf{X}}}{v\theta^2} \zeta_y^2 dy \geq (1 - C(N(\tau_1, \tau_2) + \delta)) \frac{1}{v_+} \int_{\mathbb{R}} \left(\psi_y^2 + \frac{\nu}{\theta_+} \zeta_y^2 \right) dy \\ &= (1 - C(N(\tau_1, \tau_2) + \delta)) \frac{1}{v_+} \int_0^1 \left(\psi_z^2 + \frac{\nu}{\theta_+} \zeta_z^2 \right) \frac{dz}{dy} dz. \end{aligned}$$

Integrating (2.1)₂ with $\varepsilon = 1$ over $(-\infty, \xi]$ yields

$$\frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} = s_3^2 (V^{-\mathbf{X}} - v_-) + P^{-\mathbf{X}} - p_-.$$

On one hand, by (4.14) and (4.13), it holds

$$\frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} = \frac{1}{s_3} \frac{P_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} + \frac{R_2^s}{V^{-\mathbf{X}}} = \frac{1}{s_3} \frac{-\delta}{V^{-\mathbf{X}}} \frac{dz}{dy} + \frac{R_2^s}{V^{-\mathbf{X}}}.$$

On the other hand,

$$\begin{aligned} s_3^2(V^{-\mathbf{X}} - v_-) + P^{-\mathbf{X}} - p_- &= -\frac{p_+ - p_-}{v_+ - v_-}(V^{-\mathbf{X}} - v_-) + P^{-\mathbf{X}} - p_- \\ &= \frac{1}{v_+ - v_-} \left[(P^{-\mathbf{X}} - p_+)(V^{-\mathbf{X}} - v_-) - (P^{-\mathbf{X}} - p_-)(V^{-\mathbf{X}} - v_+) \right]. \end{aligned}$$

Recalling $z = (p_- - P^{-\mathbf{X}})/\delta$ and $1 - z = (P^{-\mathbf{X}} - p_+)/\delta$, we have

$$\frac{1}{z(1-z)} \frac{dz}{dy} = \frac{\delta s_3 V^{-\mathbf{X}}}{v_+ - v_-} \left(\frac{V^{-\mathbf{X}} - v_-}{P^{-\mathbf{X}} - p_-} - \frac{V^{-\mathbf{X}} - v_+}{P^{-\mathbf{X}} - p_+} \right) + \frac{s_3}{z(1-z)} \frac{R_2^s}{\delta}.$$

Recalling that

$$\frac{|R_2^s|}{\delta} \leq C |P_y^{-\mathbf{X}}| = C \delta \frac{dz}{dy},$$

then using (2.4) and (4.17), we obtain

$$\left| \frac{1}{z(1-z)} \frac{dz}{dy} - \delta \alpha_+ v_+ \frac{R\gamma}{\nu(\gamma-1)^2 + R\gamma} \right| \leq C \delta^2. \quad (4.19)$$

Thus, by (4.19) and Poincaré inequality (2.11), it holds

$$\begin{aligned} &\mathbf{D}_1(\tau) + \mathbf{D}_2(\tau) \\ &\geq (1 - C(N(\tau_1, \tau_2) + \delta)) \frac{1}{v_+} \int_0^1 z(1-z) \left(\psi_z^2 + \frac{\nu}{\theta_+} \zeta_z^2 \right) \frac{1}{z(1-z)} \frac{dz}{dy} dz \\ &\geq (1 - C(N(\tau_1, \tau_2) + \delta)) \delta \alpha_+ \frac{R\gamma}{\nu(\gamma-1)^2 + R\gamma} \int_0^1 z(1-z) \left(\psi_z^2 + \frac{\nu}{\theta_+} \zeta_z^2 \right) dz \\ &\geq (1 - C(N(\tau_1, \tau_2) + \delta)) \delta 2\alpha_+ \frac{R\gamma}{\nu(\gamma-1)^2 + R\gamma} \int_0^1 \left(\left| \psi - \int_0^1 \psi dz \right|^2 + \frac{\nu}{\theta_+} \left| \zeta - \int_0^1 \zeta dz \right|^2 \right) dz \\ &= (1 - C(N(\tau_1, \tau_2) + \delta)) \delta 2\alpha_+ \frac{R\gamma}{\nu(\gamma-1)^2 + R\gamma} \left(\int_0^1 \psi^2 dz - \left(\int_0^1 \psi dz \right)^2 \right) \\ &\quad + (1 - C(N(\tau_1, \tau_2) + \delta)) \delta 2\alpha_+ \frac{R\gamma}{\nu(\gamma-1)^2 + R\gamma} \frac{\nu}{\theta_+} \left(\int_0^1 \zeta^2 dz - \left(\int_0^1 \zeta dz \right)^2 \right). \end{aligned} \quad (4.20)$$

Since

$$1 > \frac{R\gamma}{\nu(\gamma-1)^2 + R\gamma} \rightarrow 0, \quad \text{as } \gamma \rightarrow \infty,$$

we will use the last term in (4.20) to control the bad term \mathbf{B}_1 . By Cauchy's inequality, it holds

$$\begin{aligned} \int_0^1 \zeta^2 dz &= \int_0^1 \left(\zeta - \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} + \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} \right)^2 dz \\ &\geq (1 - \delta^{\frac{1}{4}}) \left(\frac{\gamma-1}{R} \frac{p_+}{s_3} \right)^2 \int_0^1 \psi^2 dz - C \delta^{-\frac{1}{4}} \int_0^1 \left(\zeta - \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} \right)^2 dz \end{aligned}$$

and

$$\begin{aligned} \left(\int_0^1 \zeta dz \right)^2 &\leq 2 \left(\int_0^1 \left(\zeta - \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} \right) dz \right)^2 + 2 \left(\int_0^1 \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} dz \right)^2 \\ &\leq 2 \int_0^1 \left(\zeta - \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} \right)^2 dz + 2 \left(\frac{\gamma-1}{R} \frac{p_+}{s_3} \right)^2 \left(\int_0^1 \psi dz \right)^2. \end{aligned}$$

Thus, using (4.13), it holds

$$\begin{aligned} &\int_0^1 \psi^2 dz + \frac{\nu}{\theta_+} \int_0^1 \zeta^2 dz \\ &\geq \int_0^1 \psi^2 dz + (1 - \delta^{\frac{1}{4}}) (\gamma-1)^2 \frac{\nu \theta_+}{s_3^2 v_+^2} \int_0^1 \psi^2 dz - C \delta^{-\frac{1}{4}} \int_0^1 \left(\zeta - \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} \right)^2 dz \\ &\geq (1 - \delta^{\frac{1}{4}}) \frac{\nu(\gamma-1)^2 + R\gamma}{R\gamma} \int_0^1 \psi^2 dz - C \delta \int_0^1 \psi^2 dz - C \delta^{-\frac{3}{4}} \mathbf{G}_2(\tau), \end{aligned}$$

where in the last inequality, we have used (iii) in Lemma 2.1 that

$$\frac{\theta_+}{s_3^2 v_+^2} = \frac{\theta_+}{\gamma p_+ v_+} + O(\delta) = \frac{1}{R\gamma} + O(\delta).$$

Therefore, we can deduce from (4.20) that

$$\begin{aligned} & \mathbf{D}_1(\tau) + \mathbf{D}_2(\tau) \\ & \geq (1 - C(N(\tau_1, \tau_2) + \delta))\delta 2\alpha_+ \frac{R\gamma}{\nu(\gamma-1)^2 + R\gamma} \left[(1 - \delta^{\frac{1}{4}}) \frac{\nu(\gamma-1)^2 + R\gamma}{R\gamma} \int_0^1 \psi^2 dz \right. \\ & \quad \left. - C\delta \int_0^1 \psi^2 dz - C\delta^{-\frac{3}{4}} \mathbf{G}_2(\tau) - \frac{2\nu(\gamma-1)^2 + R\gamma}{R\gamma} \left(\int_0^1 \psi dz \right)^2 \right] \\ & \geq (1 - C(N(\tau_1, \tau_2) + \delta^{\frac{1}{4}}))\delta 2\alpha_+ \int_0^1 \psi^2 dz - C\delta^{\frac{1}{4}} \mathbf{G}_2(\tau) - \delta 2\alpha_+ \frac{2\nu(\gamma-1)^2 + R\gamma}{\nu(\gamma-1)^2 + R\gamma} \left(\int_0^1 \psi dz \right)^2. \end{aligned} \quad (4.21)$$

• **Estimate on $-\frac{\delta}{2M}|\dot{\mathbf{X}}(\tau)|^2$:** We first decompose $-\frac{\delta}{M}\dot{\mathbf{X}}(\tau)$ into

$$-\frac{\delta}{M}\dot{\mathbf{X}}(\tau) = -\int_{\mathbb{R}} a^{-\mathbf{X}} \frac{P^{-\mathbf{X}}\psi}{V^{-\mathbf{X}}s_3} V_y^{-\mathbf{X}} dy + \int_{\mathbb{R}} a^{-\mathbf{X}} \psi U_y^{-\mathbf{X}} dy + \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{p_+\psi}{\Theta^{-\mathbf{X}}s_3} \Theta_y^{-\mathbf{X}} dy =: \sum_{i=4}^6 \mathbf{Y}_i(\tau).$$

Using (4.14), we have

$$\begin{aligned} \mathbf{Y}_4(\tau) &= \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{P^{-\mathbf{X}}\psi}{V^{-\mathbf{X}}s_3^3} P_y^{-\mathbf{X}} dy - \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{P^{-\mathbf{X}}\psi}{V^{-\mathbf{X}}s_3} R_1^s dy, \\ \mathbf{Y}_5(\tau) &= \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{\psi}{s_3} P_y^{-\mathbf{X}} dy + \int_{\mathbb{R}} a^{-\mathbf{X}} \psi R_2^s dy, \\ \mathbf{Y}_6(\tau) &= \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{\gamma-1}{R} \frac{p_+\psi}{\Theta^{-\mathbf{X}}s_3^3} P_y^{-\mathbf{X}} dy + \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{p_+\psi}{\Theta^{-\mathbf{X}}s_3} R_3^s dy, \end{aligned}$$

which together with (iii) of Lemma 2.1 implies

$$\begin{aligned} \left| \mathbf{Y}_4(\tau) - \int_{\mathbb{R}} \frac{s_3 v_+}{\gamma^2 p_+} P_y^{-\mathbf{X}} \psi dy \right| &\leq C\sqrt{\delta} \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| |\psi| dy, \\ \left| \mathbf{Y}_5(\tau) - \int_{\mathbb{R}} \frac{s_3 v_+}{\gamma p_+} P_y^{-\mathbf{X}} \psi dy \right| &\leq C\sqrt{\delta} \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| |\psi| dy, \\ \left| \mathbf{Y}_6(\tau) - (\gamma-1) \int_{\mathbb{R}} \frac{s_3 v_+}{\gamma^2 p_+} P_y^{-\mathbf{X}} \psi dy \right| &\leq C\sqrt{\delta} \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| |\psi| dy. \end{aligned}$$

Hence, it holds

$$\left| -\frac{\delta}{M}\dot{\mathbf{X}}(\tau) - \int_{\mathbb{R}} \frac{2s_3 v_+}{\gamma p_+} P_y^{-\mathbf{X}} \psi dy \right| \leq C\sqrt{\delta} \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| |\psi| dy,$$

which together with the new change of variable (4.13) and (4.17) gives

$$\left| -\frac{\delta}{M}\dot{\mathbf{X}}(\tau) + \delta \frac{4v_+\alpha_+}{\gamma+1} \int_0^1 \psi dz \right| \leq C\delta^{\frac{3}{2}} \int_0^1 |\psi| dz. \quad (4.22)$$

By (4.22), it holds

$$\left| \dot{\mathbf{X}}(\tau) - M \frac{4v_+\alpha_+}{\gamma+1} \int_0^1 \psi dz \right| = \left| \frac{M}{\delta} \left(-\frac{\delta}{M}\dot{\mathbf{X}}(\tau) + \delta \frac{4v_+\alpha_+}{\gamma+1} \int_0^1 \psi dz \right) \right| \leq C\sqrt{\delta} \int_0^1 |\psi| dz,$$

which yields

$$\left(\left| M \frac{4v_+\alpha_+}{\gamma+1} \int_0^1 \psi dz \right| - |\dot{\mathbf{X}}(\tau)| \right)^2 \leq C\delta \int_0^1 \psi^2 dz,$$

which together with the algebraic inequality $\frac{m^2}{2} - n^2 \leq (m - n)^2$ indicates

$$M^2 \frac{8v_+^2 \alpha_+^2}{(\gamma + 1)^2} \left(\int_0^1 \psi dz \right)^2 - |\dot{\mathbf{X}}(\tau)|^2 \leq C\delta \int_0^1 \psi^2 dz.$$

Thus, we get

$$-\frac{\delta}{2M} |\dot{\mathbf{X}}(\tau)|^2 \leq -M \frac{4v_+^2 \alpha_+^2}{(\gamma + 1)^2} \delta \left(\int_0^1 \psi dz \right)^2 + C\delta^2 \int_0^1 \psi^2 dz. \quad (4.23)$$

• **Conclusion:** First, combination of (4.18), (4.21) and (4.23) yields

$$\begin{aligned} & \mathbf{B}_1(\tau) - \frac{7}{8}(\mathbf{D}_1(\tau) + \mathbf{D}_2(\tau)) - \frac{\delta}{2M} |\dot{\mathbf{X}}(\tau)|^2 \\ & \leq \alpha_+ \delta \int_0^1 \psi^2 dz + C(\eta + N(\tau_1, \tau_2) + \sqrt{\delta}) \delta \int_0^1 \psi^2 dz + \frac{C}{\eta} \sqrt{\delta} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)) \\ & - (1 - C(N(\tau_1, \tau_2) + \delta^{\frac{1}{4}})) \frac{7}{4} \alpha_+ \delta \int_0^1 \psi^2 dz + C\delta^{\frac{1}{4}} \mathbf{G}_2(\tau) \\ & + 2\alpha_+ \frac{2\nu(\gamma - 1)^2 + R\gamma}{\nu(\gamma - 1)^2 + R\gamma} \delta \left(\int_0^1 \psi dz \right)^2 - M \frac{4v_+^2 \alpha_+^2}{(\gamma + 1)^2} \delta \left(\int_0^1 \psi dz \right)^2. \end{aligned}$$

Choosing $N(\tau_1, \tau_2)$, δ and η suitably small such that

$$C(\eta + N(\tau_1, \tau_2) + \sqrt{\delta}) \leq \frac{\alpha_+}{3}, \quad C(N(\tau_1, \tau_2) + \delta^{\frac{1}{4}}) \leq \frac{1}{21},$$

which together with $M = \frac{(\gamma+1)^2}{2\alpha_+ v_+^2} \frac{2\nu(\gamma-1)^2 + R\gamma}{\nu(\gamma-1)^2 + R\gamma}$ gives

$$\mathbf{B}_1(\tau) - \frac{7}{8}(\mathbf{D}_1(\tau) + \mathbf{D}_2(\tau)) - \frac{\delta}{2M} |\dot{\mathbf{X}}(\tau)|^2 \leq -\frac{\alpha_+}{3} \delta \int_0^1 \psi^2 dz + C\delta^{\frac{1}{4}} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)),$$

which indicates the desired inequality (4.11) by using (4.13). The proof of Lemma 4.2 is completed. \square

4.3 Energy estimates

Now we are in a stage to show the L^2 estimates.

Lemma 4.3 *Under the hypotheses of Proposition 3.3, there exists constant $C > 0$, such that for any $\tau \in [\tau_1, \tau_2]$, it holds*

$$\begin{aligned} & \|(\phi, \psi, \zeta)(\tau)\|^2 + \int_{\tau_1}^{\tau} \left(\delta |\dot{\mathbf{X}}(\tau)|^2 + G^s(\tau) + \sum_{i=1}^2 G_i(\tau) \right) d\tau + \int_{\tau_1}^{\tau} \|(\psi_y, \zeta_y)\|^2 d\tau \\ & \leq C \|(\phi, \psi, \zeta)(\tau_1)\|^2, \end{aligned} \quad (4.24)$$

where we denote

$$\begin{aligned} G^s(\tau) &= \int_{\mathbb{R}} |U_y^{-\mathbf{X}}| \psi^2 dy, \quad G_1(\tau) = \frac{1}{\sqrt{\delta}} \int_{\mathbb{R}} |U_y^{-\mathbf{X}}| \left(\phi + \frac{\psi}{s_3} \right)^2 dy, \\ G_2(\tau) &= \frac{1}{\sqrt{\delta}} \int_{\mathbb{R}} |U_y^{-\mathbf{X}}| \left(\zeta - \frac{\gamma-1}{R} \frac{p_+ \psi}{s_3} \right)^2 dy. \end{aligned} \quad (4.25)$$

Proof: First of all, we use (4.1) and Lemma 4.2 to have

$$\begin{aligned}
& \frac{d}{d\tau} \int_{\mathbb{R}} a^{-\mathbf{X}} \mathcal{E} dy + \mathbf{G}_1(\tau) + \mathbf{G}_2(\tau) + \frac{1}{8}(\mathbf{D}_1(\tau) + \mathbf{D}_2(\tau)) + \frac{\delta}{2M} |\dot{\mathbf{X}}(\tau)|^2 \\
&= \mathbf{B}_1(\tau) - \frac{7}{8}(\mathbf{D}_1(\tau) + \mathbf{D}_2(\tau)) - \frac{\delta}{2M} |\dot{\mathbf{X}}(\tau)|^2 + \sum_{i=2}^7 \mathbf{B}_i(\tau) + \dot{\mathbf{X}}(\tau) \sum_{i=1}^3 \mathbf{Y}_i(\tau) \\
&\leq -\frac{\alpha_+}{3} \underbrace{\int_{\mathbb{R}} |P_y^{-\mathbf{X}}| \psi^2 dy}_{\mathbf{G}^s(\tau)} + C\delta^{\frac{1}{4}}(\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)) + \sum_{i=2}^7 \mathbf{B}_i(\tau) + \frac{\delta}{4M} |\dot{\mathbf{X}}(\tau)|^2 + \frac{C}{\delta} \sum_{i=1}^3 |\mathbf{Y}_i(\tau)|^2.
\end{aligned} \tag{4.26}$$

In what follows, it is to control the bad terms $\mathbf{B}_i(\tau)$ ($i = 2, \dots, 7$) and $\mathbf{Y}_i(\tau)$ ($i = 1, 2, 3$) by the good terms $\mathbf{G}^s(\tau)$, $\mathbf{G}_i(\tau)$ and $\mathbf{D}_i(\tau)$ ($i = 1, 2$).

• **Estimates for $\mathbf{B}_i(\tau)$ ($i = 2, \dots, 7$):** The smallness of assumption (3.18) and wave strengths leads to

$$\mathbf{B}_2(\tau) \leq C(N(\tau_1, \tau_2) + \delta)(\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)).$$

For $\mathbf{B}_3(\tau)$, it holds

$$\begin{aligned}
\mathbf{B}_3(\tau) &\leq C \int_{\mathbb{R}} a_y^{-\mathbf{X}} \left| \left(\phi + \frac{\psi}{s_3}, \zeta - \frac{\gamma-1}{R} \frac{p+\psi}{s_3} \right) \right| \psi^2 dy + \frac{C}{\sqrt{\delta}} \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| |\psi|^3 dy \\
&\quad + C\sqrt{\delta} \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| \psi^2 dy =: \sum_{i=1}^2 \mathbf{B}_{3,i}(\tau) + C\sqrt{\delta} \mathbf{G}^s(\tau).
\end{aligned}$$

By Cauchy inequality, Gagliardo-Nirenberg inequality and (3.6), it holds

$$\begin{aligned}
\mathbf{B}_{3,1}(\tau) &\leq C \|\psi\|_{L^\infty}^2 \sqrt{\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)} \left(\int_{\mathbb{R}} |a_y^{-\mathbf{X}}| dy \right)^{\frac{1}{2}} \\
&\leq C \|\psi\| \|\psi_y\| \delta^{\frac{1}{4}} \sqrt{\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)} \leq C\delta^{\frac{1}{4}} N(\tau_1, \tau_2) (\|\psi_y\|^2 + \mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)).
\end{aligned}$$

Likewise, we have

$$\begin{aligned}
\mathbf{B}_{3,2}(\tau) &\leq \frac{C}{\sqrt{\delta}} \|\psi\|_{L^\infty}^2 \int_{\mathbb{R}} |P_y^{-\mathbf{X}}| |\psi| dy \leq \frac{C}{\sqrt{\delta}} \|\psi\| \|\psi_y\| \sqrt{\mathbf{G}^s(\tau)} \left(\int_{\mathbb{R}} |P_y^{-\mathbf{X}}| dy \right)^{\frac{1}{2}} \\
&\leq CN(\tau_1, \tau_2) \|\psi_y\| \sqrt{\mathbf{G}^s(\tau)} \leq CN(\tau_1, \tau_2) (\|\psi_y\|^2 + \mathbf{G}^s(\tau)).
\end{aligned}$$

Combination the estimates of $\mathbf{B}_{3,i}(\tau)$ ($i = 1, 2$) gives

$$|\mathbf{B}_3(\tau)| \leq CN(\tau_1, \tau_2) (\|\psi_y\|^2 + \mathbf{G}_1(\tau) + \mathbf{G}_2(\tau) + \mathbf{G}^s(\tau)).$$

For $\mathbf{B}_4(\tau)$ and $\mathbf{B}_5(\tau)$, using Cauchy inequality, we have

$$\begin{aligned}
|\mathbf{B}_4(\tau)| + |\mathbf{B}_5(\tau)| &\leq \frac{1}{40} \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{\Theta^{-\mathbf{X}} \psi_y^2}{v\theta} dy + \frac{\nu}{40} \int_{\mathbb{R}} a^{-\mathbf{X}} \frac{\Theta^{-\mathbf{X}} \zeta_y^2}{v\theta^2} dy + C \int_{\mathbb{R}} |(U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})|^2 |(\phi, \zeta)|^2 dy \\
&\leq \frac{1}{40} (\mathbf{D}_1(\tau) + \mathbf{D}_2(\tau)) + C\delta^2 \mathbf{G}^s(\tau) + C\delta^{\frac{5}{2}} (\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)).
\end{aligned}$$

Likewise,

$$|\mathbf{B}_6(\tau)| \leq \frac{1}{40} (\mathbf{D}_1(\tau) + \mathbf{D}_2(\tau)) + C \int_{\mathbb{R}} |a_y^{-\mathbf{X}}|^2 |(\psi, \zeta)|^2 dy,$$

where

$$\begin{aligned}
C \int_{\mathbb{R}} |a_y^{-\mathbf{X}}|^2 |(\psi, \zeta)|^2 dy &\leq C \|a_y^{-\mathbf{X}}\|_{L^\infty} \mathbf{G}_2(\tau) + \frac{C}{\delta} \|P_y^{-\mathbf{X}}\|_{L^\infty} \mathbf{G}^s(\tau) \\
&\leq C\delta^{\frac{3}{2}} \mathbf{G}_2(\tau) + C\delta \mathbf{G}^s(\tau),
\end{aligned}$$

which indicates

$$|\mathbf{B}_6(\tau)| \leq \frac{1}{40}(\mathbf{D}_1(\tau) + \mathbf{D}_2(\tau)) + C\delta^{\frac{3}{2}}\mathbf{G}_2(\tau) + C\delta\mathbf{G}^s(\tau).$$

By (ii) of Lemma 2.1 and (3.6), it holds

$$\begin{aligned} \mathbf{B}_7(\tau) &\leq C \int_{\mathbb{R}} a_y^{-\mathbf{X}} |(U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})| |(\phi, \psi, \zeta)|^2 dy \\ &\leq C \|(U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})\|_{L^\infty} \int_{\mathbb{R}} a_y^{-\mathbf{X}} \left| \left(\phi + \frac{\psi}{s_3}, \zeta - \frac{\gamma-1}{R} \frac{p_+\psi}{s_3} \right) \right|^2 dy \\ &\quad + C \|a_y^{-\mathbf{X}}\|_{L^\infty} \int_{\mathbb{R}} |(U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})| \psi^2 dy \\ &\leq C\delta^2(\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)) + C\delta^{\frac{3}{2}}\mathbf{G}^s(\tau). \end{aligned}$$

Thus, we combine the above estimates and choose $N(\tau_1, \tau_2)$ and δ suitably small such that

$$\sum_{i=2}^7 \mathbf{B}_i(\tau) \leq \frac{1}{16}(\mathbf{G}^s(\tau) + \mathbf{G}_1(\tau) + \mathbf{G}_2(\tau) + \mathbf{D}_1(\tau) + \mathbf{D}_2(\tau)). \quad (4.27)$$

• **Estimates for $\mathbf{Y}_i(\tau)$ ($i = 1, 2, 3$):** For $\mathbf{Y}_1(\tau)$, it holds

$$\begin{aligned} \frac{C}{\delta} |\mathbf{Y}_1(\tau)|^2 &\leq C \left| \int_{\mathbb{R}} a_y^{-\mathbf{X}} \left(\phi + \frac{\psi}{s_3}, \zeta - \frac{\gamma-1}{R} \frac{p_+\psi}{s_3} \right) dy \right|^2 \\ &\leq C(\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)) \int_{\mathbb{R}} a_y^{-\mathbf{X}} dy \leq C\sqrt{\delta}(\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)). \end{aligned}$$

For $\mathbf{Y}_2(\tau)$, it holds

$$\begin{aligned} \frac{C}{\delta} |\mathbf{Y}_2(\tau)|^2 &\leq \frac{C}{\delta} \left| \int_{\mathbb{R}} |\Theta_y^{-\mathbf{X}}| |(\phi, \zeta)|^2 dy \right|^2 \\ &\leq \frac{C}{\delta} \|\Theta_y^{-\mathbf{X}}\|_{L^\infty} \|(\phi, \zeta)\|^2 \int_{\mathbb{R}} |\Theta_y^{-\mathbf{X}}| |(\phi, \zeta)|^2 dy \\ &\leq C\delta N(\tau_1, \tau_2)^2 \left(\sqrt{\delta}(\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau)) + \mathbf{G}^s(\tau) \right). \end{aligned}$$

Likewise, we have

$$\begin{aligned} \frac{C}{\delta} |\mathbf{Y}_3(\tau)|^2 &\leq \frac{C}{\delta} \left| \int_{\mathbb{R}} a_y^{-\mathbf{X}} |(\phi, \psi, \zeta)|^2 dy \right|^2 \leq \frac{C}{\delta} \|a_y^{-\mathbf{X}}\|_{L^\infty} \|(\phi, \psi, \zeta)\|^2 \int_{\mathbb{R}} a_y^{-\mathbf{X}} |(\phi, \psi, \zeta)|^2 dy \\ &\leq C\sqrt{\delta} N(\tau_1, \tau_2)^2 \left(\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau) + \frac{1}{\sqrt{\delta}} \mathbf{G}^s(\tau) \right). \end{aligned}$$

Thus, we combine the above estimates and choose $N(\tau_1, \tau_2)$ and δ suitably small to have

$$\sum_{i=1}^3 \frac{C}{\delta} |\mathbf{Y}_i(\tau)|^2 \leq \frac{1}{16}(\mathbf{G}_1(\tau) + \mathbf{G}_2(\tau) + \mathbf{G}^s(\tau)). \quad (4.28)$$

We substitute (4.27) and (4.28) into (4.26), then integrate the resultant inequality over (τ_1, τ) , and note that

$$\mathbf{G}^s(\tau) \sim G^s(\tau), \quad \mathbf{G}_i(\tau) \sim G_i(\tau), \quad \mathbf{D}_1(\tau) \sim \|\psi_y\|^2, \quad \mathbf{D}_2(y) \sim \|\zeta_y\|^2,$$

we can obtain the desired inequality (4.24) with the new notations (4.25). Here $A \sim B$ denotes A is equivalent to B . The proof of Lemma 4.3 is completed. \square

Next, we estimate the derivative of ϕ_y .

Lemma 4.4 *Under the hypotheses of Proposition 3.3, there exists constant $C > 0$, such that for any $\tau \in [\tau_1, \tau_2]$, it holds*

$$\|\phi_y(\tau)\|^2 + \int_{\tau_1}^{\tau} \|\phi_y\|^2 d\tau \leq C(\|(\phi, \psi, \zeta)(\tau_1)\|^2 + \|\phi_y(\tau_1)\|^2 + \delta). \quad (4.29)$$

Proof: Set $\tilde{v} = \frac{v}{V-\mathbf{X}}$, then the equation (3.9)₂ can be rewritten as

$$\begin{aligned} \left(\frac{\tilde{v}_y}{\tilde{v}}\right)_\tau - \dot{\mathbf{X}}(\tau) \left(\frac{V_y^{-\mathbf{X}}}{V-\mathbf{X}} - \frac{(V_y^{-\mathbf{X}})^2}{(V-\mathbf{X})^2} - U_y^{-\mathbf{X}}\right) - \psi_\tau + \frac{R\theta}{v} \frac{\tilde{v}_y}{\tilde{v}} \\ - \frac{R\zeta_y}{v} + (p - P^{-\mathbf{X}}) \frac{V_y^{-\mathbf{X}}}{V-\mathbf{X}} - R\Theta_y^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V-\mathbf{X}}\right) = 0, \end{aligned} \quad (4.30)$$

where we have used the fact

$$-(p - P^{-\mathbf{X}})_y = \frac{R\theta}{v} \frac{\tilde{v}_y}{\tilde{v}} - \frac{R\zeta_y}{v} + (p - P^{-\mathbf{X}}) \frac{V_y^{-\mathbf{X}}}{V-\mathbf{X}} - R\Theta_y^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V-\mathbf{X}}\right).$$

Multiplying (4.30) by $\frac{\tilde{v}_y}{\tilde{v}}$, we have

$$\begin{aligned} \left(\frac{1}{2} \left(\frac{\tilde{v}_y}{\tilde{v}}\right)^2 - \psi \frac{\tilde{v}_y}{\tilde{v}}\right)_\tau + \left(\psi \frac{\tilde{v}_\tau}{\tilde{v}}\right)_y + \frac{R\theta}{v} \left(\frac{\tilde{v}_y}{\tilde{v}}\right)^2 \\ = \dot{\mathbf{X}}(\tau) \left(\frac{V_y^{-\mathbf{X}}}{V-\mathbf{X}} - \frac{(V_y^{-\mathbf{X}})^2}{(V-\mathbf{X})^2} - U_y^{-\mathbf{X}}\right) \frac{\tilde{v}_y}{\tilde{v}} + \dot{\mathbf{X}}(\tau) \frac{V_y^{-\mathbf{X}}}{V-\mathbf{X}} \psi_y + \psi_y \left(\frac{u_y}{v} - \frac{U_y^{-\mathbf{X}}}{V-\mathbf{X}}\right) \\ + \left(\frac{R\zeta_y}{v} - (p - P^{-\mathbf{X}}) \frac{V_y^{-\mathbf{X}}}{V-\mathbf{X}} + R\Theta_y^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V-\mathbf{X}}\right)\right) \frac{\tilde{v}_y}{\tilde{v}}. \end{aligned}$$

Integrating the above equality with respect to τ and y over $[\tau_1, \tau] \times \mathbb{R}_\pm$ and using Cauchy inequality, we obtain

$$\begin{aligned} \int_{\mathbb{R}} \left(\frac{1}{2} \left(\frac{\tilde{v}_y}{\tilde{v}}\right)^2 - \psi \frac{\tilde{v}_y}{\tilde{v}}\right) (\tau, y) dy + \int_{\tau_1}^{\tau} \int_{\mathbb{R}} \frac{R\theta}{2v} \left(\frac{\tilde{v}_y}{\tilde{v}}\right)^2 dy d\tau \\ \leq \int_{\mathbb{R}} \left(\frac{1}{2} \left(\frac{\tilde{v}_y}{\tilde{v}}\right)^2 - \psi \frac{\tilde{v}_y}{\tilde{v}}\right) (\tau_1, y) dy + \int_{\tau_1}^{\tau} \left[\psi \frac{\tilde{v}_\tau}{\tilde{v}}\right] (\tau) d\tau + \int_{\tau_1}^{\tau} \int_{\mathbb{R}} \left|\psi_y \left(\frac{u_y}{v} - \frac{U_y^{-\mathbf{X}}}{V-\mathbf{X}}\right)\right| dy d\tau \\ + \int_{\tau_1}^{\tau} |\dot{\mathbf{X}}(\tau)| \int_{\mathbb{R}} \left|\frac{V_y^{-\mathbf{X}}}{V-\mathbf{X}} \psi_y\right| dy d\tau + C \int_{\tau_1}^{\tau} |\dot{\mathbf{X}}(\tau)|^2 \int_{\mathbb{R}} \left(\frac{V_y^{-\mathbf{X}}}{V-\mathbf{X}} - \frac{(V_y^{-\mathbf{X}})^2}{(V-\mathbf{X})^2} - U_y^{-\mathbf{X}}\right)^2 dy d\tau \\ + C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} \left|\frac{R\zeta_y}{v} - (p - P^{-\mathbf{X}}) \frac{V_y^{-\mathbf{X}}}{V-\mathbf{X}} + R\Theta_y^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V-\mathbf{X}}\right)\right|^2 dy d\tau. \end{aligned} \quad (4.31)$$

To deal with the terms in (4.31) which involve jumps at $y = 0$, we recall the observation by Hoff [12] that the jump discontinuity of the solution (v, u) to (3.2) and (3.3) satisfies

$$[\log v(\tau, 0)] = [\log v(\tau_1, 0)] \exp \left\{ \int_{\tau_1}^{\tau} \alpha(s) ds \right\}$$

with

$$\alpha(\tau) = \frac{p(\log v(\tau, 0+), \theta(\tau, 0)) - p(\log v(\tau, 0-), \theta(\tau, 0))}{\log v(\tau, 0+) - \log v(\tau, 0-)},$$

from which it follows for $\tau \geq \tau_1$,

$$\left[\frac{u_y}{v}\right] = [p], \quad |[v](\tau)| \leq C |[v](\tau_1)| \exp\{-C(\tau - \tau_1)\}. \quad (4.32)$$

Hence, by (4.32), the jump across $y = 0$ can be bounded as follows

$$\begin{aligned}
& \int_{\tau_1}^{\tau} \left[\psi \frac{\tilde{v}_\tau}{\tilde{v}} \right] (\tau) d\tau = \int_{\tau_1}^{\tau} \psi(\tau, 0) \left[\frac{v_\tau}{v} - \frac{V_\tau^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right] (\tau) d\tau \\
&= \int_{\tau_1}^{\tau} \psi(\tau, 0) \left[\frac{u_y}{v} - \frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right] (\tau) d\tau + \int_{\tau_1}^{\tau} \psi(\tau, 0) \dot{\mathbf{X}}(\tau) \left[\frac{V_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right] (\tau) d\tau \\
&= \int_{\tau_1}^{\tau} \psi(\tau, 0) [p](\tau) d\tau = R \int_{\tau_1}^{\tau} \psi(\tau, 0) \theta(\tau, 0) \left[\frac{1}{v} \right] (\tau) d\tau = -R \int_{\tau_1}^{\tau} \frac{\psi(\tau, 0) \theta(\tau, 0)}{v(\tau, 0+) v(\tau, 0-)} [v](\tau) d\tau \\
&\leq C \int_{\tau_1}^{\tau} \|\psi\|_{L^\infty}(\tau) |[v](\tau_1)| e^{-C(\tau-\tau_1)} d\tau \leq C\delta \int_{\tau_1}^{\tau} \|\psi\|^{\frac{1}{2}} \|\psi_y\|^{\frac{1}{2}} e^{-C(\tau-\tau_1)} d\tau \\
&\leq C\delta \int_{\tau_1}^{\tau} \|\psi_y\|^2 d\tau + C\delta \sup_{\tau \in [\tau_1, \tau_2]} \|\psi\|^2(\tau) + C\delta.
\end{aligned}$$

By Cauchy inequality, it holds

$$\begin{aligned}
\int_{\tau_1}^{\tau} \int_{\mathbb{R}} \left| \psi_y \left(\frac{u_y}{v} - \frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right) \right| dy d\tau &\leq C \int_{\tau_1}^{\tau} \|\psi_y\|^2 d\tau + C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |U_y^{-\mathbf{X}}|^2 \phi^2 dy d\tau \\
&\leq C \int_{\tau_1}^{\tau} \|\psi_y\|^2 d\tau + C\delta^2 \int_{\tau_1}^{\tau} (G^s(\tau) + G_1(\tau)) d\tau,
\end{aligned}$$

and

$$\begin{aligned}
& \int_{\tau_1}^{\tau} |\dot{\mathbf{X}}(\tau)| \int_{\mathbb{R}} \left| \frac{V_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \psi_y \right| dy d\tau + C \int_{\tau_1}^{\tau} |\dot{\mathbf{X}}(\tau)|^2 \int_{\mathbb{R}} \left(\frac{V_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} - \frac{(V_y^{-\mathbf{X}})^2}{(V^{-\mathbf{X}})^2} - U_y^{-\mathbf{X}} \right)^2 dy d\tau \\
&\leq C \int_{\tau_1}^{\tau} |\dot{\mathbf{X}}(\tau)| \|V_y^{-\mathbf{X}}\| \|\psi_y\| d\tau + C \int_{\tau_1}^{\tau} |\dot{\mathbf{X}}(\tau)|^2 \|(V_y^{-\mathbf{X}}, (V_y^{-\mathbf{X}})^2, U_y^{-\mathbf{X}})\|^2 d\tau \\
&\leq C \int_{\tau_1}^{\tau} \|\psi_y\|^2 d\tau + C\delta^3 \int_{\tau_1}^{\tau} |\dot{\mathbf{X}}(\tau)|^2 d\tau.
\end{aligned}$$

Similarly, we have

$$\begin{aligned}
& C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} \left| \frac{R\zeta_y}{v} - (p - P^{-\mathbf{X}}) \frac{V_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} - R\Theta_y^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V^{-\mathbf{X}}} \right) \right|^2 dy d\tau \\
&\leq C \int_{\tau_1}^{\tau} \|\zeta_y\|^2 d\tau + C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |(V_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})|^2 |(\phi, \zeta)|^2 dy d\tau \\
&\leq C \int_{\tau_1}^{\tau} \|\zeta_y\|^2 d\tau + C\delta^2 \int_{\tau_1}^{\tau} (G^s(\tau) + G_1(\tau) + G_2(\tau)) d\tau.
\end{aligned}$$

Note that

$$\frac{\tilde{v}_y}{\tilde{v}} = \frac{v_y}{v} - \frac{V_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} = \frac{\phi_y}{v} - \frac{\phi V_y^{-\mathbf{X}}}{v V^{-\mathbf{X}}},$$

which yields

$$C^{-1}(\phi_y^2 - |V_y^{-\mathbf{X}} \phi|^2) \leq \left(\frac{\tilde{v}_y}{\tilde{v}} \right)^2 \leq C(\phi_y^2 + |V_y^{-\mathbf{X}} \phi|^2).$$

Thus, combination of the above inequalities and Lemma 4.3 implies the desired inequality (4.29). The proof of Lemma 4.4 is completed. \square

Lemma 4.5 *Under the hypotheses of Proposition 3.3, there exists constant $C > 0$, such that for any $\tau \in [\tau_1, \tau_2]$, it holds*

$$\|(\psi_y, \zeta_y)(\tau)\|^2 + \int_{\tau_1}^{\tau} (\|(\psi_{yy}, \zeta_{yy})\|^2 + \|(\psi_\tau, \zeta_\tau)\|^2) d\tau \leq C(N^2(\tau_1) + \delta) + C\delta \int_{\tau_1}^{\tau} \|(\psi_{\tau y}, \zeta_{\tau y})\|^2 d\tau. \quad (4.33)$$

Proof: We multiply (3.9)₂ by $-\psi_{yy}$ to have

$$\begin{aligned}
& \left(\frac{\psi_y^2}{2} \right)_\tau - (\psi_y \psi_\tau)_y + \frac{\psi_{yy}^2}{v} \\
&= -\dot{\mathbf{X}}(\tau) U_y^{-\mathbf{X}} \psi_{yy} + \left(-\frac{p}{v} \phi_y + \frac{R}{v} \zeta_y \right) \psi_{yy} + R \Theta_y^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V-\mathbf{X}} \right) \psi_{yy} \\
&- R V_y^{-\mathbf{X}} \left(\frac{\theta}{v^2} - \frac{\Theta^{-\mathbf{X}}}{(V-\mathbf{X})^2} \right) \psi_{yy} - U_{yy}^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V-\mathbf{X}} \right) \psi_{yy} + \frac{1}{v^2} \phi_y \psi_y \psi_{yy} \\
&+ \frac{1}{v^2} U_y^{-\mathbf{X}} \phi_y \psi_{yy} + \frac{1}{v^2} V_y^{-\mathbf{X}} \psi_y \psi_{yy} + V_y^{-\mathbf{X}} U_y^{-\mathbf{X}} \left(\frac{1}{v^2} - \frac{1}{(V-\mathbf{X})^2} \right) \psi_{yy}.
\end{aligned} \tag{4.34}$$

Integrating (4.34) with respect to τ and y over $[\tau_1, \tau] \times \mathbb{R}_\pm$ yields

$$\begin{aligned}
& \int_{\mathbb{R}} \frac{\psi_y^2}{2}(\tau, y) dy + \int_{\tau_1}^{\tau} \int_{\mathbb{R}} \frac{\psi_{yy}^2}{2v} dy d\tau \leq \int_{\mathbb{R}} \frac{\psi_y^2}{2}(\tau_1, y) dy - \int_{\tau_1}^{\tau} [\psi_y \psi_\tau](\tau) d\tau \\
&+ C \int_{\tau_1}^{\tau} |\dot{\mathbf{X}}(\tau)|^2 \int_{\mathbb{R}} |U_y^{-\mathbf{X}}|^2 dy d\tau + C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} (\phi_y^2 + \zeta_y^2) dy d\tau + C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |\phi_y| |\psi_y| |\psi_{yy}| dy d\tau \\
&+ C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |(U_{yy}^{-\mathbf{X}}, V_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})|^2 |(\phi, \zeta)|^2 dy d\tau + C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}})|^2 |(\phi_y, \psi_y)|^2 dy d\tau.
\end{aligned} \tag{4.35}$$

We control the jump term across $y = 0$ as follows,

$$\begin{aligned}
& - \int_{\tau_1}^{\tau} [\psi_y \psi_\tau](\tau) d\tau = - \int_{\tau_1}^{\tau} \psi_\tau(\tau, 0) [\psi_y](\tau) d\tau = - \int_{\tau_1}^{\tau} \psi_\tau(\tau, 0) [u_y](\tau) d\tau \\
&= - \int_{\tau_1}^{\tau} \psi_\tau(\tau, 0) \left[\left(\frac{u_y}{v} - p \right) v \right](\tau) d\tau \\
&= - \int_{\tau_1}^{\tau} \psi_\tau(\tau, 0) \left(\frac{u_y}{v} - p \right)(\tau, 0) [v](\tau) d\tau \\
&\leq C \int_{\tau_1}^{\tau} \|\psi_\tau\|_{L^\infty} (\|\psi_y\|_{L^\infty} + 1) [v](\tau_1) e^{-c(\tau-\tau_1)} d\tau \\
&\leq C \delta \int_{\tau_1}^{\tau} \|\psi_\tau\|^{\frac{1}{2}} \|\psi_{\tau y}\|^{\frac{1}{2}} (\|\psi_y\|^{\frac{1}{2}} \|\psi_{yy}\|^{\frac{1}{2}} + 1) e^{-c(\tau-\tau_1)} d\tau.
\end{aligned} \tag{4.36}$$

By equation (3.9)₂ and assumption (3.18), it holds

$$\begin{aligned}
\|\psi_\tau\| &\leq C (|\dot{\mathbf{X}}(\tau)| \|U_y^{-\mathbf{X}}\| + \|\psi_{yy}\| + \|(\phi_y, \psi_y, \zeta_y)\| + \|\phi_y \psi_y\| \\
&+ \|(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}}, U_{yy}^{-\mathbf{X}})\phi\| + \|V_y^{-\mathbf{X}} \zeta\|) \\
&\leq C (\delta^{\frac{3}{2}} |\dot{\mathbf{X}}(\tau)| + \|\psi_{yy}\| + \|(\phi_y, \psi_y, \zeta_y)\| + \delta^{\frac{3}{2}}),
\end{aligned} \tag{4.37}$$

where we have used the fact that

$$\|\phi_y \psi_y\| \leq \|\phi_y\| \|\psi_y\|_{L^\infty} \leq C \|\phi_y\| \|\psi_y\|^{\frac{1}{2}} \|\psi_{yy}\|^{\frac{1}{2}} \leq CN(\tau_1, \tau_2) (\|\psi_y\| + \|\psi_{yy}\|).$$

Substituting (4.37) into (4.36) yields

$$\begin{aligned}
& - \int_{\tau_1}^{\tau} [\psi_y \psi_\tau](\tau) d\tau \leq C \delta \int_{\tau_1}^{\tau} (\delta^{\frac{3}{2}} |\dot{\mathbf{X}}(\tau)| + \|\psi_{yy}\| + \|(\phi_y, \psi_y, \zeta_y)\| + \delta^{\frac{3}{2}})^{\frac{1}{2}} \\
&\quad \times \|\psi_{\tau y}\|^{\frac{1}{2}} (\|\psi_y\|^{\frac{1}{2}} \|\psi_{yy}\|^{\frac{1}{2}} + 1) e^{-c(\tau-\tau_1)} d\tau \\
&\leq C \delta \int_{\tau_1}^{\tau} (\|(\psi_{yy}, \psi_{\tau y})\|^2 + \|(\phi_y, \psi_y, \zeta_y)\|^2 + \delta |\dot{\mathbf{X}}(\tau)|^2) d\tau + C \delta.
\end{aligned}$$

By Gagliardo-Nirenberg inequality and assumption (3.18), it holds

$$\begin{aligned}
C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |\phi_y| |\psi_y| |\psi_{yy}| dy d\tau &\leq C \int_{\tau_1}^{\tau} \|\phi_y\| \|\psi_y\|_{L^\infty} \|\psi_{yy}\| d\tau \\
&\leq CN(\tau_1, \tau_2) \int_{\tau_1}^{\tau} \|\psi_y\|^{\frac{1}{2}} \|\psi_{yy}\|^{\frac{3}{2}} d\tau \\
&\leq CN(\tau_1, \tau_2) \int_{\tau_1}^{\tau} (\|\psi_y\|^2 + \|\psi_{yy}\|^2) d\tau.
\end{aligned}$$

Other terms can be treated similar as that of in Lemma 4.4. Substituting the above estimates into (4.35) and using Lemmas 4.3, 4.4, we obtain

$$\|\psi_y(\tau)\|^2 + \int_{\tau_1}^{\tau} \|\psi_{yy}\|^2 d\tau \leq C(N^2(\tau_1) + \delta) + C\delta \int_{\tau_1}^{\tau} \|\psi_{\tau y}\|^2 d\tau. \quad (4.38)$$

Next, we multiply (3.9)₃ by $-\zeta_{yy}$ to have

$$\begin{aligned}
&\frac{R}{\gamma-1} \left(\frac{\zeta_y^2}{2} \right)_\tau - \frac{R}{\gamma-1} (\zeta_y \zeta_\tau)_y + \frac{\nu}{v} \zeta_{yy}^2 \\
&= -\dot{\mathbf{X}}(\tau) \frac{R\Theta_y^{-\mathbf{X}}}{\gamma-1} \zeta_{yy} + p\psi_y \zeta_{yy} + (p - P^{-\mathbf{X}}) U_y^{-\mathbf{X}} \zeta_{yy} - \nu \Theta_{yy}^{-\mathbf{X}} \left(\frac{1}{v} - \frac{1}{V-\mathbf{X}} \right) \zeta_{yy} \\
&+ \frac{\nu}{v^2} \phi_y \zeta_y \zeta_{yy} + \frac{\nu}{v^2} \Theta_y^{-\mathbf{X}} \phi_y \zeta_{yy} + \frac{\nu}{v^2} V_y^{-\mathbf{X}} \zeta_y \zeta_{yy} + \nu V_y^{-\mathbf{X}} \Theta_y^{-\mathbf{X}} \left(\frac{1}{v^2} - \frac{1}{(V-\mathbf{X})^2} \right) \zeta_{yy} \\
&- \frac{1}{v} \psi_y^2 \zeta_{yy} - \frac{2}{v} U_y^{-\mathbf{X}} \psi_y \zeta_{yy} - (U_y^{-\mathbf{X}})^2 \left(\frac{1}{v} - \frac{1}{V-\mathbf{X}} \right) \zeta_{yy}.
\end{aligned} \quad (4.39)$$

Integrating (4.39) with respect to τ and y over $[\tau_1, \tau] \times \mathbb{R}_\pm$ gives

$$\begin{aligned}
&\int_{\mathbb{R}} \frac{R}{\gamma-1} \frac{\zeta_y^2}{2}(\tau, y) dy + \int_{\mathbb{R}} \frac{\nu}{v} \frac{\zeta_{yy}^2}{2} dy \leq \int_{\mathbb{R}} \frac{R}{\gamma-1} \frac{\zeta_y^2}{2}(\tau_1, y) dy - \frac{R}{\gamma-1} \int_{\tau_1}^{\tau} [\zeta_y \zeta_\tau](\tau) d\tau \\
&+ C \int_{\tau_1}^{\tau} |\dot{\mathbf{X}}(\tau)|^2 \int_{\mathbb{R}} |\Theta_y^{-\mathbf{X}}|^2 dy d\tau + C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} \psi_y^2 dy d\tau + C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |\phi_y| |\zeta_y| |\zeta_{yy}| dy d\tau \\
&+ C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} \psi_y^2 |\zeta_{yy}| dy d\tau + C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |(U_y^{-\mathbf{X}}, \Theta_{yy}^{-\mathbf{X}}, V_y^{-\mathbf{X}} \Theta_y^{-\mathbf{X}})|^2 |(\phi, \zeta)|^2 dy d\tau \\
&+ C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})|^2 |(\phi_y, \psi_y, \zeta_y)|^2 dy d\tau.
\end{aligned} \quad (4.40)$$

The jump across $y = 0$ can be bounded as follows

$$\begin{aligned}
-\frac{R}{\gamma-1} \int_{\tau_1}^{\tau} [\zeta_y \zeta_\tau](\tau) d\tau &= -\frac{R}{\gamma-1} \int_{\tau_1}^{\tau} \zeta_\tau(\tau, 0) [\zeta_y](\tau) d\tau = -\frac{R}{\gamma-1} \int_{\tau_1}^{\tau} \zeta_\tau(\tau, 0) [\theta_y](\tau) d\tau \\
&= -\frac{R}{\gamma-1} \int_{\tau_1}^{\tau} \zeta_\tau(\tau, 0) \frac{\theta_y}{v}(\tau, 0) [v](\tau) d\tau \\
&\leq C \int_{\tau_1}^{\tau} \|\zeta_\tau\|_{L^\infty} (\|\zeta_y\|_{L^\infty} + 1) [v](\tau_1) e^{-c(\tau-\tau_1)} d\tau \\
&\leq C\delta \int_{\tau_1}^{\tau} \|\zeta_\tau\|^{\frac{1}{2}} \|\zeta_{\tau y}\|^{\frac{1}{2}} (\|\zeta_y\|^{\frac{1}{2}} \|\zeta_{yy}\|^{\frac{1}{2}} + 1) e^{-c(\tau-\tau_1)} d\tau.
\end{aligned} \quad (4.41)$$

By equation (3.9)₃ and assumption (3.18), it holds

$$\begin{aligned}
\|\zeta_\tau\| &\leq C(|\dot{\mathbf{X}}(\tau)| \|\Theta_y^{-\mathbf{X}}\| + \|\zeta_{yy}\| + \|\psi_y\| + \|\phi_y \zeta_y\| + \|\psi_y^2\| \\
&+ \|(U_y^{-\mathbf{X}}, (U_y^{-\mathbf{X}})^2, V_y^{-\mathbf{X}} \Theta_y^{-\mathbf{X}}, \Theta_{yy}^{-\mathbf{X}})(\phi, \zeta)\| + \|(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})(\phi_y, \psi_y, \zeta_y)\|) \\
&\leq C(\delta^{\frac{3}{2}} |\dot{\mathbf{X}}(\tau)| + \|(\psi_{yy}, \zeta_{yy})\| + \|(\phi_y, \psi_y, \zeta_y)\| + \delta^{\frac{3}{2}}),
\end{aligned} \quad (4.42)$$

where we have used the facts that

$$\|\phi_y \zeta_y\| \leq \|\phi_y\| \|\zeta_y\|_{L^\infty} \leq C \|\phi_y\| \|\zeta_y\|^{\frac{1}{2}} \|\zeta_{yy}\|^{\frac{1}{2}} \leq CN(\tau_1, \tau_2)(\|\zeta_y\| + \|\zeta_{yy}\|)$$

and

$$\|\psi_y^2\| = \|\psi_y\|_{L^4}^2 \leq C \|\psi_y\|^{\frac{3}{2}} \|\psi_{yy}\|^{\frac{1}{2}} \leq CN(\tau_1, \tau_2) \|\psi_y\|^{\frac{1}{2}} \|\psi_{yy}\|^{\frac{1}{2}} \leq CN(\tau_1, \tau_2)(\|\psi_y\| + \|\psi_{yy}\|).$$

Substituting (4.42) into (4.41) yields

$$\begin{aligned} -\frac{R}{\gamma-1} \int_{\tau_1}^{\tau} [\zeta_y \zeta_{\tau}] (\tau) d\tau &\leq C\delta \int_{\tau_1}^{\tau} (\delta^{\frac{3}{2}} |\dot{\mathbf{X}}(\tau)| + \|(\psi_{yy}, \zeta_{yy})\| + \|(\phi_y, \psi_y, \zeta_y)\| + \delta^{\frac{3}{2}})^{\frac{1}{2}} \\ &\quad \times \|\zeta_{\tau y}\|^{\frac{1}{2}} (\|\zeta_y\|^{\frac{1}{2}} \|\zeta_{yy}\|^{\frac{1}{2}} + 1) e^{-c(\tau-\tau_1)} d\tau \\ &\leq C\delta \int_{\tau_1}^{\tau} (\|(\psi_{yy}, \zeta_{yy}, \zeta_{\tau y})\|^2 + \|(\phi_y, \psi_y, \zeta_y)\|^2 + \delta |\dot{\mathbf{X}}(\tau)|^2) d\tau + C\delta. \end{aligned}$$

By Gagliardo-Nirenberg inequality and assumption (3.18), it holds

$$\begin{aligned} C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} |\phi_y| |\zeta_y| |\zeta_{yy}| dy d\tau &\leq C \int_{\tau_1}^{\tau} \|\phi_y\| \|\zeta_y\|_{L^\infty} \|\zeta_{yy}\| d\tau \\ &\leq C \int_{\tau_1}^{\tau} N(\tau_1, \tau_2) \|\zeta_y\|^{\frac{1}{2}} \|\zeta_{yy}\|^{\frac{3}{2}} d\tau \\ &\leq CN(\tau_1, \tau_2) \int_{\tau_1}^{\tau} (\|\zeta_y\|^2 + \|\zeta_{yy}\|^2) d\tau \end{aligned}$$

and

$$\begin{aligned} C \int_{\tau_1}^{\tau} \int_{\mathbb{R}} \psi_y^2 |\zeta_{yy}| dy d\tau &\leq C \int_{\tau_1}^{\tau} \|\psi_y\|_{L^4}^2 \|\zeta_{yy}\| d\tau \leq C \int_{\tau_1}^{\tau} \|\psi_y\|^{\frac{3}{2}} \|\psi_{yy}\|^{\frac{1}{2}} \|\zeta_{yy}\| d\tau \\ &\leq CN(\tau_1, \tau_2) \int_{\tau_1}^{\tau} \|\psi_y\|^{\frac{1}{2}} \|\psi_{yy}\|^{\frac{1}{2}} \|\zeta_{yy}\| d\tau \\ &\leq CN(\tau_1, \tau_2) \int_{\tau_1}^{\tau} (\|\psi_y\|^2 + \|\psi_{yy}\|^2 + \|\zeta_{yy}\|^2) d\tau. \end{aligned}$$

Other terms can be treated similar as that of in Lemma 4.4. Substituting the above estimates into (4.40) and using Lemmas 4.3, 4.4, we have

$$\|\zeta_y(\tau)\|^2 + \int_{\tau_1}^{\tau} \|\zeta_{yy}\|^2 d\tau \leq C(N^2(\tau_1) + \delta) + C\delta \int_{\tau_1}^{\tau} \|(\zeta_{\tau y}, \psi_{yy})\|^2 d\tau. \quad (4.43)$$

We combine (4.38) and (4.43) with suitably small δ to have

$$\|(\psi_y, \zeta_y)(\tau)\|^2 + \int_{\tau_1}^{\tau} \|(\psi_{yy}, \zeta_{yy})\|^2 d\tau \leq C(N^2(\tau_1) + \delta) + C\delta \int_{\tau_1}^{\tau} \|(\psi_{\tau y}, \zeta_{\tau y})\|^2 d\tau. \quad (4.44)$$

Combination of (4.37), (4.42) and (4.44) gives

$$\begin{aligned} &\int_{\tau_1}^{\tau} \|(\psi_{\tau}, \zeta_{\tau})\|^2 d\tau \\ &\leq C \int_{\tau_1}^{\tau} (\delta^3 |\dot{\mathbf{X}}(\tau)|^2 + \|(\psi_{yy}, \zeta_{yy})\|^2 + \|(\phi_y, \psi_y, \zeta_y)\|^2 + G^s(\tau) + G_1(\tau) + G_2(\tau)) d\tau \\ &\leq C(N^2(\tau_1) + \delta) + C\delta \int_{\tau_1}^{\tau} \|(\psi_{\tau y}, \zeta_{\tau y})\|^2 d\tau, \end{aligned} \quad (4.45)$$

which together with (4.44) and suitably small δ leads to the desired inequality (4.33). The proof of Lemma 4.5 is completed. \square

Lemma 4.6 *Under the hypotheses of Proposition 3.3, there exists constant $C > 0$, such that for any $\tau \in [\tau_1, \tau_2]$, it holds*

$$\|(\psi_\tau, \zeta_\tau)(\tau)\|^2 + \int_{\tau_1}^{\tau} \|(\psi_{\tau y}, \zeta_{\tau y})\|^2 d\tau \leq C(N^2(\tau_1) + \delta). \quad (4.46)$$

Proof: First, we apply the operator ∂_τ to the equation (3.9)₂ to have

$$\psi_{\tau\tau} = \ddot{\mathbf{X}}(\tau)U_y^{-\mathbf{X}} - (s_3 + \dot{\mathbf{X}}(\tau))\dot{\mathbf{X}}(\tau)U_{yy}^{-\mathbf{X}} + \left(\frac{u_y}{v} - p\right)_{\tau y} - \left(\frac{U_y^{-\mathbf{X}}}{V-\mathbf{X}} - P^{-\mathbf{X}}\right)_{\tau y}.$$

Multiplying the above equation by ψ_τ , we have

$$\begin{aligned} \left(\frac{\psi_\tau^2}{2}\right)_\tau + \frac{\psi_{\tau y}^2}{v} &= \left(\psi_\tau\left(\frac{u_y}{v} - p\right)_\tau - \psi_\tau\left(\frac{U_y^{-\mathbf{X}}}{V-\mathbf{X}} - P^{-\mathbf{X}}\right)_\tau\right)_y \\ &+ \ddot{\mathbf{X}}(\tau)\psi_\tau U_y^{-\mathbf{X}} - (s_3 + \dot{\mathbf{X}}(\tau))\dot{\mathbf{X}}(\tau)\psi_\tau U_{yy}^{-\mathbf{X}} \\ &+ \psi_{\tau y}\frac{u_y}{v^2}v_\tau - \psi_{\tau y}\frac{U_{\tau y}^{-\mathbf{X}}}{v} + \psi_{\tau y}\left(\frac{U_y^{-\mathbf{X}}}{V-\mathbf{X}}\right)_\tau + \psi_{\tau y}(p - P^{-\mathbf{X}})_\tau, \end{aligned} \quad (4.47)$$

where

$$\begin{aligned} &\frac{u_y}{v^2}v_\tau - \frac{U_{\tau y}^{-\mathbf{X}}}{v} + \left(\frac{U_y^{-\mathbf{X}}}{V-\mathbf{X}}\right)_\tau \\ &= \frac{u_y^2}{v^2} - \frac{(U_y^{-\mathbf{X}})^2}{(V-\mathbf{X})^2} + \dot{\mathbf{X}}(\tau)\frac{V_y^{-\mathbf{X}}U_y^{-\mathbf{X}}}{(V-\mathbf{X})^2} - U_{\tau y}^{-\mathbf{X}}\left(\frac{1}{v} - \frac{1}{V-\mathbf{X}}\right) \\ &= \frac{\psi_y^2}{v^2} + 2\frac{\psi_y}{v^2}U_y^{-\mathbf{X}} + (U_y^{-\mathbf{X}})^2\left(\frac{1}{v^2} - \frac{1}{(V-\mathbf{X})^2}\right) + \dot{\mathbf{X}}(\tau)\frac{V_y^{-\mathbf{X}}U_y^{-\mathbf{X}}}{(V-\mathbf{X})^2} + (s_3 + \dot{\mathbf{X}}(\tau))U_{yy}^{-\mathbf{X}}\left(\frac{1}{v} - \frac{1}{V-\mathbf{X}}\right) \end{aligned}$$

and

$$\begin{aligned} (p - P^{-\mathbf{X}})_\tau &= \frac{R\theta_\tau}{v} - \frac{R\Theta_\tau^{-\mathbf{X}}}{V-\mathbf{X}} - \frac{pv_\tau}{v} + \frac{P^{-\mathbf{X}}V_\tau^{-\mathbf{X}}}{V-\mathbf{X}} \\ &= \frac{R\zeta_\tau}{v} + R\Theta_\tau^{-\mathbf{X}}\left(\frac{1}{v} - \frac{1}{V-\mathbf{X}}\right) - \frac{pu_y}{v} + \frac{P^{-\mathbf{X}}}{V-\mathbf{X}}(U_y^{-\mathbf{X}} - \dot{\mathbf{X}}(\tau)V_y^{-\mathbf{X}}) \\ &= \frac{R\zeta_\tau}{v} - \frac{p\psi_y}{v} - R(s_3 + \dot{\mathbf{X}}(\tau))\Theta_y^{-\mathbf{X}}\left(\frac{1}{v} - \frac{1}{V-\mathbf{X}}\right) - \dot{\mathbf{X}}(\tau)\frac{P^{-\mathbf{X}}V_y^{-\mathbf{X}}}{V-\mathbf{X}} - \left(\frac{p}{v} - \frac{P^{-\mathbf{X}}}{V-\mathbf{X}}\right)U_y^{-\mathbf{X}}. \end{aligned}$$

Integrating (4.47) with respect to τ and y over $[\tau_1, \tau] \times \mathbb{R}_\pm$, and using Cauchy inequality and the above two equalities, we obtain

$$\begin{aligned} &\int_{\mathbb{R}} \frac{\psi_\tau^2}{2}(\tau, y)dy + \int_{\tau_1}^{\tau} \int_{\mathbb{R}} \frac{\psi_{\tau y}^2}{2v} dy d\tau \\ &\leq \int_{\mathbb{R}} \frac{\psi_\tau^2}{2}(\tau_1, y)dy - \int_{\tau_1}^{\tau} \left[\psi_\tau\left(\frac{u_y}{v} - p\right)_\tau - \psi_\tau\left(\frac{U_y^{-\mathbf{X}}}{V-\mathbf{X}} - P^{-\mathbf{X}}\right)_\tau \right](\tau)dy \\ &+ \underbrace{\int_{\tau_1}^{\tau} \int_{\mathbb{R}} |\ddot{\mathbf{X}}(\tau)| |\psi_\tau| |U_y^{-\mathbf{X}}| dy d\tau + \int_{\tau_1}^{\tau} \int_{\mathbb{R}} (s_3 + |\dot{\mathbf{X}}(\tau)|) |\dot{\mathbf{X}}(\tau)| |\psi_\tau| |U_{yy}^{-\mathbf{X}}| dy d\tau}_{J_1} \\ &+ C \underbrace{\int_{\tau_1}^{\tau} \int_{\mathbb{R}} \left(\psi_y^4 + \psi_y^2 |U_y^{-\mathbf{X}}|^2 + |U_y^{-\mathbf{X}}|^4 \phi^2 + |\dot{\mathbf{X}}(\tau)|^2 |V_y^{-\mathbf{X}} U_y^{-\mathbf{X}}|^2 + (s_3 + |\dot{\mathbf{X}}(\tau)|)^2 |U_{yy}^{-\mathbf{X}}|^2 \phi^2 \right) dy d\tau}_{J_2} \\ &+ C \underbrace{\int_{\tau_1}^{\tau} \int_{\mathbb{R}} \left(\zeta_\tau^2 + \psi_y^2 + (s_3 + |\dot{\mathbf{X}}(\tau)|)^2 |\Theta_y^{-\mathbf{X}}|^2 \phi^2 + |\dot{\mathbf{X}}(\tau)|^2 |V_y^{-\mathbf{X}}|^2 + |U_y^{-\mathbf{X}}|^2 |(\phi, \zeta)|^2 \right) dy d\tau}_{J_3}, \end{aligned} \quad (4.48)$$

where the jump across $y = 0$ in fact vanishes, i.e.,

$$\begin{aligned}
& \left[\psi_\tau \left(\frac{u_y}{v} - p \right)_\tau - \psi_\tau \left(\frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} - P^{-\mathbf{X}} \right)_\tau \right] (\tau) \\
&= [\psi_\tau] (\tau) \left(\frac{u_y}{v} - p \right)_\tau (\tau, 0-) + \psi_\tau (\tau, 0+) \left[\left(\frac{u_y}{v} - p \right)_\tau \right] (\tau) - [\psi_\tau] (\tau) \left(\frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} - P^{-\mathbf{X}} \right)_\tau (\tau, 0) \\
&= [\psi]_\tau (\tau) \left(\frac{u_y}{v} - p \right)_\tau (\tau, 0-) + \psi_\tau (\tau, 0+) \left[\frac{u_y}{v} - p \right]_\tau (\tau) - [\psi]_\tau (\tau) \left(\frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} - P^{-\mathbf{X}} \right)_\tau (\tau, 0) = 0.
\end{aligned}$$

In the following, we control the remaining terms on the right-hand side of (4.48). By (3.4), Lemma 2.1 and (3.18), it holds

$$|\dot{\mathbf{X}}(\tau)| \leq \frac{C}{\delta} \|\psi(\tau)\| \|(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})\| \leq C\delta^{\frac{1}{2}},$$

and

$$\begin{aligned}
|\ddot{\mathbf{X}}(\tau)| &\leq \frac{C}{\delta} (s_3 + |\dot{\mathbf{X}}(\tau)|) \int_{\mathbb{R}} |a_y^{-\mathbf{X}}| |(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})| |\psi| dy \\
&\quad + \frac{C}{\delta} (s_3 + |\dot{\mathbf{X}}(\tau)|) \int_{\mathbb{R}} |(V_{yy}^{-\mathbf{X}}, U_{yy}^{-\mathbf{X}}, \Theta_{yy}^{-\mathbf{X}}, (V_y^{-\mathbf{X}})^2, (\Theta_y^{-\mathbf{X}})^2)| |\psi| dy \\
&\quad + \frac{C}{\delta} \int_{\mathbb{R}} |(V_y^{-\mathbf{X}}, U_y^{-\mathbf{X}}, \Theta_y^{-\mathbf{X}})| |\psi_\tau| dy \\
&\leq C\delta^{\frac{1}{2}} (\sqrt{G^s(\tau)} + \|\psi_\tau(\tau)\|).
\end{aligned}$$

Then, we use the above two inequalities, (4.24) and (4.45) to have

$$\begin{aligned}
J_1 &\leq C\delta^{\frac{1}{2}} \int_{\tau_1}^\tau (\sqrt{G^s(\tau)} + \|\psi_\tau\|) \|\psi_\tau\| \|U_y^{-\mathbf{X}}\| d\tau + C \int_{\tau_1}^\tau |\dot{\mathbf{X}}(\tau)| \|\psi_\tau\| \|U_{yy}^{-\mathbf{X}}\| d\tau \\
&\leq C\delta^2 \int_{\tau_1}^\tau (G^s(\tau) + \|\psi_\tau\|^2 + \delta |\dot{\mathbf{X}}(\tau)|^2) d\tau \leq C(N^2(\tau_1) + \delta) + C\delta \int_{\tau_1}^\tau \|(\psi_{\tau y}, \zeta_{\tau y})\|^2 d\tau.
\end{aligned}$$

Similarly, using Sobolev inequality, (4.24) and (4.33), we have

$$\begin{aligned}
J_2 + J_3 &\leq C \int_{\tau_1}^\tau (\|\psi_{yy}\|^2 + \|\zeta_\tau\|^2 + \|\psi_y\|^2 + G^s(\tau) + G_1(\tau) + G_2(\tau) + \delta |\dot{\mathbf{X}}(\tau)|^2) d\tau \\
&\leq C(N^2(\tau_1) + \delta) + C\delta \int_{\tau_1}^\tau \|(\psi_{\tau y}, \zeta_{\tau y})\|^2 d\tau.
\end{aligned}$$

Substituting the above estimates into (4.48) with suitably small δ gives

$$\|\psi_\tau(\tau)\|^2 + \int_{\tau_1}^\tau \|\psi_{\tau y}\|^2 d\tau \leq C(N^2(\tau_1) + \delta) + C\delta \int_{\tau_1}^\tau \|\zeta_{\tau y}\|^2 d\tau. \quad (4.49)$$

Next, we apply the operator ∂_τ to the equation (3.9)₃ to have

$$\begin{aligned}
\frac{R\zeta_{\tau\tau}}{\gamma-1} &= \ddot{\mathbf{X}}(\tau) \frac{R\Theta_y^{-\mathbf{X}}}{\gamma-1} - (s_3 + \dot{\mathbf{X}}(\tau)) \dot{\mathbf{X}}(\tau) \frac{R\Theta_{yy}^{-\mathbf{X}}}{\gamma-1} + \nu \left(\frac{\theta_y}{v} \right)_{\tau y} - \nu \left(\frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right)_{\tau y} \\
&\quad + \left(u_y \left(\frac{u_y}{v} - p \right) \right)_\tau - \left(U_y^{-\mathbf{X}} \left(\frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} - P^{-\mathbf{X}} \right) \right)_\tau.
\end{aligned}$$

Multiplying the above equation by ζ_τ , we have

$$\begin{aligned}
\frac{R}{\gamma-1} \left(\frac{\zeta_\tau^2}{2} \right)^2 + \nu \frac{\zeta_{\tau y}^2}{v} &= \nu \left(\zeta_\tau \left(\frac{\theta_y}{v} \right)_\tau - \zeta_\tau \left(\frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right)_\tau \right)_y \\
&\quad + \ddot{\mathbf{X}}(\tau) \zeta_\tau \frac{R\Theta_y^{-\mathbf{X}}}{\gamma-1} - (s_3 + \dot{\mathbf{X}}(\tau)) \dot{\mathbf{X}}(\tau) \zeta_\tau \frac{R\Theta_{yy}^{-\mathbf{X}}}{\gamma-1} - \nu \zeta_{\tau y} \frac{\Theta_{\tau y}^{-\mathbf{X}}}{v} + \nu \zeta_{\tau y} \frac{\theta_y}{v^2} v_\tau \\
&\quad + \nu \zeta_{\tau y} \left(\frac{\Theta_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} \right)_\tau + \zeta_\tau u_{\tau y} \left(\frac{u_y}{v} - p \right) + \zeta_\tau u_y \left(\frac{u_y}{v} - p \right)_\tau \\
&\quad - \zeta_\tau U_{\tau y}^{-\mathbf{X}} \left(\frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} - P^{-\mathbf{X}} \right) - \zeta_\tau U_y^{-\mathbf{X}} \left(\frac{U_y^{-\mathbf{X}}}{V^{-\mathbf{X}}} - P^{-\mathbf{X}} \right)_\tau.
\end{aligned}$$

Integrating the above equality with respect to τ and y over $[\tau_1, \tau] \times \mathbb{R}_\pm$ gives

$$\begin{aligned}
& \int_{\mathbb{R}} \frac{R}{\gamma-1} \frac{\zeta_\tau^2}{2}(\tau, y) dy + \int_{\tau_1}^\tau \int_{\mathbb{R}} \nu \frac{\zeta_{\tau y}^2}{v} dy d\tau \\
&= \int_{\mathbb{R}} \frac{R}{\gamma-1} \frac{\zeta_\tau^2}{2}(\tau_1, y) dy - \int_{\tau_1}^\tau \nu \left[\zeta_\tau \left(\frac{\theta_y}{v} \right)_\tau - \zeta_\tau \left(\frac{\Theta_y^{-\mathbf{X}}}{V-\mathbf{X}} \right)_\tau \right](\tau) d\tau \\
&+ \int_{\tau_1}^\tau \int_{\mathbb{R}} \left(\ddot{\mathbf{X}}(\tau) \zeta_\tau \frac{R\Theta_y^{-\mathbf{X}}}{\gamma-1} - (s_3 + \dot{\mathbf{X}}(\tau)) \dot{\mathbf{X}}(\tau) \zeta_\tau \frac{R\Theta_y^{-\mathbf{X}}}{\gamma-1} \right) dy d\tau \\
&+ \int_{\tau_1}^\tau \int_{\mathbb{R}} \left\{ -\nu \zeta_{\tau y} \frac{\Theta_y^{-\mathbf{X}}}{v} + \nu \zeta_{\tau y} \frac{\theta_y}{v^2} v_\tau + \nu \zeta_{\tau y} \left(\frac{\Theta_y^{-\mathbf{X}}}{V-\mathbf{X}} \right)_\tau + \zeta_\tau u_{\tau y} \left(\frac{u_y}{v} - p \right) \right. \\
&\left. + \zeta_\tau u_y \left(\frac{u_y}{v} - p \right)_\tau - \zeta_\tau U_{\tau y}^{-\mathbf{X}} \left(\frac{U_y^{-\mathbf{X}}}{V-\mathbf{X}} - P^{-\mathbf{X}} \right) - \zeta_\tau U_y^{-\mathbf{X}} \left(\frac{U_y^{-\mathbf{X}}}{V-\mathbf{X}} - P^{-\mathbf{X}} \right)_\tau \right\} dy d\tau,
\end{aligned} \tag{4.50}$$

where the jump in fact vanishes, i.e.,

$$\begin{aligned}
& \left[\zeta_\tau \left(\frac{\theta_y}{v} \right)_\tau - \zeta_\tau \left(\frac{\Theta_y^{-\mathbf{X}}}{V-\mathbf{X}} \right)_\tau \right](\tau) \\
&= [\zeta_\tau](\tau) \left(\frac{\theta_y}{v} \right)_\tau(\tau, 0-) + \zeta_\tau(\tau, 0+) \left[\left(\frac{\theta_y}{v} \right)_\tau \right](\tau) - [\zeta_\tau](\tau) \left(\frac{\Theta_y^{-\mathbf{X}}}{V-\mathbf{X}} \right)_\tau(\tau, 0) \\
&= [\zeta]_\tau(\tau) \left(\frac{\theta_y}{v} \right)_\tau(\tau, 0-) + \zeta_\tau(\tau, 0+) \left[\frac{\theta_y}{v} \right]_\tau(\tau) - [\zeta]_\tau(\tau) \left(\frac{\Theta_y^{-\mathbf{X}}}{V-\mathbf{X}} \right)_\tau(\tau, 0) = 0.
\end{aligned} \tag{4.51}$$

The other terms on the right-hand side of (4.50) can be controlled as (4.49), therefore, it holds

$$\|\zeta_\tau(\tau)\|^2 + \int_{\tau_1}^\tau \|\zeta_{\tau y}\|^2 d\tau \leq C(N^2(\tau_1) + \delta) + C\delta \int_{\tau_1}^\tau \|\psi_{\tau y}\|^2 d\tau. \tag{4.52}$$

Thus, combination of (4.49) and (4.52) together with suitably small δ gives the desired inequality (4.46). The proof of Lemma 4.6 is completed. \square

Finally, combination of Lemmas 4.3-4.6 yields Proposition 3.3.
