# QUANTITATIVE SPECTRAL STABILITY FOR AHARONOV-BOHM OPERATORS WITH MANY COALESCING POLES

#### VERONICA FELLI, BENEDETTA NORIS, ROBERTO OGNIBENE, AND GIOVANNI SICLARI

Abstract. The behavior of simple eigenvalues of Aharonov-Bohm operators with many coalescing poles is discussed. In the case of half-integer circulation, a gauge transformation makes the problem equivalent to an eigenvalue problem for the Laplacian in a domain with straight cracks, laying along the moving directions of poles. For this problem, we obtain an asymptotic expansion for eigenvalues, in which the dominant term is related to the minimum of an energy functional associated with the configuration of poles and defined on a space of functions suitably jumping through the cracks.

Concerning configurations with an odd number of poles, an accurate blow-up analysis identifies the exact asymptotic behaviour of eigenvalues and the sign of the variation in some cases. An application to the special case of two poles is also discussed.

Keywords. Magnetic Schrödinger operators, Aharonov–Bohm potentials, asymptotics of eigenvalues, blow-up analysis.

### 1. INTRODUCTION

This paper deals with asymptotic expansions of the eigenvalue variation for Aharonov-Bohm operators with many coalescing poles with half-integer circulation, under homogeneous Dirichlet boundary conditions on a simply connected open bounded domain  $\Omega \subset \mathbb{R}^2$ . More precisely, we consider the case of any number  $k$  of poles moving along straight lines towards a collision point  $P \in \Omega$ , with distances from P vanishing with the same order. Without loss of generality, we assume that  $P = 0 \in \Omega$ , so that the moving poles can be written as multiples of k fixed points  ${a<sup>j</sup>}_{j=1,...,k}$  with the same multiplicative infinitesimal parameter  $\varepsilon > 0$ .

Since we are interested in the asymptotic behaviour of eigenvalues as  $\varepsilon \to 0^+$ , it is not restrictive to assume that there exists  $R < 1$  such that

$$
\{a^j\}_{j=1,\ldots,k} \subset D_R(0) \subset \Omega,
$$

where, for every  $r > 0$  and  $x \in \mathbb{R}^2$ , we denote  $D_r(x) := \{y \in \mathbb{R}^2 : |x - y| < r\}$ . Henceforth, we denote  $D_r(0)$  simply by  $D_r$ .

We assume that, among the  $k$  poles, there are  $k_1$  poles that stand alone on their own straight line through the origin, while the remaining ones form  $k_2$  pairs of poles staying on the same straight line but on different sides with respect to the origin. Hence

<span id="page-0-0"></span>
$$
k = k_1 + 2k_2
$$
 with  $k_1, k_2 \in \mathbb{N}$ ,  $(k_1, k_2) \neq (0, 0)$ ,

and, for every 
$$
j = 1, ..., k
$$
, there exist  $r_j > 0$  and  $\alpha^j \in (-\pi, \pi]$  such that  $\alpha^j \neq \alpha^\ell$  if  $j \neq \ell$  and

(1.1) 
$$
a^j = r_j(\cos(\alpha^j), \sin(\alpha^j)),
$$

where  $\alpha^{j_1} \neq \alpha^{j_2} \pm \pi$  if  $j_1 \neq j_2$  and  $j_1, j_2 \in \{1, \ldots, k_1\}$ , while  $\alpha^j \in (-\pi, 0]$  and  $\alpha^{j+k_2} = \alpha^j + \pi$  for every  $j \in \{k_1 + 1, \ldots, k_1 + k_2\}$ . For the sake of simplicity, we treat in detail configurations of the type described above, see Figure [1;](#page-1-0) in Section [8](#page-40-0) we explain how our methods and results can be extended to more general configurations of poles.

For every  $j = 1, ..., k$  and  $\varepsilon \in (0, 1]$ , we define

 $a^j_\varepsilon := \varepsilon a^j.$ 

Date: Revised version, December 7, 2023.

FIGURE 1. Configuration of poles  $(k_1 + 1 \le j \le k_1 + k_2)$ .

For every  $b = (b_1, b_2) \in \mathbb{R}^2$ , the Aharonov-Bohm vector potential with pole b and circulation  $\rho \in \mathbb{R}$ is defined as

$$
A_b^{\rho}(x_1,x_2) := \rho\left(\frac{-(x_2-b_2)}{(x_1-b_1)^2 + (x_2-b_2)^2}, \frac{x_1-b_1}{(x_1-b_1)^2 + (x_2-b_2)^2}\right), \quad (x_1,x_2) \in \mathbb{R}^2 \setminus \{b\}.
$$

In this paper, we consider the case of half-integer circulations  $\rho \in \frac{1}{2} + \mathbb{Z}$ , which is of particular interest from the mathematical point of view due to applications to the problem of spectral minimal partitions, see [\[10,](#page-42-0) [24\]](#page-43-0). For  $\rho = \frac{1}{2}$  we denote

$$
(1.2) \t\t A_b := A_b^{1/2}.
$$

We are interested in the multi-singular vector potential

<span id="page-1-3"></span><span id="page-1-1"></span>
$$
\mathcal{A}_{\varepsilon}^{(n_1, n_2, \dots, n_k)} := \sum_{j=1}^k A_{a_{\varepsilon}^j}^{n_j + \frac{1}{2}} = \sum_{j=1}^k (2n_j + 1) A_{a_{\varepsilon}^j},
$$

having at each pole  $a_{\varepsilon}^j$  half-integer circulation  $n_j + \frac{1}{2}$  with  $n_j \in \mathbb{Z}$ , and in the corresponding eigenvalue problem

(1.3) 
$$
\begin{cases} \left(i\nabla + \mathcal{A}_{\varepsilon}^{(n_1, n_2, ..., n_k)}\right)^2 u = \lambda u, & \text{in } \Omega, \\ u = 0, & \text{on } \partial\Omega, \end{cases}
$$

where the magnetic Schrödinger operator  $(i\nabla + \mathcal{A}_{\varepsilon}^{(n_1, n_2,...,n_k)})^2$  acts as

$$
\left(i\nabla+\mathcal{A}_{\varepsilon}^{(n_1,n_2,...,n_k)}\right)^2 u := -\Delta u + 2i \mathcal{A}_{\varepsilon}^{(n_1,n_2,...,n_k)}\cdot \nabla u + \left|\mathcal{A}_{\varepsilon}^{(n_1,n_2,...,n_k)}\right|^2 u.
$$

Since  $n_j \in \mathbb{Z}$ ,  $\mathcal{A}_{\varepsilon}^{(n_1, n_2, ..., n_k)}$  is gauge equivalent to the vector potential

<span id="page-1-2"></span>
$$
\mathcal{A}_{\varepsilon} := \sum_{j=1}^k (-1)^{j+1} A_{a_{\varepsilon}^j}.
$$

Therefore the operators  $(i\nabla + \mathcal{A}_{\varepsilon}^{(n_1,n_2,...,n_k)})^2$  and  $(i\nabla + \mathcal{A}_{\varepsilon})^2$  are unitarily equivalent (see [\[19,](#page-43-1) Theorem 1.2 and  $[20,$  Proposition 2.2.), and consequently the spectrum of  $(1.3)$  coincides with that of

(1.4) 
$$
\begin{cases} (i\nabla + \mathcal{A}_{\varepsilon})^2 u = \lambda u, & \text{in } \Omega, \\ u = 0, & \text{on } \partial\Omega. \end{cases}
$$

Hence, to study the behaviour as  $\varepsilon \to 0^+$  of the spectrum of [\(1.3\)](#page-1-1), it is not restrictive to consider problem  $(1.4)$ . We refer to  $(2.2)$  for the variational formulation of  $(1.4)$ . From classical spectral theory, problem [\(1.4\)](#page-1-2) has a diverging sequence of real positive eigenvalues  $\{\lambda_{\varepsilon,n}\}_{n\in\mathbb{N}\setminus\{0\}}$ ; in the sequence  $\{\lambda_{\varepsilon,n}\}_{n\in\mathbb{N}\setminus\{0\}}$  we repeat each eigenvalue according to its multiplicity. Moreover, the eigenspace associated to each eigenvalue has finite dimension.

<span id="page-2-0"></span>As  $\varepsilon \to 0^+$ , the following limit eigenvalue problem comes into play:

(1.5) 
$$
\begin{cases} \left(i\nabla + \frac{1+(-1)^{k+1}}{2}A_0\right)^2 u = \lambda u, & \text{in } \Omega, \\ u = 0, & \text{on } \partial\Omega, \end{cases}
$$

with  $A_0$  defined as in [\(1.2\)](#page-1-3) with  $b = 0$ . If k is odd, the operator in [\(1.5\)](#page-2-0) is the Aharonov-Bohm operator with one pole in 0 and circulation  $\frac{1}{2}$ ; as above, the classical Spectral Theorem applies and provides a diverging sequence of real positive eigenvalues  $\{\lambda_{0,n}\}_{n\in\mathbb{N}\setminus\{0\}}$  with finite multiplicity. Furthermore, it is well-known that, in this case, eigenfunctions vanish in 0 with order  $\frac{m}{2}$ , for some odd  $m \in \mathbb{N}$ , and have exactly m nodal lines meeting at 0 and dividing the whole  $2\pi$ -angle into m equal parts; see  $[15,$  Theorem 1.3, Section 7 and  $(3.14)$ – $(3.15)$  for a description of the asymptotic behaviour at 0 of eigenfunctions of [\(1.5\)](#page-2-0).

If  $k$  is even the nature of the limit eigenvalue problem undergoes a significant mutation. Indeed, for k even, the operator in  $(1.5)$  is the classical Dirichlet Laplacian and the eigenvalue problem [\(1.5\)](#page-2-0) can be rewritten as

(1.6) 
$$
\begin{cases} -\Delta u = \lambda u, & \text{in } \Omega, \\ u = 0, & \text{on } \partial \Omega. \end{cases}
$$

We conclude that, for every  $k \in \mathbb{N} \setminus \{0\}$ , the spectrum of  $(1.5)$  is a diverging sequence  $\{\lambda_{0,n}\}_{n \in \mathbb{N} \setminus \{0\}}$ of positive real eigenvalues.

We recall from  $[20,$  Theorem 1.2 that, whatever the number k of poles is,

<span id="page-2-4"></span><span id="page-2-1"></span>the function  $\varepsilon \mapsto \lambda_{\varepsilon,n}$  is continuous on [0, 1],

so that, in particular,

$$
\lim_{\varepsilon \to 0^+} \lambda_{\varepsilon,n} = \lambda_{0,n}
$$

for every  $n \in \mathbb{N} \setminus \{0\}$ . The present paper aims at giving a sharp asymptotic expansion for the variation  $\lambda_{\varepsilon,n} - \lambda_{0,n}$  of simple eigenvalues with respect to the moving configuration of poles.

In the case of one moving pole, [\[11\]](#page-42-1) establishes a first relation between the rate of convergence [\(1.7\)](#page-2-1) and the number of the nodal lines of the corresponding eigenfunction. Sharper asymptotic expansions for simple eigenvalues are obtained in  $[1]$ , in the case of one pole moving along the tangent to a nodal line of the limit eigenfunction, and in  $[2]$ , in the case of one pole moving along any direction. The case of one pole approaching the boundary is treated in [\[6\]](#page-42-4) and [\[23\]](#page-43-4). The methods developed in [\[1\]](#page-42-2), [\[6\]](#page-42-4), and [\[23\]](#page-43-4) are based on an Almgren type frequency formula, which provides local energy bounds for eigenfunctions. These are used to estimate the Rayleigh quotient, whose minimax levels characterize the eigenvalues, and to prove the convergence of a family of blown-up eigenfunctions to some non trivial limit profile. In particular, using the notation introduced above, in [\[1\]](#page-42-2) it is proved that, for  $k = k_1 = 1$  and  $a_{\varepsilon}^1 = \varepsilon a^1 = \varepsilon r_1(\cos(\alpha^1), \sin(\alpha^1))$ moving along the tangent to one of the m nodal lines of the limit eigenfunction  $u_0$ , if  $\lambda_{0,n}$  is a simple, then

(1.8) 
$$
\lambda_{\varepsilon,n} - \lambda_{0,n} = 4 r_1^m (|\beta_1|^2 + |\beta_2|^2) \mathfrak{M} \varepsilon^m + o(\varepsilon^m) \text{ as } \varepsilon \to 0^+.
$$

In [\(1.8\)](#page-2-2)  $(\beta_1, \beta_2) \neq (0, 0)$  is such that

<span id="page-2-2"></span>
$$
\lim_{r \to 0^+} r^{-\frac{m}{2}} u_0(r \cos t, r \sin t) = \beta_1 e^{i\frac{t}{2}} \cos \left(\frac{m}{2}t\right) + \beta_2 e^{i\frac{t}{2}} \sin \left(\frac{m}{2}t\right),
$$

see [\(3.14\)](#page-15-0), and  $\mathfrak{M} < 0$  is a negative constant depending only on m, which has the following variational characterization:

<span id="page-2-3"></span>(1.9) 
$$
\mathfrak{M} = \min \left\{ \frac{1}{2} \int_{\mathbb{R}^2_+} |\nabla u(x)|^2 dx - \frac{m}{2} \int_0^1 x_1^{\frac{m}{2}-1} u(x_1,0) dx_1 : u \in \mathcal{D}_s^{1,2}(\mathbb{R}^2_+) \right\},
$$

where  $s := \{(x_1, x_2) \in \mathbb{R}^2 : x_2 = 0 \text{ and } x_1 \ge 1\}, \mathbb{R}^2_+ = \{(x_1, x_2) \in \mathbb{R}^2 : x_2 > 0)\},\$  and  $\mathcal{D}_s^{1,2}(\mathbb{R}^2_+)$ is the completion of  $C_c^{\infty}(\overline{\mathbb{R}^2_+}\setminus s)$  with respect to the norm  $(\int_{\mathbb{R}^2_+}|\nabla u|^2 dx)^{1/2}$ . For an explicit formula for  $\mathfrak{M}$  we refer to [\[5,](#page-42-5) Theorem 2.3]. The quantity appearing in [\(1.9\)](#page-2-3) can be interpreted as a weighted torsional rigidity of the segment along which the pole is moving. Concerning the classical notion of torsional rigidity of a set, the literature is vast; among many others, we cite the classical books [\[25,](#page-43-5) [17\]](#page-43-6) for the basic definitions and some possible application in shape optimization and  $[27, 13, 12]$  $[27, 13, 12]$  $[27, 13, 12]$  $[27, 13, 12]$  for more recent investigations in the field. We also point out  $[8]$ , where a notion of thin torsional rigidity is exploited in the study of spectral stability for some singularly perturbed problems.

In the case of one single pole, the study of Aharonov-Bohm eigenvalues benefits from the known regularity of the eigenvalue as a function of the pole position. Indeed, in [\[20\]](#page-43-2) it is proved that, in the case of one moving pole, eigenvalues are analytic as functions of the pole, so that the eigenvalue variation admits a Taylor expansion. The sharp asymptotics on nodal lines [\(1.8\)](#page-2-2) obtained in [\[1\]](#page-42-2) is used in [\[2\]](#page-42-3) to compute the leading term of such Taylor expansion, exploiting symmetry and periodicity properties of the Fourier coefficients of the blow-up profile with respect to the moving direction. In the case of many poles, the analyticity property is maintained as long as the poles are away from each other (see again [\[20\]](#page-43-2)), but is lost in the case of a collision; indeed in [\[4\]](#page-42-9) (and in [\[3\]](#page-42-10) for symmetric domains) it is proved that, in the case of two poles colliding at a point outside the nodal set of the limit eigenfunction, the eigenvalue variation is asymptotic to the logarithm of the distance.

From the above discussion it therefore emerges that the case of multiple colliding poles presents additional significant difficulties. So far, up to our knowledge, in the literature only the case of two coalescing poles has been addressed with the aim of deriving precise asymptotic estimates in terms of the distance between the two poles. The paper [\[3\]](#page-42-10) derives the asymptotic behaviour of eigenvalues of Aharonov–Bohm operators with two colliding poles moving on an axis of symmetry of the domain, which is assumed not to be tangent to any nodal line of the limit eigenfunction. The argument used in [\[3\]](#page-42-10) is based on isospectrality with the Dirichlet Laplacian on the domain with a small segment removed, for which an asymptotic expansion of the eigenvalue variation is obtained by a capacity argument, in the spirit of  $[14]$ . The complementary case of two colliding poles, which move on an axis of symmetry coinciding with a nodal line of the limit eigenfunction, is treated in [\[5\]](#page-42-5), exploiting an isospectrality result and a monotonicity formula in the spirit of [\[1\]](#page-42-2). The assumption of symmetry of the domain is removed in  $[4]$ , in the case of two poles collapsing at an interior point out of nodal lines of the limit eigenfunction; this is possible thanks to an estimate of the diameter of the nodal set of magnetic eigenfunctions close to the collision point.

In the present paper we develop a new approach that provides asymptotic expansions of the eigenvalue variation in the most general case of any number of poles moving towards a collision point. We propose a method which combines the idea of torsional rigidity, naturally appearing in  $[1]$  (see also  $[6,$  Theorem 2.2]) to variationally characterize the coefficient of the leading term as in [\(1.9\)](#page-2-3), with that of capacity, which [\[14\]](#page-42-11) and [\[3\]](#page-42-10) show to be the good small parameter in a spectral perturbation theory in domains with small holes.

<span id="page-3-0"></span>Let us assume that there exists  $n_0 \in \mathbb{N} \setminus \{0\}$  such that

(1.10) 
$$
\lambda_{0,n_0} \text{ is a simple eigenvalue of } (1.5).
$$

In view of [\(1.7\)](#page-2-1), assumption [\(1.10\)](#page-3-0) implies that also  $\lambda_{\varepsilon,n_0}$  is simple as an eigenvalue of [\(1.4\)](#page-1-2), provided  $\varepsilon$  is sufficiently small. Simplicity of the spectrum is a *generic* property for many differential operators. We refer e.g. to  $[26]$ , where the author exhibits sufficient conditions for genericity of simplicity of the spectrum for various families of differential operators (including Aharonov-Bohm operators with a single pole). See also [\[7\]](#page-42-12) for a focus on the particular case of Aharonov-Bohm operators.

The first step in our approach is to perform some gauge transformation, making the magnetic eigenvalue problem [\(1.4\)](#page-1-2), and its corresponding limit one [\(1.5\)](#page-2-0), equivalent to eigenvalue problems for the Laplacian in domains with straight cracks, laying along the moving directions of poles, see [\(2.10\)](#page-7-0) and [\(2.14\)](#page-7-1). Fixing a  $L^2$ -normalized eigenfunction  $v_0$  of the equivalent limit eigenvalue problem [\(2.14\)](#page-7-1) associated to the eigenvalue  $\lambda_{0,n_0},$  we prove in Theorem [2.1](#page-7-2) the following asymptotic expansion:

<span id="page-3-1"></span>(1.11) 
$$
\lambda_{\varepsilon,n_0} - \lambda_{0,n_0} = 2(\mathcal{E}_{\varepsilon} - L_{\varepsilon}(v_0)) + o(||\nabla V_{\varepsilon}||^2_{L^2(\Omega)}) \text{ as } \varepsilon \to 0^+,
$$

where  $L_{\varepsilon}$  is the linear functional defined in [\(2.16\)](#page-7-3),  $\mathcal{E}_{\varepsilon}$  is the minimum of an energy functional associated with the configuration of poles and defined on a space of functions suitably jumping through the cracks, see [\(2.19\)](#page-7-4), and  $V_{\varepsilon}$  is the potential attaining such a minimum. We observe that  $\mathcal{E}_{\varepsilon}$  is a kind of intermediate quantity between torsional rigidity and capacity of the set obtained as the union of the segments connecting the poles to the origin. Indeed, the capacity of a set is defined by minimizing the  $L^2$ -norm of the gradient among functions which are prescribed on the set; the torsional rigidity, instead, is constructed by minimizing an energy functional, which contains a linear term involving an integral on the set, without prescribing any condition. In the definition of  $\mathcal{E}_{\varepsilon}$  given in [\(2.19\)](#page-7-4), we minimize an energy functional over a family of functions which are only partially prescribed on the cracks, in the sense that we impose a jump condition on the functions across the segments, obtaining a jump of the normal derivatives as a consequent natural condition. The development of such an intermediate notion provides a unified approach, which does not require an a priori relation between the configuration of poles and the orientation of the nodal set of the limit eigenfunction. We mention that elliptic problems in cracked domains, with jumps of the unknown function and its normal derivative prescribed on the cracks, are studied in [\[22\]](#page-43-9).

For k odd, a blow-up analysis allows us to identify the exact asymptotic behaviour of the quanti-ties appearing in the right hand side of [\(1.11\)](#page-3-1). In Theorem [2.2](#page-8-0) we prove that  $\lim_{\varepsilon \to 0^+} \varepsilon^{-m} \mathcal{E}_{\varepsilon} = \mathcal{E},$ where m is the vanishing order of  $v_0$  at 0 and  $\mathcal E$  is the minimum of the energy functional defined in [\(2.28\)](#page-8-1) over a space of suitably jumping functions, see [\(2.31\)](#page-8-2). Thus we generalize [\(1.8\)](#page-2-2) in the multipolar case, obtaining the following explicit expansion

<span id="page-4-0"></span>(1.12) 
$$
\lambda_{\varepsilon,n_0} - \lambda_{0,n_0} = 2 \, \varepsilon^m \big( \mathcal{E} - L(\Psi_0) \big) + o(\varepsilon^m)
$$

as  $\varepsilon \to 0^+$ , where L is the linear functional defined in [\(2.27\)](#page-8-3) and  $\Psi_0$  is the  $\frac{m}{2}$ -homogeneous harmonic function introduced in  $(2.26)$ . We note that the assumption that k is odd is crucial in the blow-up analysis, since it guarantees the validity of the Hardy-type inequality proved in Proposition [6.2,](#page-23-0) needed to characterize the functional space containing the limiting blow-up profile. In the particular case of all poles moving either along the tangents to nodal lines or along the bisectors between nodal lines of the limit eigenfunction, we can prove that the quantity  $\mathcal{E} - L(\Psi_0)$ , appearing as the coefficient of the leading term of the asymptotic expansion [\(1.12\)](#page-4-0), does not vanish, see Proposition [2.3;](#page-9-0) this shows that  $m$  is exactly the vanishing order of the eigenvalue variation. On the other hand, the study of the continuity properties of the coefficients appearing in [\(1.12\)](#page-4-0), see Theorem [6.8,](#page-28-0) allows us to prove the existence of configurations of poles for which  $\mathcal{E} - L(\Psi_0) = 0$  and hence  $\lambda_{\varepsilon,n_0} - \lambda_{0,n_0}$  is an infinitesimal of higher order than m.

If  $k$  is even, a Hardy type inequality is no more available, and therefore the blow-up analysis meets the technical difficulty of identifying the limiting profile in an appropriate functional space. In spite of that, in the case of two poles colliding in a point of the nodal set of the limit eigenfunction and moving either along the tangents to its nodal lines or along its bisectors, in Theorems [2.6](#page-11-0) and [2.7](#page-11-1) we are able to derive the exact asymptotic behavior of  $\mathcal{E}_{\varepsilon} - L_{\varepsilon}(v_0)$ , and consequently of  $\lambda_{\varepsilon,n_0} - \lambda_{0,n_0}$  thanks to the use of elliptic coordinates; in this way we generalize the results of [\[3\]](#page-42-10) and [\[5\]](#page-42-5), which require an axial symmetry of the domain as a further hypothesis.

<span id="page-4-2"></span>In the next section we state the main results of the paper, after having introduced the necessary notations.

### 2. STATEMENT OF THE MAIN RESULTS

To give a variational formulation of problem [\(1.4\)](#page-1-2), we introduce the functional space  $H^{1,\varepsilon}(\Omega,\mathbb{C}),$ defined as the completion of

<span id="page-4-1"></span>
$$
\{\phi \in H^1(\Omega, \mathbb{C}) \cap C^{\infty}(\Omega, \mathbb{C}) : \phi \equiv 0 \text{ in a neighbourhood of } a_{\varepsilon}^j \text{ for all } j = 1, \dots, k\}
$$

with respect to the norm

$$
(2.1) \t\t ||w||_{H^{1,\varepsilon}(\Omega,\mathbb{C})} := \left( ||w||^2_{L^2(\Omega,\mathbb{C})} + ||\nabla w||^2_{L^2(\Omega,\mathbb{C}^2)} + \sum_{j=1}^k \left\| \frac{w}{|-\alpha_{\varepsilon}^j|} \right\|_{L^2(\Omega,\mathbb{C})}^2 \right)^{1/2}.
$$

We observe that  $H^{1,\varepsilon}(\Omega,\mathbb{C}) = \left\{ u \in H^1(\Omega,\mathbb{C}) : \frac{u}{|\cdot-a_\varepsilon|} \in L^2(\Omega,\mathbb{C}) \text{ for all } j=1,\ldots,k \right\}.$ 

In [\[18\]](#page-43-10) (see also [\[9\]](#page-42-13) and [\[15,](#page-43-3) Lemma 3.1, Remark 3.2]), the following local magnetic Hardy-type inequality

$$
\int_{D_r(b)} |i \nabla w + A_b^{\rho} w|^2 dx \ge \left( \min_{j \in \mathbb{Z}} |j - \rho| \right)^2 \int_{D_r(b)} \frac{|w(x)|^2}{|x - b|^2} dx
$$

is proved for every  $b \in \mathbb{R}^2$  and  $w \in C_c^{\infty}(\overline{D_r(b)} \setminus \{b\}, \mathbb{C})$ . It follows that the norm  $(2.1)$  is equivalent to the norm

$$
\left( \left\| (i\nabla + \mathcal{A}_{\varepsilon}) u \right\|_{L^2(\Omega,\mathbb{C}^2)}^2 + \left\| u \right\|_{L^2(\Omega,\mathbb{C})}^2 \right)^{1/2}.
$$

To deal with homogeneous Dirichlet boundary conditions, we also introduce the space  $H_0^{1,\varepsilon}(\Omega,\mathbb{C})$ defined as the closure of  $C_c^{\infty}(\Omega \setminus \{a_{\varepsilon}^1, \ldots, a_{\varepsilon}^k\})$  in  $H^{1,\varepsilon}(\Omega, \mathbb{C})$ . The space  $H_0^{1,\varepsilon}(\Omega, \mathbb{C})$  can be explicitly characterized as

<span id="page-5-0"></span>
$$
H_0^{1,\varepsilon}(\Omega,\mathbb{C}) = \left\{ w \in H_0^1(\Omega,\mathbb{C}) : \frac{w}{|\cdot - a_\varepsilon^j|} \in L^2(\Omega,\mathbb{C}) \text{ for all } j = 1,\ldots,k \right\}.
$$

We say that  $\lambda \in \mathbb{R}$  is an *eigenvalue* of [\(1.4\)](#page-1-2) if there exists  $u \in H_0^{1,\varepsilon}(\Omega,\mathbb{C}) \setminus \{0\}$  (called *eigenfunction*) such that

(2.2) 
$$
\int_{\Omega} (i\nabla + \mathcal{A}_{\varepsilon}) u \cdot \overline{(i\nabla + \mathcal{A}_{\varepsilon}) w} dx = \lambda \int_{\Omega} u \overline{w} dx \text{ for all } w \in H_0^{1,\varepsilon}(\Omega, \mathbb{C}).
$$

We recall from the introduction that the eigenvalue problem  $(1.4)$  (and hence  $(2.2)$ ) admits a diverging sequence of real positive eigenvalues

$$
\lambda_{\varepsilon,1}\leq \lambda_{\varepsilon,2}\leq \lambda_{\varepsilon,3}\leq \cdots,
$$

repeated in the enumeration according to their multiplicity.

In a similar way, the variational formulation of  $(1.5)$  in the case k odd (corresponding to a problem of type  $(1.4)$  with only one pole located at 0) can be be given in the functional space  $\{w \in H_0^1(\Omega, \mathbb{C}) : \frac{w}{|x|} \in L^2(\Omega, \mathbb{C})\}.$  In the case k even, instead, [\(1.5\)](#page-2-0) takes the form of the classical eigenvalue problem for the Dirichlet Laplacian, whose variational formulation is well known. In both cases, [\(1.5\)](#page-2-0) admits a diverging sequence of real positive eigenvalues

$$
\lambda_{0,1} \leq \lambda_{0,2} \leq \lambda_{0,3} \leq \cdots,
$$

repeated according to their multiplicity.

A suitable gauge transformation allows us to obtain equivalent formulations of [\(1.4\)](#page-1-2) and [\(1.5\)](#page-2-0) as eigenvalue problems for the Laplacian in domains with straight cracks. For every  $\varepsilon \in [0, 1]$  we define

$$
\Sigma^{j} := \{ ta^{j} : t \in \mathbb{R} \} \text{ for all } j = 1, ..., k_{1} + k_{2},
$$
  
\n
$$
\Gamma_{\varepsilon}^{j} := \{ ta^{j} : t \in (-\infty, \varepsilon] \}, \quad S_{\varepsilon}^{j} := \{ ta^{j} : t \in [0, \varepsilon] \} \text{ for all } j = 1, ..., k_{1},
$$
  
\n
$$
S_{\varepsilon}^{j} := \{ ta^{j} + (\varepsilon - t)a^{j+k_{2}} : t \in [0, \varepsilon] \} \text{ for all } j = k_{1} + 1, ..., k_{1} + k_{2},
$$
  
\n
$$
\Gamma_{\varepsilon} := \left( \bigcup_{j=1}^{k_{1}} \Gamma_{\varepsilon}^{j} \right) \cup \left( \bigcup_{j=k_{1}+1}^{k_{1}+k_{2}} S_{\varepsilon}^{j} \right),
$$

see Figure [2.](#page-6-0) We note that, for every  $j = 1, \ldots, k_1, \Gamma_0^j = \Gamma_\varepsilon^j \setminus S_\varepsilon^j$  is the straight half-line starting at 0 with slope  $\alpha_j + \pi$ . For every  $\varepsilon \in [0,1]$ , we consider the functional space  $\mathcal{H}_{\varepsilon}$  defined as the closure of

$$
\{w \in H^1(\Omega \setminus \Gamma_\varepsilon) = H^1(\Omega \setminus \Gamma_\varepsilon, \mathbb{R}) : w = 0 \text{ on a neighbourhood of } \partial\Omega\}
$$

 $\inf H^1(\Omega \setminus \Gamma_{\varepsilon})$  endowed with the norm  $||w||_{H^1(\Omega \setminus \Gamma_{\varepsilon})} = ||\nabla w||_{L^2(\Omega \setminus \Gamma_{\varepsilon})} + ||w||_{L^2(\Omega)}$ . From the Poincaré type inequality stated in Proposition [3.2,](#page-12-0) it follows that

$$
||w||_{\mathcal{H}_{\varepsilon}} := \left(\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 \, dx\right)^{1/2}
$$

<span id="page-6-0"></span>

FIGURE 2. The sets  $\Gamma_{\varepsilon}$ ,  $\Gamma_0$ ,  $S_{\varepsilon}^j$   $(1 \leq j \leq k_1 + k_2)$ .

is a norm on  $\mathcal{H}_{\varepsilon}$  equivalent to  $||w||_{H^1(\Omega\setminus\Gamma_{\varepsilon})}$ . The corresponding scalar product is denoted as  $(\cdot,\cdot)_{\mathcal{H}_\varepsilon}.$ 

For every  $j = 1, ..., k_1 + k_2$ , with the notation  $\nu^j := (-\sin(\alpha^j), \cos(\alpha^j))$  we consider the half-planes

<span id="page-6-5"></span>
$$
\pi^j_+ := \{ x \in \mathbb{R}^2 : x \cdot \nu^j > 0 \} \quad \text{and} \quad \pi^j_- := \{ x \in \mathbb{R}^2 : x \cdot \nu^j < 0 \}.
$$

We observe that  $\nu^{j}$  is the unit outer normal vector to  $\pi^{j}$  on  $\partial \pi^{j}$ . In view of classical trace results and embedding theorems for fractional Sobolev spaces in dimension 1, for every  $j = 1, \ldots, k_1 + k_2$ and  $p \in [2, +\infty)$  there exist continuous trace operators

(2.3) 
$$
\gamma_+^j: H^1(\pi_+^j \setminus \Gamma_1) \to L^p(\Sigma^j) \quad \text{and} \quad \gamma_-^j: H^1(\pi_-^j \setminus \Gamma_1) \to L^p(\Sigma^j).
$$

We also define the trace operators

<span id="page-6-6"></span>(2.4) 
$$
T^{j}: H^{1}(\mathbb{R}^{2} \setminus \Gamma_{1}) \to L^{p}(\Sigma^{j}), \quad T^{j}(w) := \gamma_{+}^{j}(w|_{\pi_{+}^{j}}) + \gamma_{-}^{j}(w|_{\pi_{-}^{j}}),
$$

for every  $j = 1, ..., k_1 + k_2$  and  $p \in [2, +\infty)$ . For every  $\varepsilon \in [0, 1]$ , the restrictions to  $\mathcal{H}_{\varepsilon}$  of the operators  $\gamma^j_+$ ,  $\gamma^j_-$  and  $T^j$  are linear and continuous, since any element of  $\mathcal{H}_{\varepsilon}$  can be trivially extended by 0 to an element of  $H^1(\mathbb{R}^2 \setminus \Gamma_1)$ ; furthermore, due to the boundedness of  $\Omega$ , such restrictions are continuous and compact from  $\mathcal{H}_{\varepsilon}$  into  $L^p(\Sigma^j \cap \Omega)$  for all  $p \in [1, +\infty)$ .

<span id="page-6-3"></span>For every  $\varepsilon \in (0, 1]$ , we define the space

(2.5) 
$$
\widetilde{\mathcal{H}}_{\varepsilon} := \left\{ \begin{matrix} w \in \mathcal{H}_{\varepsilon} : & T^{j}(w) = 0 \text{ on } \Gamma_{\varepsilon}^{j} \text{ for all } j = 1, ..., k_{1}, \\ & T^{j}(w) = 0 \text{ on } S_{\varepsilon}^{j} \text{ for all } j = k_{1} + 1, ..., k_{1} + k_{2} \end{matrix} \right\},
$$

and, for  $\varepsilon = 0$ ,

<span id="page-6-4"></span>(2.6) 
$$
\widetilde{\mathcal{H}}_0 := \{ w \in \mathcal{H}_0 : T^j(w) = 0 \text{ on } \Gamma_0^j \text{ for all } j = 1, ..., k_1 \}.
$$

In Section [3.3](#page-13-0) we construct a function

<span id="page-6-1"></span>(2.7) 
$$
\Theta_{\varepsilon}: \mathbb{R}^2 \setminus \{a_{\varepsilon}^j : j = 1, ..., k\} \to \mathbb{R}
$$

such that

<span id="page-6-2"></span>(2.8) 
$$
\begin{cases} \Theta_{\varepsilon} \in C^{\infty}(\mathbb{R}^{2} \setminus \Gamma_{\varepsilon}) \\ \nabla \Theta_{\varepsilon} \text{ can be extended to be in } C^{\infty}(\mathbb{R}^{2} \setminus \{a_{\varepsilon}^{j} : j = 1, ..., k\}) \text{ with } \nabla \Theta_{\varepsilon} = \mathcal{A}_{\varepsilon}, \end{cases}
$$

see [\(3.5\)](#page-13-1) for the definition of  $\Theta_{\varepsilon}$ . The phase multiplication

<span id="page-6-7"></span>(2.9) 
$$
u(x) \mapsto v(x) := e^{-i\Theta_{\varepsilon}(x)}u(x), \quad x \in \Omega \setminus \Gamma_{\varepsilon},
$$

transforms any solution  $u$  to problem  $(1.4)$  into a solution  $v$  to

<span id="page-7-0"></span>(2.10)  
\n
$$
\begin{cases}\n-\Delta v = \lambda v, & \text{in } \Omega \setminus \Gamma_{\varepsilon}, \\
v = 0, & \text{on } \partial \Omega, \\
T^{j}(v) = 0, & \text{on } \Gamma_{\varepsilon}^{j} \text{ for all } j = 1, ..., k_{1}, \\
T^{j}(\nabla v \cdot \nu^{j}) = 0, & \text{on } \Gamma_{\varepsilon}^{j} \text{ for all } j = 1, ..., k_{1}, \\
T^{j}(v) = 0, & \text{on } S_{\varepsilon}^{j} \text{ for all } j = k_{1} + 1, ..., k_{1} + k_{2}, \\
T^{j}(\nabla v \cdot \nu^{j}) = 0, & \text{on } S_{\varepsilon}^{j} \text{ for all } j = k_{1} + 1, ..., k_{1} + k_{2},\n\end{cases}
$$

In [\(3.7\)](#page-14-0) we also define a function

<span id="page-7-8"></span>
$$
\Theta_0: \mathbb{R}^2 \setminus \{0\} \to \mathbb{R}
$$

satisfying

<span id="page-7-9"></span>(2.12) 
$$
\begin{cases} \Theta_0 \in C^{\infty}(\mathbb{R}^2 \setminus \Gamma_0) \\ \nabla \Theta_0 \text{ can be extended to be in } C^{\infty}(\mathbb{R}^2 \setminus \{0\}) \text{ with } \nabla \Theta_0 = \frac{1 + (-1)^{k+1}}{2} A_0. \end{cases}
$$

The gauge transformation

<span id="page-7-5"></span>(2.13) 
$$
u(x) \mapsto v(x) := e^{-i\Theta_0(x)}u(x), \quad x \in \Omega \setminus \Gamma_0,
$$

shows that the limit eigenvalue problem  $(1.5)$  is equivalent to

<span id="page-7-1"></span>(2.14) 
$$
\begin{cases}\n-\Delta v = \lambda v, & \text{in } \Omega \setminus \Gamma_0, \\
v = 0, & \text{on } \partial \Omega, \\
T^j(v) = 0, & \text{on } \Gamma_0^j \text{ for all } j = 1, ..., k_1, \\
T^j(\nabla v \cdot \nu^j) = 0, & \text{on } \Gamma_0^j \text{ for all } j = 1, ..., k_1,\n\end{cases}
$$

in the sense that the two problems have the same eigenvalues and their eigenfunctions match each other via the phase multiplication [\(2.13\)](#page-7-5), see Section [3.3](#page-13-0) for details. Therefore, under assumption  $(1.10)$ ,  $\lambda_{0,n_0}$  is also a simple eigenvalue of  $(2.14)$ . Let

<span id="page-7-6"></span>(2.15)  $v_0$  be an eigenfunction of [\(2.14\)](#page-7-1) associated to  $\lambda_{0,n_0}$  such that  $||v_0||_{L^2(\Omega)} = 1$ ;

it is not restrictive to assume that  $v_0$  is real-valued, see Remark [3.5.](#page-14-1) Once  $v_0$  is fixed as above, for every  $\varepsilon \in (0,1]$  we define

<span id="page-7-3"></span>(2.16) 
$$
L_{\varepsilon} : \mathcal{H}_1 \to \mathbb{R}, \quad L_{\varepsilon}(w) := 2 \sum_{j=1}^{k_1 + k_2} \int_{S_{\varepsilon}^j} \nabla v_0 \cdot \nu^j \gamma_+^j(w) dS
$$

and

<span id="page-7-11"></span>(2.17) 
$$
J_{\varepsilon} : \mathcal{H}_{\varepsilon} \to \mathbb{R}, \quad J_{\varepsilon}(w) := \frac{1}{2} \int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 \, dx + L_{\varepsilon}(w).
$$

As proved in Proposition [4.2,](#page-17-0) for every  $\varepsilon \in (0,1]$  there exists a unique  $V_{\varepsilon} \in \mathcal{H}_{\varepsilon}$  such that

<span id="page-7-7"></span>(2.18) 
$$
V_{\varepsilon} - v_0 \in \widetilde{\mathcal{H}}_{\varepsilon}
$$
 and  $J_{\varepsilon}(V_{\varepsilon}) = \min \left\{ J_{\varepsilon}(w) : w \in \mathcal{H}_{\varepsilon} \text{ and } w - v_0 \in \widetilde{\mathcal{H}}_{\varepsilon} \right\}.$ 

Our first main result is the following expansion of the eigenvalue variation  $\lambda_{\varepsilon,n_0} - \lambda_{0,n_0}$  in terms of

<span id="page-7-4"></span>
$$
(\text{2.19}) \qquad \qquad \mathcal{E}_{\varepsilon} = J_{\varepsilon}(V_{\varepsilon})
$$

<span id="page-7-2"></span>and  $L_{\varepsilon}(v_0)$ .

**Theorem 2.1.** Under assumption  $(1.10)$ , let  $v_0$  be as in  $(2.15)$ . Then

<span id="page-7-10"></span>(2.20) 
$$
\lambda_{\varepsilon,n_0} - \lambda_{0,n_0} = 2(\mathcal{E}_{\varepsilon} - L_{\varepsilon}(v_0)) + o(||V_{\varepsilon}||^2_{\mathcal{H}_{\varepsilon}}) \quad \text{as } \varepsilon \to 0^+,
$$

where  $\mathcal{E}_{\varepsilon}$  and  $V_{\varepsilon}$  are defined in [\(2.19\)](#page-7-4) and [\(2.18\)](#page-7-7), respectively.

2.1. The case k odd. For k odd, the asymptotic behaviour of  $\mathcal{E}_{\varepsilon}$  as  $\varepsilon \to 0^+$  can be quantified in terms of the vanishing order of  $v_0$  at the collision point 0. Indeed, as detailed in Proposition [3.6,](#page-14-2) if k is odd, there exists  $\beta \in \mathbb{R} \setminus \{0\}$  such that, as  $\varepsilon \to 0^+,$ 

<span id="page-8-5"></span>(2.21) 
$$
\varepsilon^{-\frac{m}{2}}v_0(\varepsilon\cos t,\varepsilon\sin t)\to\beta f(t)\sin\left(\frac{m}{2}(t-\alpha_0)\right)
$$

in  $C^{1,\tau}([0,2\pi] \setminus {\{\alpha^j + \pi\}}_{j=1}^{k_1},\mathbb{R})$  for all  $\tau \in (0,1)$ , where  $m \in \mathbb{N}$  is odd and corresponds to the number of nodal lines of  $v_0$  meeting at 0 (which equals the number of nodal lines of eigenfunctions of [\(1.5\)](#page-2-0) associated to  $\lambda_{0,n_0}$ ,  $\alpha_0 \in (0, \frac{2\pi}{m})$  is the minimal slope of such nodal lines, and

<span id="page-8-8"></span>(2.22) 
$$
f: [0, 2\pi] \to \{-1, 1\}, \quad f(t) := \prod_{j=1}^{k_1} (-1)^{\chi_{[\alpha^j + \pi, 2\pi)}(t)},
$$

where

(2.23) 
$$
\chi_{[\alpha^j + \pi, 2\pi)}(t) := \begin{cases} 0, & \text{if } t \in [0, \alpha^j + \pi), \\ 1, & \text{if } t \in [\alpha^j + \pi, 2\pi). \end{cases}
$$

From  $(2.21)$  we realize that the m nodal lines of  $v_0$  which meet at 0 are tangent to the m straight half-lines

<span id="page-8-7"></span>
$$
\mathcal{R}_j = \left\{ \left( \cos \left( \alpha_0 + j \frac{2\pi}{m} \right), \sin \left( \alpha_0 + j \frac{2\pi}{m} \right) \right) r : r \ge 0 \right\}, \quad j = 0, 1, \dots, m-1,
$$

which divide the whole  $2\pi$ -angle into m equal sectors. We define the functional space

<span id="page-8-10"></span>
$$
(2.24) \quad \widetilde{\mathcal{X}} := \left\{ \begin{array}{l} w \in L^1_{\text{loc}}(\mathbb{R}^2) : \ w \in H^1(D_r \setminus \Gamma_1) \text{ for all } r > 0, \\ \nabla w \in L^2(\mathbb{R}^2 \setminus \Gamma_1, \mathbb{R}^2), \ T^j(w) = 0 \text{ on } \Gamma_0^j \text{ for all } j = 1, \dots, k_1 \end{array} \right\},
$$

and consider its closed subspace

<span id="page-8-11"></span>(2.25) 
$$
\widetilde{\mathcal{H}} := \{ w \in \widetilde{\mathcal{X}} : T^j(w) = 0 \text{ on } S_1^j \text{ for any } j = 1, ..., k_1 + k_2 \}.
$$

Letting

<span id="page-8-4"></span>(2.26) 
$$
\Psi_0(x) = \Psi_0(r \cos t, r \sin t) = \beta r^{\frac{m}{2}} f(t) \sin \left(\frac{m}{2}(t - \alpha_0)\right)
$$

with f, m,  $\beta$ , and  $\alpha_0$  as in [\(2.21\)](#page-8-5), we observe that the nodal set of  $\Psi_0$  is given by  $\bigcup_{j=0}^{m-1} \mathcal{R}_j$ . We define

<span id="page-8-3"></span>(2.27) 
$$
L: \widetilde{\mathcal{X}} \to \mathbb{R}, \quad L(w) := 2 \sum_{j=1}^{k_1+k_2} \int_{S_1^j} \nabla \Psi_0 \cdot \nu^j \gamma_+^j(w) dS
$$

and

<span id="page-8-1"></span>(2.28) 
$$
J: \widetilde{\mathcal{X}} \to \mathbb{R}, \quad J(w) := \frac{1}{2} \int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla w|^2 dx + L(w).
$$

We observe that  $L(w)$  is well-defined also for any function  $w \in H^1(D_1 \setminus \Gamma_1)$ .

<span id="page-8-9"></span>Let  $\eta \in C_c^{\infty}(\mathbb{R}^2)$  be a radial cut-off function such that

(2.29) 
$$
\begin{cases} 0 \leq \eta(x) \leq 1 \text{ for all } x \in \mathbb{R}^2, \\ \eta(x) = 1 \text{ if } x \in D_1, \quad \eta(x) = 0 \text{ if } x \in \mathbb{R}^2 \setminus D_2, \\ |\nabla \eta| \leq 2 \text{ in } D_2 \setminus D_1. \end{cases}
$$

As proved in Proposition [6.4,](#page-25-0) there exists a unique  $\widetilde{V}\in\widetilde{\mathcal{X}}$  such that

<span id="page-8-6"></span>(2.30) 
$$
\tilde{V} - \eta \Psi_0 \in \tilde{\mathcal{H}}
$$
 and  $J(\tilde{V}) = \min \left\{ J(w) : w \in \tilde{\mathcal{X}} \text{ and } w - \eta \Psi_0 \in \tilde{\mathcal{H}} \right\}.$ 

<span id="page-8-0"></span>**Theorem 2.2.** Let k be odd. Under assumption  $(1.10)$ , let  $v_0$  be as in  $(2.15)$ . Then

(i)  $\lim_{\varepsilon \to 0^+} \varepsilon^{-m} \mathcal{E}_{\varepsilon} = \mathcal{E}$ , where m is the vanishing order of  $v_0$  at 0 as in [\(2.21\)](#page-8-5) and

(2.31) 
$$
\mathcal{E} = J(\widetilde{V}) = \min_{\eta \Psi_0 + \widetilde{\mathcal{H}}} J;
$$

<span id="page-8-2"></span>(ii) 
$$
\lambda_{\varepsilon,n_0} - \lambda_{0,n_0} = 2 \varepsilon^m (\mathcal{E} - L(\Psi_0)) + o(\varepsilon^m)
$$
 as  $\varepsilon \to 0^+$ .

The expansion proved in Theorem [2.2-](#page-8-0)(ii) identifies the sharp asymptotic behaviour of the eigenvalue variation  $\lambda_{\varepsilon,n_0} - \lambda_{0,n_0}$  if  $\mathcal{E} - L(\Psi_0) \neq 0$ ; if instead  $\mathcal{E} - L(\Psi_0) = 0$ , Theorem [2.2-](#page-8-0)(ii) only provides the information that  $\lambda_{\varepsilon,n_0} - \lambda_{0,n_0}$  is an infinitesimal of higher order than m. It is therefore natural to ask whether there are configurations of poles  $\{a^j\}$  for which the quantity  $\mathcal{E} - L(\Psi_0)$  does or does not vanish. The following proposition gives an answer in this sense, also providing precise information on the sign of the eigenvalue variation in two remarkable cases: the case in which each pole moves along the tangent to a nodal line of the limit eigenfunction and the case in which each pole moves along the bisector between two nodal lines.

<span id="page-9-0"></span>**Proposition 2.3.** Let  $k = k_1 \leq m$  be odd and  $k_2 = 0$ . Under assumption [\(1.10\)](#page-3-0), let  $v_0$  be as in [\(2.15\)](#page-7-6) and  $\alpha_0$  as in [\(2.21\)](#page-8-5). For every  $j \in \{1, ..., k_1\}$  let  $\alpha^j$  be as in [\(1.1\)](#page-0-0).

(i) If  $\alpha^j \in {\alpha_0 + \ell \frac{2\pi}{m} : \ell = 0, 1, 2, \ldots, m-1}$  for all  $j \in \{1, \ldots, k_1\}$ , then  $\mathcal{E} < 0$  and  $L(\Psi_0) = 0$ ;

furthermore,  $\lambda_{\varepsilon,n_0} < \lambda_{0,n_0}$  provided that  $\varepsilon > 0$  is sufficiently small.

(ii) If  $\alpha^j \in {\alpha_0 + (1 + 2\ell) \frac{\pi}{m} : \ell = 0, 1, 2, \ldots, m - 1}$  for all  $j \in \{1, \ldots, k_1\}$ , then  $\mathcal{E} > 0$  and  $L(\Psi_0) = 0$ ;

furthermore,  $\lambda_{\varepsilon,n_0} > \lambda_{0,n_0}$  provided that  $\varepsilon > 0$  is sufficiently small.

(iii) There exists a choice of  $\{\alpha^j : j = 1, ..., k\}$  such that  $\mathcal{E} - L(\Psi_0) = 0$  and  $\lambda_{\varepsilon,n_0} - \lambda_{0,n_0} = o(\varepsilon^m)$ as  $\varepsilon \to 0^+$ .

The proof of claim (iii) in Proposition [2.3](#page-9-0) is based on a continuity argument. Indeed, the function  $\mathcal{E} - L(\Psi_0)$  varies continuously under rotations of the configuration of poles, see Theorem [6.8.](#page-28-0) Hence (i) and (ii), together with Bolzano's Theorem, guarantee the existence of intermediate configurations for which  $\mathcal{E} - L(\Psi_0)$  vanishes. The proof of claims (i) and (ii) highlights the fact that, analogously to  $\mathcal{E}_{\varepsilon}$ , also  $\mathcal E$  represents an intermediate notion between the capacity and the torsional rigidity of the set  $\cup_{j=1}^{k_1} S_1^j$ . Indeed, in case (i) it occurs that

$$
\mathcal{E} = \min_{w \in \tilde{\mathcal{H}}} \left\{ \frac{1}{2} \int_{\mathbb{R}^2 \backslash \Gamma_1} |\nabla w|^2 \, dx + L(w) \right\} < 0,
$$

see  $(6.41)$ , i.e.  $\mathcal{E}$  is the minimum of a functional containing a (quadratic) energy term and a linear one, over a linear space: this makes it somehow behaving like a torsional rigidity of the set  $\cup_{j=1}^{k_1} S_1^j$ . On the other hand, in case (ii) we have the characterization

$$
\mathcal{E} = \min \left\{ \frac{1}{2} \int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla w|^2 \, dx \colon w - \eta \Psi_0 \in \widetilde{\mathcal{H}} \right\} > 0,
$$

see [\(6.42\)](#page-30-1), which yields a notion resembling that of  $\Psi_0$ -capacity of the set  $\cup_{j=1}^{k_1} S_1^j$ .

The proof of Theorem [2.2](#page-8-0) is based on a blow-up analysis, which also provides the following result on the behavior of eigenfunctions, characterizing their blow-up profile and quantifying the convergence speed of the eigenfunctions of problem [\(1.4\)](#page-1-2) towards the corresponding eigenfunction of the limit problem [\(1.5\)](#page-2-0).

<span id="page-9-2"></span>**Theorem 2.4.** Let k be odd and  $n_0 \in \mathbb{N} \setminus \{0\}$  be such that [\(1.10\)](#page-3-0) is satisfied. Let  $u_0$  be an eigenfunction of [\(1.5\)](#page-2-0) associated to  $\lambda_{0,n_0}$  such that  $\int_{\Omega}|u_0|^2 dx = 1$ . For every  $\varepsilon \in (0,1]$ , let  $u_{\varepsilon} \in H_0^{1,\varepsilon}(\Omega,\mathbb{C})$  be the eigenfunction of  $(1.4)$  associated to the eigenvalue  $\lambda_{n_0,\varepsilon}$  such that

<span id="page-9-1"></span>(2.32) 
$$
\int_{\Omega} |u_{\varepsilon}|^2 dx = 1 \quad \text{and} \quad \int_{\Omega} e^{-i(\Theta_{\varepsilon} - \Theta_0)} u_{\varepsilon} \overline{u_0} dx \text{ is a positive real number,}
$$

where  $\Theta_{\varepsilon}$  and  $\Theta_0$  are as in [\(2.7\)](#page-6-1)–[\(2.8\)](#page-6-2) and [\(2.11\)](#page-7-8)–[\(2.12\)](#page-7-9), respectively. Then

<span id="page-9-3"></span>(2.33) 
$$
\varepsilon^{-m/2} u_{\varepsilon}(\varepsilon \cdot) \to e^{i\Theta_1} (\Psi_0 - \widetilde{V}) \quad \text{as } \varepsilon \to 0^+
$$

in 
$$
H^{1,1}(D_R, \mathbb{C})
$$
 for all  $R > 0$ , where  $\tilde{V}$  and  $\Psi_0$  are as in (2.30) and (2.26), respectively. Moreover,

<span id="page-10-4"></span>
$$
(2.34) \qquad \lim_{\varepsilon \to 0^+} \varepsilon^{-m} \int_{\mathbb{R}^2 \setminus \Gamma_1} \left| e^{-i(\Theta_{\varepsilon} - \Theta_0)} (i\nabla + \mathcal{A}_{\varepsilon}) u_{\varepsilon} - (i\nabla + A_0) u_0 \right|^2 dx = \|\nabla \widetilde{V}\|_{L^2(\mathbb{R}^2 \setminus \Gamma_1)}^2.
$$

We observe that condition  $(2.32)$  allows us to identify, among all the eigenfunctions of  $(1.4)$ associated to the eigenvalue  $\lambda_{n_0,\varepsilon}$  (that are multiples of a given one due to the simplicity of  $\lambda_{n_0,\varepsilon}$ ), the one that converges to  $u_0$  as  $\varepsilon \to 0^+$ .

<span id="page-10-6"></span>2.2. The case of two opposite poles  $(k_1 = 0, k_2 = 1)$ . In the case of two opposite poles  $a_{\varepsilon}^1$ ,  $a_{\varepsilon}^2 = -a_{\varepsilon}^1$  colliding to 0 from the two sides of the same straight line, we can rewrite the terms appearing in  $(2.20)$  in elliptic coordinates in the spirit of  $\left[3, \text{Subsection } 2.2\right]$ , thus determining the dominant term in the asymptotic expansion. This allows us to generalize [\[5,](#page-42-5) Theorem 2.6, Theorem 2.8], see also [\[3,](#page-42-10) Theorem 1.16], removing any symmetry assumption on the domain  $\Omega$ . Let us assume that

the  $n_0$ -th eigenvalue  $\lambda_{n_0}$  of the Dirichlet Laplacian in  $\Omega$  is simple.

We recall that, since k is even in this case,  $\lambda_{n_0} = \lambda_{0,n_0}$  coincides with the  $n_0$ -th eigenvalue of the limit problem [\(1.5\)](#page-2-0). Let

<span id="page-10-2"></span>(2.35) 
$$
u_0
$$
 be an eigenfunction of (1.6) associated to  $\lambda_{n_0} = \lambda_{0,n_0}$  such that  $\int_{\Omega} u_0^2 dx = 1$ .

If  $u_0(0) \neq 0$ , then, for any bounded simply connected domain  $\Omega$ , a sharp expansion of the variation  $\lambda_{\varepsilon,n_0} - \lambda_{0,n_0}$  has already been obtained in [\[4,](#page-42-9) Theorem 1.2], see Remark [7.7.](#page-40-1) Hence we assume that  $u_0(0) = 0$ . Up to a suitable choice of the coordinate system, according to the notation introduced in [\(1.1\)](#page-0-0), it is not restrictive to consider the case  $\alpha^1 = 0$ ,  $\alpha^2 = \pi$ , so that, for some  $r_1 \in (0, R)$ , the configuration of the two opposite poles is given by

(2.36) 
$$
a_{\varepsilon}^{1} = r_{1}(\varepsilon, 0) \text{ and } a_{\varepsilon}^{2} = r_{1}(-\varepsilon, 0),
$$

and

(2.37) 
$$
S_{\varepsilon} := S_{\varepsilon}^1 = [-r_1 \varepsilon, r_1 \varepsilon] \times \{0\},
$$

<span id="page-10-0"></span>see Figure [3.](#page-10-0) Furthermore, since  $u_0(0) = 0$ , it is well known that there exists  $m \in \mathbb{N} \setminus \{0\},$ 

<span id="page-10-5"></span><span id="page-10-3"></span>

<span id="page-10-1"></span>FIGURE 3. Two opposite poles colliding at 0 ( $k_1 = 0$ ,  $k_2 = 1$ ).

 $\beta \in \mathbb{R} \setminus \{0\}$  and  $\alpha_0 \in [0, \frac{\pi}{m})$  such that

(2.38) 
$$
r^{-m}u_0(r\cos t, r\sin t) \rightarrow \beta\sin(m(t-\alpha_0)) \quad \text{in } C^{1,\tau}([0,2\pi],\mathbb{C}) \quad \text{as } r \to 0^+,
$$

<span id="page-10-8"></span>for any  $\tau \in (0,1)$ . In particular, the 2m half-lines with slopes  $\alpha_0 + j\frac{\pi}{m}$ ,  $j = 0, \ldots, 2m - 1$ , are tangent to the nodal lines of  $u_0$  meeting at 0.

**Remark 2.5.** By standard regularity theory,  $u_0$  is analytic in  $\Omega$ . Let  $T_m$  be the Taylor polynomial of  $u_0$  centered at 0 of order m, with  $m \in \mathbb{N} \setminus \{0\}$  being as in [\(2.38\)](#page-10-1). Then, in view of (2.38),

<span id="page-10-7"></span>(2.39) 
$$
T_m(x_1, x_2) = \sum_{j=0}^m \frac{1}{(m-j)!j!} \frac{\partial^m u_0}{\partial x_1^{m-j} \partial x_2^j}(0) x_1^{m-j} x_2^j.
$$

For every  $t \in [0, 2\pi]$ , we have

$$
T_m(\cos t, \sin t) = \beta \sin(m(t - \alpha_0)),
$$
  
\n
$$
(\nabla T_m)(\cos t, \sin t) \cdot (-\sin t, \cos t) = m\beta \cos(m(t - \alpha_0)).
$$

Hence

<span id="page-11-2"></span>
$$
\frac{1}{m!} \frac{\partial^m u_0}{\partial x_1^m}(0) = -\beta \sin(m\alpha_0) \quad \text{and} \quad \frac{1}{(m-1)!} \frac{\partial^m u_0}{\partial x_1^{m-1} \partial x_2^1}(0) = m\beta \cos(m\alpha_0),
$$

so that, in particular,

(2.40) 
$$
\beta = \frac{(-1)^j}{m!} \frac{\partial^m u_0}{\partial x_1^{m-1} \partial x_2^1}(0) \text{ if } \alpha_0 = \frac{j\pi}{m} \text{ for some } j \in \{0, 1, ..., 2m-1\},
$$

and

<span id="page-11-3"></span>(2.41) 
$$
\beta = \frac{(-1)^{j+1}}{m!} \frac{\partial^m u_0}{\partial x_1^m} (0) \text{ if } \alpha_0 = \frac{\pi}{2m} + \frac{j\pi}{m} \text{ for some } j \in \{0, 1, ..., 2m - 1\}.
$$

If the segment  $S_{\varepsilon}$  is tangent to a nodal line of  $u_0$ , i.e. if  $\alpha_0 = \frac{j\pi}{m}$  for some  $j \in \{0, 1, ..., 2m-1\}$ , we have the following result which generalizes [\[5,](#page-42-5) Theorem 2.8] dropping any symmetry assumption on Ω.

<span id="page-11-0"></span>**Theorem 2.6.** Let  $\lambda_{n_0}$  be a simple eigenvalue of [\(1.6\)](#page-2-4) and let  $u_0$  be as in [\(2.35\)](#page-10-2). Assume that  $u_0(0) = 0$  and let  $m \in \mathbb{N} \setminus \{0\}$  and  $\alpha_0$  be as in [\(2.38\)](#page-10-1). Let  $k_1 = 0$  and  $k_2 = 1$  with the configuration of poles as in assumption [\(2.36\)](#page-10-3). If  $\alpha_0 = \frac{j\pi}{m}$  for some  $j \in \{0, 1, ..., 2m - 1\}$ , then

$$
\lambda_{\varepsilon,n_0} - \lambda_{n_0} = -\frac{m\pi\beta^2 r_1^{2m}}{4^{m-1}} \left(\frac{m-1}{\lfloor \frac{m-1}{2} \rfloor}\right)^2 \varepsilon^{2m} + o(\varepsilon^{2m}) \quad \text{as } \varepsilon \to 0^+,
$$

with  $\beta$  as in [\(2.40\)](#page-11-2).

<span id="page-11-1"></span>On the other hand, if  $S_{\varepsilon}$  lays on the bisector of the angle between the tangents to nodal lines, i.e. if  $\alpha_0 = \frac{\pi}{2m} + \frac{j\pi}{m}$  for some  $j \in \{0, 1, ..., 2m - 1\}$ , then we prove the following expansion.

**Theorem 2.7.** Let  $\lambda_{n_0}$  be a simple eigenvalue of  $(1.6)$  and let  $u_0$  be as in  $(2.35)$ . Assume that  $u_0(0) = 0$  and let  $m \in \mathbb{N} \setminus \{0\}$  and  $\alpha_0$  be as in [\(2.38\)](#page-10-1). Let  $k_1 = 0$  and  $k_2 = 1$  with the configuration of poles as in assumption [\(2.36\)](#page-10-3). If  $\alpha_0 = \frac{\pi}{2m} + \frac{j\pi}{m}$  for some  $j \in \{0, 1, ..., 2m - 1\}$ , then

$$
\lambda_{\varepsilon,n_0} - \lambda_{n_0} = \frac{m\pi\beta^2 r_1^{2m}}{4^{m-1}} \left(\frac{m-1}{\lfloor \frac{m-1}{2} \rfloor}\right)^2 \varepsilon^{2m} + o(\varepsilon^{2m}) \quad \text{as } \varepsilon \to 0^+,
$$

with  $\beta$  as in  $(2.41)$ .

We observe that Theorem [2.7](#page-11-1) is a generalization of  $[5,$  Theorem 2.6 and  $[3,$  Theorem 1.16.

The rest of the paper is organized as follows. In Section [3](#page-11-4) we collect some basic facts, such as the gauge invariance property of the problem, useful features of the functional spaces involved, and some known results that will be used in the rest of the paper. In Section [4](#page-16-0) we provide some preliminary estimates on the quantities  $\mathcal{E}_{\varepsilon}$  and  $L_{\varepsilon}$  that appear in formula [\(2.20\)](#page-7-10); such estimates are used in Section [5,](#page-19-0) where the proof of Theorem [2.1](#page-7-2) is completed. In Section [6](#page-23-1) we perform a blow-up analysis of the potential  $V<sub>ε</sub>$  appearing in [\(2.18\)](#page-7-7), in the case k odd; this is the key ingredient in the proof of Theorems [2.2](#page-8-0) and [2.4.](#page-9-2) In the same section we also complete the proof of Proposition [2.3.](#page-9-0) Finally, in Section [7](#page-33-0) we consider the case of two poles colliding to 0 from opposite sides of the same straight line, thus proving Theorems [2.6](#page-11-0) and [2.7.](#page-11-1)

### 3. Preliminaries

<span id="page-11-4"></span>3.1. Scalar potential functions for  $A_b$  outside half-lines. The construction of the gauge transformation, which makes problems  $(1.4)$  and  $(1.5)$  equivalent to eigenvalue problems for the Laplacian in domains with straight cracks, is based on the remark that, since Aharonov-Bohm vector fields are irrotational, they are gradients of some scalar potential functions in simply connected domains, such as the complement of straight half-lines starting at the pole.

For every  $b = (b_1, b_2) \in \mathbb{R}^2$ , let  $\theta_b : \mathbb{R}^2 \setminus \{b\} \to [0, 2\pi)$  be defined as

$$
\theta_b(x_1, x_2) := \begin{cases}\n\arctan\left(\frac{x_2 - b_2}{x_1 - b_1}\right), & \text{if } x_1 > b_1, x_2 \ge b_2, \\
\frac{\pi}{2}, & \text{if } x_1 = b_1, x_2 > b_2, \\
\pi + \arctan\left(\frac{x_2 - b_2}{x_1 - b_1}\right), & \text{if } x_1 < b_1, \\
\frac{3}{2}\pi, & \text{if } x_1 = b_1, x_2 < b_2, \\
2\pi + \arctan\left(\frac{x_2 - b_2}{x_1 - b_1}\right), & \text{if } x_1 > b_1, x_2 < b_2,\n\end{cases}
$$

i.e.,

<span id="page-12-5"></span>
$$
\theta_b(b+r(\cos t, \sin t)) = t
$$
 for all  $t \in [0, 2\pi)$  and  $r > 0$ .

We observe that  $\theta_b \in C^{\infty}(\mathbb{R}^2 \setminus \{(x_1, b_2) : x_1 \ge b_1\})$  and  $\nabla \theta_b$  can be extended to be in  $C^{\infty}(\mathbb{R}^2 \setminus \{b\})$ , with  $\nabla(\frac{\theta_b}{2}) = A_b$  in  $\mathbb{R}^2 \setminus \{b\}$ . For every  $b \in \mathbb{R}^2$ ,  $\alpha \in \mathbb{R}$ , and  $x = (x_1, x_2) \in \mathbb{R}^2$ , we define

(3.1) 
$$
R_{b,\alpha}(x) := \begin{bmatrix} b_1 \\ b_2 \end{bmatrix} + M_{\alpha} \begin{bmatrix} x_1 - b_1 \\ x_2 - b_2 \end{bmatrix},
$$

with

(3.2) 
$$
M_{\alpha} := \begin{bmatrix} \cos \alpha & -\sin \alpha \\ \sin \alpha & \cos \alpha \end{bmatrix},
$$

i.e.,  $R_{b,\alpha}$  is a rotation about b by an angle  $\alpha$ . Let

$$
\theta_{b,\alpha} := \theta_b \circ R_{b,\alpha},
$$

<span id="page-12-1"></span>so that  $\theta_{b,\alpha}(b+r(\cos t,\sin t)) = \alpha + t$  for every  $r > 0$  and  $t \in [-\alpha, -\alpha+2\pi)$ . We observe that  $\theta_{b,\alpha}$ is smooth in  $\mathbb{R}^2 \setminus \{b + r(\cos \alpha, -\sin \alpha) : r \ge 0\}$  and  $\nabla \theta_{b,\alpha}$  can be extended to be in  $C^{\infty}(\mathbb{R}^2 \setminus \{b\}),$ with  $\nabla\left(\frac{\theta_{b,\alpha}}{2}\right) = A_b$ , see Figure [4.](#page-12-1)

<span id="page-12-6"></span><span id="page-12-4"></span>

FIGURE 4.  $\theta_{b,\alpha}$  is smooth in  $\mathbb{R}^2 \setminus \{b + r(\cos \alpha, -\sin \alpha) : r \ge 0\}.$ 

<span id="page-12-2"></span>3.2. Some remarks on functional spaces. In this subsection we describe some properties of the functional spaces  $\mathcal{H}_{\varepsilon}$  introduced in Section [2.](#page-4-2)

**Remark 3.1.** The natural embedding  $I: \mathcal{H}_{\varepsilon} \to L^2(\Omega)$  is compact. Indeed, we can cut  $\Omega$  along the lines  $\Sigma^j$  for  $j = 1 \ldots, k_1 + k_2$ , where  $\Sigma^j$  are defined in Section [2.](#page-4-2) Then we can use classical compact embedding results for each resulting subset, see for example [\[21,](#page-43-11) Theorem 12.30].

Arguing as in Remark [3.1,](#page-12-2) from the Poincaré inequality for functions vanishing on a portion of the boundary we can deduce the following Poincaré inequality in  $\mathcal{H}_1$ , and hence in  $\mathcal{H}_{\varepsilon}$  for any  $\varepsilon \in [0,1].$ 

<span id="page-12-0"></span>**Proposition 3.2.** There exists a constant  $C_P > 0$  such that, for every  $\varepsilon \in [0,1]$  and  $w \in \mathcal{H}_{\varepsilon}$ ,

$$
\int_{\Omega} w^2 dx \leq C_P \int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 dx.
$$

<span id="page-12-3"></span>Since  $\Omega \setminus \Gamma_1 \subseteq \Omega \setminus \Gamma_{\varepsilon_1} \subseteq \Omega \setminus \Gamma_{\varepsilon_2}$ , we have  $\mathcal{H}_{\varepsilon_2} \subseteq \mathcal{H}_{\varepsilon_1} \subseteq \mathcal{H}_1$  for all  $0 \le \varepsilon_2 \le \varepsilon_1 \le 1$ . Proposition [3.3](#page-12-3) below establishes a Mosco-type convergence result for the spaces  $\mathcal{H}_{\varepsilon}$  as  $\varepsilon \to 0^+$ .

**Proposition 3.3.** Let  $\{\varepsilon_n\} \subset (0,1)$  be such that  $\lim_{n\to\infty} \varepsilon_n = 0$ . If  $\{v_n\}_n \subset \mathcal{H}_1$  and  $v \in \mathcal{H}_1$  are such that  $v_n \in \mathcal{H}_{\varepsilon_n}$  for all  $n \in \mathbb{N}$  and  $v_n \rightharpoonup v$  in  $\mathcal{H}_1$  as  $n \to \infty$ , then  $v \in \mathcal{H}_0$ .

*Proof.* For every  $\varepsilon \in (0,1]$ , there exists  $n(\varepsilon) \in \mathbb{N}$  such that  $v_n \in \mathcal{H}_{\varepsilon}$  for all  $n > n(\varepsilon)$ . The weak convergence  $v_n \rightharpoonup v$  in  $\mathcal{H}_1$  then implies that  $v \in \mathcal{H}_\varepsilon$  for all  $\varepsilon \in (0,1]$ . It follows that there exists  $\mathbf{f} \in L^2(\Omega,\mathbb{R}^N)$  such that  $\nabla v = \mathbf{f}$  in  $\mathcal{D}'(\Omega \setminus \Gamma_{\varepsilon})$  for all  $\varepsilon \in (0,1]$ . Actually,  $\nabla v = \mathbf{f}$  in  $\mathcal{D}'(\Omega \setminus \Gamma_0)$ , since, for every  $\varphi \in C_c^{\infty}(\Omega \setminus \Gamma_0)$ , supp  $\varphi \subset \Omega \setminus \Gamma_{\varepsilon}$  for  $\varepsilon$  sufficiently small. Therefore,  $v \in H^1(\Omega \setminus \Gamma_0)$ . From the fact that  $v \in \mathcal{H}_1 \cap H^1(\Omega \setminus \Gamma_0)$  it follows that  $v \in \mathcal{H}_0$ .

<span id="page-13-2"></span>Since the singleton  $\{0\}$  has null capacity in  $\Omega$ , functions in  $\mathcal{H}_0$ , respectively in  $\mathcal{H}_0$ , can be approximated by functions vanishing in a neighbourhood of 0, as stated in Lemma [3.4.](#page-13-2)

#### Lemma 3.4.

- (i) The set  $\mathcal{H}_{0,0} := \{v \in \mathcal{H}_0 : v \equiv 0 \text{ in a neighbourhood of } 0\}$  is dense in  $\mathcal{H}_0$ .
- (ii) The set  $\widetilde{\mathcal{H}}_{0,0} := \{v \in \widetilde{\mathcal{H}}_0 : v \equiv 0 \text{ in a neighbourhood of } 0\}$  is dense in  $\widetilde{\mathcal{H}}_0$ .

*Proof.* To prove (i) we first notice that, if  $v \in \mathcal{H}_0$ , then, defining  $v_n$  as

$$
v_n(x) = \begin{cases} v(x), & \text{if } |v(x)| < n, \\ -n, & \text{if } v(x) < -n, \\ n, & \text{if } v(x) > n, \end{cases}
$$

 $v_n \in \mathcal{H}_0 \cap L^{\infty}(\Omega)$  for all  $n \in \mathbb{N}$  and  $v_n \to v$  in  $\mathcal{H}_0$ . Therefore it is enough to prove that  $\mathcal{H}_{0,0} \cap L^{\infty}(\Omega)$ is dense in  $\mathcal{H}_0 \cap L^{\infty}(\Omega)$ . To this aim, let us fix some  $v \in \mathcal{H}_0 \cap L^{\infty}(\Omega)$ . For every  $\varepsilon \in (0,1)$  we consider the cut-off function  $\omega_{\varepsilon} \in W^{1,\infty}(\mathbb{R}^2)$  defined as

(3.4) 
$$
\omega_{\varepsilon}(x) := \begin{cases} 1, & \text{if } x \in D_{\varepsilon}, \\ \frac{2 \log |x| - \log \varepsilon}{\log \varepsilon}, & \text{if } x \in D_{\sqrt{\varepsilon}} \setminus D_{\varepsilon}, \\ 0, & \text{if } x \in \Omega \setminus D_{\sqrt{\varepsilon}}. \end{cases}
$$

One may directly verify that  $(1 - \omega_{\varepsilon})v \in \mathcal{H}_{0,0} \cap L^{\infty}(\Omega)$  for all  $\varepsilon \in (0,1)$  and  $(1 - \omega_{\varepsilon})v \to v$  in  $\mathcal{H}_0$ as  $\varepsilon \to 0$ . The proof of (i) is thereby complete. We can proceed in a similar way to obtain (ii).  $\square$ 

<span id="page-13-0"></span>3.3. An equivalent eigenvalue problem by gauge transformation. For every  $\varepsilon \in (0,1]$ , using the notation introduced in [\(3.3\)](#page-12-4), we define

<span id="page-13-4"></span><span id="page-13-1"></span>
$$
\theta_{\varepsilon}^{j} := \begin{cases} \theta_{a_{\varepsilon}^{j}, \pi - \alpha^{j}}, & \text{if } j = 1, \dots, k_{1} + k_{2}, \\ \theta_{a_{\varepsilon}^{j}, -\alpha^{j}}, & \text{if } j = k_{1} + k_{2} + 1, \dots, k_{1} + 2k_{2}, \end{cases}
$$

with  $\alpha^j$  as in [\(1.1\)](#page-0-0), see Figure [5,](#page-14-3) and

(3.5) 
$$
\Theta_{\varepsilon} : \mathbb{R}^2 \setminus \{a_{\varepsilon}^j : j = 1, ..., k\} \to \mathbb{R}, \quad \Theta_{\varepsilon} := \frac{1}{2} \sum_{j=1}^k (-1)^{j+1} \theta_{\varepsilon}^j.
$$

We observe that  $\Theta_{\varepsilon}$  verifies [\(2.8\)](#page-6-2).

For any  $\varepsilon \in (0,1]$ , let  $\lambda \in \mathbb{R}$  be an eigenvalue of problem [\(1.4\)](#page-1-2) associated to the eigenfunction  $u \in H_0^{1,\varepsilon}(\Omega,\mathbb{C}) \setminus \{0\}$ . Then the function

<span id="page-13-3"></span>
$$
v(x) := e^{-i\Theta_{\varepsilon}(x)}u(x), \quad x \in \Omega \setminus \Gamma_{\varepsilon},
$$

belongs to  $\mathcal{H}_{\varepsilon}$  and weakly solves [\(2.10\)](#page-7-0), in the sense that  $v \in \widetilde{\mathcal{H}}_{\varepsilon}$  and

(3.6) 
$$
\int_{\Omega \setminus \Gamma_{\varepsilon}} \nabla v \cdot \nabla w \, dx = \lambda \int_{\Omega} v w \, dx \quad \text{for all } w \in \widetilde{\mathcal{H}}_{\varepsilon},
$$

where  $\mathcal{H}_{\varepsilon}$  is defined in [\(2.5\)](#page-6-3). On the other hand, if  $v \in \mathcal{H}_{\varepsilon}$  solves [\(3.6\)](#page-13-3), then  $u = e^{i\Theta_{\varepsilon}}v$  solves [\(1.4\)](#page-1-2). Therefore the eigenvalue problems [\(1.4\)](#page-1-2) and [\(2.10\)](#page-7-0) have the same eigenvalues and their eigenfunctions match each other via the phase  $e^{-i\Theta_{\varepsilon}}$ .

<span id="page-14-3"></span>

FIGURE 5. The angles  $\theta_j^{\varepsilon}$  for  $1 \leq j \leq k_1 + 2k_2$ . The half-lines represent the singular set of the function  $\theta_j^{\varepsilon}$ .

A similar gauge transformation can be made for solutions to [\(1.5\)](#page-2-0). For every  $j = 1, \ldots, k_1$ , let  $\alpha^j$  be as in  $(1.1)$  and

<span id="page-14-0"></span>
$$
\theta_0^j := \theta_0 \circ R_{0, \pi - \alpha^j}.
$$

We define

(3.7) 
$$
\Theta_0 : \mathbb{R}^2 \setminus \{0\} \to \mathbb{R}, \quad \Theta_0(x) = \frac{1}{2} \sum_{j=1}^{k_1} (-1)^{j+1} \theta_0^j(x).
$$

If  $k_1 = 0$  we just take  $\Theta_0 \equiv 0$ . We observe that  $\Theta_0$  satisfies [\(2.12\)](#page-7-9). Furthermore, if  $t \in [0, 2\pi)$ ,

<span id="page-14-7"></span>(3.8) 
$$
\theta_0^j(\cos t, \sin t) = \begin{cases} t - \alpha^j + \pi, & \text{if } t \in [0, \alpha^j + \pi), \\ t - \alpha^j - \pi, & \text{if } t \in [\alpha^j + \pi, 2\pi), \end{cases}
$$

$$
= -\alpha^j + t + \pi(1 - 2\chi_{[\alpha^j + \pi, 2\pi)}),
$$

where X is defined in  $(2.23)$ . We have that u is an eigenfunction of problem  $(1.5)$ , associated to the eigenvalue  $\lambda$ , if and only if the function

<span id="page-14-4"></span>(3.9) 
$$
v(x) := e^{-i\Theta_0(x)}u(x), \quad x \in \Omega \setminus \Gamma_0,
$$

is a non-zero weak solution of [\(2.14\)](#page-7-1) in the sense that  $v \in \widetilde{\mathcal{H}}_0$  and

<span id="page-14-5"></span>(3.10) 
$$
\int_{\Omega \setminus \Gamma_0} \nabla v \cdot \nabla w \, dx = \lambda \int_{\Omega} v w \, dx \quad \text{for all } w \in \widetilde{\mathcal{H}}_0,
$$

where  $\widetilde{\mathcal{H}}_0$  is defined in [\(2.6\)](#page-6-4). We recall that, if  $k_1$  is even, then, letting v as in [\(3.9\)](#page-14-4), the function  $ve^{i\Theta_0} = u$  is an eigenfunction of the Dirichlet Laplacian in  $\Omega$ , hence it is smooth in  $\Omega$ .

<span id="page-14-1"></span>**Remark 3.5.** We may treat eigenfunctions of problems  $(2.10)$  and  $(2.14)$  as real-valued functions (thus justifying the choice to consider  $\mathcal{H}_{\varepsilon}$  as a space of real functions). Indeed, since all the coefficients in  $(2.10)$  and  $(2.14)$  are real, both the real and the imaginary part of any eigenfunction are eigenfunctions, if not trivial. Hence, any eigenspace of  $(2.10)$  and  $(2.14)$  admits a basis made of reals eigenfunctions. See also [\[1,](#page-42-2) Subsection 2.3].

<span id="page-14-2"></span>3.4. Asymptotics of solutions to the limit eigenvalue problem. Let  $\{\alpha^j\}_{j=1}^{k_1}$  and  $\chi_{[\alpha^j+\pi,2\pi)}$ be as in  $(1.1)$  and  $(2.23)$ , respectively. Let f be the function defined in  $(2.22)$ .

**Proposition 3.6.** Let  $k_1$  be odd. If v is a non-trivial solution to [\(2.14\)](#page-7-1), in the sense that  $v \in \mathcal{H}_0$ satisfies [\(3.10\)](#page-14-5), then there exist an odd number  $m \in \mathbb{N}$ ,  $\beta \in \mathbb{R} \setminus \{0\}$ , and  $\alpha_0 \in \left[0, \frac{2\pi}{m}\right)$  such that

<span id="page-14-6"></span>(3.11) 
$$
\varepsilon^{-\frac{m}{2}}v(\varepsilon\cos t,\varepsilon\sin t)\to\beta f(t)\sin\left(\frac{m}{2}(t-\alpha_0)\right)
$$

 $\text{in } C^{1,\tau}\big([0,2\pi] \setminus \{\alpha^{j}+\pi\}_{j=1}^{k_1},\mathbb{R}\big)$  as  $\varepsilon \to 0^+$ , for all  $\tau \in (0,1)$ . Moreover, there exists a constant  $C > 0$  such that

(3.12) 
$$
|v(x)| \leq C|x|^{\frac{m}{2}} \quad \text{and} \quad |\nabla v(x)| \leq C|x|^{\frac{m}{2}-1} \quad \text{for all } x \in \Omega \setminus \Gamma_0.
$$

Furthermore, letting

<span id="page-15-5"></span><span id="page-15-4"></span> $\Psi(x) = \Psi(r\cos t, r\sin t) = \beta r^{\frac{m}{2}} f(t) \sin \left(\frac{m}{2}(t - \alpha_0)\right),$ 

with m,  $\beta$ , and  $\alpha_0$  as in [\(3.11\)](#page-14-6) and f as in [\(2.22\)](#page-8-8), we have that, as  $\varepsilon \to 0^+$ ,

(3.13) 
$$
\varepsilon^{-\frac{m}{2}}v(\varepsilon \cdot) \to \Psi \quad in \ H^1(D_\rho \setminus \Gamma_0) \ for \ all \ \rho > 0.
$$

*Proof.* As observed above, the function  $u := e^{i\Theta_0}v$  is an eigenfunction of [\(1.5\)](#page-2-0) with k odd, i.e.

$$
\begin{cases} \left(i\nabla + A_0\right)^2 u = \lambda u, & \text{in } \Omega, \\ u = 0, & \text{on } \partial\Omega, \end{cases}
$$

with  $A_0$  defined in [\(1.2\)](#page-1-3). From [\[15,](#page-43-3) Theorem 1.3, Section 7] it follows that there exist an odd  $m \in \mathbb{N}$  and  $\beta_1, \beta_2 \in \mathbb{C}$  such that  $(\beta_1, \beta_2) \neq (0, 0)$  and, as  $\varepsilon \to 0^+,$ 

<span id="page-15-0"></span>(3.14) 
$$
\varepsilon^{-\frac{m}{2}}u(\varepsilon \cos t, \varepsilon \sin t) \to e^{\frac{i}{2}t} \left(\beta_1 \cos \left(\frac{m}{2}t\right) + \beta_2 \sin \left(\frac{m}{2}t\right)\right) \text{ in } C^{1, \tau}([0, 2\pi], \mathbb{C})
$$

and

<span id="page-15-1"></span>
$$
(3.15) \quad \varepsilon^{1-\frac{m}{2}} \nabla u(\varepsilon \cos t, \varepsilon \sin t) \to \frac{m}{2} e^{\frac{i}{2}t} \left( \beta_1 \cos \left( \frac{m}{2} t \right) + \beta_2 \sin \left( \frac{m}{2} t \right) \right) \theta(t) + \frac{d}{dt} \left( e^{\frac{i}{2}t} \left( \beta_1 \cos \left( \frac{m}{2} t \right) + \beta_2 \sin \left( \frac{m}{2} t \right) \right) \right) \tau(t) \quad \text{in } C^{0,\tau}([0,2\pi], \mathbb{C})
$$

for all  $\tau \in (0,1)$ , where  $\theta(t) = (\cos t, \sin t)$  and  $\tau(t) = (-\sin t, \cos t)$ . Furthermore, by [\(3.8\)](#page-14-7), for all  $t \in [0, 2\pi]$  we have

$$
(3.16) \qquad \sum_{j=1}^{k_1} (-1)^{j+1} \theta_0^j(\varepsilon \cos t, \varepsilon \sin t) = t + \sum_{j=1}^{k_1} (-1)^j \alpha^j + \pi - 2\pi \sum_{j=1}^{k_1} (-1)^{j+1} \chi_{[\alpha^j + \pi, 2\pi)}(t).
$$

From  $(3.14)$ , the definition of u, and  $(3.16)$  it follows that

<span id="page-15-2"></span>
$$
\varepsilon^{-\frac{m}{2}}v(\varepsilon\cos t,\varepsilon\sin t)\to f(t)e^{-\frac{i}{2}\left(\pi+\sum_{j=1}^{k_1}(-1)^j\alpha^j\right)}\left(\beta_1\cos\left(\frac{m}{2}t\right)+\beta_2\sin\left(\frac{m}{2}t\right)\right)
$$

in  $C^{1,\tau}([0,2\pi] \setminus {\alpha^j + \pi}_{j=1}^{k_1}, \mathbb{C})$  as  $\varepsilon \to 0^+$ , for all  $\tau \in (0,1)$ . Then, since v is real-valued (see Remark [3.5\)](#page-14-1), we have proved that there exist  $c_1, c_2 \in \mathbb{R}$  such that  $(c_1, c_2) \neq (0, 0)$  and

(3.17) 
$$
\varepsilon^{-\frac{m}{2}}v(\varepsilon \cos t, \varepsilon \sin t) \to f(t)\Big(c_1 \cos \left(\frac{m}{2}t\right) + c_2 \sin \left(\frac{m}{2}t\right)\Big).
$$

Letting

<span id="page-15-3"></span>
$$
\alpha_0 = \begin{cases} \frac{2}{m} \arccot \left( -\frac{c_2}{c_1} \right), & \text{if } c_1 \neq 0, \\ 0, & \text{if } c_1 = 0, \end{cases}
$$

we can rewrite  $(3.17)$  as  $(3.11)$ . Estimate  $(3.12)$  is a consequence of  $(3.14)$  and  $(3.15)$ . Finally, to prove [\(3.13\)](#page-15-5), we define

$$
\tilde{u}_{\varepsilon}(x) := \varepsilon^{-\frac{m}{2}} u(\varepsilon x), \quad \Phi(x) = \Phi(r \cos t, r \sin t) = r^{\frac{m}{2}} e^{\frac{i}{2}t} \left( \beta_1 \cos \left( \frac{m}{2} t \right) + \beta_2 \sin \left( \frac{m}{2} t \right) \right).
$$

We observe that [\(3.14\)](#page-15-0), [\(3.15\)](#page-15-1), and the Dominated Convergence Theorem imply that

$$
\nabla \tilde{u}_{\varepsilon} \to \nabla \Phi \quad \text{and} \quad \frac{\tilde{u}_{\varepsilon}}{|x|} \to \frac{\Phi}{|x|} \quad \text{in } L^2(D_\rho) \quad \text{for all } \rho > 0,
$$

which easily provides  $(3.13)$ .

<span id="page-15-6"></span>In the case  $k$  even, solutions to  $(2.14)$  are more regular.

**Proposition 3.7.** Let  $k_1$  be even. If v is a non-trivial solution to [\(2.14\)](#page-7-1), then there exist  $m \in \mathbb{N}$ ,  $\beta \in \mathbb{R} \setminus \{0\}$ , and  $\alpha_0 \in \left[0, \frac{\pi}{m}\right)$  such that

<span id="page-16-1"></span>(3.18) 
$$
\varepsilon^{-m} v(\varepsilon \cos t, \varepsilon \sin t) \to \beta f(t) \sin(m(t - \alpha_0))
$$

in  $C^{1,\tau}([0,2\pi] \setminus {\{\pi + \alpha^j\}}_{j=1}^{k_1},\mathbb{R})$  as  $\varepsilon \to 0^+$ , for all  $\tau \in (0,1)$ . Moreover, there exists a constant  $C > 0$  such that

<span id="page-16-2"></span>(3.19) 
$$
|v(x)| \leq C|x|^m \quad and \quad |\nabla v(x)| \leq \begin{cases} C|x|^{m-1}, & \text{if } m \geq 1, \\ C, & \text{if } m = 0, \end{cases}
$$

for all  $x \in \Omega \setminus \Gamma_0$ .

*Proof.* The function  $u := e^{i\Theta_0}v$  is an eigenfunction of [\(1.5\)](#page-2-0) with k even, i.e. u is an eigenfunction of the Dirichlet Laplacian. From [\(3.8\)](#page-14-7) we deduce the analogue of [\(3.16\)](#page-15-2) in the even case:

<span id="page-16-3"></span>(3.20) 
$$
\sum_{j=1}^{k_1} (-1)^{j+1} \theta_0^j(\varepsilon \cos t, \varepsilon \sin t) = \sum_{j=1}^{k_1} (-1)^j \alpha^j - 2\pi \sum_{j=1}^{k_1} (-1)^{j+1} \chi_{[\alpha^j + \pi, 2\pi)}(t)
$$

for all  $t \in [0, 2\pi]$ . Claims [\(3.18\)](#page-16-1) and [\(3.19\)](#page-16-2) follow from the fact that u is analytic, the definition of u and [\(3.20\)](#page-16-3), observing that, since  $k_1$  is even,  $|\nabla u| = |\nabla v|$ .

**Remark 3.8.** For the sake of simplicity, for any  $w \in \mathcal{H}_0$  we simply write w instead of  $\gamma^j_+(w)$  on  $S_{\varepsilon}^{j}$ , since  $\gamma_{+}^{j}(w) = \gamma_{-}^{j}(w)$  on  $S_{\varepsilon}^{j}$  for any  $j = 1, ..., k_1 + k_2$ . We also simply write  $v_0$ ,  $\nabla v_0$  and  $\nabla v_0 \cdot \nu^j$  when considering their traces on  $S^j_{\varepsilon}$ .

### 4. DEFINITION AND PROPERTIES OF  $\mathcal{E}_{\varepsilon}$

<span id="page-16-0"></span>For some  $n_0 \in \mathbb{N} \setminus \{0\}$ , let  $u_0$  be an eigenfunction of  $(1.5)$  associated to the eigenvalue  $\lambda_0 = \lambda_{0,n_0}$ and  $v_0$  be as in [\(3.9\)](#page-14-4), so that  $v_0$  is a non-zero weak solution of [\(2.14\)](#page-7-1) with  $\lambda = \lambda_0$ . By Remark [3.5](#page-14-1) it is not restrictive to assume that  $v_0$  is real-valued and  $||u_0||_{L^2(\Omega,\mathbb{C})} = ||v_0||_{L^2(\Omega)} = 1$ .

Let  $L_{\varepsilon}$  be the functional introduced in [\(2.16\)](#page-7-3). We observe that  $L_{\varepsilon}$  is well-defined; indeed, for every  $j = 1, \ldots, k_1 + k_2$ , we have  $\nabla v_0 \in L^p(S^j_{\varepsilon})$  for all  $p \in [1, 2)$  in view of  $(3.12)$  and  $(3.19)$ , whereas  $\gamma^j_+(w) \in L^q(S^j_\varepsilon)$  for all  $w \in \mathcal{H}_1$  and  $q \in [2, +\infty)$  by [\(2.3\)](#page-6-5). We provide below an estimate of the norm of  $L_{\varepsilon}$  in  $\mathcal{H}_1^*$ , where  $\mathcal{H}_1^*$  is the dual space of  $\mathcal{H}_1$ .

<span id="page-16-6"></span>**Proposition 4.1.** Let  $m \in \mathbb{N}$  be as in Proposition [3.6](#page-14-2) for  $v = v_0$ , if k is odd, or as in Proposition [3.7,](#page-15-6) if k is even. For every  $\varepsilon \in (0,1]$ , the map  $L_{\varepsilon}$  defined in [\(2.16\)](#page-7-3) belongs to  $\mathcal{H}_1^*$  and, as  $\varepsilon \to 0^+$ ,

(4.1) 
$$
||L_{\varepsilon}||_{\mathcal{H}_{1}^{*}} = \begin{cases} O(\varepsilon^{\frac{m}{2}-1+\frac{1}{p}}), & \text{if } k \text{ is odd,} \\ O(\varepsilon^{\frac{1}{p}}), & \text{if } k \text{ is even and } m = 0, \\ O(\varepsilon^{m-1+\frac{1}{p}}), & \text{if } k \text{ is even and } m > 0, \end{cases}
$$

for every  $p \in (1,2)$ . In particular,  $L_{\varepsilon} \to 0$  in  $\mathcal{H}_1^*$  as  $\varepsilon \to 0^+$ .

*Proof.* If k is odd, for every  $p \in (1,2)$  and  $w \in \mathcal{H}_1$ , from the Hölder inequality,  $(2.3)$  and  $(3.12)$  it follows that, letting  $p' = \frac{p}{p-1}$ ,

<span id="page-16-5"></span><span id="page-16-4"></span>
$$
|L_{\varepsilon}(w)| \leq 2 \sum_{j=1}^{k_1+k_2} \|\nabla v_0\|_{L^p(S_{\varepsilon}^j)} \|\gamma_+^j(w)\|_{L^{p'}(S_{\varepsilon}^j)} \leq C \varepsilon^{\frac{m}{2}-1+\frac{1}{p}} \|w\|_{\mathcal{H}_1},
$$

for some constant  $C > 0$  independent of  $\varepsilon$ . If k is even, the proof is similar due to [\(3.19\)](#page-16-2).

For every  $\varepsilon \in (0,1]$ , we now consider the functional  $J_{\varepsilon}$  defined in [\(2.17\)](#page-7-11) and, recalling the definition of  $\mathcal{H}_{\varepsilon}$  in [\(2.5\)](#page-6-3), the minimization problem

(4.2) 
$$
\inf \left\{ J_{\varepsilon}(w) : w \in \mathcal{H}_{\varepsilon} \text{ and } w - v_0 \in \widetilde{\mathcal{H}}_{\varepsilon} \right\}.
$$

Note that, since  $v_0 \in \widetilde{\mathcal{H}}_0$ , the condition  $w - v_0 \in \widetilde{\mathcal{H}}_{\varepsilon}$  is equivalent to

<span id="page-17-8"></span>(4.3) 
$$
T^{j}(w) = \begin{cases} 0, & \text{on } \Gamma^{j}_{0} \text{ for all } j = 1, ..., k_{1}, \\ 2v_{0}, & \text{on } S^{j}_{\varepsilon} \text{ for all } j = 1, ..., k_{1} + k_{2}. \end{cases}
$$

<span id="page-17-0"></span>**Proposition 4.2.** The infimum in [\(4.2\)](#page-16-4) is achieved by a unique  $V_{\varepsilon} \in \mathcal{H}_{\varepsilon}$ . Furthermore,  $V_{\varepsilon}$  weakly solves the problem

<span id="page-17-1"></span>(4.4)  
\n
$$
\begin{cases}\n-\Delta V_{\varepsilon} = 0, & \text{in } \Omega \setminus \Gamma_{\varepsilon}, \\
V_{\varepsilon} = 0, & \text{on } \partial \Omega, \\
T^{j}(V_{\varepsilon} - v_{0}) = 0, & \text{on } \Gamma_{\varepsilon}^{j} \text{ for all } j = 1, ..., k_{1}, \\
T^{j}(\nabla V_{\varepsilon} \cdot \nu^{j} - \nabla v_{0} \cdot \nu^{j}) = 0, & \text{on } \Gamma_{\varepsilon}^{j} \text{ for all } j = 1, ..., k_{1}, \\
T^{j}(V_{\varepsilon} - v_{0}) = 0, & \text{on } S_{\varepsilon}^{j} \text{ for all } j = k_{1} + 1, ..., k_{1} + k_{2}, \\
T^{j}(V_{\varepsilon} \cdot \nu^{j} - \nabla v_{0} \cdot \nu^{j}) = 0, & \text{on } S_{\varepsilon}^{j} \text{ for all } j = k_{1} + 1, ..., k_{1} + k_{2},\n\end{cases}
$$

in the sense that  $V_{\varepsilon} \in \mathcal{H}_{\varepsilon}$ ,  $V_{\varepsilon} - v_0 \in \widetilde{\mathcal{H}}_{\varepsilon}$ , and

<span id="page-17-2"></span>(4.5) 
$$
\int_{\Omega \setminus \Gamma_{\varepsilon}} \nabla V_{\varepsilon} \cdot \nabla w \, dx = -L_{\varepsilon}(w) \quad \text{for all } w \in \widetilde{\mathcal{H}}_{\varepsilon}.
$$

*Proof.* In view of [\(2.17\)](#page-7-11), the continuity of the linear operator  $L_{\varepsilon}$ , and Proposition [3.2,](#page-12-0) we can easily verify that  $J_{\varepsilon}$  is continuous and coercive on the set  $v_0 + \widetilde{\mathcal{H}}_{\varepsilon} = \{w \in \mathcal{H}_{\varepsilon} : w - v_0 \in \widetilde{\mathcal{H}}_{\varepsilon}\}\,$ which is closed and convex. Moreover,  $J_{\varepsilon}$  is convex. Therefore, the infimum in [\(4.2\)](#page-16-4) is achieved by some  $V_{\varepsilon}$ , which weakly solves [\(4.4\)](#page-17-1) in the sense of [\(4.5\)](#page-17-2). If  $V_{\varepsilon,1}, V_{\varepsilon,2} \in v_0 + \mathcal{H}_{\varepsilon}$  are weak solutions of [\(4.4\)](#page-17-1), then  $V_{\varepsilon,1} - V_{\varepsilon,2} \in \widetilde{\mathcal{H}}_{\varepsilon}$  and

<span id="page-17-3"></span>(4.6) 
$$
\int_{\Omega \setminus \Gamma_{\varepsilon}} (\nabla V_{\varepsilon,1} - \nabla V_{\varepsilon,2}) \cdot \nabla w \, dx = 0 \text{ for all } w \in \tilde{\mathcal{H}}_{\varepsilon}.
$$

Testing [\(4.6\)](#page-17-3) with  $w = V_{\epsilon,1} - V_{\epsilon,2}$  we obtain  $\nabla (V_{\epsilon,1} - V_{\epsilon,2}) = 0$  and hence, by Proposition [3.2,](#page-12-0) we conclude that  $V_{\varepsilon,1} = V_{\varepsilon,2}$ .

For every  $\varepsilon \in (0, 1]$ , let  $J_{\varepsilon}$  and  $V_{\varepsilon}$  be as  $(2.17)$  and Proposition [4.2,](#page-17-0) respectively. We consider the quantity  $\mathcal{E}_{\varepsilon} := J_{\varepsilon}(V_{\varepsilon})$  as in [\(2.19\)](#page-7-4).  $\mathcal{E}_{\varepsilon}$  plays a significant role in the asymptotic expansion of the eigenvalue variation  $\lambda_{\varepsilon,n_0} - \lambda_{0,n_0}$ , as the poles  $a_\varepsilon^j$  move towards the collision at 0.

To derive a first upper and lower bound for  $\mathcal{E}_{\varepsilon}$ , we consider, for every  $r > 0$ , the radial cut-off function  $\eta_r \in C_c^{\infty}(\mathbb{R}^2)$  defined as

<span id="page-17-4"></span>
$$
(4.7) \t\t \eta_r(x) := \eta\left(\frac{x}{r}\right)
$$

<span id="page-17-7"></span>with  $\eta$  as in [\(2.29\)](#page-8-9).

**Proposition 4.3.** Let  $m \in \mathbb{N}$  be as in Proposition [3.6](#page-14-2) for  $v = v_0$ , if k is odd, or as in Proposition [3.7,](#page-15-6) if k is even. Then there exists a constant  $C_1 > 0$  such that, for all  $\varepsilon \in (0,1]$ ,

<span id="page-17-5"></span>(4.8) 
$$
\mathcal{E}_{\varepsilon} \leq \begin{cases} C_1 \varepsilon^m, & \text{if } k \text{ is odd,} \\ C_1 \frac{1}{|\log \varepsilon|}, & \text{if } k \text{ is even and } m = 0, \\ C_1 \varepsilon^{2m}, & \text{if } k \text{ is even and } m > 0. \end{cases}
$$

Moreover, for every  $p \in (1,2)$  there exists  $C_2 = C_2(p) > 0$  such that

<span id="page-17-6"></span>(4.9) 
$$
\mathcal{E}_{\varepsilon} \geq \begin{cases} -C_2 \, \varepsilon^{m-2+\frac{2}{p}}, & \text{if } k \text{ is odd}, \\ -C_2 \, \varepsilon^{\frac{2}{p}}, & \text{if } k \text{ is even and } m = 0, \\ -C_2 \, \varepsilon^{2m-2+\frac{2}{p}}, & \text{if } k \text{ is even and } m > 0. \end{cases}
$$

In particular,  $\mathcal{E}_{\varepsilon} \to 0$  as  $\varepsilon \to 0^+$ .

Proof. If k is odd, let  $\eta_{\varepsilon} \in C_{\varepsilon}^{\infty}(\mathbb{R}^2)$  be a cut-off function as in [\(4.7\)](#page-17-4) with  $r = \varepsilon$ . From [\(2.16\)](#page-7-3),  $(2.17), (4.2), (2.19), \text{ and } (3.12)$  it follows that

$$
J_{\varepsilon}(V_{\varepsilon}) \leq J_{\varepsilon}(\eta_{\varepsilon}v_{0}) \leq \frac{1}{2} \int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla(\eta_{\varepsilon}v_{0})|^{2} dx + 2 \sum_{j=1}^{k_{1}+k_{2}} \int_{S_{\varepsilon}^{j}} |\nabla v_{0}| |v_{0}| dx
$$
  

$$
\leq \int_{(\Omega \cap D_{2\varepsilon}(0)) \setminus \Gamma_{\varepsilon}} |\nabla v_{0}|^{2} dx + \int_{\Omega \cap D_{2\varepsilon}(0)} |\nabla \eta_{\varepsilon}|^{2} v_{0}^{2} dx + 2 \sum_{j=1}^{k_{1}+k_{2}} \int_{S_{\varepsilon}^{j}} |\nabla v_{0}| |v_{0}| dx \leq C_{1} \varepsilon^{m}
$$

for some constant  $C_1 > 0$  independent of  $\varepsilon$ . If k is even and  $m \in \mathbb{N} \setminus \{0\}$ , [\(4.8\)](#page-17-5) can be proved arguing in a similar way and using [\(3.19\)](#page-16-2) instead of [\(3.12\)](#page-15-4).

If k is even and  $m = 0$ , for every  $\varepsilon \in (0,1]$  we consider the cut-off function  $\omega_{\varepsilon} \in W^{1,\infty}(\mathbb{R}^2)$ defined in [\(3.4\)](#page-13-4). We have  $0 \le \omega_{\varepsilon} \le 1$  and, thanks to [\(2.16\)](#page-7-3), [\(2.17\)](#page-7-11), [\(4.2\)](#page-16-4), [\(2.19\)](#page-7-4), and [\(3.19\)](#page-16-2) with  $m = 0$ ,

$$
J_{\varepsilon}(V_{\varepsilon}) \leq J_{\varepsilon}(\omega_{\varepsilon}v_{0}) \leq \frac{1}{2} \int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla(\omega_{\varepsilon}v_{0})|^{2} dx + 2 \sum_{j=1}^{k_{1}+k_{2}} \int_{S_{\varepsilon}^{j}} |\nabla v_{0}| |v_{0}| dx
$$
  

$$
\leq \int_{(\Omega \cap D_{\sqrt{\varepsilon}}(0)) \setminus \Gamma_{\varepsilon}} |\nabla v_{0}|^{2} dx + \int_{\Omega \cap D_{\sqrt{\varepsilon}}(0)} |\nabla \omega_{\varepsilon}|^{2} v_{0}^{2} dx + 2 \sum_{j=1}^{k_{1}+k_{2}} \int_{S_{\varepsilon}^{j}} |\nabla v_{0}| |v_{0}| dx \leq C_{1} \frac{1}{|\log \varepsilon|}
$$

for some constant  $C_1 > 0$  independent of  $\varepsilon$ . Estimate [\(4.8\)](#page-17-5) is thereby proved.

To prove [\(4.9\)](#page-17-6), we observe that

<span id="page-18-0"></span>
$$
\|V_{\varepsilon}\|_{\mathcal{H}_{1}}^{2} = \|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^{2} = 2\mathcal{E}_{\varepsilon} - 2L_{\varepsilon}(V_{\varepsilon}) \leq 2\mathcal{E}_{\varepsilon} + 2|L_{\varepsilon}(V_{\varepsilon})|
$$
  

$$
\leq 2\mathcal{E}_{\varepsilon} + 2 \|L_{\varepsilon}\|_{\mathcal{H}_{1}^{*}} \|V_{\varepsilon}\|_{\mathcal{H}_{1}} \leq 2\mathcal{E}_{\varepsilon} + 2 \|L_{\varepsilon}\|_{\mathcal{H}_{1}^{*}}^{2} + \frac{1}{2} \|V_{\varepsilon}\|_{\mathcal{H}_{1}}^{2},
$$

and hence

(4.10) 
$$
\mathcal{E}_{\varepsilon} + ||L_{\varepsilon}||_{\mathcal{H}_{1}^{*}}^{2} \geq \frac{1}{4} ||V_{\varepsilon}||_{\mathcal{H}_{1}}^{2} \geq 0,
$$

<span id="page-18-1"></span>which, together with  $(4.1)$ , implies  $(4.9)$ .

**Proposition 4.4.** We have  $V_{\varepsilon} \to 0$  as  $\varepsilon \to 0^+$  strongly in  $\mathcal{H}_1$ .

*Proof.* From Proposition [4.3](#page-17-7) we have  $\lim_{\varepsilon \to 0^+} \mathcal{E}_{\varepsilon} = 0$ , whereas Proposition [4.1](#page-16-6) implies that  $\lim_{\varepsilon \to 0^+} ||L_{\varepsilon}||_{\mathcal{U}^*} = 0$ . The conclusion then follows from (4.10).  $\lim_{\varepsilon \to 0^+} ||L_{\varepsilon}||_{\mathcal{H}_{1}^{*}} = 0.$  The conclusion then follows from [\(4.10\)](#page-18-0).

**Proposition 4.5.** We have  $\mathcal{E}_{\varepsilon} = o\left(\left\|V_{\varepsilon}\right\|_{\mathcal{H}_{\varepsilon}}\right)$  as  $\varepsilon \to 0^+$ .

Proof. Proceeding similarly to the previous proof, we have

$$
|\mathcal{E}_{\varepsilon}| \leq \frac{\|V_{\varepsilon}\|_{\mathcal{H}_1}^2}{2} + \|L_{\varepsilon}\|_{\mathcal{H}_1^*} \|V_{\varepsilon}\|_{\mathcal{H}_1}
$$

<span id="page-18-3"></span>and we can conclude thanks to  $(4.1)$  and Proposition [4.4.](#page-18-1)

Proposition 4.6. We have

<span id="page-18-2"></span>
$$
\int_{\Omega} V_{\varepsilon}^2 dx = o\left(\left\|V_{\varepsilon}\right\|_{\mathcal{H}_{\varepsilon}}^2\right) \quad \text{as } \varepsilon \to 0^+.
$$

*Proof.* Let us assume by contradiction that there exist a positive constant  $C > 0$  and a sequence  $\{\varepsilon_n\}_{n\in\mathbb{N}}\subset(0,1)$  such that  $\lim_{n\to\infty}\varepsilon_n=0$  and

(4.11) 
$$
\int_{\Omega} V_{\varepsilon_n}^2 dx \ge C \int_{\Omega \setminus \Gamma_{\varepsilon_n}} |\nabla V_{\varepsilon_n}|^2 dx \text{ for all } n \in \mathbb{N}.
$$

For every  $n \in \mathbb{N}$ , we define  $W_n := \frac{V_{\varepsilon_n}}{\|V_{\varepsilon_n}\|}$ .  $\frac{V_{\varepsilon_n}}{\|V_{\varepsilon_n}\|_{L^2(\Omega)}}$ . Then  $\|W_n\|_{L^2(\Omega)} = 1$  for every  $n \in \mathbb{N}$  and  $\{W_n\}_{n \in \mathbb{N}}$ is bounded in  $\mathcal{H}_1$  thanks to [\(4.11\)](#page-18-2). It follows that there exists  $W \in \mathcal{H}_1$  such that  $W_n \rightharpoonup W$  weakly

in  $\mathcal{H}_1$  as  $n \to \infty$ , up to a subsequence. Since  $W_n \in \mathcal{H}_{\varepsilon_n}$  for every n, from Proposition [3.3](#page-12-3) we deduce that  $W \in \mathcal{H}_0$ , while Remark [3.1](#page-12-2) ensures that

(4.12) kWkL2(Ω) = 1.

Since  $W_n - ||V_{\varepsilon_n}||_{L^2(\Omega)}^{-1}v_0 \in \widetilde{\mathcal{H}}_{\varepsilon_n}$ , we have  $T^j(W_n) = 0$  on  $\Gamma_0^j$  for all  $j = 1, \ldots, k_1$ , see [\(4.3\)](#page-17-8). By continuity of the trace operator [\(2.4\)](#page-6-6), we deduce that  $T^{j}(W) = 0$  on  $\Gamma_0^{j}$  for all  $j = 1, ..., k_1$ , hence  $W \in \widetilde{\mathcal{H}}_0$ .

Let  $w \in \widetilde{\mathcal{H}}_{0,0}$ , where  $\widetilde{\mathcal{H}}_{0,0}$  is defined in Lemma [3.4.](#page-13-2) For *n* sufficiently large,  $w \in \widetilde{\mathcal{H}}_{\varepsilon_n}$  and  $L_{\varepsilon_n}(w) = 0$ , hence we can test  $(4.5)$  with w, thus obtaining

<span id="page-19-2"></span>
$$
\int_{\Omega \setminus \Gamma_1} \nabla W_n \cdot \nabla w \, dx = \int_{\Omega \setminus \Gamma_{\varepsilon_n}} \nabla W_n \cdot \nabla w \, dx = -L_{\varepsilon_n}(w) = 0.
$$

Letting  $n \to \infty$  in the above identity, we obtain  $\int_{\Omega \backslash \Gamma_0} \nabla W \cdot \nabla w \, dx = 0$  for all  $w \in \widetilde{\mathcal{H}}_{0,0}$  and hence, by the density of  $\widetilde{\mathcal{H}}_{0,0}$  in  $\widetilde{\mathcal{H}}_0$  established in Lemma [3.4,](#page-13-2)

(4.13) 
$$
\int_{\Omega \setminus \Gamma_0} \nabla W \cdot \nabla w \, dx = 0 \text{ for all } w \in \widetilde{\mathcal{H}}_0.
$$

<span id="page-19-0"></span>Choosing  $w = W$  in [\(4.13\)](#page-19-1), we conclude that  $W = 0$ , thus contradicting [\(4.12\)](#page-19-2).

<span id="page-19-1"></span>5. Asymptotic expansion of the eigenvalue variation

For every  $\varepsilon \in [0,1]$ , we consider the bilinear form  $q_{\varepsilon} : \widetilde{\mathcal{H}}_{\varepsilon} \times \widetilde{\mathcal{H}}_{\varepsilon} \to \mathbb{R}$  defined as

(5.1) 
$$
q_{\varepsilon}(w_1, w_2) := \int_{\Omega \setminus \Gamma_{\varepsilon}} \nabla w_1 \cdot \nabla w_2 dx,
$$

where  $\mathcal{H}_{\varepsilon}$  is as in [\(2.5\)](#page-6-3). To simplify notation, we denote by  $q_{\varepsilon}$  both the bilinear form defined above and the associated quadratic form

<span id="page-19-4"></span>
$$
q_{\varepsilon}(w) = \int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 dx = ||w||_{\mathcal{H}_{\varepsilon}}^2, \quad w \in \widetilde{\mathcal{H}}_{\varepsilon}.
$$

The following preliminary result can be obtained in a standard way from the compactness properties pointed out in Remark [3.1](#page-12-2) and abstract spectral theory, see for example [\[16,](#page-43-12) Theorems 6.16 and 6.21, Proposition 8.20].

<span id="page-19-5"></span>**Proposition 5.1.** Let  $\varepsilon \in [0,1]$  and  $\mathcal{F}_{\varepsilon} : \widetilde{\mathcal{H}}_{\varepsilon} \to \widetilde{\mathcal{H}}_{\varepsilon}$  be the linear operator defined as

(5.2) 
$$
q_{\varepsilon}(\mathcal{F}_{\varepsilon}(w_1), w_2) = (w_1, w_2)_{L^2(\Omega)}.
$$

Then

- (i)  $\mathcal{F}_{\varepsilon}$  is symmetric, non-negative and compact; in particular 0 belongs to its spectrum  $\sigma(\mathcal{F}_{\varepsilon})$ .
- (ii)  $\sigma(\mathcal{F}_{\varepsilon}) \setminus \{0\} = {\mu_{n,\varepsilon}}_{n \in \mathbb{N} \setminus \{0\}},$  where  $\mu_{n,\varepsilon} := 1/\lambda_{\varepsilon,n}$  for every  $n \in \mathbb{N} \setminus \{0\}.$
- (iii) For every  $\mu \in \mathbb{R}$  and  $w \in \widetilde{\mathcal{H}}_{\varepsilon}$ ,

<span id="page-19-6"></span><span id="page-19-3"></span>
$$
\big(\operatorname{dist}(\mu, \sigma(\mathcal{F}_{\varepsilon}))\big)^2 \leq \frac{q_{\varepsilon}(\mathcal{F}_{\varepsilon}(w) - \mu w)}{q_{\varepsilon}(w)}
$$

.

Letting  $n_0 \in \mathbb{N} \setminus \{0\}$ ,  $v_0$  and  $\lambda_0 = \lambda_{0,n_0}$  be as in Section [4,](#page-16-0) to prove an asymptotic expansion of the eigenvalue variation we further assume that

(5.3) 
$$
\lambda_0
$$
 is simple as an eigenvalue of (1.5),

and, consequently, as an eigenvalue of  $(2.14)$ . Therefore, the continuity result of  $[20,$  Theorem 1.2, see [\(1.7\)](#page-2-1), implies that also  $\lambda_{\varepsilon,n_0}$  is simple for  $\varepsilon$  sufficiently small. From now on, we denote

$$
\lambda_{\varepsilon} = \lambda_{\varepsilon, n_0}.
$$

For  $\varepsilon$  small, let  $v_{\varepsilon} \in \widetilde{\mathcal{H}}_{\varepsilon}$  be the unique eigenfunction of  $(2.10)$  associated to the eigenvalue  $\lambda_{\varepsilon} = \lambda_{\varepsilon,n_0}$ satisfying

<span id="page-20-0"></span>(5.4) 
$$
\int_{\Omega} v_{\varepsilon}^2 dx = 1 \text{ and } \int_{\Omega} v_{\varepsilon} v_0 dx > 0.
$$

We denote as  $\Pi_{\varepsilon}$  the projection onto the one-dimensional space spanned by  $v_{\varepsilon}$ , i.e.

<span id="page-20-1"></span>(5.5) 
$$
\Pi_{\varepsilon}: L^{2}(\Omega) \to \widetilde{\mathcal{H}}_{\varepsilon},
$$

$$
w \mapsto (w, v_{\varepsilon})_{L^{2}(\Omega)} v_{\varepsilon}.
$$

<span id="page-20-11"></span>Theorem [2.1](#page-7-2) is contained in the following result, the proof of which is inspired by [\[3,](#page-42-10) Appendix A].

Theorem 5.2. Under assumption [\(5.3\)](#page-19-3), the following asymptotic expansion holds:

<span id="page-20-10"></span>(5.6) 
$$
\lambda_{\varepsilon} - \lambda_0 = 2\mathcal{E}_{\varepsilon} - 2L_{\varepsilon}(v_0) + o(||V_{\varepsilon}||^2_{\mathcal{H}_{\varepsilon}}) \quad \text{as } \varepsilon \to 0^+,
$$

where  $V_{\varepsilon}$  is as Proposition [4.2.](#page-17-0) Furthermore,

<span id="page-20-7"></span>(5.7) 
$$
\|v_0 - V_{\varepsilon} - \Pi_{\varepsilon}(v_0 - V_{\varepsilon})\|_{\mathcal{H}_{\varepsilon}} = o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}\right) \quad as \ \varepsilon \to 0^+,
$$

<span id="page-20-8"></span>(5.8) 
$$
\|v_0 - \Pi_{\varepsilon}(v_0 - V_{\varepsilon})\|_{L^2(\Omega)} = o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}\right) \quad as \ \varepsilon \to 0^+,
$$

<span id="page-20-9"></span>(5.9) 
$$
\|\Pi_{\varepsilon}(v_0-V_{\varepsilon})\|_{L^2(\Omega)}^2=1+o(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}) \quad as \ \varepsilon\to 0^+.
$$

*Proof.* Let  $\psi_{\varepsilon} := v_0 - V_{\varepsilon}$ . We recall that we are assuming that  $v_0$  is real-valued and  $||v_0||_{L^2(\Omega)} = 1$ . From [\(4.4\)](#page-17-1) and [\(2.14\)](#page-7-1) it follows that  $\psi_{\varepsilon} \in \tilde{\mathcal{H}}_{\varepsilon}$  is a weak solution of the problem

$$
\begin{cases}\n-\Delta \psi_{\varepsilon} = \lambda_0 v_0, & \text{in } \Omega \setminus \Gamma_{\varepsilon}, \\
\psi_{\varepsilon} = 0, & \text{on } \partial \Omega, \\
T^j(\psi_{\varepsilon}) = 0, & \text{on } \Gamma_{\varepsilon}^j \text{ for all } j = 1, ..., k_1, \\
T^j(\nabla \psi_{\varepsilon} \cdot \nu^j) = 0, & \text{on } \Gamma_{\varepsilon}^j \text{ for all } j = 1, ..., k_1, \\
T^j(\psi_{\varepsilon}) = 0, & \text{on } S_{\varepsilon}^j \text{ for all } j = k_1 + 1, ..., k_1 + k_2, \\
T^j(\nabla \psi_{\varepsilon} \cdot \nu^j) = 0, & \text{on } S_{\varepsilon}^j \text{ for all } j = k_1 + 1, ..., k_1 + k_2,\n\end{cases}
$$

in the sense that, letting  $q_{\varepsilon}$  be as in [\(5.1\)](#page-19-4),

<span id="page-20-2"></span>(5.10) 
$$
q_{\varepsilon}(\psi_{\varepsilon}, w) = \lambda_0 (v_0, w)_{L^2(\Omega)} \quad \text{for all } w \in \mathcal{H}_{\varepsilon}.
$$

Let  $v_{\varepsilon}$  be an eigenfunction of [\(2.10\)](#page-7-0) associated to  $\lambda_{\varepsilon}$  chosen as in [\(5.4\)](#page-20-0). Let  $\Pi_{\varepsilon}$  be the projection operator onto the one-dimensional space spanned by  $v_{\varepsilon}$  defined in [\(5.5\)](#page-20-1). Moreover, we define

<span id="page-20-4"></span>.

(5.11) 
$$
\hat{v}_{\varepsilon} := \frac{\Pi_{\varepsilon}(\psi_{\varepsilon})}{\|\Pi_{\varepsilon}(\psi_{\varepsilon})\|_{L^{2}(\Omega)}}
$$

From [\(5.10\)](#page-20-2) we deduce that

<span id="page-20-3"></span>(5.12) 
$$
q_{\varepsilon}(\psi_{\varepsilon}, w) - \lambda_0 (\psi_{\varepsilon}, w)_{L^2(\Omega)} = \lambda_0 (V_{\varepsilon}, w)_{L^2(\Omega)} \text{ for all } w \in \mathcal{H}_{\varepsilon}.
$$

Choosing  $w = \hat{v}_{\varepsilon}$  in [\(5.12\)](#page-20-3), by [\(3.6\)](#page-13-3) and [\(5.11\)](#page-20-4) we obtain

<span id="page-20-6"></span>(5.13) 
$$
(\lambda_{\varepsilon} - \lambda_0) (\psi_{\varepsilon}, \hat{v}_{\varepsilon})_{L^2(\Omega)} = \lambda_0 (V_{\varepsilon}, v_0)_{L^2(\Omega)} + \lambda_0 (V_{\varepsilon}, \hat{v}_{\varepsilon} - v_0)_{L^2(\Omega)}.
$$

We claim that

<span id="page-20-5"></span>(5.14) 
$$
\lambda_0 \int_{\Omega} V_{\varepsilon} v_0 dx = 2 \mathcal{E}_{\varepsilon} - 2L_{\varepsilon}(v_0).
$$

Indeed, an integration by parts yields

<span id="page-21-0"></span>(5.15) 
$$
\int_{\Omega \setminus \Gamma_{\varepsilon}} \nabla v_0 \cdot \nabla V_{\varepsilon} dx - \lambda_0 \int_{\Omega} v_0 V_{\varepsilon} dx
$$

$$
= \sum_{j=1}^{k_1} \int_{\Gamma_0^j} \left( -\gamma_+^j (V_{\varepsilon}) \gamma_+^j (\nabla v_0 \cdot \nu^j) + \gamma_-^j (V_{\varepsilon}) \gamma_-^j (\nabla v_0 \cdot \nu^j) \right) dS
$$

$$
+ \sum_{j=1}^{k_1 + k_2} \int_{S_{\varepsilon}^j} \left( -\gamma_+^j (V_{\varepsilon}) \nabla v_0 \cdot \nu^j + \gamma_-^j (V_{\varepsilon}) \nabla v_0 \cdot \nu^j \right) dS
$$

$$
= -2 \sum_{j=1}^{k_1 + k_2} \int_{S_{\varepsilon}^j} \gamma_+^j (V_{\varepsilon}) \nabla v_0 \cdot \nu^j dS + 2 \sum_{j=1}^{k_1 + k_2} \int_{S_{\varepsilon}^j} v_0 \nabla v_0 \cdot \nu^j dS,
$$

thanks to [\(4.4\)](#page-17-1). Testing [\(5.10\)](#page-20-2) with  $V_{\varepsilon} - v_0$  we obtain

<span id="page-21-1"></span>
$$
\int_{\Omega\setminus\Gamma_{\varepsilon}}|\nabla(V_{\varepsilon}-v_0)|^2=-\lambda_0\int_{\Omega}v_0(V_{\varepsilon}-v_0)\,dx,
$$

and hence, in view of [\(3.10\)](#page-14-5),

(5.16) 
$$
\int_{\Omega \setminus \Gamma_{\varepsilon}} \nabla V_{\varepsilon} \cdot \nabla v_0 \, dx = \frac{1}{2} \int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla V_{\varepsilon}|^2 \, dx + \frac{\lambda_0}{2} \int_{\Omega} v_0 V_{\varepsilon} \, dx.
$$

Combining [\(2.16\)](#page-7-3), [\(2.17\)](#page-7-11), [\(2.19\)](#page-7-4), [\(5.15\)](#page-21-0) and [\(5.16\)](#page-21-1), we derive [\(5.14\)](#page-20-5).

<span id="page-21-2"></span>From [\(5.13\)](#page-20-6) and [\(5.14\)](#page-20-5) we deduce that, for all  $\varepsilon \in (0,1)$ ,

(5.17) 
$$
(\lambda_{\varepsilon} - \lambda_0) (\psi_{\varepsilon}, \hat{v}_{\varepsilon})_{L^2(\Omega)} = 2\mathcal{E}_{\varepsilon} - 2L_{\varepsilon}(v_0) + \lambda_0 (V_{\varepsilon}, \hat{v}_{\varepsilon} - v_0)_{L^2(\Omega)}.
$$

Now we study the asymptotics, as  $\varepsilon \to 0^+$ , of each term in [\(5.17\)](#page-21-2). For the sake of clarity, we divide the rest of the proof into several steps.

Step 1. We claim that

<span id="page-21-3"></span>(5.18) 
$$
|\lambda_{\varepsilon} - \lambda_0| = o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}\right) \text{ as } \varepsilon \to 0^+.
$$

Letting  $\mu_0 := \lambda_0^{-1}$  and  $\mu_{\varepsilon} := \lambda_{\varepsilon}^{-1}$ , since  $\lambda_0$  is simple and  $\lambda_{\varepsilon} \to \lambda_0$  by [\(1.7\)](#page-2-1), we have

<span id="page-21-4"></span>(5.19) 
$$
|\lambda_{\varepsilon} - \lambda_0| = \lambda_{\varepsilon} \lambda_0 |\mu_{\varepsilon} - \mu_0| \leq 2\lambda_0^2 \operatorname{dist}(\mu_0, \sigma(\mathcal{F}_{\varepsilon})) \leq 2\lambda_0^2 \left( \frac{q_{\varepsilon}(\mathcal{F}_{\varepsilon}(\psi_{\varepsilon}) - \mu_0 \psi_{\varepsilon})}{q_{\varepsilon}(\psi_{\varepsilon})} \right)^{1/2},
$$

where the last inequality is justified by Proposition [5.1.](#page-19-5) Since  $||v_0||_{L^2(\Omega)} = 1$ , Proposition [4.4](#page-18-1) and the Cauchy-Schwarz inequality imply that

(5.20) 
$$
q_{\varepsilon}(\psi_{\varepsilon}) = \lambda_0 + \int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla V_{\varepsilon}|^2 dx - 2 \int_{\Omega \setminus \Gamma_{\varepsilon}} \nabla V_{\varepsilon} \cdot \nabla v_0 dx = \lambda_0 + o(1).
$$

Furthermore, in view of [\(5.2\)](#page-19-6) and [\(5.10\)](#page-20-2) tested with  $\mathcal{F}_{\varepsilon}(\psi_{\varepsilon}) - \mu_0 \psi_{\varepsilon}$ ,

<span id="page-21-6"></span><span id="page-21-5"></span>
$$
q_{\varepsilon}(\mathcal{F}_{\varepsilon}(\psi_{\varepsilon}) - \mu_0 \psi_{\varepsilon}) = - (V_{\varepsilon}, \mathcal{F}_{\varepsilon}(\psi_{\varepsilon}) - \mu_0 \psi_{\varepsilon})_{L^2(\Omega)} + (v_0, \mathcal{F}_{\varepsilon}(\psi_{\varepsilon}) - \mu_0 \psi_{\varepsilon})_{L^2(\Omega)} - q_{\varepsilon}(\mu_0 \psi_{\varepsilon}, \mathcal{F}_{\varepsilon}(\psi_{\varepsilon}) - \mu_0 \psi_{\varepsilon}) = - (V_{\varepsilon}, \mathcal{F}_{\varepsilon}(\psi_{\varepsilon}) - \mu_0 \psi_{\varepsilon})_{L^2(\Omega)}.
$$

Hence, by Proposition [3.2,](#page-12-0) Proposition [4.6](#page-18-3) and the Cauchy-Schwarz inequality we conclude that

(5.21) 
$$
\left(q_{\varepsilon}(\mathcal{F}_{\varepsilon}(\psi_{\varepsilon})-\mu_0\psi_{\varepsilon})\right)^{1/2}=o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}\right) \text{ as } \varepsilon \to 0^+.
$$

Claim  $(5.18)$  is proved by combining  $(5.19)$ ,  $(5.20)$ , and  $(5.21)$ .

Step 2. We claim that

(5.22) 
$$
q_{\varepsilon}(\psi_{\varepsilon} - \Pi_{\varepsilon}\psi_{\varepsilon}) = o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2\right) \text{ as } \varepsilon \to 0^+.
$$

Let

(5.23) 
$$
\chi_{\varepsilon} := \psi_{\varepsilon} - \Pi_{\varepsilon} \psi_{\varepsilon} \quad \text{and} \quad \xi_{\varepsilon} := \mathcal{F}_{\varepsilon}(\chi_{\varepsilon}) - \mu_{\varepsilon} \chi_{\varepsilon}.
$$

By definition we have

<span id="page-21-8"></span><span id="page-21-7"></span>
$$
\chi_{\varepsilon} \in N_{\varepsilon} := \{ w \in \mathcal{H}_{\varepsilon} : (w, v_{\varepsilon})_{L^2(\Omega)} = 0 \}
$$

and, since  $v_{\varepsilon}$  is an eigenfunction of [\(2.10\)](#page-7-0), from [\(5.2\)](#page-19-6) it follows that  $\mathcal{F}_{\varepsilon}(w) \in N_{\varepsilon}$  for all  $w \in N_{\varepsilon}$ . Hence the operator

$$
\widetilde{\mathcal{F}}_{\varepsilon}:=\mathcal{F}_{\varepsilon}\Big|_{N_{\varepsilon}}:N_{\varepsilon}\to N_{\varepsilon}
$$

is well-defined. Furthermore, it is easy to verify that  $\mathcal{F}_{\varepsilon}$  satisfies properties (i)-(iii) of Proposition [5.1](#page-19-5) and  $\sigma(\mathcal{F}_{\varepsilon}) = \sigma(\mathcal{F}_{\varepsilon}) \setminus {\mu_{\varepsilon}}$ . In particular, there exists a constant  $K > 0$ , which does not depends on  $\varepsilon$ , such that  $\left(\text{dist}(\mu_{\varepsilon}, \sigma(\widetilde{F}_{\varepsilon}))\right)^2 \geq K$ . Then, by [\(5.23\)](#page-21-7),

<span id="page-22-1"></span>
$$
(5.24) \ \ q_{\varepsilon}(\psi_{\varepsilon} - \Pi_{\varepsilon}\psi_{\varepsilon}) = q(\chi_{\varepsilon}) \leq \frac{1}{K} \big(\operatorname{dist}(\mu_{\varepsilon}, \sigma(\widetilde{\mathcal{F}}_{\varepsilon}))\big)^2 q_{\varepsilon}(\chi_{\varepsilon}) \leq \frac{1}{K} \ q_{\varepsilon}(\widetilde{\mathcal{F}}_{\varepsilon}(\chi_{\varepsilon}) - \mu_{\varepsilon}\chi_{\varepsilon}) = \frac{1}{K} \ q_{\varepsilon}(\xi_{\varepsilon}).
$$

To estimate  $q_{\varepsilon}(\xi_{\varepsilon})$  we use [\(5.12\)](#page-20-3) and [\(3.6\)](#page-13-3) tested with  $\xi_{\varepsilon}$ , thus obtaining

(5.25) 
$$
q_{\varepsilon}(\chi_{\varepsilon},\xi_{\varepsilon})-\lambda_{\varepsilon}(\chi_{\varepsilon},\xi_{\varepsilon})_{L^{2}(\Omega)}=\lambda_{0}\left(V_{\varepsilon},\xi_{\varepsilon}\right)_{L^{2}(\Omega)}+\left(\lambda_{0}-\lambda_{\varepsilon}\right)\left(\psi_{\varepsilon},\xi_{\varepsilon}\right)_{L^{2}(\Omega)}.
$$

From  $(5.2)$  and  $(5.25)$  we deduce that

<span id="page-22-0"></span>
$$
q_{\varepsilon}(\xi_{\varepsilon}) = q_{\varepsilon}(\mathcal{F}_{\varepsilon}(\chi_{\varepsilon}), \xi_{\varepsilon}) - \mu_{\varepsilon} q_{\varepsilon}(\chi_{\varepsilon}, \xi_{\varepsilon}) = -\mu_{\varepsilon} [q_{\varepsilon}(\chi_{\varepsilon}, \xi_{\varepsilon}) - \lambda_{\varepsilon} q_{\varepsilon}(\mathcal{F}_{\varepsilon}(\chi_{\varepsilon}), \xi_{\varepsilon})]
$$
  
=  $-\frac{\lambda_0}{\lambda_{\varepsilon}} (V_{\varepsilon}, \xi_{\varepsilon})_{L^2(\Omega)} - \frac{(\lambda_0 - \lambda_{\varepsilon})}{\lambda_{\varepsilon}} (\psi_{\varepsilon}, \xi_{\varepsilon})_{L^2(\Omega)}.$ 

From the Cauchy-Schwarz inequality, Proposition [3.2,](#page-12-0) and [\(1.7\)](#page-2-1) it follows that

(5.26) 
$$
(q_{\varepsilon}(\xi_{\varepsilon}))^{1/2} \leq C \left( \|V_{\varepsilon}\|_{L^{2}(\Omega)} + |\lambda_{\varepsilon} - \lambda_{0}| \|\psi_{\varepsilon}\|_{L^{2}(\Omega)} \right)
$$

for some constant  $C > 0$  which does not depend on  $\varepsilon$ . Furthermore, [\(5.12\)](#page-20-3) tested with  $\psi_{\varepsilon}$ , [\(5.20\)](#page-21-5), Proposition [3.2,](#page-12-0) and Proposition [4.4](#page-18-1) yield

<span id="page-22-6"></span><span id="page-22-2"></span>
$$
\|\psi_{\varepsilon}\|_{L^2(\Omega)}^2 - 1 = -(V_{\varepsilon}, \psi_{\varepsilon})_{L^2(\Omega)} + o(1) = o(1) \text{ as } \varepsilon \to 0^+.
$$

Then  $(5.22)$  follows from Proposition [4.6,](#page-18-3)  $(5.18)$ ,  $(5.24)$ , and  $(5.26)$ . Estimate  $(5.7)$  is thereby proved.

Step 3. We claim that

(5.27) 
$$
\|v_0 - \hat{v}_{\varepsilon}\|_{L^2(\Omega)} = o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}\right) \quad \text{as } \varepsilon \to 0^+.
$$

By [\(5.11\)](#page-20-4)

<span id="page-22-4"></span>
$$
(5.28) \t v_0 - \hat{v}_{\varepsilon} = v_0 - \frac{\Pi_{\varepsilon} \psi_{\varepsilon}}{\|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^2(\Omega)}} = \frac{1}{\|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^2(\Omega)}} \left( \left(\|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^2(\Omega)} - 1\right) v_0 + v_0 - \Pi_{\varepsilon} \psi_{\varepsilon} \right).
$$

Furthermore, from the definition of  $\psi_{\varepsilon}$ , Proposition [4.6,](#page-18-3) Proposition [3.2](#page-12-0) and [\(5.22\)](#page-21-8) it follows that (5.29)  $\|v_0 - \Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^2(\Omega)} \le \|v_0 - \psi_{\varepsilon}\|_{L^2(\Omega)} + \|\psi_{\varepsilon} - \Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^2(\Omega)} = o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}\right) \text{ as } \varepsilon \to 0^+,$ 

<span id="page-22-3"></span>thus proving (5.8). Since 
$$
||v_0||_{L^2(\Omega)} = 1
$$
, (5.29) and the Cauchy-Schwarz inequality imply that

<span id="page-22-5"></span>
$$
(5.30) \quad \|\Pi_{\varepsilon}\psi_{\varepsilon}\|_{L^{2}(\Omega)}^{2} = \|v_{0} - \Pi_{\varepsilon}\psi_{\varepsilon}\|_{L^{2}(\Omega)}^{2} + \|v_{0}\|_{L^{2}(\Omega)}^{2} - 2(v_{0} - \Pi_{\varepsilon}\psi_{\varepsilon}, v_{0})_{L^{2}(\Omega)} = 1 + o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}\right)
$$

as  $\varepsilon \to 0^+$ , thus proving estimate [\(5.9\)](#page-20-9). Combining [\(5.28\)](#page-22-4), [\(5.29\)](#page-22-3) and [\(5.30\)](#page-22-5) we obtain [\(5.27\)](#page-22-6). Step 4. We claim that

(5.31) 
$$
(\psi_{\varepsilon}, \hat{v}_{\varepsilon})_{L^2(\Omega)} = 1 + o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}\right) \quad \text{as } \varepsilon \to 0^+.
$$

Indeed, by [\(5.11\)](#page-20-4) we have

<span id="page-22-7"></span>
$$
(\psi_{\varepsilon}, \hat{v}_{\varepsilon})_{L^2(\Omega)} = \frac{(\psi_{\varepsilon} - \Pi_{\varepsilon} \psi_{\varepsilon}, \Pi_{\varepsilon} \psi_{\varepsilon})_{L^2(\Omega)} + \|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^2(\Omega)}^2}{\|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^2(\Omega)}}.
$$

Hence claim  $(5.31)$  follows from  $(5.22)$  and  $(5.30)$ .

Putting together Proposition [4.6,](#page-18-3) [\(5.17\)](#page-21-2), [\(5.27\)](#page-22-6), and [\(5.31\)](#page-22-7), we finally obtain

$$
\lambda_{\varepsilon} - \lambda_0 = (1 + o(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}})) (2\mathcal{E}_{\varepsilon} - 2L_{\varepsilon}(v_0) + o(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2))
$$
  
=  $2\mathcal{E}_{\varepsilon} - 2L_{\varepsilon}(v_0) + o(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2) + (\mathcal{E}_{\varepsilon} - L_{\varepsilon}(v_0)) o(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}})$   
=  $2\mathcal{E}_{\varepsilon} - 2L_{\varepsilon}(v_0) + o(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2)$  as  $\varepsilon \to 0^+$ ,

having used in the last estimate the fact that

$$
\mathcal{E}_{\varepsilon} - L_{\varepsilon}(v_0) = o\big(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}\big) \quad \text{as } \varepsilon \to 0^+,
$$

<span id="page-23-1"></span>due to  $(5.14)$  and Proposition [4.6.](#page-18-3) Expansion  $(5.6)$  is thereby proved.

#### 6. Blow-up Analysis for k odd

In this section we assume that  $k$ , and consequently  $k_1$ , are odd and we perform a blow-up analysis for the solution  $V_{\varepsilon}$  of problem [\(4.4\)](#page-17-1). In order to characterize the functional space containing the limit profile, we first need a Hardy-type inequality, for the validity of which the assumption that  $k$  is odd is crucial.

6.1. A Hardy type inequality for functions jumping on an odd number of lines. Let  $\mathcal{X}$ and  $\mathcal H$  be the functional spaces defined in [\(2.24\)](#page-8-10) and [\(2.25\)](#page-8-11), respectively. To prove a Hardy-type inequality in  $\mathbb{R}^2 \setminus D_1$  for functions in  $\widetilde{\mathcal{X}}$ , we first need the following Hardy inequality on annuli for functions jumping on an odd number of lines. For every  $r > 0$ , we define

<span id="page-23-3"></span>
$$
\widetilde{\mathcal{X}}_r := \{ w \in H^1((D_{2r} \setminus D_r) \setminus \Gamma_0) : T^j(w) = 0 \text{ on } \Gamma_0^j \text{ for all } j = 1, \ldots, k_1 \}.
$$

<span id="page-23-5"></span>**Lemma 6.1.** Let k and  $k_1$  be odd. There exists a constant  $C_H > 0$  such that, for every  $r > 0$  and  $w \in \widetilde{\mathcal{X}}_r,$ 

(6.1) 
$$
r^{-2} \int_{D_{2r}\backslash D_r} w^2 dx \leq C_H \int_{(D_{2r}\backslash D_r)\backslash \Gamma_0} |\nabla w|^2 dx.
$$

and

<span id="page-23-2"></span>(6.2) 
$$
\int_{D_{2r}\backslash D_r} \frac{w^2}{|x|^2} dx \leq C_H \int_{(D_{2r}\backslash D_r)\backslash \Gamma_0} |\nabla w|^2 dx.
$$

*Proof.* Inequality  $(6.2)$  is a direct consequence of  $(6.1)$ .

Let us first prove [\(6.1\)](#page-23-3) for  $r = 1$ . We argue by contradiction and assume that there exists a sequence  $\{w_n\}_{n\in\mathbb{N}}\subset\mathcal{X}_1$  such that, for all  $n\in\mathbb{N}$ ,

<span id="page-23-4"></span>(6.3) 
$$
\int_{D_2 \setminus D_1} w_n^2 dx = 1 \text{ and } \int_{(D_2 \setminus D_1) \setminus \Gamma_0} |\nabla w_n|^2 dx < \frac{1}{n}.
$$

Hence  $\{w_n\}_{n\in\mathbb{N}}$  is bounded in  $\widetilde{\mathcal{X}}_1$  and, up to a subsequence,  $w_n \rightharpoonup w$  weakly in  $\widetilde{\mathcal{X}}_1$  for some  $w \in \widetilde{\mathcal{X}}_1$ . From [\(6.3\)](#page-23-4) and weak lower semi-continuity of the  $L^2$ -norm, we have  $\nabla w \equiv 0$  in  $(D_2 \setminus D_1) \setminus \Gamma_0$ ; furthermore, reasoning as in Remark [3.1,](#page-12-2) the natural embedding of  $H^1((D_2 \setminus D_1) \setminus \Gamma_0)$  into  $L^2(D_2 \setminus D_1)$  is compact, hence  $||w||_{L^2(D_2 \setminus D_1)} = 1$ . It follows that w is constant on each connected component of  $(D_2 \setminus D_1) \setminus \Gamma_0$  and  $w \neq 0$ . Since  $(D_2 \setminus D_1) \setminus \Gamma_0$  has  $k_1$  connected components and  $k_1$  is odd, a contradiction arises from the condition  $T^j(w) = 0$ , which is satisfied on  $\Gamma_0^j$  for all  $j = 1, \ldots, k_1.$ 

For every  $r > 0$  and  $w \in \tilde{\mathcal{X}}_r$ , it is enough to write the proved inequality for the scaled function  $rx$ ) to obtain (6.1).  $w(rx)$  to obtain [\(6.1\)](#page-23-3).

We draw attention to the fact that the constant  $C_H$  in Lemma [6.1](#page-23-5) does not depend on r. Hence, summing over annuli that fill  $\mathbb{R}^2 \setminus D_1$ , we obtain the following result.

<span id="page-23-0"></span>**Proposition 6.2.** Let k and k<sub>1</sub> be odd. Let  $C_H > 0$  be as in Lemma [6.1.](#page-23-5) Then, for every  $w \in \widetilde{\mathcal{X}}$ ,

<span id="page-23-6"></span>(6.4) 
$$
\int_{\mathbb{R}^2 \setminus D_1} \frac{w^2}{|x|^2} dx \leq C_H \int_{(\mathbb{R}^2 \setminus D_1) \setminus \Gamma_1} |\nabla w|^2 dx.
$$

Furthermore, there exists a constant  $C_H' > 0$  such that, for all  $w \in \mathcal{X}$ ,

(6.5) 
$$
\int_{D_1} w^2 dx \leq C_H' \int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla w|^2 dx.
$$

*Proof.* If  $w \in \widetilde{\mathcal{X}}$ , then  $w \in \widetilde{\mathcal{X}}_r$  for all  $r > 1$ . Hence, by [\(6.2\)](#page-23-2),

<span id="page-24-0"></span>
$$
\int_{\mathbb{R}^2 \setminus D_1} \frac{w^2}{|x|^2} dx = \sum_{h=0}^{\infty} \int_{D_{2^{h+1}} \setminus D_{2^h}} \frac{w^2}{|x|^2} dx
$$
\n
$$
\leq C_H \sum_{h=0}^{\infty} \int_{(D_{2^{h+1}} \setminus D_{2^h}) \setminus \Gamma_0} |\nabla w|^2 dx = C_H \int_{(\mathbb{R}^2 \setminus D_1) \setminus \Gamma_1} |\nabla w|^2 dx,
$$

thus proving [\(6.4\)](#page-23-6).

By integrating the identity  $div(u^2x) = 2u\nabla u \cdot x + 2u^2$  on each subset of  $D_1$  obtained by cutting along the lines  $\Sigma^j$ ,  $j = 1 \ldots, k_1 + k_2$ , and using the Divergence Theorem, we can prove that, for all  $w \in \widetilde{\mathcal{X}}$ ,

$$
\int_{D_1} w^2 dx \le \int_{\partial D_1} w^2 dS + \int_{D_1 \backslash \Gamma_1} |\nabla w|^2 dx.
$$

Then, by continuity of the trace operator from  $H^1((D_2 \setminus D_1) \setminus \Gamma_0)$  into  $L^2(\partial D_1)$  and [\(6.4\)](#page-23-6), there exists a positive constant  $C > 0$  such that

$$
\int_{D_1} w^2 dx \le C \left( \int_{D_2 \setminus D_1} w^2 dx + \int_{(D_2 \setminus D_1) \setminus \Gamma_1} |\nabla w|^2 dx \right) + \int_{D_1 \setminus \Gamma_1} |\nabla w|^2 dx
$$
\n
$$
\le 4C \int_{D_2 \setminus D_1} \frac{w^2}{|x|^2} dx + (C+1) \int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla w|^2 dx \le (4CC_H + C + 1) \int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla w|^2 dx,
$$
\nthis proving (6.5).

<span id="page-24-1"></span>From Proposition [6.2](#page-23-0) it follows that

(6.6) 
$$
||w||_{\tilde{\mathcal{X}}} := \left(\int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla w|^2 dx\right)^{1/2}
$$

is a norm on  $\widetilde{\mathcal{X}}$  and  $\widetilde{\mathcal{X}}$  is a Hilbert space with respect to the corresponding scalar product. Proposition [6.2](#page-23-0) also ensures that the restriction operator

<span id="page-24-5"></span>(6.7) 
$$
\widetilde{\mathcal{X}} \to H^1(D_\rho \setminus \Gamma_1)
$$

is continuous with respect to the norm defined in  $(6.6)$  for every  $\rho > 0$ . Hence, for every  $p \in [1, +\infty)$ , the trace operators

(6.8) 
$$
\gamma_+^j : \widetilde{\mathcal{X}} \to L^p(S_1^j) \quad \text{and} \quad \gamma_-^j : \widetilde{\mathcal{X}} \to L^p(S_1^j)
$$

are well-defined and continuous with respect to the norm  $\|\cdot\|_{\tilde{\mathcal{X}}}$ . In particular, since  $\tilde{\mathcal{H}} \subset \tilde{\mathcal{X}}$ ,

<span id="page-24-3"></span>(6.9) 
$$
\sup_{w \in \tilde{\mathcal{H}} \setminus \{0\}} \frac{\|\gamma_+^j(w)\|_{L^p(S_1^j)}^2}{\|w\|_{\tilde{\mathcal{X}}}^2} < +\infty \quad \text{for every } p \in [1, +\infty) \text{ and } j = 1, \dots, k_1 + k_2.
$$

Using [\(6.4\)](#page-23-6), we prove now that functions in  $\widetilde{\mathcal{H}}$  can be approximated with functions with compact support. To this aim, we define

<span id="page-24-2"></span>
$$
\widetilde{\mathcal{H}}_c := \{ w \in \widetilde{\mathcal{H}} : \text{ there exists } r > 0 \text{ such that } w \equiv 0 \text{ on } \mathbb{R}^2 \setminus D_r \}.
$$

<span id="page-24-4"></span>**Proposition 6.3.**  $\widetilde{\mathcal{H}}_c$  is dense in  $\widetilde{\mathcal{H}}$ .

*Proof.* For every  $r > 1$ , let  $\eta_r$  be a cut-off function as in [\(4.7\)](#page-17-4). If  $w \in \tilde{\mathcal{H}}$ , it is clear that  $\{\eta_r w\}_{r>1} \subset \widetilde{\mathcal{H}}_c$ ; moreover, by [\(6.4\)](#page-23-6) we have  $\frac{w}{|x|} \in L^2(\mathbb{R}^2 \setminus D_1)$  and hence

$$
\int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla \eta_r|^2 w^2 dx \le 16 \int_{D_{2r} \setminus D_r} \frac{w^2}{|x|^2} dx \to 0^+ \quad \text{as } r \to \infty.
$$

This implies that  $\nabla(\eta_r w) \to \nabla w$  in  $L^2(\mathbb{R}^2 \setminus \Gamma_1)$  and hence  $\eta_r w \to w$  in  $\widetilde{\mathcal{H}}$ .

<span id="page-25-0"></span>6.2. Limit profile for blown-up potentials. In this subsection, we introduce and characterize the function  $\tilde{V}$  appearing as limit profile in a blow-up analysis for the potentials  $V_{\varepsilon}$ .

**Proposition 6.4.** There exists a unique solution  $\tilde{V} \in \tilde{\mathcal{X}}$  to the minimization problem [\(2.30\)](#page-8-6). Furthermore,  $\tilde{V}$  satisfies

<span id="page-25-1"></span>(6.10) 
$$
\begin{cases} \widetilde{V} - \eta \Psi_0 \in \widetilde{\mathcal{H}} \\ \int_{\mathbb{R}^2 \backslash \Gamma_1} \nabla \widetilde{V} \cdot \nabla w \, dx = -2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} \nabla \Psi_0 \cdot \nu^j \gamma_+^j(w) \, dS \quad \text{for all } w \in \widetilde{\mathcal{H}}. \end{cases}
$$

*Proof.* Since  $\nabla \Psi_0 \in L^p(S_1^j)$  for all  $p \in [1,2)$ , by continuity of the trace operators in [\(6.8\)](#page-24-2) we have that the linear functional  $L$  defined in  $(2.27)$  is well-defined and continuous. Then the convex functional  $J$  defined in  $(2.28)$  is continuous and coercive on the closed and convex set  $\eta\Psi_0 + \tilde{\mathcal{H}} = \{w \in \tilde{\mathcal{X}} : w - \eta\Psi_0 \in \tilde{\mathcal{H}}\}$ . Therefore [\(2.30\)](#page-8-6) admits a solution  $\tilde{V}$ , which satisfies [\(6.10\)](#page-25-1).

If  $\widetilde{V}_1$  and  $\widetilde{V}_2$  are solutions of [\(6.10\)](#page-25-1), then we may take the difference between (6.10) for  $\widetilde{V}_1$  and [\(6.10\)](#page-25-1) for  $\tilde{V}_2$ , both tested with  $\tilde{V}_1 - \tilde{V}_2 \in \tilde{\mathcal{H}}$ , and conclude that  $\tilde{V}_1 = \tilde{V}_2$  thanks to [\(6.4\)](#page-23-6). Hence  $\tilde{V}$ is the unique solution to [\(6.10\)](#page-25-1).

6.3. An equivalent characterization of  $\mathcal{E}_{\varepsilon}$ . In this subsection, we obtain an equivalent characterization of the energy  $\mathcal{E}_{\varepsilon}$  introduced in [\(2.19\)](#page-7-4), which will be used to improve [\(4.9\)](#page-17-6) and obtain an optimal estimate for  $|\mathcal{E}_{\varepsilon}|$  in the case k odd.

<span id="page-25-4"></span>**Proposition 6.5.** Let  $\eta_{\varepsilon} \in C_{\mathcal{C}}^{\infty}(\mathbb{R}^2)$  be a cut-off function as in [\(4.7\)](#page-17-4) with  $r = \varepsilon$ . Then, for every  $\varepsilon \in (0,1],$ 

<span id="page-25-2"></span>
$$
(6.11) \quad \mathcal{E}_{\varepsilon} = -\frac{1}{2} \sup_{w \in \widetilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \frac{\left(\int_{\Omega \setminus \Gamma_{\varepsilon}} \nabla w \cdot \nabla (\eta_{\varepsilon} v_{0}) + L_{\varepsilon}(w)\right)^{2}}{\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^{2} dx} + \frac{1}{2} \int_{\Omega \setminus \Gamma_{0}} |\nabla (\eta_{\varepsilon} v_{0})|^{2} dx + L_{\varepsilon}(v_{0}).
$$

*Proof.* Since  $\mathcal{E}_{\varepsilon}$  is the infimum in [\(4.2\)](#page-16-4) and  $\varphi - v_0 \in \widetilde{\mathcal{H}}_{\varepsilon}$  if and only if  $\varphi - \eta_{\varepsilon}v_0 \in \widetilde{\mathcal{H}}_{\varepsilon}$ , we have

(6.12) 
$$
\mathcal{E}_{\varepsilon} = \inf_{w \in \widetilde{\mathcal{H}}_{\varepsilon}} J_{\varepsilon}(w + \eta_{\varepsilon}v_0) = \inf_{w \in \widetilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \bigg( \inf_{t \in [0, +\infty)} J_{\varepsilon}(tw + \eta_{\varepsilon}v_0) \bigg).
$$

Moreover, by [\(2.17\)](#page-7-11)

<span id="page-25-3"></span>
$$
J_{\varepsilon}(tw + \eta_{\varepsilon}v_0) = \frac{t^2}{2} \int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 dx + t \left( \int_{\Omega \setminus \Gamma_{\varepsilon}} \nabla w \cdot \nabla (\eta_{\varepsilon}v_0) dx + L_{\varepsilon}(w) \right) + \frac{1}{2} \int_{\Omega \setminus \Gamma_0} |\nabla (\eta_{\varepsilon}v_0)|^2 dx + L_{\varepsilon}(v_0).
$$

Hence, for every  $w \in \widetilde{\mathcal{H}}_{\varepsilon} \setminus \{0\},\$ 

$$
\inf_{t\in[0,+\infty)}J_{\varepsilon}(tw+\eta_{\varepsilon}v_0)=-\frac{1}{2}\frac{\big(\int_{\Omega\setminus\Gamma_{\varepsilon}}\nabla w\cdot\nabla(\eta_{\varepsilon}v_0)\,dx+L_{\varepsilon}(w)\big)^2}{\int_{\Omega\setminus\Gamma_{\varepsilon}}|\nabla w|^2\,dx}+\frac{1}{2}\int_{\Omega\setminus\Gamma_0}|\nabla(\eta_{\varepsilon}v_0)|^2\,dx+L_{\varepsilon}(v_0),
$$

which implies  $(6.11)$  in view of  $(6.12)$ .

<span id="page-25-5"></span>**Proposition 6.6.** Let k and  $k_1$  be odd and  $m \in \mathbb{N}$  be as in Proposition [3.6](#page-14-2) for  $v = v_0$ . Then

$$
\mathcal{E}_{\varepsilon} = O\left(\varepsilon^m\right) \quad \text{as } \varepsilon \to 0^+.
$$

Proof. From Proposition [6.5](#page-25-4) and the Cauchy-Schwarz inequality it follows that

<span id="page-26-1"></span>
$$
(6.13) \quad |\mathcal{E}_{\varepsilon}| \leq \frac{1}{2} \sup_{w \in \widetilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \frac{\left(\int_{\Omega \setminus \Gamma_{\varepsilon}} \nabla w \cdot \nabla (\eta_{\varepsilon} v_{0}) + L_{\varepsilon}(w)\right)^{2}}{\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^{2} dx} + \frac{1}{2} \int_{\Omega \setminus \Gamma_{0}} |\nabla (\eta_{\varepsilon} v_{0})|^{2} dx + |L_{\varepsilon}(v_{0})|
$$
  

$$
\leq \sup_{w \in \widetilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \frac{|L_{\varepsilon}(w)|^{2}}{\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^{2} dx} + \frac{3}{2} \int_{\Omega \setminus \Gamma_{0}} |\nabla (\eta_{\varepsilon} v_{0})|^{2} dx + |L_{\varepsilon}(v_{0})|.
$$

From  $(3.12)$  and  $(2.16)$  it follows that

<span id="page-26-2"></span>
$$
(6.14) \qquad \int_{\Omega \setminus \Gamma_0} |\nabla (\eta_{\varepsilon} v_0)|^2 \, dx \le 2 \int_{D_{2\varepsilon}} |\nabla \eta_{\varepsilon}|^2 v_0^2 \, dx + 2 \int_{D_{2\varepsilon} \setminus \Gamma_0} |\nabla v_0|^2 \, dx = O(\varepsilon^m) \quad \text{as } \varepsilon \to 0^+
$$

and

<span id="page-26-3"></span>(6.15) 
$$
|L_{\varepsilon}(v_0)| = O(\varepsilon^m) \text{ as } \varepsilon \to 0^+.
$$

By [\(2.16\)](#page-7-3), the Hölder inequality, and [\(3.12\)](#page-15-4), for every  $p \in (1, 2)$  and  $p' = \frac{p}{p-1}$  we have

<span id="page-26-0"></span>(6.16) 
$$
\sup_{w \in \widetilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \frac{|L_{\varepsilon}(w)|^2}{\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 dx} \le 4(k_1 + k_2) \sup_{w \in \widetilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \frac{\sum_{j=1}^{k_1 + k_2} \left( \int_{S_{\varepsilon}^j} |\nabla v_0| |\gamma_+^j(w)| ds \right)^2}{\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 dx}
$$

$$
\le 4(k_1 + k_2) \sum_{j=1}^{k_1 + k_2} \left( \int_{S_{\varepsilon}^j} |\nabla v_0|^p ds \right)^{2/p} \sup_{w \in \widetilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \frac{||\gamma_+^j(w)||^2_{L^{p'}(S_{\varepsilon}^j)}}{\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 dx}
$$

$$
= O(\varepsilon^{m-2+\frac{2}{p}}) \sum_{j=1}^{k_1 + k_2} \sup_{w \in \widetilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \frac{||\gamma_+^j(w)||^2_{L^{p'}(S_{\varepsilon}^j)}}{\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 dx}.
$$

A change of variables and [\(6.9\)](#page-24-3) yield

<span id="page-26-4"></span>
$$
\sup_{w \in \tilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \frac{\|\gamma_+^j(w)\|_{L^{p'}(S^j_{\varepsilon})}^2}{\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 dx} \leq \varepsilon^{2/p'} \sup_{v \in \tilde{\mathcal{H}} \setminus \{0\}} \frac{\|\gamma_+^j(v)\|_{L^{p'}(S^j_1)}^2}{\|v\|_{\tilde{\mathcal{X}}}^2} = O(\varepsilon^{2/p'}) \quad \text{as } \varepsilon \to 0^+,
$$

hence from [\(6.16\)](#page-26-0) we deduce that

(6.17) 
$$
\sup_{w \in \tilde{\mathcal{H}}_{\varepsilon} \setminus \{0\}} \frac{|L_{\varepsilon}(w)|^2}{\int_{\Omega \setminus \Gamma_{\varepsilon}} |\nabla w|^2 dx} = O(\varepsilon^m) \text{ as } \varepsilon \to 0^+.
$$

The conclusion follows by combining estimates  $(6.13)$ ,  $(6.14)$ ,  $(6.15)$ , and  $(6.17)$ .

<span id="page-26-9"></span>6.4. **Blow-up analysis.** Let k and  $k_1$  be odd and  $m \in \mathbb{N}$  be as in Proposition [3.6](#page-14-2) for  $v = v_0$ . For every  $\varepsilon \in (0, 1]$ , letting  $V_{\varepsilon}$  be as Proposition [4.2,](#page-17-0) we define

<span id="page-26-6"></span>(6.18) 
$$
\widetilde{V}_{\varepsilon}(x) := \varepsilon^{-\frac{m}{2}} V_{\varepsilon}(\varepsilon x) \quad \text{and} \quad \widetilde{V}_{0,\varepsilon}(x) := \varepsilon^{-\frac{m}{2}} v_0(\varepsilon x).
$$

Extending trivially  $\widetilde{V}_{\varepsilon}$  and  $\widetilde{V}_{0,\varepsilon}$  in  $\mathbb{R}^2 \setminus \Omega$ , we have  $\widetilde{V}_{\varepsilon}, \widetilde{V}_{0,\varepsilon} \in \widetilde{\mathcal{X}}$ . Moreover

<span id="page-26-8"></span>
$$
(6.19) \t\t\t \widetilde{V}_{\varepsilon} - \widetilde{V}_{0,\varepsilon} \in \widetilde{\mathcal{H}}
$$

and, by [\(4.5\)](#page-17-2) and Proposition [6.3,](#page-24-4)

<span id="page-26-7"></span>(6.20) 
$$
\int_{\mathbb{R}^2 \setminus \Gamma_1} \nabla \widetilde{V}_{\varepsilon} \cdot \nabla w \, dx = -2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} \nabla \widetilde{V}_{0,\varepsilon} \cdot \nu^j \gamma_+^j(w) \, dS \quad \text{for all } w \in \widetilde{\mathcal{H}}.
$$

Let  $\Psi_0$  be as in [\(2.26\)](#page-8-4). From [\(3.11\)](#page-14-6) it follows that, for every  $j = 1, \ldots, k_1 + k_2$ ,

<span id="page-26-5"></span>(6.21) 
$$
\nabla \widetilde{V}_{0,\varepsilon}(x) \cdot \nu^j \to \nabla \Psi_0(x) \cdot \nu^j
$$

<span id="page-27-7"></span>as  $\varepsilon \to 0^+$  for every  $x \in S_1^j$ , with (6.22)

$$
\nabla \Psi_{0}(x) \cdot \nu^{j}
$$
\n
$$
= \begin{cases}\n\beta \frac{m}{2} |x|^{\frac{m}{2}-1} f(\alpha^{j}) \cos \left(\frac{m}{2} (\alpha^{j} - \alpha_{0})\right), & \text{if } j = 1, ..., k_{1}, \\
\beta \frac{m}{2} |x|^{\frac{m}{2}-1} f(\alpha^{j}) \cos \left(\frac{m}{2} (\alpha^{j} - \alpha_{0})\right), & \text{if } x \in (S_{1}^{j})', j = k_{1} + 1, ..., k_{1} + k_{2}, \\
-\beta \frac{m}{2} |x|^{\frac{m}{2}-1} f(\alpha^{j} + \pi) \cos \left(\frac{m}{2} (\alpha^{j} + \pi - \alpha_{0})\right), & \text{if } x \in (S_{1}^{j})'', j = k_{1} + 1, ..., k_{1} + k_{2},\n\end{cases}
$$

where, for every  $j \in k_1, \ldots, k_1 + k_2$ ,

<span id="page-27-2"></span><span id="page-27-0"></span>
$$
(S_1^j)' := \{ ta^j : t \in [0,1] \}, \quad (S_1^j)'' := \{ ta^{j+k_2} : t \in [0,1] \}.
$$

On the other hand, [\(3.12\)](#page-15-4) implies that

(6.23) 
$$
|\nabla \widetilde{V}_{0,\varepsilon}(x)| \leq C|x|^{\frac{m}{2}-1} \quad \text{in } \mathbb{R}^2 \setminus \Gamma_0.
$$

From [\(6.21\)](#page-26-5) and [\(6.23\)](#page-27-0) we deduce that, for every  $j = 1, ..., k_1 + k_2$  and  $p \in [1, 2)$ ,

<span id="page-27-1"></span>(6.24) 
$$
\nabla \Psi_0 \cdot \nu^j \in L^p(S_1^j) \text{ and } \nabla \widetilde{V}_{0,\varepsilon} \cdot \nu^j \to \nabla \Psi_0 \cdot \nu^j \text{ in } L^p(S_1^j) \text{ as } \varepsilon \to 0^+.
$$

Furthermore, by [\(3.13\)](#page-15-5) we know that

<span id="page-27-8"></span>(6.25) 
$$
\widetilde{V}_{0,\varepsilon} \to \Psi_0 \quad \text{in } H^1(D_\rho \setminus \Gamma_0) \text{ for all } \rho > 0.
$$

**Proposition 6.7.** Let k and  $k_1$  be odd and  $m \in \mathbb{N}$  be as in Proposition [3.6](#page-14-2) for  $v = v_0$ . For every  $\varepsilon \in (0,1]$ , let  $V_{\varepsilon}$  be as Proposition [4.2](#page-17-0) and  $\widetilde{V}_{\varepsilon}$  as in [\(6.18\)](#page-26-6). Then

<span id="page-27-5"></span>(6.26) 
$$
\widetilde{V}_{\varepsilon} \to \widetilde{V} \quad strongly \ in \ \widetilde{\mathcal{X}} \ as \ \varepsilon \to 0^+,
$$

where  $\widetilde{V} \in \widetilde{\mathcal{X}}$  is the unique solution to the minimization problem [\(2.30\)](#page-8-6) (and then to [\(6.10\)](#page-25-1), see Proposition  $6.4$ ).

*Proof.* Taking into account  $(3.12)$ ,  $(2.19)$ , and  $(6.18)$ , a change of variables,  $(6.9)$ , the Hölder inequality, and Proposition [6.6](#page-25-5) imply that

<span id="page-27-6"></span>
$$
(6.27) \quad \|\widetilde{V}_{\varepsilon}\|_{\widetilde{\mathcal{X}}}^{2} = \int_{\mathbb{R}^{2}\backslash\Gamma_{1}} |\nabla \widetilde{V}_{\varepsilon}|^{2} dx = \varepsilon^{-m} \|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^{2} = \varepsilon^{-m} (2\varepsilon_{\varepsilon} - 2L_{\varepsilon}(V_{\varepsilon}))
$$
  
\n
$$
\leq O(1) + 4\varepsilon^{-m} \sum_{j=1}^{k_{1}+k_{2}} \int_{S_{\varepsilon}^{j}} |\nabla v_{0}| |\gamma_{+}^{j}(V_{\varepsilon})| dS = O(1) + O(1) \sum_{j=1}^{k_{1}+k_{2}} \int_{S_{1}^{j}} |x|^{\frac{m}{2}-1} |\gamma_{+}^{j}(\widetilde{V}_{\varepsilon})| dS
$$
  
\n
$$
= O(1) + O(1) \|\widetilde{V}_{\varepsilon}\|_{\widetilde{\mathcal{X}}}, \text{ as } \varepsilon \to 0^{+}.
$$

Hence  ${\{\widetilde{V}_{\varepsilon}\}}_{\varepsilon\in(0,1]}$  is bounded in  $\widetilde{\mathcal{X}}$ . It follows that, for any sequence  $\{\varepsilon_n\}_n$  such that  $\varepsilon_n\to 0$  as  $n \to \infty$ , there exist a subsequence, still denoted by  $\{\varepsilon_n\}_n$ , and  $V \in \widetilde{\mathcal{X}}$  such that  $\widetilde{V}_{\varepsilon_n} \to V$  weakly in  $\tilde{\mathcal{X}}$  as  $n \to \infty$ . Therefore, from [\(6.20\)](#page-26-7), [\(6.9\)](#page-24-3), and [\(6.24\)](#page-27-1) we deduce that V solves the variational equation in [\(6.10\)](#page-25-1). Furthermore, by [\(6.19\)](#page-26-8) we have  $\tilde{V}_{\varepsilon} - \eta \tilde{V}_{0,\varepsilon} \in \tilde{\mathcal{H}}$ , hence [\(6.25\)](#page-27-2) ensures that V satisfies the condition  $V - \eta \Psi_0 \in \tilde{\mathcal{H}}$ . By the uniqueness part of Proposition [6.4](#page-25-0) we conclude that  $V = V$ .

Since  $\tilde{V} - \eta \Psi_0 \in \tilde{\mathcal{H}}$ , we may test [\(6.10\)](#page-25-1) with  $\tilde{V} - \eta \Psi_0$ , thus obtaining

<span id="page-27-4"></span>(6.28) 
$$
\int_{\mathbb{R}^2 \backslash \Gamma_1} |\nabla \widetilde{V}|^2 dx = \int_{\mathbb{R}^2 \backslash \Gamma_1} \nabla \widetilde{V} \cdot \nabla (\eta \Psi_0) dx - 2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} \nabla \Psi_0 \cdot \nu^j \gamma_+^j (\widetilde{V} - \eta \Psi_0) dS.
$$

On the other hand, testing [\(6.20\)](#page-26-7) with  $\tilde{V}_{\varepsilon_n} - \eta \tilde{V}_{0,\varepsilon_n} \in \tilde{\mathcal{H}}$  we obtain

<span id="page-27-3"></span>
$$
(6.29)\ \int_{\mathbb{R}^2 \backslash \Gamma_1} |\nabla \widetilde{V}_{\varepsilon_n}|^2 \, dx = \int_{\mathbb{R}^2 \backslash \Gamma_1} \nabla \widetilde{V}_{\varepsilon_n} \cdot \nabla (\eta \widetilde{V}_{0,\varepsilon_n}) \, dx - 2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} \nabla \widetilde{V}_{0,\varepsilon_n} \cdot \nu^j \gamma_+^j (\widetilde{V}_{\varepsilon_n} - \eta \widetilde{V}_{0,\varepsilon_n}) \, dS.
$$

In view of the weak convergence  $V_{\varepsilon_n} \rightharpoonup \tilde{V}$  in  $\tilde{\mathcal{X}}$ , [\(6.25\)](#page-27-2), [\(6.24\)](#page-27-1), and the continuity of the trace operators [\(6.8\)](#page-24-2), the limit of the right hand side of [\(6.29\)](#page-27-3) as  $n \to \infty$  is equal to the right hand side

of [\(6.28\)](#page-27-4), thus proving that  $V_{\varepsilon_n} \to V$  strongly in X as  $n \to \infty$  by. Since V is the unique solution of  $(6.10)$ ,  $(6.26)$  follows from the Urysohn Subsequence Principle.

In view of the blow-up analysis performed above, we are in position to prove Theorem [2.2.](#page-8-0)

Proof of Theorem [2.2.](#page-8-0) From  $(2.17)$ ,  $(2.19)$ ,  $(6.18)$ , and a change of variables it follows that

<span id="page-28-1"></span>(6.30) 
$$
\varepsilon^{-m}\mathcal{E}_{\varepsilon} = \frac{1}{2}\int_{\mathbb{R}^2\backslash\Gamma_1} |\nabla \widetilde{V}_{\varepsilon}|^2 dx + 2\sum_{j=1}^{k_1+k_2} \int_{S_1^j} \nabla \widetilde{V}_{0,\varepsilon} \cdot \nu^j \gamma_+^j(\widetilde{V}_{\varepsilon}) dS.
$$

The convergences  $(6.26)$  and  $(6.24)$ , together with the continuity of the trace operators in  $(6.8)$ , allow us to pass to the limit in the right hand side of [\(6.30\)](#page-28-1), thus yielding

<span id="page-28-2"></span>(6.31) 
$$
\lim_{\varepsilon \to 0^+} \varepsilon^{-m} \mathcal{E}_{\varepsilon} = \frac{1}{2} \int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla \widetilde{V}|^2 dx + 2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} \nabla \Psi_0 \cdot \nu^j \gamma_+^j(\widetilde{V}) dS = J(\widetilde{V}) = \mathcal{E}
$$

and proving claim (i). Furthermore, by  $(6.18)$ , a change of variable,  $(6.24)$ , and  $(6.25)$ , we have

<span id="page-28-3"></span>(6.32) 
$$
\varepsilon^{-m} L_{\varepsilon}(v_0) = 2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} \nabla \widetilde{V}_{0,\varepsilon} \cdot \nu^j \gamma_+^j(\widetilde{V}_{0,\varepsilon}) dS
$$

$$
= 2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} \nabla \Psi_0 \cdot \nu^j \gamma_+^j(\Psi_0) dS + o(1) = L(\Psi_0) + o(1) \quad \text{as } \varepsilon \to 0^+.
$$

Claim (ii) follows from  $(2.20)$ ,  $(6.31)$ ,  $(6.32)$ , and estimate  $(6.27)$ , which in particular ensures that  $\|V_\varepsilon\|_{\mathcal{F}}^2$  $\frac{2}{\mathcal{H}_{\varepsilon}} = O(\varepsilon^m)$  as  $\varepsilon \to 0$ <sup>+</sup>.

6.5. Continuity of  $\mathcal{E} - L(\Psi_0)$  with respect to rotations of poles. In this subsection we prove the continuity of  $\mathcal{E} - L(\Psi_0)$  with respect to rotations of the configuration of poles. We fix a configuration of poles  $\{a^j\}$  as in [\(1.1\)](#page-0-0). Then, for every  $\zeta \in [-\pi, \pi)$ , we define  $\Psi_0^{(\zeta)}$ ,  $L^{(\zeta)}(\Psi_0^{(\zeta)})$  and  $\mathcal{E}^{(\zeta)}$  as in [\(2.26\)](#page-8-4), [\(2.27\)](#page-8-3), and [\(2.31\)](#page-8-2), respectively, for a rotated configuration of poles  $\{a_{\zeta}^{j}\}$ , where  $a_{\zeta}^{j}$  are defined as in [\(1.1\)](#page-0-0) with angles  $\alpha^{j} + \zeta$  instead of  $\alpha^{j}$ , i.e.

$$
a_{\zeta}^j = \mathcal{R}_{\zeta}(a^j),
$$

<span id="page-28-4"></span>being  $\mathcal{R}_{\zeta} := R_{0,\zeta}$  with  $R_{0,\zeta}$  as in [\(3.1\)](#page-12-5), see Figure [6.](#page-28-4)

FIGURE 6. The rotated configuration  $\{a_{\zeta}^j\}$ .

<span id="page-28-0"></span>In the next theorem we prove that the function  $\zeta \mapsto \mathcal{E}^{(\zeta)} - L^{(\zeta)}(\Psi_0^{(\zeta)})$  is continuous. **Theorem 6.8.** The function  $G: [-\pi, \pi) \to \mathbb{R}$ ,  $G(\zeta) := \mathcal{E}^{(\zeta)} - L^{(\zeta)}(\Psi_0^{(\zeta)})$  is continuous.

*Proof.* Through a rotation, the problem of continuity at any  $\zeta \in [-\pi, \pi)$  can be reduced to the problem of continuity at  $\zeta = 0$ . Hence, it is enough to prove that  $\lim_{\zeta \to 0} G(\zeta) = \mathcal{E} - L(\Psi_0)$ .

We have

$$
\Psi_0^{(\zeta)}(r\cos t, r\sin t) = f(t-\zeta)\phi_0(r\cos t, r\sin t),
$$

where  $f$  is defined in  $(2.22)$  and

$$
\phi_0(r\cos t, r\sin t) := \beta r^{\frac{m}{2}} \sin\left(\frac{m}{2}(t-\alpha_0)\right).
$$

With a slight abuse of notation, henceforth we denote by f also the function  $(r \cos t, r \sin t) \mapsto f(t)$ defined on  $\mathbb{R}^2 \setminus \{0\}.$ 

A change of variables yields

$$
\mathcal{E}^{(\zeta)} = \min \Big\{ I_{\zeta}(w) : w \in \widetilde{\mathcal{X}} \text{ and } w - \eta f(\phi_0 \circ \mathcal{R}_{\zeta}) \in \widetilde{\mathcal{H}} \Big\},\
$$

where  $\eta \in C_c^{\infty}(\mathbb{R}^2)$  is a radial cut-off function as in [\(2.29\)](#page-8-9) and

$$
I_{\zeta}(w) = \frac{1}{2} \int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla w|^2 dx + 2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} f(\nabla \phi_0 \circ \mathcal{R}_{\zeta}) M_{\zeta} \cdot \nu^j \gamma_+^j(w) dS,
$$

being  $M_{\zeta}$  the matrix defined in [\(3.2\)](#page-12-6). Moreover

<span id="page-29-3"></span><span id="page-29-1"></span>
$$
L^{(\zeta)}(\Psi_0^{(\zeta)}) = 2 \sum_{j=1}^{k_1+k_2} \int_{S_1^j} (\nabla \phi_0 \circ \mathcal{R}_{\zeta}) M_{\zeta} \cdot \nu^j(\phi_0 \circ \mathcal{R}_{\zeta}) dS.
$$

Since, in a neighbourhood of 0,

(6.33) 
$$
|\nabla \phi_0(\mathcal{R}_{\zeta}(x))| \le C|x|^{\frac{m}{2}-1} \text{ and } |\phi_0(\mathcal{R}_{\zeta}(x))| \le C|x|^{\frac{m}{2}}
$$

for some  $C > 0$  independent of  $\zeta$ , from the Dominated Convergence Theorem we deduce that

(6.34) 
$$
\lim_{\zeta \to 0} L^{(\zeta)}(\Psi_0^{(\zeta)}) = L(\Psi_0).
$$

By Proposition [6.4,](#page-25-0) for every  $\zeta$  there exists a unique  $\widetilde{V}_{\zeta} \in \widetilde{\mathcal{X}}$  such that  $\widetilde{V}_{\zeta} - \eta f(\phi_0 \circ \mathcal{R}_{\zeta}) \in \widetilde{\mathcal{H}}$  and  $\mathcal{E}^{(\zeta)} = I_{\zeta}(\widetilde{V}_{\zeta});$  furthermore,  $\widetilde{V}_{\zeta}$  satisfies

<span id="page-29-0"></span>(6.35) 
$$
\int_{\mathbb{R}^2 \setminus \Gamma_1} \nabla \widetilde{V}_{\zeta} \cdot \nabla w \, dx = -2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} f(\nabla \phi_0 \circ \mathcal{R}_{\zeta}) M_{\zeta} \cdot \nu^j \gamma_+^j(w) \, dS \quad \text{for all } w \in \widetilde{\mathcal{H}}.
$$

Choosing  $w = V_{\zeta} - \eta f(\phi_0 \circ \mathcal{R}_{\zeta})$  in [\(6.35\)](#page-29-0) we obtain

<span id="page-29-2"></span>(6.36) 
$$
\int_{\mathbb{R}^2 \backslash \Gamma_1} |\nabla \widetilde{V}_{\zeta}|^2 dx = \int_{\mathbb{R}^2 \backslash \Gamma_1} \nabla \widetilde{V}_{\zeta} \cdot \nabla (\eta f(\phi_0 \circ \mathcal{R}_{\zeta})) dx - 2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} f(\nabla \phi_0 \circ \mathcal{R}_{\zeta}) M_{\zeta} \cdot \nu^j \gamma_+^j(\widetilde{V}_{\zeta}) dS + 2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} f(\nabla \phi_0 \circ \mathcal{R}_{\zeta}) M_{\zeta} \cdot \nu^j \gamma_+^j(f(\phi_0 \circ \mathcal{R}_{\zeta})) dS.
$$

Using Young's inequality, estimate [\(6.33\)](#page-29-1), and the continuity of the trace operators [\(6.8\)](#page-24-2), from the above identity we deduce that

$$
\|\tilde{V}_{\zeta}\|_{\widetilde{\mathcal{X}}} \leq C
$$

for some  $C > 0$  independent of  $\zeta$ . It follows that every sequence  $\zeta_n \to 0$  admits a subsequence  $\{\zeta_{n_\ell}\}_\ell$  such that  $V_{\zeta_{n_\ell}} \to W$  weakly in X as  $\ell \to \infty$ , for some  $W \in \mathcal{X}$ . On account of [\(6.33\)](#page-29-1) and [\(6.8\)](#page-24-2), the Dominated Convergence Theorem yields

$$
\int_{S_1^j} f(\nabla \phi_0 \circ \mathcal{R}_{\zeta_{n_\ell}}) M_{\zeta_{n_\ell}} \cdot \nu^j \gamma_+^j(w) dS \to \int_{S_1^j} f(\nabla \phi_0 \cdot \nu^j \gamma_+^j(w) dS = \int_{S_1^j} \nabla \Psi_0 \cdot \nu^j \gamma_+^j(w) dS
$$

as  $\ell \to \infty$ , for every  $j = 1, \ldots k_1 + k_2$  and  $w \in \mathcal{H}$ . By choosing  $\zeta = \zeta_{n_\ell}$  in [\(6.35\)](#page-29-0) and letting  $\ell \to \infty$ we obtain that

<span id="page-30-2"></span>(6.37) 
$$
\int_{\mathbb{R}^2 \setminus \Gamma_1} \nabla W \cdot \nabla w \, dx = -2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} \nabla \Psi_0 \cdot \nu^j \gamma_+^j(w) \, dS \quad \text{for all } w \in \widetilde{\mathcal{H}}.
$$

Furthermore, since  $\widetilde{V}_{\zeta} - \eta f(\phi_0 \circ \mathcal{R}_{\zeta}) \in \widetilde{\mathcal{H}}, \widetilde{\mathcal{H}}$  is a closed subspace of  $\widetilde{\mathcal{X}}$ , and  $\eta f(\phi_0 \circ \mathcal{R}_{\zeta}) \to \eta \Psi_0$ as  $\zeta \to 0$  in  $\widetilde{\mathcal{X}}$  by the Dominated Convergence Theorem, we have

<span id="page-30-3"></span>
$$
(6.38) \t\t W - \eta \Psi_0 \in \mathcal{H}.
$$

From [\(6.37\)](#page-30-2)-[\(6.38\)](#page-30-3) and the uniqueness part of Proposition [6.4](#page-25-0) we deduce that  $W = \tilde{V}$ . Having uniquely identified the weak limit independently of the subsequence, by the Urysohn subsequence principle we conclude that

<span id="page-30-4"></span>(6.39) 
$$
\widetilde{V}_{\zeta} \rightharpoonup \widetilde{V} \quad \text{weakly in } \widetilde{\mathcal{X}} \quad \text{as } \zeta \to 0.
$$

The weak convergence [\(6.39\)](#page-30-4) allows us to pass to the limit as  $\zeta \to 0$  on the right hand side of [\(6.36\)](#page-29-2), thus proving that

<span id="page-30-5"></span>
$$
(6.40) \qquad \lim_{\zeta \to 0} \int_{\mathbb{R}^2 \backslash \Gamma_1} |\nabla \widetilde{V}_{\zeta}|^2 dx = \int_{\mathbb{R}^2 \backslash \Gamma_1} \nabla \widetilde{V} \cdot \nabla (\eta \Psi_0) dx - 2 \sum_{j=1}^{k_1 + k_2} \int_{S_1^j} \nabla \Psi_0 \cdot \nu^j \gamma_+^j (\widetilde{V} - \Psi_0) dS
$$

$$
= \int_{\mathbb{R}^2 \backslash \Gamma_1} |\nabla \widetilde{V}|^2 dx,
$$

the last equality being a consequence of [\(6.10\)](#page-25-1) tested with  $w = \tilde{V} - \eta \Psi_0$ . From [\(6.40\)](#page-30-5) it follows that  $\lim_{\zeta \to 0} \mathcal{E}^{(\zeta)} = \lim_{\zeta \to 0} I_{\zeta}(\widetilde{V}_{\zeta}) = J(\widetilde{V}) = \mathcal{E}$ , which, together with [\(6.34\)](#page-29-3), yields the conclusion.  $\square$ 

When  $k_2 = 0$  and the poles  $\{a^j\}_{j=1,\dots,k_1}$  are on the tangents to nodal lines of  $v_0$  (i.e. on the nodal set of  $\Psi_0$ ), we have  $\Psi_0 = 0$  on  $S_1^j$  for all  $j = 1, ..., k_1$ ; on the other hand, if the poles are on the bisectors between nodal lines, then  $\nabla \Psi_0 \cdot \nu^j = 0$  on  $S_1^j$  for all  $j = 1, \ldots, k_1$ . This leads to Proposition [2.3,](#page-9-0) which determines, in these particular cases, the sign of the dominant term in the asymptotic expansion obtained in Theorem [2.2,](#page-8-0) and, consequently, exploits the continuity result established in Theorem [6.8](#page-28-0) to find configurations of poles for which the eigenvalue variation is an infinitesimal of higher order.

Proof of Proposition [2.3.](#page-9-0) (i) If  $\alpha^j \in {\alpha_0 + \ell \frac{2\pi}{m} : \ell = 0, 1, 2, \ldots, m-1}$  for all  $j \in {\{1, \ldots, k_1\}}$ , then  $\Psi_0 = 0$  on  $S_1^j$  for all  $j \in \{1, ..., k_1\}$ , so that  $L(\Psi_0) = 0$  and  $\eta \Psi_0 + \widetilde{\mathcal{H}} = \widetilde{\mathcal{H}}$ . It follows that

(6.41) 
$$
\mathcal{E} - L(\Psi_0) = \mathcal{E} = \min_{\widetilde{\mathcal{H}}} J.
$$

<span id="page-30-0"></span>Furthermore,  $\nabla \Psi_0 \cdot \nu^j \not\equiv 0$  on  $S_1^j$  for all  $j \in \{1, \ldots, k_1\}$ , see  $(6.22)$ , hence  $L \not\equiv 0$  in  $\widetilde{\mathcal{H}}$ . Fixing some  $w \in \widetilde{\mathcal{H}}$  such that  $L(w) \neq 0$ , we have then  $J(tw) = \frac{t^2}{2}$  $\frac{t^2}{2} \int_{\mathbb{R}^2 \setminus \Gamma_1} |\nabla w|^2 \, dx + tL(w) \, < \, 0$ for some small t, thus implying that  $\mathcal{E} = \min_{\widetilde{\mathcal{H}}} J < 0$ . Once we have established that  $\mathcal{E} - L(\Psi_0) = \mathcal{E} < 0$ , from the asymptotic expansion of Theorem [2.2-](#page-8-0)(ii) we deduce that  $\lambda_{\varepsilon,n_0} < \lambda_{0,n_0}$  for sufficiently small  $\varepsilon > 0$ .

(ii) If  $\alpha^j \in {\alpha_0 + (1 + 2\ell)\frac{\pi}{m} : \ell = 0, 1, 2, \ldots, m - 1}$  for all  $j \in \{1, \ldots, k_1\}$ , then  $\nabla \Psi_0 \cdot \nu^j \equiv 0$  on  $S_1^j$  for all  $j \in \{1, ..., k_1\}$ , see [\(6.22\)](#page-27-7). It follows that  $L \equiv 0$ , and hence  $J(w) = \frac{1}{2} ||w||^2_{\tilde{\mathcal{X}}}$ . Since, in this case,  $\Psi_0 \neq 0$  on  $S_1^j$  for all  $j \in \{1, ..., k_1\}$ , we have  $w \neq 0$  for every  $w \in \eta \Psi_0 + \widetilde{\mathcal{H}}$ . Therefore

(6.42) 
$$
\mathcal{E} - L(\Psi_0) = \mathcal{E} = \min_{\eta \Psi_0 + \tilde{\mathcal{H}}} J = \frac{1}{2} \min_{w \in \eta \Psi_0 + \tilde{\mathcal{H}}} ||w||_{\tilde{\mathcal{X}}}^2 > 0.
$$

<span id="page-30-1"></span>From the asymptotic expansion of Theorem [2.2-](#page-8-0)(ii) we finally deduce that  $\lambda_{\epsilon,n_0} > \lambda_{0,n_0}$  for sufficiently small  $\varepsilon > 0$ .

<span id="page-31-0"></span>(iii) Let us fix a configuration  $\{a^j\}_{j=1}^k$  with  $k = k_1 \leq m$  odd and  $\alpha^j \in \{\alpha_0 + \ell \frac{2\pi}{m} : 0 \leq \ell \leq m-1\}$ for all  $j \in \{1, ..., k_1\}$  as in (i). Then the rotated configuration  $\{a_{\pi/m}^j\}$  is as in (ii). By (i)-(ii) we have  $G(0) < 0$  and  $G(\frac{\pi}{m}) > 0$ . Since G is continuous by Theorem [6.8,](#page-28-0) Bolzano's Theorem ensures the existence of some  $\zeta_0 \in (0, \frac{\pi}{m})$  such that  $G(\zeta_0) = 0$ , so that the angles  $\{\alpha^j + \zeta_0 : j = 1, \ldots, k\}$  are as we are looking for.

FIGURE 7. Nodal set of  $\Psi_0$  and sign of  $\mathcal{E} - L(\Psi_0)$  ( $m = k = 3, \alpha_0 = 0$ ).

Remark 6.9. Figure [7](#page-31-0) and Figure [8](#page-31-1) provide an example that helps to better visualize the result in Proposition [2.3.](#page-9-0) In Figure [7](#page-31-0) we zoom in near a point (the origin) where the limit eigenfunction  $v_0$  vanishes of order 3/2, namely [\(2.21\)](#page-8-5) holds with  $m = 3$ . We consider the case  $\alpha_0 = 0$ . The function  $\Psi_0$  as in [\(2.26\)](#page-8-4) is the 3/2-homogeneous limit profile describing the local behavior of  $v_0$ . In the image on the left, the black lines are the nodal lines of  $v_0$ , which are tangent to the nodal lines of  $\Psi_0$  (in green). The dotted lines denote the bisectors of the nodal lines of  $\Psi_0$ . In the image on the right, we fix an admissible configuration of poles  $\{a^j\}_{j=1,2,3}$  with  $k=3$  and  $\alpha_j = 2\pi(j-1)/3$ for  $j = 1, 2, 3$ . From Proposition [2.3](#page-9-0) we know that, if all the poles lie on the nodal set of  $\Psi_0$ , then the coefficient  $\mathcal{E} - L(\Psi_0)$  of the leading term in the asymptotic expansion stated in Theorem [2.2](#page-8-0) is strictly negative. On the other hand, if all the poles lie on the bisectors of the nodal lines, then the coefficient  $\mathcal{E} - L(\Psi_0)$  is strictly positive. In Figure [8](#page-31-1) on the left, in the first picture (red

<span id="page-31-1"></span>

Figure 8. A visualization of Proposition 2.3.

arrows) we have our initial fixed configuration, which then provides a negative coefficient. In the second picture (blue arrows) we consider a rotation about the origin by an angle  $\pi/m = \pi/3$ : the rotated configuration ends up with all the poles lying on the bisectors, thus giving a positive coefficient  $\mathcal{E} - L(\Psi_0)$ . Furthermore, the continuity result in Theorem [6.8](#page-28-0) ensures the existence of some  $\zeta_0 \in (0, \pi/3)$  such that, if we rotate the initial configuration by an angle  $\zeta_0$ , we find a configuration of poles for which  $\mathcal{E} - L(\Psi_0) = 0$ : this is represented in the third picture on the left (yellow arrows). Finally, the right picture in Figure [8](#page-31-1) presents the behavior of the perturbed eigenvalue in the three cases previously described. We point out that, when  $\mathcal{E} - L(\Psi_0) = 0$  (yellow graph), it is currently not known what is the vanishing order of  $\lambda_{\varepsilon,n_0} - \lambda_{0,n_0}$ .

6.6. Blow-up and convergence rate for eigenfunctions. From the blow-up analysis for the potential  $V_{\varepsilon}$  performed in Subsection [6.4](#page-26-9) and the energy estimate given in [\(5.7\)](#page-20-7), we derive the following blow-up result for scaled eigenfunctions, together with a sharp estimate for their rate of convergence in the  $\mathcal{H}_1$ -norm.

<span id="page-32-5"></span>**Proposition 6.10.** Under assumption [\(5.3\)](#page-19-3), let k be odd and  $v_0$  be an eigenfunction of [\(2.14\)](#page-7-1) associated to the eigenvalue  $\lambda_0 = \lambda_{0,n_0}$  with  $||v_0||_{L^2(\Omega)} = 1$ . For  $\varepsilon > 0$  small, let  $\lambda_{\varepsilon} = \lambda_{\varepsilon,n_0}$  and  $v_{\varepsilon}$  be an eigenfunction of [\(2.10\)](#page-7-0) associated to  $\lambda_{\varepsilon}$  and chosen as in [\(5.4\)](#page-20-0). Let  $m \in \mathbb{N}$  be given in Proposition [3.6](#page-14-2) for  $v = v_0$ . Then

<span id="page-32-1"></span>(6.43) 
$$
\varepsilon^{-\frac{m}{2}}v_{\varepsilon}(\varepsilon x) \to \Psi_0 - \widetilde{V} \quad as \ \varepsilon \to 0^+ \ \text{in} \ H^1(D_\rho \setminus \Gamma_1) \ \text{for all} \ \rho > 0,
$$

where  $\Psi_0$  is defined in [\(2.26\)](#page-8-4) and  $\tilde{V}$  is the unique solution to [\(6.10\)](#page-25-1). Furthermore,

(6.44) 
$$
\lim_{\varepsilon \to 0^+} \varepsilon^{-\frac{m}{2}} \|v_{\varepsilon} - v_0\|_{\mathcal{H}_1} = \|\widetilde{V}\|_{\widetilde{\mathcal{X}}}.
$$

*Proof.* Using the same notation as in the proof of Theorem [5.2,](#page-20-11) let  $\psi_{\varepsilon} = v_0 - V_{\varepsilon}$ , where  $V_{\varepsilon}$  is defined as in Proposition [4.2.](#page-17-0) From [\(5.7\)](#page-20-7) it follows that

<span id="page-32-4"></span>
$$
\|\Pi_{\varepsilon}\psi_{\varepsilon}-\psi_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2=o\left(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2\right)\quad\mathrm{as}\;\varepsilon\to0^+.
$$

Therefore, defining

$$
W_{\varepsilon}(x) := \varepsilon^{-\frac{m}{2}} (\Pi_{\varepsilon} \psi_{\varepsilon} - \psi_{\varepsilon})(\varepsilon x), \quad x \in \frac{1}{\varepsilon} \Omega,
$$

and extending trivially  $W_{\varepsilon}$  in  $\mathbb{R}^2 \setminus \frac{1}{\varepsilon} \Omega$ , we have  $W_{\varepsilon} \in \widetilde{\mathcal{H}}$  and, in view of Proposition [6.7,](#page-27-8)

<span id="page-32-0"></span>
$$
||W_{\varepsilon}||_{\widetilde{\mathcal{X}}}^2 = \varepsilon^{-m} ||\Pi_{\varepsilon} \psi_{\varepsilon} - \psi_{\varepsilon}||_{\mathcal{H}_{\varepsilon}}^2 = \varepsilon^{-m} o\left(||V_{\varepsilon}||_{\mathcal{H}_{\varepsilon}}^2\right) = ||\widetilde{V}_{\varepsilon}||_{\widetilde{\mathcal{X}}}^2 o(1) = o(1)
$$

as  $\varepsilon \to 0^+$ . By continuity of the restriction operator in [\(6.7\)](#page-24-5) we deduce that

(6.45) 
$$
W_{\varepsilon} \to 0 \text{ as } \varepsilon \to 0^+ \text{ in } H^1(D_\rho \setminus \Gamma_1) \text{ for all } \rho > 0.
$$

Let us define

(6.46) 
$$
U_{\varepsilon}(x) := \varepsilon^{-\frac{m}{2}} (\Pi_{\varepsilon} \psi_{\varepsilon})(\varepsilon x), \quad x \in \frac{1}{\varepsilon} \Omega,
$$

and extend trivially  $U_{\varepsilon}$  in  $\mathbb{R}^2 \setminus \frac{1}{\varepsilon} \Omega$ . We have

<span id="page-32-2"></span>
$$
U_{\varepsilon} = \widetilde{V}_{0,\varepsilon}(x) - \widetilde{V}_{\varepsilon} + W_{\varepsilon},
$$

where  $V_{0,\varepsilon}$  and  $\tilde{V}_{\varepsilon}$  are defined in [\(6.18\)](#page-26-6). Combining [\(6.25\)](#page-27-2), [\(6.26\)](#page-27-5), and [\(6.45\)](#page-32-0), we conclude that (6.47)  $U_{\varepsilon} \to \Psi_0 - \tilde{V} \text{ as } \varepsilon \to 0^+ \text{ in } H^1(D_\rho \setminus \Gamma_1) \text{ for all } \rho > 0.$ 

From [\(5.8\)](#page-20-8) it follows that

<span id="page-32-3"></span>
$$
\int_{\Omega} v_0 \Pi_{\varepsilon} \psi_{\varepsilon} dx = 1 + o\left( \|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}} \right) \quad \text{as } \varepsilon \to 0^+,
$$

and hence, for  $\varepsilon > 0$  small enough,

$$
\int_{\Omega} \frac{\Pi_{\varepsilon} \psi_{\varepsilon}}{\|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^2(\Omega)}} v_0 dx > 0.
$$

Since  $v_{\varepsilon}$  is the unique eigenfunction of [\(2.10\)](#page-7-0) associated to  $\lambda_{\varepsilon}$  satisfying [\(5.4\)](#page-20-0), we conclude that necessarily

<span id="page-33-1"></span>(6.48) 
$$
v_{\varepsilon} = \frac{\Pi_{\varepsilon} \psi_{\varepsilon}}{\|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^2(\Omega)}}.
$$

The convergence stated in  $(6.43)$  follows from  $(6.48)$ ,  $(6.46)$ ,  $(6.47)$ , and  $(5.9)$ . Moreover, [\(5.9\)](#page-20-9) implies that

<span id="page-33-2"></span>(6.49) 
$$
\|v_{\varepsilon} - \Pi_{\varepsilon} \psi_{\varepsilon}\|_{\mathcal{H}_{1}} = \frac{|1 - \|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^{2}(\Omega)}}{\|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^{2}(\Omega)}} \|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{\mathcal{H}_{1}} = |1 - \|\Pi_{\varepsilon} \psi_{\varepsilon}\|_{L^{2}(\Omega)} \|\psi_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}} = o(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}) \text{ as } \varepsilon \to 0^{+},
$$

whereas [\(5.7\)](#page-20-7) yields that

<span id="page-33-3"></span>(6.50)  $\|\Pi_{\varepsilon}\psi_{\varepsilon}-v_0\|_{\mathcal{H}_1}^2 = \|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2 + \|\Pi_{\varepsilon}\psi_{\varepsilon}-\psi_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2 - 2(V_{\varepsilon}, \Pi_{\varepsilon}\psi_{\varepsilon}-\psi_{\varepsilon})\mu_{\varepsilon} = \|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2 + o(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2)$  $\overset{2}{\mathcal{H}}_{\varepsilon}$ as  $\varepsilon \to 0^+$ . Combining [\(6.49\)](#page-33-2) and [\(6.50\)](#page-33-3) we deduce that

<span id="page-33-4"></span>(6.51) 
$$
\|v_{\varepsilon}-v_0\|_{\mathcal{H}_1}^2=\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2+o(\|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2)\quad \text{as } \varepsilon \to 0^+.
$$

Letting  $V_{\varepsilon}$  be as in [\(6.18\)](#page-26-6), from [\(6.51\)](#page-33-4) and [\(6.26\)](#page-27-5) we deduce that

$$
\varepsilon^{-m} \|v_{\varepsilon} - v_0\|_{\mathcal{H}_1}^2 = \|\widetilde{V}_{\varepsilon}\|_{\widetilde{\mathcal{X}}}^2 (1 + o(1)) = \|\widetilde{V}\|_{\widetilde{\mathcal{X}}}^2 (1 + o(1)) \quad \text{as } \varepsilon \to 0^+,
$$
  
thus proving (6.44).

Going back to the eigenfunctions of the original magnetic problem via the inverse of transformation [\(2.9\)](#page-6-7), we deduce Theorem [2.4](#page-9-2) from Proposition [6.10.](#page-32-5)

*Proof of Theorem [2.4.](#page-9-2)* If  $u_0$  is an eigenfunction of [\(1.5\)](#page-2-0) associated to the eigenvalue  $\lambda_{0,n_0}$  such that  $\int_{\Omega} |u_0|^2 dx = 1$ , and  $u_{\varepsilon}$  is the eigenfunction of [\(1.4\)](#page-1-2) associated to  $\lambda_{n_0,\varepsilon}$  satisfying [\(2.32\)](#page-9-1), then  $v_{\varepsilon} := e^{-i\Theta_{\varepsilon}}u_{\varepsilon}$  is an eigenfunction of [\(2.10\)](#page-7-0) associated to  $\lambda_{n_0,\varepsilon}$  and  $v_0 := e^{-i\Theta_0}u_0$  is an eigenfunction of [\(2.14\)](#page-7-1) associated to  $\lambda_{n_0,0}$  such that condition [\(5.4\)](#page-20-0) is satisfied. From Proposition [6.10](#page-32-5) it follows that  $v_{\varepsilon}$  satisfies [\(6.43\)](#page-32-1) and [\(6.44\)](#page-32-4), in which we replace  $v_{\varepsilon}$  with  $e^{-i\Theta_{\varepsilon}}u_{\varepsilon}$  and  $v_0$ with  $e^{-i\Theta_0}u_0$  to get exactly [\(2.33\)](#page-9-3) and [\(2.34\)](#page-10-4), taking into account that  $\Theta_\varepsilon(\varepsilon x) = \Theta_1(x)$  for all  $x \in \mathbb{R}^2 \setminus \{a^j : j = 1, \ldots, k\}.$ 

## 7. The case of two poles

<span id="page-33-0"></span>The purpose of this section is to prove Theorems [2.6](#page-11-0) and [2.7.](#page-11-1) We consider the case  $k_1 = 0$  and  $k_2 = 1$ , with the configuration of poles as in assumption [\(2.36\)](#page-10-3), being  $r_1 \in (0, R)$  and  $\varepsilon \in (0, 1]$ . For the sake of simplicity, let us denote

$$
T := T^1
$$
,  $\gamma_+ := \gamma_+^1$ ,  $\gamma_- := \gamma_-^1$ , and  $\nu := \nu^1 = (0, 1)$ ,

see [\(2.4\)](#page-6-6). We first consider a linear functional  $L_{\varepsilon,h,\Lambda}$  more general than the one introduced in  $(2.16)$ , defined for a generic domain  $\Lambda$  and with the limit eigenfunction  $v_0$  replaced by a generic function h; the corresponding minimal energy  $\mathcal{E}_{\varepsilon,h,\Lambda}$  thus generalizes the energy  $\mathcal{E}_{\varepsilon}$  defined in [\(2.19\)](#page-7-4). For every simply connected open bounded domain  $\Lambda \subset \mathbb{R}^2$  such that  $D_R \subseteq \Lambda$  and every  $h \in H_0^1(\Lambda) \cap C^\infty(\Lambda)$ , let

$$
L_{\varepsilon,h,\Lambda}: \mathcal{H}_{1,\Lambda} \to \mathbb{R}, \quad L_{\varepsilon,h,\Lambda}(w) := 2 \int_{S_{\varepsilon}} \frac{\partial h}{\partial x_2} \gamma_+(w) \, dS
$$

and

$$
J_{\varepsilon,h,\Lambda}: \mathcal{H}_{\varepsilon,\Lambda} \to \mathbb{R}, \quad J_{\varepsilon,h,\Lambda}(w) := \frac{1}{2} \int_{\Lambda \setminus S_{\varepsilon}} |\nabla w|^2 \, dx + L_{\varepsilon,h,\Lambda}(w),
$$

where, for all  $\varepsilon \in (0,1], S_{\varepsilon}$  is defined in  $(2.37)$  and the functional space  $\mathcal{H}_{\varepsilon,\Lambda}$  is the closure of

<span id="page-33-5"></span>
$$
\{w \in H^1(\Lambda \setminus S_{\varepsilon}) : w = 0 \text{ on a neighbourhood of } \partial \Lambda\}
$$

with respect to the norm  $||w||_{H^1(\Omega \backslash S_{\varepsilon})}$ . Then the minimization problem

(7.1) 
$$
\inf \left\{ J_{\varepsilon,h,\Lambda}(w) : w \in \mathcal{H}_{\varepsilon,\Lambda} \text{ and } w - h \in \widetilde{\mathcal{H}}_{\varepsilon,\Lambda} \right\}
$$

with  $\widetilde{\mathcal{H}}_{\varepsilon,\Lambda} := \{w \in \mathcal{H}_{\varepsilon,\Lambda} : T(w) = 0 \text{ on } S_{\varepsilon}\}\,$ , is uniquely achieved, as stated in the following proposition. We omit the proof, being similar to the one of Proposition [4.2.](#page-17-0)

**Proposition 7.1.** The infimum in [\(7.1\)](#page-33-5) is achieved by a unique  $V_{\varepsilon,h,\Lambda} \in \mathcal{H}_{\varepsilon,\Lambda}$ . Furthermore,  $V_{\varepsilon,h,\Lambda}$  weakly solves the problem

<span id="page-34-1"></span>(7.2) 
$$
\begin{cases}\n-\Delta V_{\varepsilon,h,\Lambda} = 0, & \text{in } \Lambda \setminus S_{\varepsilon}, \\
V_{\varepsilon,h,\Lambda} = 0, & \text{on } \partial \Lambda, \\
T(V_{\varepsilon,h,\Lambda} - h) = 0, & \text{on } S_{\varepsilon}, \\
T\left(\frac{\partial V_{\varepsilon,h,\Lambda}}{\partial x_2} - \frac{\partial h}{\partial x_2}\right) = 0, & \text{on } S_{\varepsilon},\n\end{cases}
$$

in the sense that  $V_{\varepsilon,h,\Lambda} \in \mathcal{H}_{\varepsilon,\Lambda}$ ,  $V_{\varepsilon,h,\Lambda} - h \in \widetilde{\mathcal{H}}_{\varepsilon,\Lambda}$ , and

(7.3) 
$$
\int_{\Lambda \backslash S_{\varepsilon}} \nabla V_{\varepsilon,h,\Lambda} \cdot \nabla w \, dx = -L_{\varepsilon,h,\Lambda}(w) \quad \text{for all } w \in \widetilde{\mathcal{H}}_{\varepsilon,\Lambda}.
$$

For every  $\Lambda$ , h as above and  $\varepsilon \in (0,1]$ , let

(7.4) 
$$
\mathcal{E}_{\varepsilon,h,\Lambda} := J_{\varepsilon,h,\Lambda}(V_{\varepsilon,h,\Lambda}).
$$

For every  $L > 0$  and  $\varepsilon > 0$ , let  $E_{\varepsilon}(L)$  be the ellipse defined as

<span id="page-34-8"></span><span id="page-34-7"></span><span id="page-34-6"></span>
$$
E_{\varepsilon}(L) := \left\{ (x_1, x_2) \in \mathbb{R}^2 : \frac{x_1^2}{L^2 + r_1^2 \varepsilon^2} + \frac{x_2^2}{L^2} < 1 \right\}.
$$

We are going to compute  $\mathcal{E}_{\varepsilon,P_m,E_{\varepsilon}(L)}$ , where  $P_m$  is a homogeneous polynomial of degree  $m\geq 1$ . We shall later apply such estimate with  $P_m$  being the Taylor polynomial of  $u_0$  centered at 0 of order m, with  $u_0$  and m as in Section [2.2.](#page-10-6)

**Proposition 7.2.** Let  $m \in \mathbb{N}$ ,  $m \geq 1$ , and let  $P_m$  be a homogeneous polynomial of degree  $m$ , i.e.

(7.5) 
$$
P_m(x_1, x_2) := \sum_{j=0}^m \ell_j x_1^{m-j} x_2^j,
$$

for some  $\ell_0, \ell_1, \ldots, \ell_m \in \mathbb{R}$ . Then, for every  $L > 0$ , we have

<span id="page-34-5"></span>
$$
(7.6)\qquad \int_{E_{\varepsilon}(L)\setminus S_{\varepsilon}} |\nabla V_{\varepsilon, P_m, E_{\varepsilon}(L)}|^2 dx = \pi(\varepsilon r_1)^{2m} \left( \ell_0^2 \sum_{j=1}^m j |c_j|^2 + \ell_1^2 \sum_{j=1}^m \frac{|d_j|^2}{j} \right) + o(\varepsilon^{2m})
$$

as  $\varepsilon \to 0^+,$  where

<span id="page-34-2"></span>(7.7) 
$$
c_j = \frac{1}{\pi} \int_0^{2\pi} (\cos \eta)^m \cos(j\eta) d\eta \quad \text{for every } j \in \mathbb{N},
$$

<span id="page-34-3"></span>(7.8) 
$$
d_j = \frac{1}{\pi} \int_0^{2\pi} (\cos \eta)^{m-1} \sin \eta \sin(j\eta) d\eta \quad \text{for every } j \in \mathbb{N} \setminus \{0\}.
$$

*Proof.* We consider elliptic coordinates  $(\xi, \eta)$  defined as

(7.9) 
$$
\begin{cases} x_1 = \varepsilon r_1 \cosh(\xi) \cos(\eta), \\ x_2 = \varepsilon r_1 \sinh(\xi) \sin(\eta), \end{cases} \quad \xi \ge 0, \ \eta \in [0, 2\pi),
$$

see e.g. [\[3,](#page-42-10) Section 2.2]. In this coordinates  $S_{\varepsilon}$  is described by the conditions

<span id="page-34-0"></span>
$$
\xi = 0, \quad \eta \in [0, 2\pi),
$$

whereas  $E_{\varepsilon}(L)$  is described by

<span id="page-34-4"></span> $\xi \in [0, \xi_{\varepsilon}), \quad \eta \in [0, 2\pi),$ 

where  $\xi_{\varepsilon}$  is such that  $r_1 \varepsilon \sinh(\xi_{\varepsilon}) = L$ , that is

(7.10) 
$$
\xi_{\varepsilon} = \operatorname{arcsinh}\left(\frac{L}{r_1 \varepsilon}\right) = \log\left(\frac{L}{r_1 \varepsilon} + \sqrt{1 + \frac{L^2}{r_1^2 \varepsilon^2}}\right).
$$

In particular  $\partial E_{\varepsilon}(L)$  is described by the conditions

$$
\xi = \xi_{\varepsilon}, \quad \eta \in [0, 2\pi).
$$

The map

$$
F_{\varepsilon} : [0, \xi_{\varepsilon}) \times [0, 2\pi) \to E_{\varepsilon}(L), \quad F_{\varepsilon}(\xi, \eta) = (x_1, x_2),
$$

defined by [\(7.9\)](#page-34-0), has a Jacobian matrix of the form

$$
J_{F_{\varepsilon}}(\xi,\eta) = \varepsilon r_1 \sqrt{\cosh^2 \xi - \cos^2 \eta} \ O(\xi,\eta)
$$

for some orthogonal matrix  $O(\xi, \eta)$ , and det  $J_{F_{\varepsilon}}(\xi, \eta) = \varepsilon^2 r_1^2(\cosh^2 \xi - \cos^2 \eta)$ . In particular  $F_{\varepsilon}$  is a conform mapping and  $J_{F_{\varepsilon}}(\xi, \eta)$  is an invertible matrix if  $(\xi, \eta) \neq (0, 0)$  and  $(\xi, \eta) \neq (0, \pi)$ .

Let  $V_{\varepsilon,P_m,L} := V_{\varepsilon,P_m,E_{\varepsilon}(L)} \circ F_{\varepsilon}$ , where  $V_{\varepsilon,P_m,E_{\varepsilon}(L)}$  is the solution of  $(7.2)$  in the case  $\Lambda = E_{\varepsilon}(L)$ and  $h = P_m$ . We observe that, since  $F_{\varepsilon}(\xi, \eta) \in \mathbb{R}_+^2$  if  $\eta \in (0, \pi)$  and  $F_{\varepsilon}(\xi, \eta) \in \mathbb{R}_-^2$  if  $\eta \in (\pi, 2\pi)$ ,

$$
\widehat{V}_{\varepsilon,P_m,L}(0,\eta) = \begin{cases} \gamma_+(V_{\varepsilon,P_m,E_{\varepsilon}(L)})(\varepsilon r_1 \cos \eta,0), & \text{if } \eta \in (0,\pi), \\ \gamma_-(V_{\varepsilon,P_m,E_{\varepsilon}(L)})(\varepsilon r_1 \cos \eta,0), & \text{if } \eta \in (\pi,2\pi). \end{cases}
$$

Furthermore,

$$
\frac{\partial \widehat{V}_{\varepsilon, P_m, L}}{\partial \xi}(0, \eta) = \begin{cases} \varepsilon r_1(\sin \eta) \, \gamma_+ \left( \frac{\partial V_{\varepsilon, P_m, E_{\varepsilon}(L)}}{\partial x_2} \right) (\varepsilon r_1 \cos \eta, 0), & \text{if } \eta \in (0, \pi), \\ \varepsilon r_1(\sin \eta) \, \gamma_- \left( \frac{\partial V_{\varepsilon, P_m, E_{\varepsilon}(L)}}{\partial x_2} \right) (\varepsilon r_1 \cos \eta, 0), & \text{if } \eta \in (\pi, 2\pi). \end{cases}
$$

We also note that, for every  $\eta \in [0, 2\pi)$ ,

$$
P_m(F_{\varepsilon}(0,\eta)) = (\varepsilon r_1)^m \ell_0(\cos \eta)^m \quad \text{and} \quad \frac{\partial P_m}{\partial x_2}(F_{\varepsilon}(0,\eta)) = \ell_1(\varepsilon r_1)^{m-1}(\cos \eta)^{m-1}.
$$

Therefore,  $\widehat{V}_{\varepsilon,P_m,L}$  solves the problem

<span id="page-35-0"></span>
$$
(7.11)
$$
\n
$$
\begin{cases}\n-\Delta \widehat{V}_{\varepsilon,P_m,L} = 0, & \text{in } (0, \xi_{\varepsilon}) \times (0, 2\pi), \\
\widehat{V}_{\varepsilon,P_m,L}(\xi_{\varepsilon}, \eta) = 0, & \text{for all } \eta \in [0, 2\pi), \\
\widehat{V}_{\varepsilon,P_m,L}(\xi, 0) = \widehat{V}_{\varepsilon,P_m,L}(\xi, 2\pi), & \text{for all } \xi \in (0, \xi_{\varepsilon}), \\
\widehat{V}_{\varepsilon,P_m,L}(0, \eta) + \widehat{V}_{\varepsilon,P_m,L}(0, 2\pi - \eta) = 2\ell_0(\varepsilon r_1)^m (\cos \eta)^m, & \text{for all } \eta \in (0, \pi), \\
\frac{\partial \widehat{V}_{\varepsilon,P_m,L}}{\partial \xi}(0, \eta) - \frac{\partial \widehat{V}_{\varepsilon,P_m,L}}{\partial \xi}(0, 2\pi - \eta) = 2\ell_1(\varepsilon r_1)^m (\cos \eta)^{m-1} \sin \eta, & \text{for all } \eta \in (0, \pi).\n\end{cases}
$$

Let us consider the Fourier expansion of  $(\varepsilon r_1)^{-m} \hat{V}_{\varepsilon,P_m,L}$  with respect to the variable  $\eta$ 

$$
\frac{1}{(\varepsilon r_1)^m}\widehat{V}_{\varepsilon,P_m,L}(\xi,\eta) = \frac{a_{0,\varepsilon}(\xi)}{2} + \sum_{j=1}^{\infty} \Big( a_{j,\varepsilon}(\xi) \cos(j\eta) + b_{j,\varepsilon}(\xi) \sin(j\eta) \Big),
$$

where

$$
a_{j,\varepsilon}(\xi) := \frac{(\varepsilon r_1)^{-m}}{\pi} \int_0^{2\pi} \widehat{V}_{\varepsilon,P_m,L}(\xi,\eta) \cos(j\eta) d\eta \quad \text{for all } j \in \mathbb{N},
$$
  

$$
b_{j,\varepsilon}(\xi) := \frac{(\varepsilon r_1)^{-m}}{\pi} \int_0^{2\pi} \widehat{V}_{\varepsilon,P_m,L}(\xi,\eta) \sin(j\eta) d\eta \quad \text{for all } j \in \mathbb{N} \setminus \{0\}.
$$

Since  $\cos(2\pi - \eta) = \cos \eta$  for any  $\eta \in (0, \pi)$ , from [\(7.11\)](#page-35-0) it follows that

$$
a_{0,\varepsilon}(0) + 2\sum_{j=1}^{\infty} a_{j,\varepsilon}(0) \cos(j\eta) = 2\ell_0(\cos\eta)^m \quad \text{ for all } \eta \in (0, 2\pi),
$$

hence  $\{a_{j,\varepsilon}(0)\}_{j\in\mathbb{N}}$  are the Fourier coefficients of  $\ell_0(\cos\eta)^m$  with respect to the orthonormal basis  $\frac{1}{\sqrt{2}}$  $\frac{1}{2\pi}, \frac{1}{\sqrt{\pi}} \cos(j\eta), \frac{1}{\sqrt{\pi}} \sin(j\eta) \}_{j \in \mathbb{N} \setminus \{0\}}$  of  $L^2(0, 2\pi)$ , i.e.

$$
a_{j,\varepsilon}(0) = \ell_0 c_j
$$
 for all  $j \in \mathbb{N}$ ,

with  $c_j$  as in [\(7.7\)](#page-34-2). In particular

(7.12) 
$$
a_{j,\varepsilon}(0) = \ell_0 c_j = 0 \text{ if } j > m.
$$

On the other hand, the last condition in [\(7.11\)](#page-35-0) reads as

<span id="page-36-0"></span>
$$
\sum_{j=1}^{\infty} b'_{j,\varepsilon}(0) \sin(j\eta) = \ell_1(\cos \eta)^{m-1} \sin \eta \quad \text{for all } \eta \in (0, 2\pi).
$$

It follows that  $b'_{j,\varepsilon}(0)$  are independent of  $\varepsilon$  and

<span id="page-36-1"></span>
$$
b'_{j,\varepsilon}(0) = \ell_1 d_j \quad \text{for all } j \in \mathbb{N} \setminus \{0\},
$$

with  $d_j$  as in [\(7.8\)](#page-34-3); hence

(7.13) 
$$
b'_{j,\varepsilon}(0) = \ell_1 d_j = 0 \quad \text{if } j > m.
$$

From the equation in [\(7.11\)](#page-35-0) it follows that

$$
0 = \frac{1}{(\varepsilon r_1)^m} \Delta \widehat{V}_{\varepsilon, P_m, L}
$$
  
= 
$$
\frac{a_{0,\varepsilon}''(\xi)}{2} + \sum_{j=1}^{\infty} \left( (a_{j,\varepsilon}''(\xi) - j^2 a_{j,\varepsilon}(\xi)) \cos(j\eta) + (b_{j,\varepsilon}''(\xi) - j^2 b_{j,\varepsilon}(\xi)) \sin(j\eta) \right),
$$

hence

<span id="page-36-2"></span>(7.14) 
$$
a_{0,\varepsilon}(\xi) = -\frac{a_{0,\varepsilon}(0)}{\xi_{\varepsilon}} \xi + a_{0,\varepsilon}(0) = -\frac{\ell_0 c_0}{\xi_{\varepsilon}} \xi + \ell_0 c_0 \quad \text{for all } \xi \in (0, \xi_{\varepsilon}),
$$

$$
a_{j,\varepsilon}(\xi) = \ell_0 c_j \left( \frac{e^{j\xi}}{1 - e^{2j\xi_{\varepsilon}}} + \frac{e^{-j\xi}}{1 - e^{-2j\xi_{\varepsilon}}}\right) \quad \text{for all } \xi \in (0, \xi_{\varepsilon}) \text{ and } j \in \mathbb{N} \setminus \{0\},
$$

$$
b_{j,\varepsilon}(\xi) = \frac{\ell_1 d_j}{j} \left( \frac{e^{j\xi}}{1 + e^{2j\xi_{\varepsilon}}} - \frac{e^{-j\xi}}{1 + e^{-2j\xi_{\varepsilon}}}\right) \quad \text{for all } \xi \in (0, \xi_{\varepsilon}) \text{ and } j \in \mathbb{N} \setminus \{0\},
$$

with  $\xi_{\varepsilon}$  as in [\(7.10\)](#page-34-4). Then, by [\(7.12\)](#page-36-0) and [\(7.13\)](#page-36-1),  $a_{j,\varepsilon} \equiv b_{j,\varepsilon} \equiv 0$  for all  $j > m$ , so that

$$
\frac{1}{(\varepsilon r_1)^m}\widehat{V}_{\varepsilon,P_m,L}(\xi,\eta) = \frac{a_{0,\varepsilon}(\xi)}{2} + \sum_{j=1}^m \Big(a_{j,\varepsilon}(\xi)\cos(j\eta) + b_{j,\varepsilon}(\xi)\sin(j\eta)\Big).
$$

By a change of variables and the Parseval identity,

<span id="page-36-3"></span>
$$
(7.15) \qquad \int_{E_{\varepsilon}(L)\backslash S_{\varepsilon}} |\nabla V_{\varepsilon, P_m, E_{\varepsilon}(L)}|^2 dx = \int_0^{\xi_{\varepsilon}} \int_0^{2\pi} |\nabla \widehat{V}_{\varepsilon, P_m, L}|^2 d\eta d\xi
$$

$$
= (\varepsilon r_1)^{2m} \frac{\pi}{2} \int_0^{\xi_{\varepsilon}} |a'_{0,\varepsilon}(\xi)|^2 d\xi
$$

$$
+ (\varepsilon r_1)^{2m} \pi \sum_{j=1}^m \int_0^{\xi_{\varepsilon}} (|a'_{j,\varepsilon}(\xi)|^2 + j^2 |b_{j,\varepsilon}(\xi)|^2 + |b'_{j,\varepsilon}(\xi)|^2 + j^2 |a_{j,\varepsilon}(\xi)|^2) d\xi.
$$

Let us compute each integral in the above formula. In view of [\(7.14\)](#page-36-2) and [\(7.10\)](#page-34-4), it is clear that

$$
\int_0^{\xi_{\varepsilon}} |a'_{0,\varepsilon}(\xi)|^2 d\eta = \frac{\ell_0^2 c_0^2}{\xi_{\varepsilon}} = \frac{\ell_0^2 c_0^2}{|\log \varepsilon|} + O\left(\frac{1}{|\log \varepsilon|^2}\right) \quad \text{as } \varepsilon \to 0^+.
$$

Furthermore, for every  $j \in \mathbb{N} \setminus \{0\},\$ 

$$
j^{2} \int_{0}^{\xi_{\varepsilon}} |b_{j,\varepsilon}(\xi)|^{2} d\xi = \ell_{1}^{2} d_{j}^{2} \int_{0}^{\xi_{\varepsilon}} \left( \frac{e^{j\xi}}{1 + e^{2j\xi_{\varepsilon}}} - \frac{e^{-j\xi}}{1 + e^{-2j\xi_{\varepsilon}}} \right)^{2} d\xi
$$
  
\n
$$
= \frac{\ell_{1}^{2} d_{j}^{2}}{(1 + e^{2j\xi_{\varepsilon}})^{2}} \int_{0}^{\xi_{\varepsilon}} e^{2j\xi} d\xi + \frac{\ell_{1}^{2} d_{j}^{2}}{(1 + e^{-2j\xi_{\varepsilon}})^{2}} \int_{0}^{\xi_{\varepsilon}} e^{-2j\xi} d\xi - \frac{2\ell_{1}^{2} d_{j}^{2}\xi_{\varepsilon}}{2 + e^{-2j\xi_{\varepsilon}} + e^{2j\xi_{\varepsilon}}}
$$
  
\n
$$
= \frac{\ell_{1}^{2} d_{j}^{2}}{2j} \left( \frac{1}{(1 + e^{2j\xi_{\varepsilon}})^{2}} (e^{2j\xi_{\varepsilon}} - 1) + \frac{1}{(1 + e^{-2j\xi_{\varepsilon}})^{2}} (1 - e^{-2j\xi_{\varepsilon}}) \right) - \frac{2\ell_{1}^{2} d_{j}^{2}\xi_{\varepsilon}}{2 + e^{-2j\xi_{\varepsilon}} + e^{2j\xi_{\varepsilon}}}
$$
  
\n
$$
= \frac{\ell_{1}^{2} d_{j}^{2}}{2j} (1 + o(1)) \text{ as } \varepsilon \to 0^{+}
$$

and similarly

$$
\int_0^{\xi_{\varepsilon}} |b'_{j,\varepsilon}(\xi)|^2 d\xi = \ell_1^2 d_j^2 \int_0^{\xi_{\varepsilon}} \left( \frac{e^{j\xi}}{1 + e^{2j\xi_{\varepsilon}}} + \frac{e^{-j\xi}}{1 + e^{-2j\xi_{\varepsilon}}} \right)^2 d\xi = \frac{\ell_1^2 d_j^2}{2j} (1 + o(1)) \text{ as } \varepsilon \to 0^+.
$$

Finally, for every  $j \in \mathbb{N} \setminus \{0\}$ ,

$$
\int_0^{\xi_{\varepsilon}} |a'_{j,\varepsilon}(\xi)|^2 d\xi = j^2 \ell_0^2 c_j^2 \int_0^{\xi_{\varepsilon}} \left( \frac{e^{j\xi}}{1 - e^{2j\xi_{\varepsilon}}} - \frac{e^{-j\xi}}{1 - e^{-2j\xi_{\varepsilon}}} \right)^2 d\xi = \ell_0^2 c_j^2 \frac{j}{2} (1 + o(1)),
$$
  

$$
j^2 \int_0^{\xi_{\varepsilon}} |a_{j,\varepsilon}(\xi)|^2 d\xi = j^2 \ell_0^2 c_j^2 \int_0^{\xi_{\varepsilon}} \left( \frac{e^{j\xi}}{1 - e^{2j\xi_{\varepsilon}}} + \frac{e^{-j\xi}}{1 - e^{-2j\xi_{\varepsilon}}} \right)^2 d\xi = \ell_0^2 c_j^2 \frac{j}{2} (1 + o(1)),
$$

as  $\varepsilon \to 0^+$ , as shown in the proof of [\[3,](#page-42-10) Lemma 2.3]. Replacing the above estimates in [\(7.15\)](#page-36-3) we obtain  $(7.6)$ .

**Proposition 7.3.** Let  $m \in \mathbb{N} \setminus \{0\}$ . For every  $j \in \mathbb{N} \setminus \{0\}$ , let  $c_j$  and  $d_j$  be as in [\(7.7\)](#page-34-2) and [\(7.8\)](#page-34-3), respectively. Then

<span id="page-37-0"></span>(7.16) 
$$
\sum_{j=1}^{m} j|c_j|^2 = \frac{m}{4^{m-1}} \bigg( \frac{m-1}{\lfloor \frac{m-1}{2} \rfloor} \bigg)^2,
$$

<span id="page-37-1"></span>(7.17) 
$$
\sum_{j=1}^{m} \frac{1}{j} |d_j|^2 = \frac{1}{m4^{m-1}} \left( \frac{m-1}{\lfloor \frac{m-1}{2} \rfloor} \right)^2.
$$

*Proof.* For the proof of  $(7.16)$  we refer to  $[4,$  Proposition A.3]. To prove  $(7.17)$ , we observe that, in view of [\(7.7\)](#page-34-2),

$$
(\cos \eta)^m = \frac{c_0}{2} + \sum_{j=1}^m c_j \cos(j\eta)
$$
 for all  $\eta \in [0, 2\pi]$ .

Deriving the previous identity with respect to  $\eta$ , we obtain

$$
(\cos \eta)^{m-1} \sin \eta = \frac{1}{m} \sum_{j=1}^{m} j c_j \sin(j\eta) = \sum_{j=1}^{m} d_j \sin(j\eta) \text{ for all } \eta \in [0, 2\pi],
$$

in view of [\(7.8\)](#page-34-3). It follows that  $d_j = \frac{j}{m} c_j$  for all  $j = 1, ..., m$ , hence [\(7.17\)](#page-37-1) follows from [\(7.16\)](#page-37-0).  $\Box$ 

<span id="page-37-2"></span>**Remark 7.4.** Let  $m \in \mathbb{N}$ ,  $m \geq 1$ , and let  $P_m$  be a homogeneous polynomial of degree m as in [\(7.5\)](#page-34-6). Let  $\Lambda \subset \mathbb{R}^2$  be a simply connected open bounded domain such that  $D_R \subseteq \Lambda$ .

(i) If the coefficient  $\ell_0$  in [\(7.5\)](#page-34-6) is zero, then  $P_m \equiv 0$  on  $S_\varepsilon$  for all  $\varepsilon \in (0,1]$ . Hence  $V_{\varepsilon,P_m,\Lambda} \in \mathcal{H}_{\varepsilon,\Lambda}$ and, in view of [\(7.3\)](#page-34-7),  $\int_{\Lambda\setminus S_{\varepsilon}} |\nabla V_{\varepsilon,P_m,\Lambda}|^2 dx = -L_{\varepsilon,P_m,\Lambda}(V_{\varepsilon,P_m,\Lambda}),$  so that

$$
\mathcal{E}_{\varepsilon, P_m, \Lambda} = -\frac{1}{2} \int_{\Lambda \backslash S_{\varepsilon}} |\nabla V_{\varepsilon, P_m, \Lambda}|^2 \, dx.
$$

(ii) If the coefficient  $\ell_1$  in [\(7.5\)](#page-34-6) is zero, then  $\frac{\partial P_m}{\partial x_2} \equiv 0$  on  $S_\varepsilon$  for all  $\varepsilon \in (0,1]$ . Hence  $L_{\varepsilon, P_m, \Lambda} \equiv 0$ and

$$
\mathcal{E}_{\varepsilon, P_m, \Lambda} = \frac{1}{2} \int_{\Lambda \backslash S_{\varepsilon}} |\nabla V_{\varepsilon, P_m, \Lambda}|^2 \, dx.
$$

<span id="page-38-1"></span>**Proposition 7.5.** Let  $\Omega \subset \mathbb{R}^2$  be a simply connected open bounded domain with  $0 \in D_R \subseteq \Omega$ . For every  $\varepsilon \in (0,1)$ , let  $S_{\varepsilon}$  be defined in [\(2.37\)](#page-10-5). Let  $P_m$  be a homogeneous polynomial of degree m as in [\(7.5\)](#page-34-6) and  $\mathcal{E}_{\varepsilon,P_m,\Omega}$  be defined in [\(7.4\)](#page-34-8) with  $\Lambda=\Omega$  and  $h=P_m$ . Then, letting  $\ell_0$  and  $\ell_1$  be as in  $(7.5)$ , we have

(i) if  $\ell_0 = 0$ , then

$$
\mathcal{E}_{\varepsilon,P_m,\Omega} = -\frac{\pi}{2} r_1^{2m} \ell_1^2 \varepsilon^{2m} \frac{1}{m4^{m-1}} \left( \frac{m-1}{\lfloor \frac{m-1}{2} \rfloor} \right)^2 + o(\varepsilon^{2m}) \quad \text{as } \varepsilon \to 0^+;
$$

(ii) if  $\ell_1 = 0$ , then

<span id="page-38-0"></span>
$$
\mathcal{E}_{\varepsilon,P_m,\Omega} = \frac{\pi}{2} r_1^{2m} \ell_0^2 \varepsilon^{2m} \frac{m}{4^{m-1}} \left( \frac{m-1}{\lfloor \frac{m-1}{2} \rfloor} \right)^2 + o(\varepsilon^{2m}) \quad \text{as } \varepsilon \to 0^+.
$$

*Proof.* The set  $\Omega$  is open and  $0 \in \Omega$ , hence there exist  $L_1, L_2 > 0$  such that, for every  $\varepsilon \in (0,1]$ ,  $S_{\varepsilon} \subset E_{\varepsilon}(L_1) \subset \Omega \subset E_{\varepsilon}(L_2)$  (e.g. we can choose any  $0 < L_1 < \sqrt{R^2 - r_1^2}$  and  $L_2 = \text{diam}\,\Omega$ ). From  $(7.1), (7.4),$  $(7.1), (7.4),$  $(7.1), (7.4),$  $(7.1), (7.4),$  and the space inclusions  $\mathcal{H}_{\varepsilon,E_{\varepsilon}(L_1)} \subset \mathcal{H}_{\varepsilon,\Omega} \subset \mathcal{H}_{\varepsilon,E_{\varepsilon}(L_2)},$   $\mathcal{H}_{\varepsilon,E_{\varepsilon}(L_1)} \subset \mathcal{H}_{\varepsilon,\Omega} \subset \mathcal{H}_{\varepsilon,E_{\varepsilon}(L_2)}$ obtained by trivial extension, we deduce that, for every  $\varepsilon \in (0,1],$ 

(7.18) 
$$
\mathcal{E}_{\varepsilon,P_m,E_{\varepsilon}(L_2)} \leq \mathcal{E}_{\varepsilon,P_m,\Omega} \leq \mathcal{E}_{\varepsilon,P_m,E_{\varepsilon}(L_1)}.
$$

If  $\ell_0 = 0$ , from Remark [7.4,](#page-37-2) [\(7.6\)](#page-34-5), and [\(7.17\)](#page-37-1) it follows that, for  $i = 1, 2$ ,

$$
\mathcal{E}_{\varepsilon, P_m, E_{\varepsilon}(L_i)} = -\frac{1}{2} \int_{E_{\varepsilon}(L_i) \setminus S_{\varepsilon}} |\nabla V_{\varepsilon, P_m, E_{\varepsilon}(L_i)}|^2 dx
$$
  
= 
$$
-\frac{\pi}{2} (\varepsilon r_1)^{2m} \ell_1^2 \left( \sum_{j=1}^m \frac{|d_j|^2}{j} \right) + o(\varepsilon^{2m}) = -\frac{\pi}{2} r_1^{2m} \ell_1^2 \varepsilon^{2m} \frac{1}{m4^{m-1}} \left( \frac{m-1}{\frac{m-1}{2}} \right)^2 + o(\varepsilon^{2m})
$$

as  $\varepsilon \to 0^+$ , thus proving (i) in view of [\(7.18\)](#page-38-0).

On the other hand, if  $\ell_1 = 0$ , then Remark [7.4,](#page-37-2) [\(7.6\)](#page-34-5), and [\(7.16\)](#page-37-0) imply that, for  $i = 1, 2$ ,

$$
\mathcal{E}_{\varepsilon, P_m, E_{\varepsilon}(L_i)} = \frac{1}{2} \int_{E_{\varepsilon}(L_i) \setminus S_{\varepsilon}} |\nabla V_{\varepsilon, P_m, E_{\varepsilon}(L_i)}|^2 dx
$$
  
= 
$$
\frac{\pi}{2} (\varepsilon r_1)^{2m} \ell_0^2 \left( \sum_{j=1}^m j |c_j|^2 \right) + o(\varepsilon^{2m}) = \frac{\pi}{2} r_1^{2m} \ell_0^2 \varepsilon^{2m} \frac{m}{4^{m-1}} \left( \frac{m-1}{\lfloor \frac{m-1}{2} \rfloor} \right)^2 + o(\varepsilon^{2m})
$$

as  $\varepsilon \to 0^+$ , thus proving (ii) in view of [\(7.18\)](#page-38-0).

Let  $u_0$  be as in [\(2.35\)](#page-10-2) with  $u_0(0) = 0$  and  $m, \beta, \alpha_0$  be as in [\(2.38\)](#page-10-1). Let  $T_m$  be the Taylor polynomial of  $u_0$  centered at 0 of order m written in [\(2.39\)](#page-10-7). In particular  $T_m$  is of the form [\(7.5\)](#page-34-6) with

$$
\ell_j = \frac{1}{(m-j)!j!} \frac{\partial^m u_0}{\partial x_1^{m-j} \partial x_2^j}(0).
$$

If  $\alpha_0 = \frac{j\pi}{m}$  for some  $j \in \{0, 1, \ldots, 2m - 1\}$ , then, by Remark [2.5,](#page-10-8)  $\ell_0 = T_m(1,0) = 0$ 

and

<span id="page-38-2"></span>
$$
\ell_1 = \frac{\partial T_m}{\partial x_2}(1,0) = \nabla T_m(1,0) \cdot (0,1) = m\beta \cos(j\pi) = (-1)^j m\beta.
$$

Hence, by Proposition [7.5,](#page-38-1) in this case we have

(7.19) 
$$
\mathcal{E}_{\varepsilon,T_m,\Omega} = -\frac{\pi}{2} r_1^{2m} \varepsilon^{2m} \frac{m\beta^2}{4^{m-1}} \left( \frac{m-1}{\lfloor \frac{m-1}{2} \rfloor} \right)^2 + o(\varepsilon^{2m}) \text{ as } \varepsilon \to 0^+.
$$

On the other hand, if  $\alpha_0 = \frac{\pi}{2m} + \frac{j\pi}{m}$  for some  $j \in \{0, 1, \ldots, 2m - 1\}$ , then, by Remark [2.5,](#page-10-8)

$$
\ell_0 = T_m(1,0) = -\beta \sin\left(\frac{\pi}{2} + j\pi\right) = (-1)^{j+1}\beta
$$

and

<span id="page-39-6"></span>
$$
\ell_1 = \frac{\partial T_m}{\partial x_2}(1,0) = m\beta \cos\left(\frac{\pi}{2} + j\pi\right) = 0.
$$

In this case, Proposition [7.5](#page-38-1) then provides the expansion

(7.20) 
$$
\mathcal{E}_{\varepsilon,T_m,\Omega} = \frac{\pi}{2} r_1^{2m} \varepsilon^{2m} \frac{m\beta^2}{4^{m-1}} \left( \frac{m-1}{\left\lfloor \frac{m-1}{2} \right\rfloor} \right)^2 + o(\varepsilon^{2m}) \text{ as } \varepsilon \to 0^+.
$$

Let  $g := u_0 - T_m$ . Since  $u_0$  is smooth and  $T_m$  is its Taylor polynomial at 0 of order m, then

<span id="page-39-1"></span>(7.21) 
$$
g(x) = O(|x|^{m+1})
$$
 and  $|\nabla g(x)| = O(|x|^m)$  as  $x \to 0$ .

**Proposition 7.6.** Let m and  $\alpha_0$  be as in [\(2.38\)](#page-10-1). For every  $\varepsilon \in (0,1]$ , let  $V_{\varepsilon,T_m,\Omega}$  and  $\mathcal{E}_{\varepsilon,T_m,\Omega}$  be as in [\(7.1\)](#page-33-5) and [\(7.4\)](#page-34-8), with  $\Lambda = \Omega$  and  $h = T_m$ , and let  $V_{\varepsilon} = V_{\varepsilon, u_0, \Omega}$  and  $\mathcal{E}_{\varepsilon} = \mathcal{E}_{\varepsilon, u_0, \Omega}$  be as in [\(2.18\)](#page-7-7) and [\(2.19\)](#page-7-4), respectively. Then

<span id="page-39-0"></span>(7.22) 
$$
\|V_{\varepsilon} - V_{\varepsilon,T_m,\Omega}\|_{\mathcal{H}_{\varepsilon}}^2 = O(\varepsilon^{2m+1}) = o(\varepsilon^{2m}) \quad \text{as } \varepsilon \to 0^+
$$

and, if either  $\alpha_0 = \frac{j\pi}{m}$  or  $\alpha_0 = \frac{\pi}{2m} + \frac{j\pi}{m}$  for some  $j \in \{0, 1, ..., 2m - 1\}$ ,

<span id="page-39-2"></span>(7.23) 
$$
||V_{\varepsilon}||_{\mathcal{H}_{\varepsilon}} = O(\varepsilon^m) \quad as \; \varepsilon \to 0^+,
$$

<span id="page-39-5"></span>(7.24) 
$$
\mathcal{E}_{\varepsilon} - \mathcal{E}_{\varepsilon, T_m, \Omega} = o(\varepsilon^{2m}) \quad \text{as } \varepsilon \to 0^+.
$$

*Proof.* Let  $W_{\varepsilon} := V_{\varepsilon} - V_{\varepsilon,T_m,\Omega}$ . Then  $W_{\varepsilon}$  satisfies [\(7.3\)](#page-34-7) with  $h := g$ . Let  $\eta_{\varepsilon}$  be as in [\(4.7\)](#page-17-4). Testing [\(7.3\)](#page-34-7) with  $w = W_{\varepsilon} - \eta_{\varepsilon} g$ , by Young's Inequality and [\(2.3\)](#page-6-5) we obtain

$$
\begin{split} \Vert W_{\varepsilon} \Vert^{2}_{\mathcal{H}_{\varepsilon}}&=\int_{\Omega \backslash S_{\varepsilon}}\eta_{\varepsilon}\nabla W_{\varepsilon}\cdot \nabla g \,dx+\int_{\Omega \backslash S_{\varepsilon}}g\nabla W_{\varepsilon}\cdot \nabla \eta_{\varepsilon}\,dx-2\int_{S_{\varepsilon}}\frac{\partial g}{\partial x_{2}}\gamma^{+}(W_{\varepsilon})\,dS+2\int_{S_{\varepsilon}}\frac{\partial g}{\partial x_{2}}g \,dS\\ &\leq \frac{1}{2}\left\Vert W_{\varepsilon} \right\Vert^{2}_{\mathcal{H}_{\varepsilon}}+C\left(\int_{\Omega}\eta_{\varepsilon}^{2}|\nabla g|^{2}\,dx+\int_{\Omega}g^{2}|\nabla \eta_{\varepsilon}|^{2}\,dx+\int_{S_{\varepsilon}}\left|\frac{\partial g}{\partial x_{2}}\right|^{2}\,dS\right)+2\int_{S_{\varepsilon}}\left|\frac{\partial g}{\partial x_{2}}\right|\left|g\right|dS, \end{split}
$$

for some positive constant  $C > 0$ . Hence [\(7.22\)](#page-39-0) follows from [\(4.7\)](#page-17-4) and [\(7.21\)](#page-39-1). We have

<span id="page-39-3"></span>
$$
(7.25)\quad \mathcal{E}_{\varepsilon} - \mathcal{E}_{\varepsilon,T_m,\Omega} = \frac{1}{2} \left( \|V_{\varepsilon}\|_{\mathcal{H}_{\varepsilon}}^2 - \|V_{\varepsilon,T_m,\Omega}\|_{\mathcal{H}_{\varepsilon}}^2 \right) + 2 \int_{S_{\varepsilon}} \left( \frac{\partial u_0}{\partial x_2} \gamma_+(V_{\varepsilon}) - \frac{\partial T_m}{\partial x_2} \gamma_+(V_{\varepsilon,T_m,\Omega}) \right) dS.
$$

By Remark [7.4](#page-37-2) and Proposition [7.5](#page-38-1) we have that, if either  $\alpha_0 = \frac{j\pi}{m}$  or  $\alpha_0 = \frac{\pi}{2m} + \frac{j\pi}{m}$  for some  $j \in \{0, 1, \ldots, 2m-1\}$ , then  $||V_{\varepsilon,T_m,\Omega}||_{\mathcal{H}_{\varepsilon}} = \sqrt{2|\mathcal{E}_{\varepsilon,T_m,\Omega}|} = O(\varepsilon^m)$  as  $\varepsilon \to 0^+$ . Then, [\(7.23\)](#page-39-2) follows from  $(7.22)$ . Using again  $(7.22)$  we conclude that

<span id="page-39-4"></span>
$$
(7.26) \t\t\t ||V_{\varepsilon}||_{\mathcal{H}_{\varepsilon}}^{2} - ||V_{\varepsilon,T_{m},\Omega}||_{\mathcal{H}_{\varepsilon}}^{2} = (V_{\varepsilon} - V_{\varepsilon,T_{m},\Omega}, V_{\varepsilon} + V_{\varepsilon,T_{m},\Omega})_{\mathcal{H}_{\varepsilon}} = o(\varepsilon^{2m}) \quad \text{as } \varepsilon \to 0^{+}.
$$

Furthermore, fixing some  $p > 2$  and letting  $p' = \frac{p}{p-1}$ , Hölder's inequality, [\(7.21\)](#page-39-1), and the continuity of the trace operators [\(2.3\)](#page-6-5) imply that

<span id="page-40-2"></span>
$$
(7.27) \qquad \left| \int_{S_{\varepsilon}} \left( \frac{\partial u_0}{\partial x_2} \gamma_+(V_{\varepsilon}) - \frac{\partial T_m}{\partial x_2} \gamma_+(V_{\varepsilon, T_m, \Omega}) \right) dS \right|
$$
  
\n
$$
= \left| \int_{S_{\varepsilon}} \left( \frac{\partial g}{\partial x_2} \gamma_+(V_{\varepsilon}) + \frac{\partial T_m}{\partial x_2} (\gamma_+(V_{\varepsilon}) - \gamma_+(V_{\varepsilon, T_m, \Omega})) \right) dS \right|
$$
  
\n
$$
\leq \int_{S_{\varepsilon}} \left| \frac{\partial g}{\partial x_2} \right| |\gamma_+(V_{\varepsilon})| dS + \int_{S_{\varepsilon}} \left| \frac{\partial T_m}{\partial x_2} \right| |\gamma_+(W_{\varepsilon})| dS
$$
  
\n
$$
\leq \text{const} \left( \varepsilon^{m + \frac{1}{p'}} \left( \int_{S_{\varepsilon}} |\gamma_+(V_{\varepsilon})|^p dS \right)^{1/p} + \varepsilon^{m - 1 + \frac{1}{p'}} \left( \int_{S_{\varepsilon}} |\gamma_+(W_{\varepsilon})|^p dS \right)^{1/p} \right)
$$
  
\n
$$
\leq \text{const} \left( \varepsilon^{m + \frac{1}{p'}} ||V_{\varepsilon}||_{\mathcal{H}_{\varepsilon}} + \varepsilon^{m - 1 + \frac{1}{p'}} ||W_{\varepsilon}||_{\mathcal{H}_{\varepsilon}} \right)
$$
  
\n
$$
= O\left( \varepsilon^{2m + \frac{1}{p'}} \right) + O\left( \varepsilon^{2m - \frac{1}{2} + \frac{1}{p'}} \right) = o(\varepsilon^{2m}) \quad \text{as} \quad \varepsilon \to 0^+,
$$

where we used estimates  $(7.23)$  and  $(7.22)$ . Combining  $(7.25)$ ,  $(7.26)$ , and  $(7.27)$  we finally obtain  $(7.24)$ .

**Proof of Theorems [2.6](#page-11-0) and [2.7](#page-11-1).** Since we are considering only two opposite poles on the same line, we have  $v_0 = e^{-i\Theta_0}u_0 = u_0$ . Let  $m \in \mathbb{N} \setminus \{0\}$  and  $\alpha_0 \in [0, \frac{\pi}{m})$  be as in  $(2.38)$ .

If  $\alpha_0 = \frac{j\pi}{m}$  or  $\alpha_0 = \frac{\pi}{2m} + \frac{j\pi}{m}$  for some  $j \in \{0, 1, \ldots, 2m - 1\}$ , then, by  $(2.38)$  (see Remark [2.5\)](#page-10-8),  $u_0(x) = T_m(x) + O(|x|^{m+1})$  and  $\frac{\partial u_0}{\partial x_2}(x) = \frac{\partial T_m}{\partial x_2}(x) + O(|x|^m)$  as  $x \to 0$ , so that

<span id="page-40-3"></span>(7.28) 
$$
L_{\varepsilon}(u_0) = 2 \int_{S_{\varepsilon}} \frac{\partial T_m}{\partial x_2} T_m dS + O(\varepsilon^{2m+1}) = O(\varepsilon^{2m+1}) \text{ as } \varepsilon \to 0^+
$$

since, in this case, either  $T_m|_{S_\varepsilon} \equiv 0$  or  $\frac{\partial T_m}{\partial x_2}|_{S_\varepsilon} \equiv 0$ .

<span id="page-40-4"></span>From Theorem [2.1,](#page-7-2) [\(7.28\)](#page-40-3), [\(7.23\)](#page-39-2), and [\(7.24\)](#page-39-5), it follows that

$$
(7.29) \qquad \lambda_{\varepsilon,n_0} - \lambda_{0,n_0} = 2\mathcal{E}_{\varepsilon} - 2L_{\varepsilon}(u_0) + o(||V_{\varepsilon}||_{\mathcal{H}_{\varepsilon}}^2) = 2\mathcal{E}_{\varepsilon,T_m,\Omega} + o(\varepsilon^{2m}) \quad \text{as } \varepsilon \to 0^+.
$$

Theorem [2.6](#page-11-0) follows from [\(7.29\)](#page-40-4) and [\(7.19\)](#page-38-2), while Theorem [2.7](#page-11-1) is a consequence of [\(7.29\)](#page-40-4) and  $(7.20)$ .

<span id="page-40-1"></span>**Remark 7.7.** The case  $m = 0$  has been omitted in the present section as, for  $u_0(0) \neq 0$  the sharp expansion is already contained in [\[5\]](#page-42-5) even without symmetry assumptions on the domain; however, the above argument could also apply in such a case, providing an alternative proof of the result of [\[5\]](#page-42-5).

#### 8. Dealing with more general configurations of poles

<span id="page-40-0"></span>In this section, we give a hint on how our approach could be extended to treat other possible configurations of poles, which are not covered in the present paper for the sake of simplicity of exposition. By Theorem [2.1,](#page-7-2) the quantity that sharply measures the eigenvalue variation is  $\mathcal{E}_{\varepsilon} - L_{\varepsilon}(v_0)$ , where  $\mathcal{E}_{\varepsilon}$  is as in [\(2.19\)](#page-7-4),  $L_{\varepsilon}$  as in [\(2.16\)](#page-7-3) and  $v_0$  is the limit eigenfunction after a gauge transformation, thus solving [\(2.14\)](#page-7-1). As explained in the introduction,  $\mathcal{E}_{\varepsilon}$  is essentially an intermediate quantity between a capacity and a torsional rigidity, measuring the set  $\cup_{j=1}^{k_1+k_2} S^j_{\varepsilon}$ . For the success of our method it is important that the limit eigenfunction  $v_0$  is regular on the sets  $S^j_\varepsilon$ , while the perturbed eigenfunction  $v_\varepsilon$  jumps on them, together with  $\nabla v_\varepsilon \cdot \nu^j$ . Our approach can be applied to all configurations of poles for which, after a gauge transformation as in Section [3.3,](#page-13-0) the origin belongs to the half-lines on which the perturbed eigenfunction  $v_{\varepsilon}$  jumps.

We provide below some examples. Since the gauge transformation for a configuration of poles is the composition of the gauge transformations of the families of poles lying on the same straight line, we now focus on a single set of  $k$  collinear poles. Hence, for sake of simplicity, we assume

$$
\{a^j\}_{j=1,...,k} \subset D_R(0) \cap \{(x_1, 0) : x_1 \in \mathbb{R}\} \subset \Omega.
$$

More precisely, we assume that  $k = n_1 + n_2$ , where  $n_1, n_2 \in \mathbb{N}$  denote, respectively, the number of poles which lie on the left and on the right side with respect to the origin (either  $n_1$  or  $n_2$  might be zero). Namely,

$$
a^{j} = \begin{cases} (-\delta_{j}, 0), & \text{for } j = 1, ..., n_{1}, \\ (\delta_{j}, 0), & \text{for } j = n_{1} + 1, ..., n_{1} + n_{2}, \end{cases}
$$

where  $\delta_i > 0$  are such that

$$
-\delta_1 < -\delta_2 < \cdots < -\delta_{n_1} < 0 < \delta_{n_1+1} < \cdots < \delta_{n_1+n_2}
$$

.

,

For the above configuration, we consider problem [\(1.4\)](#page-1-2). One of the following cases occurs:

- (i)  $n_1$  and  $n_2$  are both even;
- (ii)  $n_1$  and  $n_2$  are both odd;
- (iii)  $n_1$  is odd and  $n_2$  is even (or vice versa).

The procedure developed to prove our main result Theorem [2.1](#page-7-2) can be reproduced in cases (i) and (ii), as well as in case (iii) if  $n_2 = 0$ .

Let us now briefly describe, in these cases, how problem [\(1.4\)](#page-1-2) becomes after a tailored gauge transformation. Hereafter, we denote by  $\Sigma := \mathbb{R} \times \{0\}$  the  $x_1$  axis, by  $T : H^1(\mathbb{R}^2 \setminus \Sigma) \to L^p(\Sigma)$ the jump trace operator defined as in [\(2.4\)](#page-6-6) with  $\Sigma$  instead of  $\Sigma^j$ , and by  $\nu := (0,1)$ .

**Case (i):** even number of poles evenly distributed, i.e.  $n_1 = 2N$  and  $n_2 = 2M$  for some  $N, M \in \mathbb{N}$ (see Figure [9a\)](#page-42-14). In this case, reasoning as in Section [3.3,](#page-13-0) it is possible to find a gauge transformation such that problem [\(1.4\)](#page-1-2) is equivalent to

$$
\begin{cases}\n-\Delta v = \lambda v, & \text{in } \Omega \setminus \bigcup_{j=1}^{N+M} S_{\varepsilon}^j, \\
v = 0, & \text{on } \partial \Omega, \\
T(v) = T(\nabla v \cdot \nu) = 0, & \text{on } \bigcup_{j=1}^{N+M} S_{\varepsilon}^j,\n\end{cases}
$$

where

$$
S^j_\varepsilon:=\begin{cases} [-\varepsilon\delta_{2j-1},-\varepsilon\delta_{2j}]\times\{0\},&\text{if }j=1,\ldots,N,\\ [\varepsilon\delta_{2j-1},\varepsilon\delta_{2j}]\times\{0\},&\text{if }j=N+1,\ldots,N+M. \end{cases}
$$

**Case (ii):** even number of poles oddly distributed, i.e.  $n_1 = 2N + 1$  and  $n_2 = 2M + 1$  for some  $N, M \in \mathbb{N}$  (see Figure [9b\)](#page-42-15). Once again, reasoning as in Section [3.3,](#page-13-0) one can find a gauge transformation such that problem [\(1.4\)](#page-1-2) is equivalent to

$$
\begin{cases}\n-\Delta v = \lambda v, & \text{in } \Omega \setminus \bigcup_{j=1}^{N+M+1} S_{\varepsilon}^j \\
v = 0, & \text{on } \partial \Omega, \\
T(v) = T(\nabla v \cdot \nu) = 0, & \text{on } \bigcup_{j=1}^{N+M+1} S_{\varepsilon}^j,\n\end{cases}
$$

where

$$
S_{\varepsilon}^{j} := \begin{cases} [-\varepsilon \delta_{2j-1}, -\varepsilon \delta_{2j}] \times \{0\}, & \text{for } j = 1, \dots, N, \\ [-\varepsilon \delta_{2N+1}, \varepsilon \delta_{2N+2}] \times \{0\}, & \text{for } j = N+1, \\ [\varepsilon \delta_{2j-1}, \varepsilon \delta_{2j}] \times \{0\}, & \text{for } j = N+2, \dots, N+M+1. \end{cases}
$$

(iii): odd number of poles all on the same side, i.e.  $n_1 = 2N + 1$  and  $n_2 = 0$  (see Figure [9c\)](#page-42-16). In this case, problem [\(1.4\)](#page-1-2) is equivalent to

$$
\begin{cases}\n-\Delta v = \lambda v, & \text{in } \Omega \setminus \left[\Gamma_0 \cup \left(\bigcup_{j=1}^{N+1} S_{\varepsilon}^j\right)\right], \\
v = 0, & \text{on } \partial\Omega, \\
T(v) = T(\nabla v \cdot \nu) = 0, & \text{on } \Gamma_0, \\
T(v) = T(\nabla v \cdot \nu) = 0, & \text{on } \bigcup_{j=1}^{N+1} S_{\varepsilon}^j,\n\end{cases}
$$

where

$$
S_{\varepsilon}^{j} := \begin{cases} [-\varepsilon \delta_{2j-1}, -\varepsilon \delta_{2j}] \times \{0\}, & \text{for } j = 1, \dots, N, \\ [-\varepsilon \delta_{2N+1}, 0] \times \{0\}, & \text{for } j = N+1. \end{cases}
$$

<span id="page-42-14"></span>To conclude, the only case left open in the present work is case (iii) with  $n_2 \neq 0$ . This requires non-trivial technical adaptations and will be the object of future investigation.
