# BOUNDED COHOMOLOGY PROPERTY ON SMOOTH PROJECTIVE FIBERED SURFACES 

SICHEN LI

#### Abstract

Let $X$ be a smooth projective surface and the closed Mori cone $\overline{\mathrm{NE}}(X)=$ $\sum \mathbb{R}_{\geq_{0}}\left[C_{i}\right]$ with some curves $C_{i}$ on $X$. We say that $X$ satisfies the bounded cohomology property if there exists a constant $c_{X}>0$ such that $h^{1}\left(\mathcal{O}_{X}(C)\right) \leq c_{X} h^{0}\left(\mathcal{O}_{X}(C)\right)$ for every curve $C$ on $X$. When the Picard number $\rho(X)=2$, we prove that $X$ satisfies the bounded cohomology property if one of the following holds: (i) the Kodaira dimension $\kappa(X) \leq 1$, (ii) the Iitaka dimension $\kappa\left(X, C_{1}\right)=1$ and $C_{2}^{2}<0$ and (iii) $\kappa\left(X, C_{1}\right)=$ $\kappa\left(X, C_{2}\right)=1$. Moreover, we show that $X$ with the arbitrary Picard number satisfies the bounded cohomology property if each $C_{i}$ has $\kappa\left(X, C_{i}\right)=1$.

## 1. Introduction

The bounded negativity conjecture (BNC) is one of the most intriguing problems in the theory of projective surfaces and can be formulated as follows.

Conjecture 1.1. [2, Conjecture 1.1] For a smooth projective surface $X$ over $\mathbb{C}$ there exists an integer $b(X) \geq 0$ such that $C^{2} \geq-b(X)$ for every curve $C \subseteq X$.

Remark 1.2. To the best of our knowledge, we collect some known cases of BNC as follows:
(1) $X$ admits a surjective endomorphism that is not an isomorphism (cf. [2, Proposition 2.1]).
(2) $d(X)=1$ (cf. [5, Theorem 2.3] and [8]), i.e. every pseudo-effective divisor $D$ on $X$ has an integral Zariski decomposition.
(3) $X$ satisfies the bounded cohomology property (cf. [6, Proposition 14]), i.e. there is a constant $c_{X}>0$ such that $h^{1}\left(\mathcal{O}_{X}(C)\right) \leq h^{0}\left(\mathcal{O}_{X}(C)\right)$ for every curve $C$ on $X$ (cf. [1, Conjecture 2.5.3]).
(4) $X$ has the Picard number $\rho(X) \leq 2$ (cf. [11, Proposition 2.6]).

This motivates the author of [11-14] to study smooth projective surfaces $X$ with either $d(X)=1$ or which satisfies the bounded cohomology property. In particular, these results clarify which surfaces satisfy the bounded cohomology property. More precisely, let the

[^0]closed Mori cone $\overline{\mathrm{NE}}(X)=\mathbb{R}_{\geq 0}\left[C_{1}\right]+\mathbb{R}_{\geq 0}\left[C_{2}\right]$ such that $C_{1}$ and $C_{2}$ with $C_{2}^{2}<0$ are some curves on $X$. We proved that $X$ satisfies the bounded cohomology property if one of the following cases holds: (i) the Kodaira dimension $\kappa(X) \leq 1$, (ii) $C_{1}^{2}<0$, and (ii) $\kappa(X)=2$, the irregularity $q(X)=0$ and the Iitaka dimension $\kappa\left(X, C_{1}\right)=1$. This was motivated by an interesting question as follows.

Question 1.3. [12, Question 3.6] Let $X$ be a smooth projective surface and the closed Mori cone $\overline{\mathrm{NE}}(X)=\sum \mathbb{R}_{\geq 0}\left[C_{i}\right]$ with $C_{i}$ some curves on $X$. Does $X$ satisfy the bounded cohomology property?

Thanks to the classification of algebraic surfaces (cf. [3, 4]), we can answer Question 1.3 when $\rho(X)=2$ as follows.

Theorem 1.4. Let $X$ be a smooth projective surface and the $\overline{\mathrm{NE}}(X)=\mathbb{R}_{\geq 0}\left[C_{1}\right]+\mathbb{R}_{\geq 0}\left[C_{2}\right]$ with some curves $C_{i}$ on $X$. Then $X$ satisfies the bounded cohomology property if one of the following cases holds.
(1) $\kappa(X) \leq 1$.
(2) $\kappa\left(X, C_{1}\right)=1$ and $C_{2}^{2}<0$.
(3) $\kappa\left(X, C_{1}\right)=\kappa\left(X, C_{2}\right)=1$.

Then $X$ satisfies the bounded cohomology property.
Remark 1.5. To completely answer Question 1.3 in the case that the Picard number $\rho(X)=2$, see Proposition 2.8 and Remark 2.9.

Let $X$ be a smooth projective surface and $\overline{\mathrm{NE}}(X)=\sum \mathbb{R}_{\geq 0}\left[C_{i}\right]$ with some curves $C_{i}$ on $X$. Moreover, we show that $X$ with the arbitrary Picard number satisfies the bounded cohomology property if each $C_{i}$ has the Iitaka dimension $\kappa\left(X, C_{i}\right)=1$ as follows.

Theorem 1.6. Let $X$ be a smooth projective surface and $\overline{\mathrm{NE}}(X)=\sum \mathbb{R}_{\geq 0}\left[C_{i}\right]$ with some curves $C_{i}$ on $X$. Suppose each $C_{i}$ has $\kappa\left(X, C_{i}\right)=1$. Then $X$ satisfies the bounded cohomology property.

To completely answer Question 1.3, by Proposition 4.2, it suffices to answer an interesting question as follows.

Question 1.7. Let $X$ be a smooth projective surface and $\overline{\mathrm{NE}}(X)=\sum \mathbb{R}_{\geq 0}\left[C_{i}\right]$ with some curves $C_{i}$ on $X$. Is there a positive constant $m(X)$ such that $C^{2} \leq m(X) h^{0}\left(\mathcal{O}_{X}(C)\right)$ for every curve $C$ with $C^{2}>0$ on $X$ ?

The paper is organized as follows. In Section 2, we collect basic results of the bounded cohomology property on smooth projective surfaces. Theorem 1.4 is proved in Section 3. In Section 4, we prove Theorem 1.6.

Notation and Terminology. Let $X$ be a smooth projective surface over $\mathbb{C}$.

- By a curve on $X$ we will mean a reduced and irreducible curve.
- A negative curve on $X$ is a curve with negative self-intersection.
- A prime divisor $C$ on $X$ is either a nef curve or a negative curve in which case that $h^{0}\left(\mathcal{O}_{X}(C)\right)=1$.
- We say $X$ has $b(X)>0$ if $X$ has at least one negative curve.
- We say $X$ has $b(X)=0$ if $X$ has no any negative curve.
- For every $\mathbb{R}$-divisor $D$ with $D^{2} \neq 0$ on $X$, we define a value $l_{D}$ of $D$ as follows:

$$
l_{D}:=\frac{\left(K_{X} \cdot D\right)}{\max \left\{1, D^{2}\right\}}
$$

- For every $\mathbb{R}$-divisor $D$ with $D^{2}=0$ on $X$, we define a value $l_{D}$ of $D$ as follows:

$$
l_{D}:=\frac{\left(K_{X} \cdot D\right)}{\max \left\{1, h^{0}\left(\mathcal{O}_{X}(D)\right)\right\}}
$$

Acknowledgments. I would like to thank Yi Gu for answering questions.

## 2. Preliminaries

The following is a numerical characterization of the bounded cohomology property.
Proposition 2.1. [12, Proposition 2.3] Let $X$ be a smooth projective surface. If there exists a positive constant $m(X)$ such that $l_{C} \leq m(X)$ for every curve $C$ on $X$ and $\left|D^{2}\right| \leq m(X) h^{0}\left(\mathcal{O}_{X}(D)\right)$ for every curve $D$ with either $D^{2}<0$ or $l_{D}>1$ and $D^{2}>0$ on $X$, then $X$ satisfies the bounded cohomology property.

The following is due to Serre duality.
Proposition 2.2. Let $C$ be a curve on a smooth projective surface $X$. Then

$$
h^{2}\left(\mathcal{O}_{X}(C)\right)-\chi\left(\mathcal{O}_{X}\right) \leq q(X)-1 .
$$

Proposition 2.3. [13, Proposition 2.3] Let $C$ be a curve on a smooth projective surface $X$. Suppose $C^{2}=0$. Then there exists a constant $a_{C}$ such that $l_{D} \leq a_{C}$ for every $n>0$ and every curve $D \in|n C|$ (note that being a curve implies $D$ is reduced and irreducible).

Proposition 2.4. [13, Proposition 2.8] Let $X$ be a smooth projective surface and the closed Mori cone $\overline{\mathrm{NE}}(X)=\sum \mathbb{R}_{\geq 0}\left[C_{i}\right]$ with $C_{i}$ some curves on $X$. Then $X$ has finitely many negative curves and there exists a positive constant $m(X)$ such that $l_{D} \leq m(X)$ for every curve $D$ with $D^{2} \neq 0$ on $X$.

The following is a technique result of the case that $\rho(X)=2$ and $b(X)>0$.

Proposition 2.5. [13, Proposition 3.5] Let $X$ be a smooth projective surface with $\rho(X)=$ 2 and $b(X)>0$. To answer Question 1.3, we may assume that the canonical divisor $K_{X}=a C_{1}+a^{\prime} C_{2}$ with $a, a^{\prime} \in \mathbb{R}_{\geq 0}$ and every curve $D=a_{1} C_{1}+a_{2} C_{2}$ with $a_{1}>a$ and $0<2 a_{2}<a^{\prime}$.

The following proposition is a crucial result in the proof of the case that $\rho(X)=2$.
Proposition 2.6. Let $X$ be a smooth projective surface with $\rho(X)=2$. Suppose $\overline{\mathrm{NE}}(X)=$ $\mathbb{R}_{\geq 0}\left[C_{1}\right]+\mathbb{R}_{\geq 0}\left[C_{2}\right]$ with some curves $C_{i}$ on $X$. Then the following statement hold.
(1) $C_{1}^{2} \leq 0$ and $C_{2}^{2} \leq 0$.
(2) Let a curve $D \equiv a_{1} C_{1}+a_{2} C_{2}$ with $a_{1}, a_{2}>0$. Then $D$ is ample.

Proof. (1) follows from [9, Lemma 1.22]. By [12, Proposition 3.1], $D$ is nef and big. Then

$$
D_{>0}:=\{C \in \overline{\mathrm{NE}}(X) \mid D \cdot C>0\} \supset \overline{\mathrm{NE}}(X) \backslash\{0\}
$$

By the Kleiman's ampleness criterion (cf. [9, Theorem 1.44]), $D$ is ample.
The following says that we may reduce every curve to the integral divisors when deal with the bounded cohomology property. This is motivated by [12, Proof of Lemma 3.4].

Proposition 2.7. Let $X$ be a smooth projective surface and the $\overline{\mathrm{NE}}(X)=\mathbb{R}_{\geq 0}\left[C_{1}\right]+$ $\mathbb{R}_{\geq 0}\left[C_{2}\right]$ with some curves $C_{i}$ on $X$. Let a curve $D=a_{1} C_{1}+a_{2} C_{2}$ with $a_{1}, a_{2}>0$. Then we may assume that $a_{1}, a_{2} \in \mathbb{Z}_{>0}$.

Proof. Note that $D$ is ample by Proposition 2.6. Then $D \cdot C_{1}, D \cdot C_{2} \in \mathbb{Z}_{\geq 0}$ as $D$ is a curve. So we assume that $a_{1}, a_{2} \in \mathbb{Z}_{\geq 0}$ after replacing $D$ by $d D$ with some $d \in \mathbb{Z}_{>0}$. In fact, by the Cramer's rule, $d=\left(C_{1} \cdot C_{2}\right)^{2}+\left(C_{1}^{2}\right) \cdot\left(C_{2}^{2}\right)>0$ is independent of the choice of $D$.

The following proposition gives a list of all cases of Question 1.3 when $\rho(X)=2$.
Proposition 2.8. Let $X$ be a smooth projective surface and the $\overline{\mathrm{NE}}(X)=\mathbb{R}_{\geq 0}\left[C_{1}\right]+$ $\mathbb{R}_{\geq 0}\left[C_{2}\right]$ with some curves $C_{i}$ on $X$. To completely answer Question 1.3, it suffices to consider the following cases.
(1) $C_{1}^{2}<0$ and $C_{2}^{2}<0$.
(2) $\kappa\left(X, C_{1}\right)=1$ and $C_{2}^{2}<0$.
(3) $\kappa\left(X, C_{1}\right)=\kappa\left(X, C_{2}\right)=1$.
(4) $\kappa\left(X, C_{1}\right)=0, C_{1}^{2}=0$ and $C_{2}^{2}<0$.
(5) $\kappa\left(X, C_{1}\right)=1$ and $C_{2}^{2}=0$.
(6) $\kappa\left(X, C_{1}\right)=\kappa\left(X, C_{2}\right)=0$ and $b(X)=0$.

Proof. Note that $C_{i}^{2}<0$ implies that $\kappa\left(X, C_{i}\right)=0$, and $\kappa\left(X, C_{i}\right)=1$ implies that $C_{i}^{2}=0$. So it follows from Proposition 2.6.

Remark 2.9. The case (1) follows from [12, Lemma 3.4]. In this paper we show the cases (2) and (3) satisfy the bounded cohomology property, and give a reduced result of the case that $\rho(X)=2$ and $b(X)=0$.

Proposition 2.10. Let $X$ be a minimal projective surface with $\kappa(X)=0$. Then $X$ satisfies the bounded cohomology property.

Proof. Since $\kappa(X)$ and $K_{X}$ is nef, then $K_{X} \equiv 0$. Then $l_{C}=0$ for every curve $C$ on $X$. By the adjunction formula, $C^{2} \geq-2$. Then by Riemann-Roch Theorem and Proposition 2.2, we have

$$
2 h^{1}\left(\mathcal{O}_{X}(C)\right)=2 h^{0}\left(\mathcal{O}_{X}(C)\right)+2 h^{2}\left(\mathcal{O}_{X}(C)\right)-2 \chi\left(\mathcal{O}_{X}\right)-C^{2} \leq 2(q(X)+1) h^{0}\left(\mathcal{O}_{X}(C)\right)
$$

So $X$ satisfies the bounded cohomology property.
Definition 2.11. A weak del Pezzo surface is a smooth, geometrically irreducible and proper surface $X$ such that $-K_{X}$ is nef and big.

Proposition 2.12. Weak del Pezzo surfaces satisfy the bounded cohomology property.
Proof. Let $X$ be a del Pezzo surface. Then $-K_{X}$ is ample. Take a curve $C$ on $X$. Note that $K_{X} \cdot C<0$. If $C^{2}<0$, then by adjunction formula, $C$ is a smooth rational curve with $C^{2}=-1$. Then $K_{X} \cdot C=-1$. So $l_{C}=-1$. If $C^{2} \geq 0$, then $C-K_{X}$ is ample. So by Kawamata-Viehweg vanishing theorem, $h^{1}\left(\mathcal{O}_{X}(C)\right)=h^{1}\left(\mathcal{O}_{X}\left(C-K_{X}\right)+K_{X}\right)=0$. Then by Proposition 2.1, $X$ satisfies the bounded cohomology property.

## 3. Proof of Theorem 1.4

Lemma 3.1. Let $X$ be a smooth projective surface with $\rho(X)=2$. Suppose $\kappa(X)=-\infty$. Then $X$ satisfies the bounded cohomology property.

Proof. By the Enriques-Kodaira classification of relatively minimal surfaces (cf. [3,4]) and $\kappa(X)=-\infty, X$ is either a ruled surface or one point blow of $\mathbb{P}^{2}$. By [13, Lemma 3.2], we may assume that $b(X)=0$. So we only consider the case $X$ is a ruled surface. Let $X$ be a geometrically ruled surface over a smooth curve $B$ of genus $g$ wih invariant $e$. Let $C \subset X$ be the unique section, and let $f$ be a fibre. By [7, Proposition V. 2.3 and 2.9],

$$
\operatorname{Pic} X \cong \mathbb{Z} C \oplus \pi^{*} \operatorname{Pic} B, C \cdot f=1, f^{2}=0, C^{2}=-e, K_{X} \equiv-2 C+(2 g-2-e) f
$$

Note that $e \leq 0$ since $b(X)=0$ and $C^{2}=-e$. Then by [7, Propositions V. 2.20 and 2.21], every curve $D=a C+b f(\neq C, f)$ has either $a>0$ and $b \geq \frac{1}{2} a e$ or $a \geq 2$ and $b \geq \frac{1}{2} a e$. Notice that $\kappa(X, C)=1$ when assume that $b=0$ and $a>1$.

Now we show there exists a positive constant $m(X)$ such that $l_{D} \leq m(X)$ for every curve $D$. If $e=0$, then it follows from Proposition 2.4. If $e<0$, then by [7, Proposition V. 2.21], every curve $D$ has either $D^{2}=0$ or $D^{2}>0 . D^{2}=0$ implies that $D=f$. Moreover, $D^{2}>0$ implies that $D$ is ample and $a>0, b>\frac{1}{2} a e$. Then $D \cdot C>0$ and $D \cdot f>0$. Take $C^{\prime}=C+\frac{1}{2} e f$ and then $D \cdot C^{\prime}>0$, and we have

$$
\begin{aligned}
l_{D} & =\frac{\left(K_{X} \cdot D\right)}{D^{2}} \\
& =\frac{-2(C \cdot D)+(2 g-2-e)(f \cdot D)}{a\left(C^{\prime} \cdot D\right)+\left(b-\frac{1}{2} a e\right)(f \cdot D)} \\
& \leq \frac{|4 g-4-2 e|}{2 b-a e},
\end{aligned}
$$

where $2 b-a e \in \mathbb{Z}_{>0}$.
By Proposition 2.3, we may assume that $a>0$ and $b>0$. Note that $D$ is ample by Proposition 2.6. If $e \geq 2 g-2$ or $b>2 g-2-e$, then

$$
\begin{equation*}
\left(K_{X}-D\right) D=-(2+a)(C \cdot D)+(2 g-2-e-b)(f \cdot D) \leq 0 \tag{1}
\end{equation*}
$$

By Riemann-Roch Theorem, (1) and Proposition 2.2 imply that

$$
\begin{aligned}
h^{1}\left(\mathcal{O}_{X}(D)\right) & =h^{0}\left(\mathcal{O}_{X}(D)\right)+h^{2}\left(\mathcal{O}_{X}(D)\right)+\frac{\left(K_{X}-D\right) D}{2}-\chi\left(\mathcal{O}_{X}\right) \\
& <(q(X)+1) h^{0}\left(\mathcal{O}_{X}(D)\right)
\end{aligned}
$$

Now assume $e<2 g-2$ and $0<b<2 g-2-e$. Since the amplitude of divisors depends only its numerical equivalence class (cf. [10, Proposition 1.3.13]), we have

$$
\begin{equation*}
h^{0}\left(\mathcal{O}_{X}(D)\right)=h^{0}\left(\mathcal{O}_{X}(a C+b f)\right) \geq h^{0}\left(X, \mathcal{O}_{X}(a C)\right) \tag{2}
\end{equation*}
$$

By [10, Corollary 2.1.38], there exists a positive constant $c=4(g-1-e) c_{X}^{-1}$ (which is independent of the choice of $D$ ) such that

$$
\begin{equation*}
h^{0}\left(X, \mathcal{O}_{X}(a C)\right) \geq 4 a(g-1-e) c_{X}^{-1} \tag{3}
\end{equation*}
$$

By (2) and (3), we have

$$
\begin{equation*}
h^{0}\left(\mathcal{O}_{X}(D)\right) \geq 4 a(g-1-e) c_{X}^{-1} \tag{4}
\end{equation*}
$$

On the other hand,

$$
\begin{equation*}
D^{2}=2 a b \leq 4 a(g-1-e) . \tag{5}
\end{equation*}
$$

where using $0<b<2(g-1-e)$. Therefore, by (4) and (5), we have

$$
D^{2} \leq c_{X} h^{0}\left(\mathcal{O}_{X}(D)\right)
$$

Then the proof follows from Propositions 2.1 and 2.4.

Lemma 3.2. [13, Lemma 3.6] Let $X$ be a smooth projective surface with $\rho(X)=2$. Suppose $\kappa(X)=0$. Then $X$ satisfies the bounded cohomology property.

The following may extend [12, Lemma 3.2] without assuming that $b(X)>0$.
Lemma 3.3. Let $X$ be a smooth projective surface and the $\overline{\mathrm{NE}}(X)=\mathbb{R}_{\geq 0}\left[C_{1}\right]+\mathbb{R}_{\geq 0}\left[C_{2}\right]$ with some curves $C_{i}$ on $X$. Suppose $\kappa(X)=1$. Then $X$ satisfies the bounded cohomology property.

Proof. Since $\kappa(X)=1$ and $\rho(X)=1$ and $\kappa(X)$ is a birational invariant, $K_{X}=C_{1}$ is nef and semiample. By [3, Proposition IX.2], we have $K_{X}^{2}$ and there is a surjective endomorphism $p: X \rightarrow B$ over a smooth curve $B$, whose general fiber $F$ is an elliptic curve. By [12, Lemma 3.2], we may assume that $C_{2}^{2}=0$ and $C_{2}=C$. By Propositions 2.3, 2.6 and 2.7, we assume that every curve $D=a_{1} K_{X}+a_{2} C$ with $a_{1}, a_{2} \in \mathbb{Z}_{>0}$. If $a_{1}>1$, then $D-K_{X}=\left(a_{1}-1\right) K_{X}+a_{2} C$ is nef and big by Proposition 2.6. So

$$
h^{1}\left(\mathcal{O}_{X}(D)\right)=h^{1}\left(\mathcal{O}_{X}\left(\left(D-K_{X}\right)+K_{X}\right)=0\right.
$$

by Kawamata-Viehweg vanishing theorem. If $a_{1}=1$, then

$$
\begin{equation*}
\left(K_{X}-D\right) D=-a_{2}(C \cdot D)<0 . \tag{6}
\end{equation*}
$$

By Riemann-Roch Theorem, (6) and Proposition 2.2 imply that

$$
\begin{aligned}
h^{1}\left(\mathcal{O}_{X}(D)\right) & =h^{0}\left(\mathcal{O}_{X}(D)\right)+h^{2}\left(\mathcal{O}_{X}(D)\right)+\frac{\left(K_{X}-D\right) D}{2}-\chi\left(\mathcal{O}_{X}\right) \\
& <(q(X)+1) h^{0}\left(\mathcal{O}_{X}(D)\right)
\end{aligned}
$$

Then the proof follows from Propositions 2.1 and 2.4.
The following may extend [13, Lemma 3.7] without assuming that $q(X)=0$.
Lemma 3.4. Let $X$ be a smooth projective surface and the $\overline{\mathrm{NE}}(X)=\mathbb{R}_{\geq 0}\left[C_{1}\right]+\mathbb{R}_{\geq 0}\left[C_{2}\right]$ with some curves $C_{i}$ on $X$. Suppose $\kappa\left(X, C_{1}\right)=1$ and $C_{2}^{2}<0$. Then $X$ satisfies the bounded cohomology property.

Proof. By Proposition 2.6, we assume that the canonical divisor $K_{X}=a C_{1}+a^{\prime} C_{2}$ with $a, a^{\prime}>0$ and every curve $D=a_{1} C_{1}+a_{2} C_{2}$ with $a_{1}>a$ and $0<2 a_{2}<a^{\prime}$. Then by Lemma 2.7, assume that $a_{1}, a_{2} \in \mathbb{Z}_{>0}$. Since the amplitude of divisors depends only its numerical equivalence class, we have

$$
\begin{equation*}
h^{0}\left(\mathcal{O}_{X}(D)\right)=h^{0}\left(\mathcal{O}_{X}\left(a_{1} C_{1}+a_{2} C_{2}\right)\right) \geq h^{0}\left(X, \mathcal{O}_{X}\left(a_{1} C_{1}\right)\right) . \tag{7}
\end{equation*}
$$

By [10, Corollary 2.1.38], there exists a positive constant $c=\left(c_{X}^{-1} a^{\prime}\right) \cdot\left(C_{1} \cdot C_{2}\right)$ (which is independent of the choice of $D$ ) such that

$$
\begin{equation*}
h^{0}\left(X, \mathcal{O}_{X}\left(a_{1} C_{1}\right)\right) \geq\left(c_{X}^{-1} a^{\prime}\right) \cdot\left(C_{1} \cdot C_{2}\right) a_{1} \tag{8}
\end{equation*}
$$

By (7) and (8), we have

$$
\begin{equation*}
h^{0}\left(\mathcal{O}_{X}(D)\right) \geq\left(c_{X}^{-1} a^{\prime}\right) \cdot\left(C_{1} \cdot C_{2}\right) a_{1} \tag{9}
\end{equation*}
$$

On the other hand,

$$
\begin{equation*}
D^{2}=2 a_{1} a_{2}\left(C_{1} \cdot C_{2}\right)-a_{2}^{2}\left(-C_{2}^{2}\right) \leq a^{\prime}\left(C_{1} \cdot C_{2}\right) a_{1}, \tag{10}
\end{equation*}
$$

where using $0<2 a_{2}<a^{\prime}$ and $-C_{2}^{2}>0$. Therefore, by (9) and (10), we have

$$
D^{2} \leq c_{X} h^{0}\left(\mathcal{O}_{X}(D)\right)
$$

Then the proof follows from Propositions 2.1 and 2.4.
The following is a technique result of the case that $\rho(X)=2$ and $b(X)=0$.
Proposition 3.5. Let $X$ be a smooth projective surface and the $\overline{\mathrm{NE}}(X)=\mathbb{R}_{\geq 0}\left[C_{1}\right]+$ $\mathbb{R}_{\geq 0}\left[C_{2}\right]$ with some curves $C_{i}$ on $X$. Suppose $C_{1}^{2}=C_{2}^{2}=0$. To show $X$ satisfies the bounded cohomology property, we may assume that $K_{X}=a C_{1}+a^{\prime} C_{2}$ with $a, a^{\prime}>0$ and every curve $D=a_{1} C_{1}+a_{2} C_{2}$ with $a_{1}>a$ and $2 a_{2}<a^{\prime}$, or $a_{1}<a$ and $a_{2}>a^{\prime}$.

Proof. By Propositions 2.3 and 2.6, we assume that every curve $D=a_{1} C_{1}+a_{2} C_{2}$ with $a_{1}, a_{2}>0$ and it is ample. By Lemma 3.3, $K_{X}=a C_{1}+a^{\prime} C_{2}$ with $a, a^{\prime}>0$. Then

$$
\begin{equation*}
\left(K_{X}-D\right) D=\left(a-a_{1}\right)\left(D \cdot C_{1}\right)+\left(a^{\prime}-a_{2}\right)\left(D \cdot C_{2}\right) . \tag{11}
\end{equation*}
$$

If $a_{1}>a$ and $a_{2}>a^{\prime}$, then by Riemann-Roch Theorem, (11) and Proposition 2.2, we have

$$
\begin{aligned}
2 h^{1}\left(\mathcal{O}_{X}(D)\right) & =2 h^{0}\left(\mathcal{O}_{X}(D)\right)+2 h^{2}\left(\mathcal{O}_{X}(D)\right)+\left(K_{X}-D\right) D-2 \chi\left(\mathcal{O}_{X}\right) \\
& \leq 2 q(X) h^{0}\left(\mathcal{O}_{X}(D)\right)
\end{aligned}
$$

If $a_{1}>a$ and $a_{2}<a^{\prime}$, then $D^{2} \leq 2 a_{1} a^{\prime}\left(C_{1} \cdot C_{2}\right)$ and

$$
\begin{align*}
\left(K_{X}-D\right) D & =\left(\left(a-a_{1}\right) C_{1}+\left(a^{\prime}-a_{2}\right) C_{2}\right)\left(a_{1} C_{1}+a_{2} C_{2}\right) \\
& =\left(\left(a-a_{1}\right) a_{2}+\left(a^{\prime}-a_{2}\right) a_{1}\right)\left(C_{1} \cdot C_{2}\right)  \tag{12}\\
& \leq\left(\left(a^{\prime}-2 a_{2}\right) a_{1}+a a^{\prime}\right)\left(C_{1} \cdot C_{2}\right)
\end{align*}
$$

If $2 a_{2} \geq a^{\prime}$, then by Riemann-Roch Theorem, (12) and Proposition 2.2, we have

$$
\begin{aligned}
2 h^{1}\left(\mathcal{O}_{X}(D)\right) & =2 h^{0}\left(\mathcal{O}_{X}(D)\right)+2 h^{2}\left(\mathcal{O}_{X}(D)\right)+\left(K_{X}-D\right) D-2 \chi\left(\mathcal{O}_{X}\right) \\
& \leq\left(2 q(X)+a a^{\prime}\left(C_{1} \cdot C_{2}\right)\right) h^{0}\left(\mathcal{O}_{X}(D)\right)
\end{aligned}
$$

Therefore, by Propositions 2.1 and 2.4, we may assume that either $a_{1}>a$ and $2 a_{2}<a^{\prime}$, or $a_{1}<a$ and $a_{2}>a^{\prime}$.

Lemma 3.6. Let $X$ be a smooth projective surface and the $\overline{\mathrm{NE}}(X)=\mathbb{R}_{\geq 0}\left[C_{1}\right]+\mathbb{R}_{\geq 0}\left[C_{2}\right]$ with some curves $C_{i}$ on $X$. Suppose $\kappa\left(X, C_{1}\right)=\kappa\left(X, C_{2}\right)=1$. Then $X$ satisfies the bounded cohomology property.

Proof. Note that $C_{1}^{2}=C_{2}^{2}=0$ since $\kappa\left(X, C_{1}\right)=\kappa\left(X, C_{2}\right)=1$. By Proposition 3.5, we may assume that $K_{X}=a C_{1}+a^{\prime} C_{2}$ with $a, a^{\prime}>0$ and every curve $D=a_{1} C_{1}+a_{2} C_{2}$ with $a_{1}>a$ and $2 a_{2}<a^{\prime}$, or $a_{1}<a$ and $a_{2}>a^{\prime}$. Note that

$$
\begin{equation*}
D^{2}=2 a_{1} a_{2}\left(C_{1} \cdot C_{2}\right) \leq a_{1} a^{\prime}\left(C_{1} \cdot C_{2}\right) \text { or } D^{2} \leq 2 a_{2} a\left(C_{1} \cdot C_{2}\right) . \tag{13}
\end{equation*}
$$

Without loss of generality, we assume that $a_{1}>a$ as $\kappa\left(X, C_{1}\right)=\kappa\left(X, C_{2}\right)=1$. Since the amplitude of divisors depends only its numerical equivalence class, we have

$$
\begin{equation*}
h^{0}\left(\mathcal{O}_{X}(D)\right)=h^{0}\left(\mathcal{O}_{X}\left(a_{1} C_{1}+a_{2} C_{2}\right)\right) \geq h^{0}\left(X, \mathcal{O}_{X}\left(a_{1} C_{1}\right)\right) \tag{14}
\end{equation*}
$$

By [10, Corollary 2.1.38], there exists a positive constant $c=\left(c_{X}^{-1} a^{\prime}\right) \cdot\left(C_{1} \cdot C_{2}\right)$ (which is independent of the choice of $D$ ) such that

$$
\begin{equation*}
h^{0}\left(X, \mathcal{O}_{X}\left(a_{1} C_{1}\right)\right) \geq\left(c_{X}^{-1} a^{\prime}\right) \cdot\left(C_{1} \cdot C_{2}\right) a_{1} \tag{15}
\end{equation*}
$$

By (14) and (15), we have

$$
\begin{equation*}
h^{0}\left(\mathcal{O}_{X}(D)\right) \geq\left(c_{X}^{-1} a^{\prime}\right) \cdot\left(C_{1} \cdot C_{2}\right) a_{1} \tag{16}
\end{equation*}
$$

Therefore, by (13) and (16), we have

$$
D^{2} \leq c_{X} h^{0}\left(\mathcal{O}_{X}(D)\right)
$$

Then the proof follows from Propositions 2.1 and 2.4.
Proof of Theorem 1.4. It follows from Lemmas 3.3, 3.4 and 3.6.

## 4. Proof of Theorem 1.6

The following is a crucial result in the proof of Theorem 1.6.
Proposition 4.1. Let $X$ be a smooth projective surface. Suppose $\overline{\mathrm{NE}}(X)=\sum \mathbb{R}_{\geq 0}\left[C_{i}\right]$ with some curves $C_{i}$ on $X$. Then each $C_{i}$ has $C_{i} \leq 0$. Let a curve $D=\sum a_{i} C_{i}$. Then (i) $a_{i}$ for all $i \Longleftrightarrow$ (ii) $D^{2}>0 \Longleftrightarrow$ (iii) $D$ is big $\Longleftrightarrow D$ is ample.

Proof. Note that each $C_{i}$ has $C_{i}^{2} \leq 0$ by [9, Lemma 1.22].
(i) $\Rightarrow$ (ii). If all $a_{i}>0$, then $D$ is an interior point of $\overline{N E}(X)$. So $D$ is big. Note that $D^{2} \geq 0$ since a negative curve does not be big. So $D$ is nef and then $D^{2}>0$.
(ii) $\Rightarrow$ (iii). Note that $D^{2}>0$ implies that $D$ is not a negative curve. So $D$ is nef and then $D$ is big. Note that $D$ is big implies that $D$ is nef as $D$ is a curve.
(iii) $\Rightarrow$ (iv). Suppose $D$ is nef and big. By the Kleiman's ampleness criterion (cf. [9, Theorem 1.44]), $D$ is ample as

$$
D_{>0}:=\{C \in \overline{\mathrm{NE}}(X) \mid D \cdot C>0\} \supset \overline{\mathrm{NE}}(X) \backslash\{0\}
$$

(iv) $\Rightarrow$ (i). Suppose $D$ is ample. Then $D$ is an interior point of $\overline{\mathrm{NE}}(X)$. Therefore, we have $a_{k}>0$ for all $k$.

Proposition 4.2. Let $X$ be a smooth projective surface and the $\overline{\mathrm{NE}}(X)=\sum \mathbb{R}_{\geq 0}\left[C_{i}\right]$ with some curves $C_{i}$ on $X$. If there exists a positive constant $m(X)$ such that $D^{2} \leq$ $m(X) h^{0}\left(\mathcal{O}_{X}(D)\right)$ for every curve $D$ with $D^{2}>0$ on $X$, then $X$ satisfies the bounded cohomology property.

Proof. Let a curve $D=\sum a_{i} C_{i}$ with $a_{i} \geq 0$ for each $i$ with $1 \leq i \leq \rho(X)$ and $K_{X}=$ $\sum b_{i} C_{i}$. Suppose $D^{2} \leq 0$. By [13, Proposition 2.8], $X$ has finitely many negative curves. Then we can assume that $D^{2}=0$ and $D \neq a_{i} C_{i}$ with $a_{i}>0$ for each $1 \leq i \leq \rho(X)$. Notice that $D$ is nef since $D$ is curve. So $D \cdot C_{i} \geq 0$. Then $0=D^{2}=D \cdot\left(\sum_{i} a_{i} C_{i}\right)$ implies that $D \cdot C_{i}=0$ for each $i$. Therefore, we have

$$
l_{D}=\frac{\left(K_{X} \cdot D\right)}{h^{0}\left(\mathcal{O}_{X}(D)\right)}=\frac{\sum b_{i}\left(D \cdot C_{i}\right)}{h^{0}\left(\mathcal{O}_{X}(D)\right)}=0
$$

So we end the proof by Propositions 2.1, 2.3 and 2.4.

Proof of Theorem 1.6. Let $K_{X}=\sum b_{i} C_{i}$ and a curve $D=\sum a_{i} C_{i}$ with $a_{i} \geq 0$ for all $i$. By Proposition 4.1, each $C_{i}$ has $C_{i}^{2} \leq 0$. Then $\kappa\left(X, C_{i}\right)=1$ implies that $C_{i}^{2}=0$. By Propositions 4.1 and 4.2, we can assume that $D$ is ample, $D^{2}>0$ and $a_{i}>0$ for each $i>0$. Note that

$$
\begin{equation*}
\left(K_{X}-D\right) D=\sum\left(b_{i}-a_{i}\right)\left(D \cdot C_{i}\right) . \tag{17}
\end{equation*}
$$

If $a_{i} \geq b_{i}$ for all $i$, then by Riemann-Roch Theorem, Proposition 2.2 and (17), we have

$$
\begin{aligned}
h^{1}\left(\mathcal{O}_{X}(D)\right) & =h^{0}\left(\mathcal{O}_{X}(D)\right)+h^{2}\left(\mathcal{O}_{X}(D)\right)-\chi\left(\mathcal{O}_{X}\right)+\frac{\left(K_{X}-D\right) D}{2} \\
& \leq q(X) h^{0}\left(\mathcal{O}_{X}(D)\right)
\end{aligned}
$$

Without loss of generality, we assume that $a_{1} \geq a_{2} \geq \cdots \geq a_{\rho(X)}$ since $\kappa\left(X, C_{i}\right)=1$ for all $i$. Then

$$
\begin{align*}
\left(K_{X}-D\right) D & =\sum\left(\left(b_{i}-a_{i}\right) C_{i}\right)\left(\sum b_{i} C_{i}\right) \\
& =\sum_{i \neq i^{\prime}}\left(b_{i}-a_{i}\right) b_{i^{\prime}}\left(C_{i} \cdot C_{i^{\prime}}\right) \\
& =\sum_{i<j}\left(\left(b_{i}-b_{i}\right) a_{j}+\left(b_{j}-a_{j}\right) a_{i}\right)\left(C_{i} \cdot C_{j}\right)  \tag{18}\\
& =\sum_{i<j}\left(\left(b_{i}-2 a_{i}\right) a_{j}+b_{j} a_{i}\right)\left(C_{i} \cdot C_{j}\right) .
\end{align*}
$$

If $2 a_{i} \leq b_{i}$ for all $i$, then by (18), we have

$$
\begin{equation*}
\left(K_{X}-D\right) D \leq \rho(X)(\rho(X)-1) \sum_{i<j} b_{i} b_{j}\left(C_{i} \cdot C_{j}\right):=2 L(X) . \tag{19}
\end{equation*}
$$

Then by Riemann-Roch Theorem, (19) and Proposition 2.2 imply that

$$
\begin{aligned}
h^{1}\left(\mathcal{O}_{X}(D)\right) & =h^{0}\left(\mathcal{O}_{X}(D)\right)+h^{2}\left(\mathcal{O}_{X}(D)\right)+\frac{\left(K_{X}-D\right) D}{2}-\chi\left(\mathcal{O}_{X}\right) \\
& \leq(q(X)+L(X)) h^{0}\left(\mathcal{O}_{X}(D)\right)
\end{aligned}
$$

Now we assume that $2 a_{i}>b_{i}$ for some $i$. Here, we present a technique skill as follows. Take a biggest integer $k$ such that $2 a_{k}>b_{k}$ and $a_{k} \gg 0$, then we may assume that $2 a_{i}>b_{i}$ for $i<k$ since $a_{1} \geq a_{2} \geq \cdots a_{\rho(X)}$, and $2 a_{j} \leq b_{j}$ for $j>k$. Let

$$
\begin{gathered}
A_{1}=\frac{k(k-1)}{2} \max _{i}\left\{\left|b_{i}\right|\left(C_{i} \cdot C_{j}\right),\left|b_{j}\right|\left(C_{i} \cdot C_{j}\right)\right\}, \\
A_{2}=(\rho(X)-k)(k-1) \max \left\{\left|b_{j}\right|\left(C_{i} \cdot C_{j}\right)\right\}, A_{2}=\sum_{k<i<j}\left|b_{i} b_{j}\right|\left(C_{i} \cdot C_{j}\right) .
\end{gathered}
$$

Then we have

$$
\begin{aligned}
\left(K_{X}-D\right) D & =\sum_{i<j \leq k}\left(\left(b_{i}-2 a_{i}\right) a_{j}+b_{j} a_{i}\right)\left(C_{i} \cdot C_{j}\right)+\sum_{i \leq k<j}\left(\left(b_{i}-2 a_{i}\right) a_{j}+b_{j} a_{i}\right)\left(C_{i} \cdot C_{j}\right) \\
& +\sum_{k<i<j}\left(\left(b_{i}-2 a_{i}\right) a_{j}+b_{j} a_{i}\right)\left(C_{i} \cdot C_{j}\right) \\
& \leq \sum_{i<j \leq k}\left|b_{j}\right| a_{i}\left(C_{i} \cdot C_{j}\right)+\sum_{i \leq k<j}\left|b_{j}\right| a_{i}\left(C_{i} \cdot C_{j}\right)+\sum_{k<i<j}\left|b_{i} b_{j}\right|\left(C_{i} \cdot C_{j}\right) . \\
& \leq\left(A_{1}+A_{2}\right) a_{1}+A_{3} \\
& \leq\left(A_{1}+A_{2}+1\right) a_{1},
\end{aligned}
$$

where using $a_{1} \gg 0$. Since the amplitude of divisors depends only its numerical equivalence class, we have

$$
\begin{equation*}
h^{0}\left(\mathcal{O}_{X}(D)\right)=h^{0}\left(\mathcal{O}_{X}\left(\sum a_{i} C_{i}\right)\right) \geq h^{0}\left(X, \mathcal{O}_{X}\left(a_{1} C_{1}\right)\right) \tag{20}
\end{equation*}
$$

By [10, Corollary 2.1.38], there exists a positive constant $c=2\left(A_{1}+A_{2}+1\right)$ (which is independent of the choice of $D$ ), we have

$$
\begin{equation*}
h^{0}\left(\mathcal{O}_{X}(D)\right) \geq h^{0}\left(\mathcal{O}_{X}\left(b_{1} C_{1}\right)\right) \geq c a_{1} \tag{21}
\end{equation*}
$$

Then by (20) and (21) we have

$$
\begin{equation*}
\left(K_{X}-D\right) D \leq 2 h^{0}\left(\mathcal{O}_{X}(D)\right) \tag{22}
\end{equation*}
$$

So by Riemann-Roch Theorem, Proposition 2.2 and (22), we have

$$
\begin{aligned}
h^{1}\left(\mathcal{O}_{X}(D)\right) & =h^{0}\left(\mathcal{O}_{X}(D)\right)+h^{2}\left(\mathcal{O}_{X}(D)\right)-\chi\left(\mathcal{O}_{X}\right)+\frac{\left(K_{X}-D\right) D}{2} \\
& \leq(q(X)+1) h^{0}\left(\mathcal{O}_{X}(D)\right) .
\end{aligned}
$$

This ends the proof of Theorem 1.6.
