(Dated: November 14, 2023)

The African School Series on Electronic Structure Methods and Applications (ASESMA) has had a positive impact on growth of computational material science in Kenya, visibility of Kenyan universities and strong collaboration ties between Kenyan scientist and the rest of the world. Data retrieved from Scopus indicate that computational materials scientists in Kenya have published numerous articles, book chapters, and conference proceedings in peer-reviewed, high impact journals. The trend is likely to continue due to access to affordable computers, spread of electricity to remote areas, open-source softwares and cheaper internet.

Keywords: DFT; Kenya; material science; ASESMA;

I. INTRODUCTION

The information extracted from Scopus database reveals that Kenyan scientists published over 40 thousands articles, book chapters, and conference proceedings in the last decade. This signifies an improvement in the quality of science in Kenya. Many of these articles published in high-ranking impact factor journals have attracted many citations. However, over 70% of these projects are not funded by the government of Kenya. There are many possible reasons for this. Fundamentally, the funding agencies have their own priority areas to fund such as in applied sciences. By default, this eliminates projects undertaken in the field of basic sciences. Such funding structures suppresses creativity and innovation. Science should never be at the whims of funding bodies. To some extent, computational materials scientist through international collaborations have successfully demonstrated that there can never be the "Kenyan Science" or "African Science" or "Western Science". What matters is relevance of the science to the society bearing in mind that the world is a global village.

Scientists in Kenya should devise innovative ways to evade the challenges of limited funding to carry out a variety of science projects, to continue contributing to the knowledge database. The pooling of resources and collaborations with Africa and the Western continents is one such avenue that can bear bountiful fruits. Such networks are important in growing scientific disciplines based on theory and virtual laboratories. For instance, the computational materials scientists' community is evolving rapidly due to availability of electricity throughout the country, computers, open-source codes, web-based data storage facilities, and availability of internet even in remote areas. Computational material science utilizes different simulation and modeling methods to expand our knowledge of different materials science topics. Through

computation, we are able to get information of atomic or molecular interactions that are impossible to see through experimental methods. Density-functional theory (DFT) is one of the popular computational methods used in physics, chemistry and materials science used to investigate the electronic structure of many-body systems^{1,2}. There have been initiatives by international bodies to popularize computational materials science in Africa, and Kenya has not been left behind. The African School on Electronic Structure Methods and Applications (ASESMA) is an initiative that have contributed immensely on research activities surrounding DFT in Kenya and Africa at large³⁻⁹. Kenya hosted the 2012 ASESMA school which saw a number of western scientists and others from Africa camping in the country for two weeks to discuss the basics of electronic structure and hands-on tutorials on simulations of materials. The seed sown at that time has led to growth of new crop of computational materials scientists equipped with both the theory and coding skills for development and application of DFT open-source codes¹⁰⁻¹³. Their collaboration with western scientists have in principle enhanced the science in Kenyan institutions of higher learning and improved their visibility across the world. Today, Kenyan computational materials scientists have everything they need to do a world-class computational materials science research and compete favourable with the rest of the world in generation on new ideas and expansion of existing knowledge about materials¹⁴⁻⁷⁰.

ACKNOWLEDGEMENTS

This work was inspired by lectures at ASESMA2023 school that took place in Kigali, Rwanda. The author is grateful for the financial support provided by Kenya Education Network (KENET) through Computational Modeling and Materials Science (CMMS) Research mini-grants 2019 and travel grant of June 2023. The computer resources at CTheP laboratory at Masinde Muliro University of Science and Technology and assistance pro-
