Abstract

This survey article has grown out of the GAIED (pronounced “guide”) workshop organized by the authors at the NeurIPS 2023 conference. We organized the GAIED workshop as part of a community-building effort to bring together researchers, educators, and practitioners to explore the potential of generative AI for enhancing education. This article aims to provide an overview of the workshop activities and highlight several future research directions in the area of GAIED.

1 Introduction

Recent advances in generative AI, in particular deep generative and large language models like ChatGPT, are having transformational effects on the educational landscape. On the one hand, these advances provide unprecedented opportunities to enhance education by creating unique human-machine collaborative systems. For instance, these models could act as personalized digital tutors for students, as digital assistants for educators, and as digital peers to enable new collaborative learning scenarios. On the other hand, the advanced capabilities of these generative AI models have brought unexpected challenges for educators and policymakers worldwide. For instance, these advances have caused a chaotic disruption in universities and schools to design regulatory policies about the usage of these models and to educate both students and instructors about their strengths and limitations.

For us to fully realize these opportunities and tackle these challenges, it is time critical to build a community of researchers, educators, and practitioners that are “multilingual” with (a) technical expertise in the cutting-edge advances in generative AI, (b) first-hand experience of working with students in classrooms, and (c) know-how of building/deploying educational technology at scale. The goal of the GAIED (pronounced “guide”) workshop has been to foster such a multilingual community and bring together researchers, educators, and practitioners to explore the potential of generative AI for enhancing education. The workshop investigated these opportunities and challenges in education by focusing discussions along two thrusts:

*<https://gaied.org/neurips2023/>

[†] Authors are listed in alphabetical order.

- I. **GAI→ED**: Exploring how recent advances in generative AI provide new opportunities to drastically improve state-of-the-art educational technology.
- II. **ED→GAI**: Identifying unique challenges in education caused by these recent advances and how to tackle them by bringing in desired safeguards along with technical innovations in generative AI.

2 Overview of the GAIED@NeurIPS'23 Workshop Activities

In this section, we provide an overview of the GAIED workshop organized at the NeurIPS'23 conference; full details are available on the [workshop website](#). Given that this workshop bridged ideas in a central topic in machine learning (generative AI) and a key domain for societal impact (education), the workshop attracted considerable interest and engagement in the NeurIPS community. The workshop was organized as a physical event, and we had up to 150 attendees at the peak. The workshop program, including two poster sessions and a panel session, and the physical environment at the NeurIPS'23 venue provided ample opportunities for extensive discussions and networking among attendees.

2.1 Topics of Interests

As mentioned above, the workshop focussed on two thrusts, each covering several topics of interest. These topics served as guidelines when selecting the speakers for invited talks and when accepting the contributed papers.

The topics in the **GAI→ED** thrust focussed on leveraging recent advances in generative AI to improve state-of-the-art educational technology, including (i) exploring the capabilities of generative AI and large-language models in novel educational scenarios, e.g., personalized content generation and grading; (ii) exploring novel human-machine collaborative systems where generative models play different roles, e.g., as digital tutors, assistants, or peers; (iii) sharing viewpoints, novel ideas, or field experiences about using generative AI in real-world educational settings.

The topics in the **ED→GAI** thrust focussed on tackling unique challenges in education by bringing in desired safeguards along with technical innovations in generative AI, including (i) developing novel prompting and fine-tuning techniques to safeguard the outputs of generative AI and large-language models against biases and incorrect information; (ii) developing novel safeguarding techniques to validate the authenticity of content, e.g., to determine whether an assignment was written by students or generated by models; (iii) sharing viewpoints, unique challenges, or field experiences about concerns among educators and policymakers in using generative AI.

2.2 Accepted Papers and Poster Sessions

In our call for papers and participation, we invited submissions of research papers reporting new results and position papers reporting new viewpoints or field experiences relevant to the workshop's topics of interest mentioned above.³ For the reviewing process, we assembled a program committee of over 50 reviewers, recruited both through invitations and through a special call for researchers with relevant experience to act as reviewer.⁴ We had 48 paper submissions in total. The reviewing process was double-blind, and each paper received at least three reviews from our program committee.

The final workshop program included 33 accepted papers that were presented as part of two poster sessions. We also requested authors to prepare a 60 second short lighting video to broaden the dissemination of their works. Accepted papers are publicly available as non-archival reports and are accessible on the workshop website along with the poster PDFs and video material submitted by authors.⁵ In Section 3.1, we provide an overview of the key research topics covered in these 33 papers at the workshop.

2.3 Invited Talks and Panel Session

We invited a set of speakers with diverse backgrounds ranging from researchers with different expertise to industry practitioners and educators directly involved in educational activities. The invited speakers

³Full details about the call are available at <https://gaied.org/neurips2023/index.html#CFP>

⁴The final list of reviewers is available at <https://gaied.org/neurips2023/index.html#Reviewers>

⁵Link to paper PDFs can be found at <https://gaied.org/neurips2023/index.html#Papers>

covered various topics of interest and achieved a balance across different perspectives and disciplines. In total, the workshop had 6 invited talks; each of these talks being about 20 minutes long. The list of speakers, along with their talk titles, is provided below:

1. [Kristen DiCerbo](#) (Khan Academy): *Implementation of AI Tools in Education at Scale*. The talk discussed the development and research efforts behind Khanmigo, Khan Academy’s GPT-4-powered tutor for students and assistant for teachers. In particular, the talk presented insights into Khanmigo, including the choice of models, approach to safety and security, and, most importantly, efforts to build learning science into the system so that it will help more learners learn more. References from the talk and related work by the speaker: [1].
2. [Elena Glassman](#) (Harvard University): *Generating and Revealing Structured Variation to Help Humans Learn Programming*. The talk discussed how AI-assisted programming tools are rapidly being integrated into CS classrooms and highlighted a key challenge of this rapid integration: reliance on AI assistance may hamper learning as learners may not be sufficiently cognitively engaged with the AI assistance. The talk also presented recent works on cultivating cognitive engagement through the use of aligned differences based on the design implications of various theories of human concept learning and related psychological studies. References from the talk and related work by the speaker: [2–5].
3. [Hieke Keuning](#) (Utrecht University): *Learning Programming in the Era of Generative AI*. The talk discussed how the rise of generative AI and LLMs is changing the nature of programming and, consequently, the need to teach programming at different levels of abstraction with the need for different skills. The talk presented opportunities to use LLMs to support students’ learning by generating formative feedback, explanations, and hints for programming tasks. The talk further highlighted challenges that LLM-based support may not be effective directly as its usefulness depends greatly on the learning goals and context. References from the talk and related work by the speaker: [6–13].
4. [Tobias Kohn](#) (Karlsruhe Institute of Technology): *Hopes and Fears: Should We Use AI in Schools and Will It Revolutionise How We Think About Education?* The talk discussed how generative AI in education has been a highly polarising issue, with some welcoming the new opportunities while others warning of the risks of how students may utilize generative AI. The talk also provided perspectives on what it would mean to include the “correct” use of generative AI in our curricula. One of the key messages is that generative AI must not replace crucial human interaction in education. References from the talk and related work by the speaker: [7, 14, 15]
5. [Chris Piech](#) (Stanford University): *Generative AI for Joyful Education*. The talk presented an overview of different AI and machine learning algorithms for enhancing education, covering a decade of research from the emergence of deep knowledge tracing in 2015 to recent developments in generative AI. One of the key messages is that we drastically underutilize human potential, as the magnitude of people who want to teach is roughly proportional to the magnitude of people who want to learn. The talk also highlighted new grand challenges and research directions in leveraging generative AI for education by developing AI models to augment teacher training, make learners generate new content, create curiosity among learners, and spark joy. References from the talk and related work by the speaker: [16–24]
6. [Lu Wang](#) (University of Michigan): *Personalized Writing Learning Assistant using Natural Language Processing: Opportunities and Challenges*. The talk discussed ongoing efforts to leverage LLMs to build personalized argumentative writing assistants. The talk also presented recent works on building human-NLP collaborative tools to help educators create active learning opportunities at scale. The talk further highlighted challenges associated with employing LLMs for educational support because of hallucinations, outdated knowledge, the lack of complex reasoning abilities, and the lack of creativity. References from the talk and related work by the speaker: [25–29].

In addition to these invited talks, the speakers also participated in a panel session of 60 minutes duration. In Section 3.2, we provide an overview of the research themes discussed in the panel session. The video recordings of these invited talks and the panel session are publicly available.⁶

⁶Link to video recordings can be found at <https://gaied.org/neurips2023/index.html#Speakers>

Paper	Application Domain and Educational Scenario	Models	Techniques
3 [30]	Detecting machine generated text to avoid misuse in academic settings	GPT-4, GPT-3.5	In-context
4 [31]	Generating answers and explanations for different academic subjects	GPT-4, GPT-3.5	In-context
5 [32]	Generating program repair for Python programming education	StarCoder, CodeGen	Fine-tuning
7 [33]	Generating new tasks for elementary-level visual programming	LSTM models, GPT-4	New architecture
8 [34]	Generative student agents for teacher training in elementary schools	GPT-4	In-context
9 [35]	Generating Q/A across different cognitive levels for 8th-grade science	GPT-3.5	In-context
10 [36]	Generating distractors and feedback for math multi-choice questions	GPT-4, GPT-3.5	In-context
11 [37]	Conversational Q/A for educating patients about their clinical visits	GPT-4	In-context
12 [38]	LLMs for early forecasting of student performance in MATLAB course	FLAN-T5	Fine-tuning
14 [39]	Generating synthetic student-teacher dialogues for physics	GPT-4, LLaMA-2	In-context, fine-tuning
15 [40]	Classifying student help requests in programming courses	GPT-4, GPT-3.5	In-context, fine-tuning
16 [41]	Generating images for virtual reality based clinical education	Diffuson models	New architecture
17 [42]	Generating multi-choice questions aligned with Bloom’s taxonomy	GPT-3.5, RoBERTa	In-context
18 [43]	Generating educational questions using small language models	T5-base, T5-small	Pre-training, fine-tuning
19 [44]	New dataset of student-ChatGPT dialogues in EFL writing education	GPT-3.5	In-context
21 [45]	Evaluating LLMs on high-school mathematical problem solving tasks	LLaMA-2, MAmmoTH	Fine-tuning
26 [46]	Investigating behavior of LLMs when generating code explanations	GPT-4, GPT-3.5, LLaMA-2	In-context
27 [47]	Generating stories in Chilean Spanish to assist students in writing	GPT-3, BLOOM, GPT-2	Fine-tuning
30 [48]	Retrieval-augmented generation using LLMs to enhance healthcare education	GPT-4	In-context
31 [49]	Generating comprehensive lecture metadata and questions from lecture videos	GPT-4	In-context
32 [50]	Conversational programming and interactive support in CS courses	GPT-4	In-context
33 [51]	Generating mini-puzzles and images to aid language learning	PaLM, Imagen	In-context
34 [52]	Assisting teachers in Sierra Leone with LLM-powered chatbot via WhatsApp	GPT-3.5	In-context
35 [53]	Framework for introducing pedagogical transparency in GAI applications	n/a	n/a
38 [54]	Conversational tutoring systems with LLM agents via learning-by-teaching	GPT-4	In-context
39 [55]	Producing graphs from natural language commands for mathematical pedagogy	GPT-4 with SymPy	In-context
40 [56]	Interactive QA to support conceptual discussion of high-school math concepts	GPT-3.5	In-context
41 [57]	Personalized advising for undergraduate major recommendation in universities	GPT-4, GPT-3.5	In-context
43 [58]	Retrieving exercises relevant to user queries for online language learning	GPT-4, mBERT	In-context, fine-tuning
44 [59]	IRT evaluation of LLMs’ ability to generate math assessment questions	GPT-4	In-context
46 [60]	Generating feedback for high-school programming assignments	GPT-4, GPT-3.5	In-context
47 [61]	Detecting educational content in videos for kindergarten literacy and maths	BLIP-2, Whisper	Supervised training
48 [62]	Enabling conversations with historical scientists for history education	GPT-3.5	In-context

Figure 2: Summary of the 33 accepted papers at the workshop along different dimensions, including the application domain and educational scenario considered, models used, and specific learning/training techniques employed.

3.2 Key Research Directions

Next, we highlight a few key research directions based on questions and discussions in the panel session at the workshop.

Emerging curricula and skill sets. Generative AI is bringing in transformational effects on the educational landscape, quickly changing how we think about education, from how we teach to what skills students need. For instance, generative models like GPT-4 can provide solutions to the questions typical in many undergraduate curricula. In light of these changes, it is time-critical for the community to jointly explore what this means for instructors and students, and how curricula should evolve to keep up with these advances. Some of the key questions along this theme are:

- How do teaching practices, instructors' roles, and curricula need to adapt given the ubiquitous availability of generative AI models and their capabilities to solve questions in undergraduate curricula?
- How might the ubiquity of AI in generating content challenge current assessment methods, and what innovative strategies could be employed to fairly and effectively evaluate student learning?
- Are there any risks that the usage of generative AI in educational settings could homogenize critical thinking or creativity among students, and what measures can be taken to prevent this?
- How can we utilize generative AI to personalize education at scale, and what curricular changes are necessary to support individualized learning journeys?

Diversity, equity, inclusion, and accessibility. With the introduction of AI tools in education, it is crucial to ensure that these tools benefit everyone and increase equity in education. However, there is an increasing concern that the current trajectory of AI in education could lead to a wider gap between institutions/individuals that can afford these technologies and those that cannot. Consequently, it is crucial for us to explore AI's potential in either closing or widening the gap in educational opportunities, and discuss ways to ensure these technologies are accessible and fair to all learners. Some of the key questions along this theme are:

- What measures can be taken to increase the accessibility of AI educational tools to underprivileged or underrepresented communities in order to bridge the digital and educational divide?
- How can the algorithms behind generative AI be audited for fairness and transparency to ensure that all students benefit equally from these technologies?
- What are the ethical considerations when using AI to track and analyze student performance data, particularly concerning the privacy and agency of students from vulnerable populations?
- How can we combat the risk where AI systems, mostly developed in technologically advanced countries, are imposed upon educational institutions in less developed regions?

Metrics and evaluation. The challenge with new AI technologies in education doesn't stop with their development; it continues into how we deploy and assess their effectiveness in real classrooms. For instance, one of the challenges for AI and machine learning researchers developing new generative models for educational use is what automated metrics, objectives, and benchmarks to use that align the model's performance with educational goals. To ensure that developed generative educational technologies will achieve the desired educational goals, the community must connect the dots between basic AI research and classroom outcomes, creating ways to reliably measure the impact of AI on student learning over time. Some of the key questions along this theme are:

- What specific benchmarks and standardized metrics should be developed to rigorously test and compare the effectiveness of various generative AI tools developed for educational applications?
- How can we improve the pipeline from research idea, to technical development, to deployment and evaluation with real students?
- Given the constant development and changes in models like GPT-4 and Gemini that big corporations own, how should we ensure reproducibility and comparison of techniques developed over time?
- How can we establish longitudinal studies to gauge the long-term effects of generative AI on students' critical thinking, creativity, and ability to learn independently?

4 Conclusions

Generative AI for education is an important, time-critical area for researchers, educators, and practitioners: ongoing advances in generative AI will continue providing unprecedented opportunities to enhance education, and unique challenges in education will require further technical innovations in generative AI. The talks, papers, and discussions at the GAIED@NeurIPS'23 workshop highlighted excitement in the community around the main areas covered in this article, and the diverse array of perspectives as well as panelist comments demonstrated the importance of drawing on ideas from multiple disciplines, including (but not limited to) human-computer interaction, learning sciences, natural language processing, machine learning, and program synthesis. This need for multiple perspectives and the unique challenges raised by educational applications highlight the need for continued fostering of community in the area of GAIED.
