NEW STAIRWAYS TO THE STARS. BIRTH AND EVOLUTION

OF TWO PIONEERING USENET NEWSGROUPS

IN ASTROPHYSICS (1983-1994)

Cmc: computer-mediated communication

Abstract: The foundation of two pioneering Usenet newsgroups in astrophysics - still existent

today - and some of the main milestones in their history have been tracked from the origins at

Princeton University in 1983 to 1994. To this aim, in line with authoritative recommendations

from the discipline of web history, different kinds of sources have been retrieved and

combined: mainly, online archives of Usenet newsgroups and human sources. The latter have

included on one side the kind contribution provided by four astrophysicists, two of which had

a role in the maintaining of these newsgroups, through individual interviews; on the other side

that from the sixty-seven researchers who answered a purpose-built questionnaire submitted

within the Italian National Institute for Astrophysics in May 2023.

Keywords: Usenet newsgroups; computer-mediated communication; web history; astrophysics; early web; scholarly communication; internet

1. Introduction

The present research will investigate the creation and main milestones - in the first ten years of activity - of two pioneering Usenet newsgroups dedicated to astrophysics, apparently unexplored by previous literature. Together with mailing lists, Usenet newsgroups have been acknowledged a role for getting to valuable historical information about definite communities, so it is hoped that the present research may add something to what is known about the astrophysics environment in the last twenty years of the twentieth century.

As it is known, Usenet newsgroups at large can be dated back at the very beginning of the year 1980, after the creation of Usenet at the end of 1979.²

Part VI: The Public Announcement." CircleID, November 27, 2019,

An early, simple and - unsurprisingly - entirely US-based definition of Usenet newsgroup can be found in an unsigned post dated April 20, 1982:

"USENET is an international network of UNIX sites, with hookups into the ARPA network, too. It is basically a fancy electronic Bulletin Board system. Numerous BTL machines are connected [...] In addition, there are major sites at universities: UC Berkeley, Duke, U Waterloo, and so on ... and at industry nationwide: DEC, Tektronics, Microsoft, Intel, etc. There are numerous bulletin board categories, set up in a hierarchy. The first "node" in a category name indicates the breadth of distribution, later nodes indicate content. [...] Newsgroup naming conventions: NO prefix= LOCAL ONLY; btl. = Bell Labs; net. = USENET wide categories; fa. = from ARPA-Net (no return feed, except via mail)."

In the light of the secondary role Usenet newsgroups presently play after the diffusion of new means of online communication,⁴ it seems useful to remember with Hyman that "USENET was fabulously successful, growing very rapidly from a few computers in North Carolina, and soon spreading to hundreds of systems throughout the world, but predominantly in North America" and that

"Usenet [was featured] as a burgeoning locus of Internet culture, to the point where it became a metonym for "the Net" of the 1990s itself. For a generation of young college students, Usenet served as their first experience with the Internet [...] . Indeed, this period marked Usenet's peak use, followed by a gradual decline at the start of the new millennium [...] as its

⁵ Avi Hyman, "Twenty Years of ListServ as an Academic Tool," *The Internet and Higher Education*, no. 6 (2003): 17–24, 18-19.

underlying communications protocols were superseded by the Internet's TCP/IP (Russell, 2014). Usenet was used not just for discussion, but also for producing and circulating a huge volume of informational, educational, humorous, and folkloric material, including technical standards, tutorials [...]."

The two Usenet newsgroups which will be investigated are sci.astro (unmoderated) and sci.astro.research (moderated). Their origins date back to 1983, about forty years ago; their activity has been substantially uninterrupted thencefort - all the same, they have undergone a notable evolution, whose main stages will be synthetically accounted for, until 1994.

According to the short scope-notes made available since their debut, sci.astro was - and still is - dedicated to "Astronomy discussions and information", while sci.astro.research was meant as an advanced venue (a "Forum in astronomy/astrophysics research").

Sketching the history of these two international newsgroups doesn't obviously equal tracking the whole history of the uptake of discipline-specific Usenet newsgroups in the worldwide astrophysical context. As it has rightly been stated for the development of the Net

at large, and even more for the early years of the networked communication,⁹ it would be totally wrong to try and draw historic accounts of cmc tools' uptakes as linear worldwide processes. Instead, it was a multiple-velocity and multimode process, taking place both on the large scale of nations¹⁰ and on the smaller one of regions, communities¹¹ and institutions. It was affected by multiple variables, such as the type of the internet connections available, and the technical and technical-political dynamics behind it;¹² especially in the early period, other

Press, 1997), chap. 3,

factors could have been at play, such as localisms, which in astrophysics as well as in other disciplines could justifiably grow, for example, around outstanding projects or research centres, until the wider diffusion of the internet in the '90s - and beyond. Such a technocultural complexity evokes Hyman's lucid definition of "virtual tribalism [...] rather than a global village" ¹³ and, for as much as the Internet is concerned, challenges the famous concept McLuhan had forged for the interconnected world.

As an example in the astrophysics domain, it seems notable that as late as 1996 the 130-pages wide guide "Yellow NetPagesTM - USENET Newsgroups", which listed about 15.000 newsgroups worldwide,¹⁴ testifies the persistence of dozens of astronomical newsgroups of national or institutional scope (e.g.: research centres), when the two international newsgroups under examination were born years before. Also, in 1994 Andernach and colleagues inform that "the 'ADASS' news hierarchy (for Astronomical Data Analysis Software and Systems) has been established in parallel to the Usenet news. This set of newsgroups is intended as a forum for discussion of astronomical data analysis software. These newsgroups were established by the IRAF Group at NOAO. [...] The hierarchy

currently covers the ADASS Conferences and discussions about IRAF-related software, but other groups are encouraged to establish additional subgroups."15

All the same, the creation of sci.astro and sci.astro.research seems to mark an especially significant milestone in the virtualization of the astrophysical communication, due to various factors: their international and broad scope; their many-to-many working mode - which made their uptake different from that of other early-internet communication tools such as the earlier one-to-one email. As such, it calls forth the idea of a wide learning community and some of the related dynamics. For as much as it results, it also marks a very early stage in the uptake of Usenet newsgroups for scholarly communication in general.

2. Method and Sources

Very conveniently, web historian Camille Paloque-Bergès recalls the teaching of the "Annales" School when bolstering the need to "integrate [...] a growing variety of sources" in order to gain well-grounded research in web history. ¹⁶ In fact, this approach looks mandatory,

https://iopscience.iop.org/article/10.1086/133497/pdf (accessed 23 Jan 2024).

¹⁵ Heinz Andernach, Robert J. Hanisch, and Fionn Murtagh, "Network Resources for Astronomers," *Publications* of the Astronomical Society of the Pacific (PASP) 106 (1994): 1190–1216, on 1192,

[&]quot;Les archives de courrier électronique sont considérées comme 'un problème très contemporain de préservation de la mémoire' (Bergeron *et al.*, 2014, p. 212). L'intégration d'une variété croissante de sources [....] est un fait accepté de l'historiographie depuis au moins l'école des Annales." ["The archives of emails are considered as 'a very contemporary issue of preservation of memory' (Bergeron *et al.*, 2014, p. 212). The integration of a growing variety of sources [....] is a fact accepted by historiography at least since the Annales school" (Paloque-Bergès, Camille. *Qu'est-Ce Qu'un Forum Internet? Une Généalogie Historique Au Prisme Des*

considered how deficiently and often fortuitously networked messages have often been preserved before becoming research objects years later - so that, for example, Valérie Schafer talks about "[...] black boxes, which seldom allow to measure the loss of data and the representativeness of the preserved elements." If possible, this observation results to be even more appropriate for newsgroups, whose specific situation has been summarized as follows: "the main challenge regarding Usenet archives for historians and social scientists is their accessibility, fragmentation and non-exhaustivity: not only are there holes in the archives [...] but there are also several collections with concurrent data [...]." In full adhesion to these views and to the consequent recommendations, the present research will combine multiple sources: 1. human sources - constituted both by (1.a.) the answers of four individual astrophysicists, two of which had a role in the maintaining of one or the other resource; and by (1.b.) the results of a survey conducted among Italian astrophysicists and technologists in May 2023, dedicated to their experiences as users of cmc and newsgroups, as will be detailed

below; 2. preserved online archives of Usenet newsgroups, which allow to harvest invaluable information.

In fact a third source has been tentatively explored, the one represented by the literature, but it hasn't resulted to be particularly fruitful.

[Sub-paragraphs of par. #2 will be included in a more advanced draft.]

3. A History, re-discovered

3.1. In the beginning: Net.astro and Net.astro.expert (November, 1983)

At the origins of the international Usenet newsgroups dedicated to astrophysics we find net.astro and net.astro.expert.

The creation of net.astro, as well as that of net.astro.expert as we'll see below, was proposed by US astrophysicist William L. Sebok (1951-2022), by that time 32 years old and working at Princeton University¹⁹. He did so through a post on the meta-newsgroup

¹⁹ "A brilliant student, Bill graduated from Tallmadge High School and the University of Akron. He attended graduate school at Caltech, where he earned a Ph.D. in astronomy. Bill was a postdoctoral researcher at Princeton University and spent most of his career in the Astronomy Department at the University of Maryland, College Park, where he was a computer system manager and software expert." ("Obituary," https://web.archive.org/web/20230103182538/https://www.tributearchive.com/obituaries/23588343/william-l-sebok/ellicott-city/maryland/harry-h-witzkes-family-funeral-home, accessed 29 Jan 2024.)

net.news.group, and on newsgroup net.space, on November 14, 1983,²⁰ substantially following the general procedure indicated by Curt Stephens on February 3, 1982.²¹

The important A-News Archive, which covers the almost initial period of newsgroups' existence, doesn't contain any astronomical or astrophysical newsgroup. The same result comes from some further early lists of newsgroups we have retrieved, covering the years 1982-1983 and prior to Sebok's proposal. Thus, it appears to be very likely that

the post on net.space (https://groups.google.com/g/net.space/c/76iybyGt5uQ/m/ejlczvX97XcJ) and six, also
favourable, to that on net.news.group
(https://web.archive.org/web/20240130134653/https://groups.google.com/g/net.news.group/c/76iybyGt5uQ/

[&]quot;A new newsgroup may be created by simply posting material to the net under a new newsgroup name. However, THIS IS NOT RECOMMENDED! There are limits to the number of newsgroups that can be supported by the net. If you wish to send material to the net, first try to find an established newsgroup that deals with a subject related to that material. If there is no appropriate newsgroup, suggest the creation of a new group via net.news.group. Usually, there will be enough feedback to establish whether there is an audience for the subject that you would like to discuss."

(https://web.archive.org/web/20231025112028/https://groups.google.com/g/net.news.group/c/IdR9WeVdGc 4 , accessed 30 Jan 2024.

net.astro and net.astro.expert were in fact pioneering initiatives for astrophysics. Not only: about the other academic disciplines, although it would be risky to judge about the scholarly nature of the newsgroups included in the lists mentioned above before a complete scrutiny of their content, it seems that the newsgroups created before net.astro and net.astro.expert were seldom of a scholarly nature - although they may have conveyed highly specialistic content such as IT issues and solutions. A couple of these very rare cases are a newsgroup for mathematics, net.math, which results to have born on February 8, 1982, ²² and another one for physics - net.physics - which was created in the Summer of the same year. This emphasizes the importance of net.astro and, especially, net.astro.expert as pioneering initiatives in the context of early-web scholarly communication at large.

Now, in Sebok's words, the proposal was the following:

"I would like to propose the establishment of net.astro. This group would be for topics in and relating to astronomy. It would NOT be about the space program, which is the territory of net.space. In a sense I am proposing to split the discussion of purely astronomical topics from net.space. There is much excitement going on in astronomy and many people with access to the net who could contribute information on what is currently happening (indeed many of those people are making it happen). Many (perhaps, judging from the people at Princeton, I could even say most) of these people keep silent because they are not very interested in the contents of net.space (and often, not very interested in the contents of the rest of the net itself). I am proposing a news group for these people, to bring them out of the woodwork. And I think that news of what is happening in astronomy is exciting enough to be of interest to the general public."²³

News/NET.math/82.02.08_watmath.1664_net.math.html (accessed 30 Jan 2024).

²²https://web.archive.org/web/19991117155759/http://communication.ucsd.edu/A-

²³https://web.archive.org/web/20231017130607/https://utzoo.superglobalmegacorp.com/usenet/news008f1/ b19/net/news/group/835.tx (accessed 30 Jan 2024).

And following:

"Perhaps what I am really proposing is a net.astro.wizards, in analogy with net.unix-wizards. Just plain net.astro would then be for questions of the order of "Why does the moon look larger at the horizon?" which would be unwelcome in net.astro.wizards. If amateur astronomers wished to establish a group to discuss topics of interest to them they could call it something like net.astro.amateur. Comments? Please feel free to mail comments to me or post them to this group on the net."²⁴

In fact, Sebok was proposing to create two different-level newsgroups, one for tendentially non-specialistic discussion, net.astro, and especially another one for more advanced topics - which he at first hypothesized to call "net.astro.wizards", but later on named "net.astro.expert". Additionally, he supposed that astronomy amateurs might wish to create a group of their own, different both from net.astro and from net.astro.expert ("net.astro.amateurs") - but seeming unsure about that.

Indirectly, Sebok informs us that "purely astronomical topics" were (sometimes?) formerly discussed in the earlier newsgroup "net.space". As we learn, net.space already existed by April 19, 1982, was dedicated to "Space programs and research" and was "undigested from fa.space". 26

Also interestingly to us, in an email reply to Bill Sebok about his proposal, which was re-posted by the latter on November 21, 1983, US IT expert Douglas Tody, by that time

²⁴ Ibid.

²⁵ Sebok's change of mind about the name of the new resource is attested in a message dated 21 Nov 1983 (https://web.archive.org/web/20230404121504/https://utzoo.superglobalmegacorp.com/usenet/news007f3/b19/net/news/group/866.txt (accessed 30 Jan 2024).

²⁶https://web.archive.org/web/20231024150938/https://www.usenetarchives.com/view.php?id=net.sources& mid=PGFuZXdzLkF1Y2JhcnBhLjExODI%2B (accessed 30 Jan 2024).

working at Kitt Peak National Observatory, informed Sebok that he had "talked about setting up an electronic network among the astronomy centers in the past but never got anywhere. Your idea seems like a good way to do it, since there are already a significant number of sites on the unix network".²⁷

Going back to Sebok's initiative, in the proposal post mentioned above, in a further post two days later, and in a shortly later message on net.astro.expert (December 18, 1983),²⁸ Sebok points out that he had started discussing his idea with his colleagues at Princeton University around October (e.g.: "This article been posted after consultation with the

_

²⁷ The email was reposted by Sebok within a digest message, sent to both net.news.group and net.space. For the latter see https://web.archive.org/web/20240108155455/https://groups.google.com/g/net.space/c/7sMsKmbf920 accessed 30 2024; for the former, https://web.archive.org/web/20240108160219/https://groups.google.com/g/net.news.group/c/7sMsKmbf920 /m/Z7VkeT4svswJ .About Doug Tody, by that time 31 years old, see Robert Hanisch, "Douglas Tody (1952-2022)," Bulletin of the AAS 54, no. 1 (2022): 1-5., https://web.archive.org/web/20240131151737/https://baas.aas.org/pub/2022i034/release/1 (accessed 30 Jan 2024).

Respectively: 14 and 16 Nov 1983, subject "net.astro", in the same thread on GG (https://web.archive.org/web/20240130160528/https://groups.google.com/g/net.news.group/c/76iybyGt5uQ), accessed 31 Jan 2024; 18 Dec 1983, subj. "net.foo and net.foo.expert", https://web.archive.org/web/20230426191214/https://groups.google.com/g/net.astro.expert/c/Bs2lqxlZJr0, accessed 31 Jan 2024.

members of the Department here, as well has some of the astronomers at the Institute for Advanced study.").²⁹

As noted before, what Sebok aims at is a two-tier communication system:

"the main concern I have been told about in the month of consultation I did before posting the original article was a fear that the level of discussion in this group would be too trivial to be worth following (and contributing to). Thus the idea of a separate subgroup, tentatively named net.astro.wizards. These people are less computer oriented, and thus need more encouragement, than professionals in systems programming (net.unix-wizards) or artificial intelligence (net.ai). Also, as I previously mentioned, amateur astronomers would then be in good position to establish their own group, tentatively net.astro.amateur. Amateur astronomers and professional astronomers are mostly (but not always) different people. There would then be a well defined place, net.astro, to put beginners questions."³⁰

On the same net.astro.expert, on December 18, Sebok is very clear about his general goals, sheds light on the perceived attitude of his environment and mentions a previous achievement of his, the server Astrovax:

"My goals in the establishment of net.astro were 1) to get astronomers involved in the net 2) to increase the support of astronomers and astronomy sites for net as a whole and to encourage new astronomy sites to join. I know how tenous the initial support for the net really is, if it wasn't for my own action astrovax would not be on the net."³¹

Apart from in the post just mentioned, traces of these origins and intentions can hardly be found in the first few years of the best-known online archives of newsgroups, Google

²⁹https://web.archive.org/web/20240131142016/https://groups.google.com/g/net.news.group/c/76iybyGt5u

Q (14 Nov. 1983; accessed 31 Jan 2024).

³⁰ Ibid. (16 Nov 1983).

https://web.archive.org/web/20230426191214/https://groups.google.com/g/net.astro.expert/c/Bs2lqxlZJr0 (accessed 31 Jan 2024).

Groups, whose collection of net.astro spans from November 29, 1983 to October 19, 1986³² (starts a bit later in different archives; ends the same day on Usenet Archives), while net.astro.expert is there from November 29, 1983 to October 11, 1986.³³ For net.astro, the oldest message preserved on GG and written by founder William L. Sebok (subject: "STS-9 launch and Pravda announcement"),³⁴ is a reply to a message which is not included, so even this wide collection doesn't provide us either with the first post, or with the new newsgroup's original scopes, motivations or policies.

The actual creation of net.astro and net.astro.expert happened through two control messages sent by William Sebok, which have been retrieved. Both of them were posted on November 26, 1983 and include the two newsgroups' scopes: "net.astro is for *discussion* of topics in and related to astronomy"; "net.astro.expert is for *informed discussion* of topics in and related to astronomy" (emphasis added).

The meta-newsgroup net.news.group confirms that Net.astro wasn't active yet as at November 15, 1983, but was on December 1.

https://web.archive.org/web/20240110081511/https://groups.google.com/g/net.astro (accessed 31 Jan 2024).

https://web.archive.org/web/20240108164558/https://groups.google.com/g/net.astro/c/EIWFzupRa6c (29 Nov 1983; accessed 31 Jan 2024).

3.1.1.Net.astro.expert

Net.astro.expert is the name eventually given to the distinct newsgroup Sebok had proposed for advanced astrophysical subjects, and which had been initially suggested as "net.astro.wizards".

For this newsgroup, both Usenet Archives and Google Groups provide what is likely to be the first post, dated November 28, 1983, UTC time on Usenet Archives, with subject "Astronomical computing" (on Google Groups it is available with one additional comment attached, and with a different time-zone stamp).³⁵ The first post's author, Steve Grandi of Kitt Peak National Observatory, notices that "net.astro.expert has just magically appeared this morning" - a statement Seebok doesn't seem to have liked very much ("For me it didn't just magically appear but took more than a month of work to bring it into existence. [...] Now it is up to the rest of you. Enjoy. [...]").³⁶

Grandi is eager to experience the new tool:

"Since net.astro.expert has just [...] appeared [...] I thought I would try to get an interesting discussion going. Given that the medium of the discussion is a computer network, my topic may seem rather obvious -- the state of computing in professional astronomy. Let me pose two questions and make a few comments about each one --Should a national astronomy

https://web.archive.org/web/20240115163009/https://www.usenetarchives.com/view.php?id=net.astro.expert&mid=PDI3MEBrcG5vLIVVQ1A%2B and

https://web.archive.org/web/20231107100852/https://groups.google.com/g/net.astro.expert/c/GLym0fyl-iE (both accessed 31 Jan 2024).

³⁵ Respectively:

³⁶ https://web.archive.org/web/20231107100852/https://groups.google.com/g/net.astro.expert/c/GLym0fyl-iE (accessed 31 Jan 2024).

supercomputing center be set up? [...] Are astronomy graduate students getting a proper grounding in software engineering? [...]"³⁷

According to administrator Greg Woods, who replies, these questions had been asked in the wrong group:

"from my understanding of these two groups [net.astro and net.astro.experts], this topic does not belong in the expert subgroup, which was intended for technical discussions *directly* related to astronomy. This is sort of a peripheral topic (albeit an important one!), and so belongs in the more general group net.astro. I have posted this article to both groups in an attempt to move the discussion to where I think it belongs."³⁸

The borders between net.astro and net.astro.expert didn't appear to be completely clear also to other readers, as we see e.g. in a post Sebok replied to on December 18 ("do you read net.astro.expert and not net.astro, or net.astro and not net.astro.expert? As long as few or no people actually read one group and not the other, there's no need for separate groups."). 39

In the founder's reply, "[...] I think his point that most things were posted to both groups was ill founded anyway. I see one such article in our system now. I don't recall seeing more than two other double postings since the groups were founded. [...]"

Following, Sebok repeats the rationale at the basis of net.astro.expert, and the idea of the twofold creation:

"Before I proposed net.astro I talked to the astronomers here and at the Institute for Advanced Study about the the idea. The responses I got from this people guided the path I took. I could see that the main excuse these people might give for not contributing was that the level of the discussion was too low and that it was wasting their time. [...] I was very afraid that this might be an example of the discussion on net.astro. I also have not been

³⁸ Ibid. This comment is missing in Usenet Archives' collection.

³⁹ https://web.archive.org/web/20230103183254/https://groups.google.com/g/net.astro.expert/c/Bs2IqxIZJrO (accessed 31 Jan 2024).

particularly impressed with net.physics. Thus the idea of net.astro.expert to give the experts a place to speak. It has been my hope (and still is) that some of the interesting discussions I hear at lunches here and elsewhere I might begin to hear on the net. [...] . If net.astro.expert had been created later [than net.astro] the astronomers would have written off the whole idea of the net.",40

Notably, what Sebok explains he had in mind for net.astro.expert wasn't simply a resource for information sharing, but rather, ideally, a place for debating interesting ideas - a venue for lively scholarly communication.

Also, Sebok incidentally lets us know that he was a reader of net.physics - which, nevertheless, he admits he didn't find particularly useful for him.

Three weeks after the debut, Sebok feels the need to inform that the traffic on net.astro.expert wasn't very high and to anticipate that he would take some remedial action about that.⁴¹ At the same time, he calls from more contributions from his peers ("Astronomers, please get your collegues to post something (or better yet, post something yourselves). As Dr. John Bahcall says at the Tuesday lunch at the Institute for Advanced Studies, "Tell us something interesting...")"42

On November 4, 1985 Sebok informs that he had made a manual addition to the newsgroup, putting it in contact with a mailing list of US astrophysicists.⁴³ Undoubtedly, the aim was to foster the potential of net.astro.expert by incrementing the number of interactions.

⁴⁰ Ibid.

⁴¹ "I have not been overwhelmed by the response yet but I very strongly think it is too early to call it a failure. I have some ideas to stimulate things that I might carry out after I'm back from Christmas vacation. [...]" (ibid.). ⁴² Ibid.

⁴³ "As an experiment I have started to run a manual gateway between net.astro.expert and the VLBI (Very Long Baseline Interferometry) mailing list on the NRAO decnet (tc vlbi%pho...@cit-hamlet.arpa). This will put

It is difficult to say how popular net.astro.expert became among the contemporary astrophysicists. The widest collection of this newsgroup we have consulted, which results to be that of GG, contains 193 posts and comments distributed in four years (Usenet Archives, which exhibits a more user-friendly interface, nevertheless stops at 86 posts and comments). The distribution is as follows: 11 in 1983 (from November 29); 70 in 1984; 85 in 1985; 27 in 1986 (until October 11, for the reasons we'll see below). It seems reasonable to suppose that net.astro.expert was sufficiently popular for that period, but the uncertainty on the amount of preservation of posts and comments, as well as the scarce knowledge we have of how much exactly astrophysicists were able to connect to computer-mediated communication tools around 1983, suggests caution in judging about this aspect.

Certainly, according to the messages still preserved on GG, it results that net.astro.expert's activity never went out of the US environment - which is strongly related to the situation of the networked connections available worldwide by that time.⁴⁴ A guest post from an Australian researcher, dated July 18, 1985 and forwarded by Steve Grandi, informs

another group of real astronomers in contact with net.astro.expert. In the net.astro.expert -> VLBI mailing list direction I will pass everything. However the VLBI mailing list often consists of updates to various pieces of astronomical software. Most of the postings of this type I will weed out, although I may let some get through to give the rest of the net some information on the state of professional astronomical software." https://web.archive.org/web/20221213101454/https://groups.google.com/g/net.astro.expert/c/evzDqjvB62U (accessed 31 Jan 2024).

⁴⁴ See notes 10 and 11 above.

that "we don't get (nor can post to) net.astro or net.astro.expert anywhere in Australia, given the costs of transpacific phone calls." 45

4. The Great Renaming (1986) and the birth of the unified sci.astro

The Great Renaming was "one of the most important events to take place during the 'Golden Age' of Usenet', and of newsgroups; 46 a turning point, which brought to a change in newsgroups' names, classification and organization.

This process was announced in detail in two newsgroup posts by one of its protagonists, who signs as "Rick" - in all likelyhood, internet pioneer and influential

⁴⁵https://web.archive.org/web/20240110094458/https://groups.google.com/g/net.astro.expert/c/Ya7xz3hCOC

administrator Rick Adams,⁴⁷ on the meta-newsgroup net.news.group, on August 11, 1986. The first post is particularly important as it describes the modes and scheduled timing of the Renaming⁴⁸, as they had been previously decided by the powerful board of administrators - "approximately forty" people, also known as "the Backbone Cabal"⁴⁹ - of which "Rick" was a member.

As we learn, the transition from old to new names would take place "in two phases. Roughly half of them will be created in mid-September [1986], the rest at a later time when we feel the bugs have been worked out of the distributions and software. At a later date (probably December) the "backbone" will simply stop carrying the "net" groups."⁵⁰

Following, Rick Adams lists the newsgroups and flanks their current names with the new ones they would assume after the Renaming process. The latter would be based on a

A (accessed 5 Feb 2024).

⁴⁹ "The Backbone Cabal [...] was made up of a small group of male computer experts in their 20's and 30's" (Bumgarner, "The Great Renaming"; see also parts 2-4.)

⁵⁰https://web.archive.org/web/20221206155428/https://groups.google.com/g/net.news.group/c/rhZVfEQpyP A (accessed Feb 2, 2024).

general transition from Mod.*, Net.* and Fa.* prefixes to a subject-based, seven-categories classification scheme, with corresponding new prefixes.

Now, as we learn, the Backbone Cabal's decision about net.astro and net.astro.expert was not only to change their names according to the prefix "sci." created for "Science, Research and Technology", but also to merge them in one newsgroup - which seems to have happened only very rarely. The name of the unified newsgroup would be "sci.astro"; the situation remained unchanged for eight years, until 1994.

Around 1995, the readers of sci.astro were "51000" and cci.astro appeared to be a victim of its success, as messages were estimated to be as many as "3170" per month and "106" per day.⁵¹

5. A New Worldwide Scenario: Globalization, Specialization and Need for Moderation in the '90s. The Birth of Sci.astro.research (1994)

In the '90s a massive and rapid expansion of the number of people being able to connect to the Internet in wide areas of the globe, and consequently that of readers of and contributors to the Usenet newsgroups, was experienced.⁵² According to Baym, who reports data by Rick

⁵² E.g.: Abbate, "Inventing the internet", 181; Helen V. Milner, "The Global Spread of the Internet: The Role of International Diffusion Pressures in Technology Adoption," in *2nd Conference on Interdependence, Diffusion, and Sovereignty* (Los Angeles: UCLA, 2003), 1-44; James Curran, "Rethinking Internet History," in

⁵¹ https://web.archive.org/web/20010224093004/http://www.ibiblio.org/usenet-i/groups-html/sci.astro.html (accessed Feb 2, 2024).

Adams, this tide affected also the Usenet newsgroups, starting in 1990 with a further acceleration in 1992, both for number of newsgroups and number of articles, as well as for number of sent bytes.⁵³

This evolution led to a rapid end of the previously dominating communication practices and culture, rooted in the IT environment. This culture was strongly affected by the need to prevent the waste of valuable bandwidth⁵⁴, so for example avoidance of redundancy, avoidance of cross-posting, care in choosing the right newsgroup, making sure of reading previous messages before posting on a subject were repeated prescriptions. After the early years, the more and more frequent violations of these rules led, among other things, to the resignation of a first-magnitude member of the Backbone Cabal, Gene Spafford,⁵⁵ from his adminstrator role, as he explained in a meaningful message on April 29, 1993.⁵⁶

Misunderstanding the Internet, by James Curran, Natalie Fenton, and Des Freedman (London: Routledge, 2012), 35.

⁵³ Baym, "From Practice to Culture on Usenet," 31.

⁵⁴ About mailing lists: "It was considered bad etiquette in the early 1990s to engage in a debate, due to precious bandwidth consumption. [...] the first actual flame war [...] is occurring no sooner than June 1993." (Hocquet and Wieber, "Mailing List Archives," 46).

⁵⁵ About Eugene H. Spafford, "professor [...] in Computer Science at Purdue University, where he has been a member of the faculty since 1987", see https://spaf.cerias.purdue.edu/narrate.html (accessed Jan 17, 2024).

⁵⁶ "Starting several years ago [...] I have had a growing sense of futility: people on the net can't possibly find the postings useful, because most of the advice in them is completely ignored. People don't seem to think before posting, they are purposely rude, they blatantly violate copyrights, they crosspost everywhere, use 20 line signature files, and do basically every other thing the postings (and common sense and common courtesy)

As a side consequence of this process, a vast amount of poor-quality, misdirected or just spamming-type messages started appearing,⁵⁷ especially on those newsgroups which weren't moderated. Sci.astro was one of them. Hence probably the need to have available a newsgroup whose contents would be checked before being disseminated to the readers worldwide.⁵⁸ This feeling was a general phenomenon: as another early internet expert, Lauren Weinstein, wrote on October 25, 1990, "[...] the net has tended only to address the traffic *volume* issues, while as a whole not wanting to worry about the "quality" issues. It's the increase in volume, with if anything a continuing decay of the signal/noise ratio, which has driven many of the "old-timers" (including myself) into much more restricted reading of and

advise not to. Regularly, there are postings of questions that can be answered by the newusers articles, clearly indicating that they aren't being read. 'Sendsys' bombs and forgeries abound. [...] Reason, etiquette, accountability, and compromise are strangers in far too many newsgroups these days." (
https://web.archive.org/web/20221214153737/https://danflood.com/cshistory/spafs-farewell-letter/, (accessed 5 Feb 2024).

The appariton of spam from the mid-90s on" is confirmed by Hocquet and Wieber, "Mailing list archives", 41. Thagard recalls how different the situation was between moderated newsgroups, "leaving entries that are likely to be relevant to researcher's work", and unmoderated ones, "often fill up with junk". Significantly, he exemplifies through the difference between sci.physics.research and "unmoderated, junk-laden groups such as sci.physics." (Paul Thagard, "Internet Epistemology: Contributions of New Information Technologies to Scientific Research," 1997, http://cogsci.uwaterloo.ca/Articles/Pages/Epistemology.html, accessed Feb 12, 2024).

⁵⁸ See Paloque-Bergès, Qu'est-Ce Qu'un Forum Internet?, 47.

participation in the net than some years ago."⁵⁹ On sci.astro, some readers commented: "Too many full-time researchers are frightened away by the low signal-to-noise in this group";⁶⁰ "sci.astro is getting too filled up with junk to check regularly if I'm busy."⁶¹

According to Mauldin, in 1991 "by far the bulk of the SCIASTRO traffic are discussions of individual questions about astronomy and astrophysics", but "a significant portion of the articles are posted by individuals buying and selling equipment or asking for advice about buying equipment".⁶²

6. Sci.astro.research (1994)

Sci.astro.research was created in May 1994 as a moderated newsgroup.

The astrophysical research community was perfectly aware that the unified sci.astro wasn't scholarly-specific. In an article published on PASP, a research journal, in 1994, Andernach, Hanisch & Murtagh define sci.astro as a newsgroup for "general astronomy discussion and information" and specify that "sci.astro provides considerable discussion of

⁵⁹https://web.archive.org/web/20221227101821/https://danflood.com/cs-content/cshistory/csh_usenet3.htm , in a thread (accessed 17 Jan 2024). About Weinstein:

⁶¹ Ibid.

amateur and popular astronomy questions, but it is read by many professional astronomers and is one possible forum for technical questions".⁶³

The idea of creating sci.astro.research as a separate subgroup was launched by US physicist Martin E. Sulkanen, who by that time used to work at Marshall Space Flight Center at NASA, by means of a post on sci.astro sent on February 15, 1994 (subject: "Is it time for a moderated research subgroup?").⁶⁴ His aims seem to be aligned with those by William Sebok inasmuch a specific discussion area would be provided for professional astrophysicists - but in fact, as we'll see, things are more articulated.

Sulkanen's call to the readers is as follows:

"Dear reader, the newsgroup sci.astro is an unmoderated group for discussion and dissemination of information putatively related to the fields of astronomy, astrophysics, amateur astronomy, astronomy education, and space and physics related topics. The wide popularity of astronomy has made sci.astro a very active newsgroup, with a substantial daily bandwidth of articles on diverse topics.

However [...] the daily bandwidth is quite large, with a correspondingly small "signal-to-noise" ratio of postings that are of relevance to the activities of research astronomers. In addition, sci.astro is also subject to its share of abuse by (cross)posting of articles of minimal or imaginary relevance to astronomy and astrophysics. Thus, the reaction of many research astronomers to sci.astro has been to avoid it entirely [emphasis added]. This has an adverse effect on the timely dissemination of information and related discussion, for example, on [...] transient phenomena [...], as well as providing effective communication between researchers on topics of mutual interest.

64 https://web.archive.org/web/20230103180346/https://groups.google.com/g/sci.astro/c/jyxdPTquAjw/m/5x8 x4suBzNEJ, followed by 25 comments (comments preserved are 15 on https://web.archive.org/web/20221227180904/https://www.usenetarchives.com/view.php?id=sci.astro&mid=PDJqcXY3ZSRoc2xAYXZkbXM4Lm1zZmMubmFzYS5nb3Y%2B; both archives accessed Feb 12, 2024).

⁶³ Andernach, Hanisch, and Murtagh, "Network Resources for Astronomers," 1191.

I would like to suggest the creation of a new moderated newsgroup, sci.astro.research. The manifesto for this group would be similar to that of sci.physics.research, not in specific topics, but in its moderation philosophy. Postings to the group would be confined to astronomy/astrophysics related research, but one could imagine that would include questions about hardware, software, and postings of amateur observations of variable stars, comets, and supernovae (something that would be of the quality of an IAU telegram).

Also included would be preprint/reprint lists (the NRAO (un)rap sheets), and news summaries in astronomy & physics ("Physics News Update", etc.).

However, I heartily encourage suggestions and opinions on the degree of moderation to sci.astro.research.

What would the effect of s.a.r have on s.a? Actually, I think s.a would benefit from the existence of s.a.r...more astronomers would be likely to use news and contribute to both groups.

Please send your suggestions and comments to me regarding this idea. I would like to pursue a formal RFD [Request For Discussion] for sci.astro.research within the next few weeks."65

The twenty-five comments preserved on GG are rather mixed. Although about half of them were immediately in favour (some further ones look uncertain), the concerns of some amateur astronomers are very clearly represented, e.g. by two posts by the same female astronomy amateur. One of them maintains:

"These two posters have summed up my original concerns. As an amateur, I was afraid that, although I *could* read sci.astro.research, everything would be so esoteric that I wouldn't want to. Meanwhile, sci.astro would become nothing but fringe... the useful middle ground would be lost. [...] Replacing "research" with another word--although I can't think of one right now--would help to convey the intent."

A US professional astrophysicist proposed:

⁶⁵https://web.archive.org/web/20230529164926/https://groups.google.com/g/sci.astro/c/jyxdPTquAjw/m/5x8 x4suBzNEJ (accessed 12 Feb 2024).

⁶⁶ Ibid (thread), comment dated 17 Feb 1994.

"What could be done would be to moderate sci.astro and create sci.astro.d, the .d standing for "discussion." That would continue to allow the coexistence of amateur and professional discussion but the moderator(s) could filter out the low S/N postings. (I like to think of this idea as a lightly moderated newsgroup, sort of what sci.space has turned into.) And, since the name would be the same, we wouldn't be putting up perceived barriers."⁶⁷

Interestingly, another commenter who appears to be an astronomy amateur is in favour:

"[...] I reckon some moderation would be in order. I subscribed to this group to get useful information, not to wade through reams of [...] stuff [...]. A lot of people apparently want to learn something from this group, including me, and the only way we can hope to do that is to get more active astronomical / astrophysical professionals to join in and share their thoughts and experiences with us amateurs. Let's do it."68

The first Request for Discussion - the formal step preliminary to vote - came in a message Sulkanen sent on March 9, 1994, which "may be distibuted freely to other relevant newsgroups." This post - a long one - starts with an "introduction" that replicates the February call, meaningfully adding in the end:

69 The message was posted on sci.astro (https://web.archive.org/web/20231115170439/https://groups.google.com/g/sci.astro/c/n-

wd_QOrP9Q/m/fJZHYvJbqzcJ), sci.physics, sci.physics.research,sci.space.science and (at least) on two metanewsgroups: news.groups and news.announce.newgroups, with subject "RFD: sci.astro.research moderated".

Sulkanen writes that the "RFD is being submitted" to the newsgroups listed above "on 28 February 1994" - (ibid), but a RFD with that date hasn't been found in any of the newsgroups abovementioned.. Instead, on March 25, he informs that "the release of the RFD was not until 10 March 1994"

⁶⁷ Ibid. (thread), comment dated 18 Feb 1994.

⁶⁸ Ibid. (thread), comment dated 21 Feb 1994.

"Of course, the role of sci.astro is not to provide an exclusive forum for research, however, the present condition of sci.astro greatly inhibits the involvement of the astronomical research community.

Informal discussion about creation of a moderated subgroup of sci.astro has recently appeared in sci.astro and by e-mail. There was general support for the creation of such a group, provided that it did not adversely effect the interaction between amateur and professional astronomers. There was particularly strong support for a moderated subgroup voiced by professional and academic astronomers."⁷⁰

In the "charter" section, more detail is provided:

"The purpose of this newsgroup is the discussion of astronomy & astrophysics research, and the dissemination of information related to astronomy & astrophysics research. Postings appropriate for sci.astro.research would include (but does not exclusively consist of): (i) inquiries or discussions about specific current or historical research, or (ii) of research-related topics (observing equipment, computational techniques & software, catalogs, textbooks, journals, references, etc.), (iii) observations of astrophysical phenomena of interest to researchers (novae, supernovae, variable stars, high-energy sources, extragalactic astronomy, planetary astronomy, etc.), (iv) announcement of recent publications submitted to refereed journals or of collections of such publications received as preprints, (v) announcement of future conferences & workshops, proposal or grant announcements of opportunity, and (vi) general scientific news relevant to astronomy & astrophysics."⁷¹

It seems notable that discussions on historical (astrophysical) research is one of the admitted topics - which wasn't appreciated by one of the commenters. Also, topic ii) and iii) often involve amateur astronomers.

(https://web.archive.org/web/20240213093257/https://groups.google.com/g/sci.astro/c/cwmrlds66Vo/m/no PmlqCF3-wJ .

⁷⁰ https://web.archive.org/web/20231115170439/https://groups.google.com/g/sci.astro/c/n-wd QOrP9Q/m/fJZHYvJbqzcJ (accessed 12 Feb 2024).

⁷¹ Ibid.

The proposed moderator for the group is the same Martin Sulkanen,⁷² who would act with the following criteria:

"The moderator will have relatively broad powers to determine postings that are appropriate for the newsgroup. However, there are some basic principles that the moderator will adhere to:

- "1. Postings will be judged on their relevancy to scientific research in astronomy and astrophysics. [...] The criterion is *not* the credentials of the author (contributions by amateurs are encouraged), but the relevance of the post to research issues.
- 2. Controversial topics and issues in research can be addressed, provided that they are discussed with scientific rigor [...]; "because I say so" speculations will be redirected to sci.astro.
- 3. "Unverified" astronomical observations will be posted with a disclaimer regarding the reliability of the observation. A verified observation is defined as one that has been checked and is certified for accuracy by the supporting institution [...]
- 4. Personal attacks, crossposts irrelevant to astrophysics/astronomy research, commercial advertisements, political discussions, or posts originating from addresses that cannot receive e-mail will be rejected."⁷³

And for favouring users' compliance to the rules "a FAQ, covering the moderation philosophy and other administrivia, will be posted monthly by the moderator."⁷⁴

The Call FOR Vote (CFV), which would have been "posted within 30 days of the posting of this RFD", was "planned to be conducted by a Usenet Volunteer Votetaker." In

https://web.archive.org/web/20240121161116/https://www.ibiblio.org/usenet-i/groups-

html/sci.astro.research.html (accessed Jan 14 2024).

74 Ibid.

⁷² Ibid. In fact Sulkanen results to have held this position (e.g.

⁷³ Ibid.

⁷⁵ Ibid.

fact the calls were two, posted on 5 ad 12 April respectively⁷⁶ by Brenda J. Roder (NASA), who also announced the results on April 27, 1994.⁷⁷ In her words:

"Moderated group sci.astro.research passes [...]. There were 466 YES votes and 15 NO votes, for a total of 481 valid votes. There was 1 abstain and 3 invalid ballots. [...] There is a five day discussion period after these results are posted. If no serious allegations of voting irregularities are raised, the moderator of news.announce.newgroups will create the group shortly thereafter." ⁷⁸

While it is difficult to say whether little more than 480 votes represented a wide or limited percentage of the connected astrophysical community, the situation of the nationalities involved in the voting process is clear enough and shows that a major change had occurred in the geographic distribution of the participants. While net.astro appears to have been entirely US-based, the people who voted about creating sci.astro.research have different nationalities. Building on the domain of the email addresses which Brenda Roder reports for each of the 481 valid votes, and in addition to a 16,21% of votes whose geographic origin looks uncertain (as they come from commercial internet providers), we find that 18,50% of votes come from Europe (most of them from Germany and from the UK, although Norway, Austria, Holland, Sweden, Switzerland, Finland, Poland and Denmark are represented as well). The US account for a 49,48% (probably underrated, as many of the emails from private companies might be American); other countries account for a further 15,80%, largely dominated by Canada and Australia but including Japan (3 votes) and one vote each from Mexico, Brazil, South Africa,

⁷⁶https://web.archive.org/web/20221228111323/https://groups.google.com/g/news.announce.newgroups/c/ n-wd_QOrP9Q_, in the same thread. (accessed Feb 12, 2024).

⁷⁷ Ibid.

⁷⁸ Ibid.

New Zealand and Soviet Union. As understandable, the great majority of votes comes from academic and research domains. The very few "no" votes come mainly from the US (73,33%); apparently none from Europe or from other continents, arguably showing how eager researchers in these countries were to join international specialistic conversations on astrophysics.

The GG collection of sci.astro.research preserves the newsgroup's inaugural message, "Welcome to sci.astro.research", which Martin Sulkanen sent as the "s.a.r. moderator" on May 2, 1994.⁷⁹

Here, he reiterates his will to not marginalise amateur astronomers in the new group, provided their contributions are sufficiently relevant for research,⁸⁰ and, interestingly, made it clear that he didn't have in mind a place for mere documentation. The latter was already largely available through the www, so what he envisioned was a venue for interactivity:

"Through Mosaic & the World-Wide Web (WWW) there now exists a great deal of information available for the research astronomer, and the purpose of this newsgroup is not be

⁷⁹https://web.archive.org/web/20221219164151/https://groups.google.com/g/sci.astro.research/c/jtKZVHDW hk8 (accessed 12 Feb 2024).

[&]quot;Particular attention will be paid by the moderator to include contributions by amateur and professional alike, but requiring that posts be relevant to astronomy/astrophysics research issues [...]"; "This newsgroup <s.a.r.> is about research activities in astronomy & astrophysics, open not only to the professional researchers, but to amateurs that are carrying out (or would like to start) research programs (e.g. variable star observations) as well." (Ibid.; emphasis added).

redundant with those services. Thus, this newsgroup will probably stress the quasi-interactive aspects of Usenet rather than the archival aspects of the WWW. "81

This seems to resonate well with one of William Sebok's aims at the moment of creating net.astro.expert. The creator of sci.astro.research - as well as the founder of net.astro.expert in 1983 - looks for a living communication venue, not (only) for a simple, albeit well-implemented and well-maintained archive of professional information. Dynamic vs. static approach, interactive vs. passive attitude are knowingly compared: peculiarity and potential of the change of paradigm, in progressive transition to the 2.0. mode, had been grasped very well.

Also interestingly, as claimed by Martin Sulkanen in his call to readers of February 15, 1994, the creation of sci.astro.research after that of sci.astro parallels the process that had happened in physics one year before, when sci.physics.research had made its debut (February 1993) after sci.physics and with the same motivation: the will to have a moderated group available.⁸² Elsewhere, Sulkanen is very clear about this: "sci.physics.research [is] my prototype for s.a.r".⁸³

⁸¹ Ibid; emphasis added.

⁸² "Sci.physics.research is a newsgroup intended to facilitate relatively noise-free discussions of issues in and about physics. It grew out of the unmoderated group sci.physics in February 1993 as a response to a perceived signal-to-noise-ratio problem in the unmoderated group [...]" (https://web.archive.org/web/20240121163741/https://math.ucr.edu/home/baez/spr.html , accessed 12 Feb 2024).

⁸³https://web.archive.org/web/20231128101657/https://groups.google.com/g/sci.astro/c/sOA9pbUZyNM/m/i
UZkqQr6mr8J (accessed 12 Feb 2024). Some years later (2001), the then-moderator of sci.astro.research,

Around 1995, readers of sci.astro.research were estimated at "7300" and messages at 42 per month and 1 per day.⁸⁴

As we learn, even after the creation of sci.astro.research, at least one further initiative appeared for sizing down sci.astro furtherly by splitting it into different sub-groups and making some of them moderated (while sci.astro would be renamed to "sci.astro.misc"). The idea was launched through a "Request for Discussion" message posted on sci.astro on June 21, 1995:

"Traffic in sci.astro has reached more than 2000 articles per month (about 80 per day). This is close to the limit where it is recommended to split a group. In addition, there is an increasing number of threads dealing with "non traditional" astronomy, which makes it difficult to follow any kind of discussion. This is so severe that many posts recently complained about the high traffic and noise to signal ratio. One of the main current threads has "cranks" as subject...

That aside, although there are a few specialized groups under sci.astro (e.g. fits, hubble, planetarium, research), the subjects addressed in sci.astro are extremely varied (from the Earth to distant galaxies, and from time conventions to extra terrestrial life). Therefore, it appears obvious that sci.astro desperately NEEDS to be split."85

Martin Hardcastle, would confirm: "sci.astro.research [...] should be `lightly' moderated, bearing the same relation to sci.astro as sci.physics.research does to sci.physics. (

17 NI4PeMIJ . "This article starts a discussion that will last three to four weeks in news.groups, and in that group ONLY. A second RFD will be issued halfway through the discussion possibly with some changes [...]. If necessary, a third RFD will be posted. At the end of the discussion period, a call for votes (CFV) will be issued if

A similar process had occurred in mathematics less than two years before. Even after the creation of sci.math.research, a RFD dated February 15, 1993 stated that "consensus seems to have it [sic] that sci.math should be split" in order to get "clear separation of interests between recreational, educational and professional research in mathematics".⁸⁶

The sci.astro collection in GG preserves the comments of 18 readers, expressed until July 5, 1995. Although many commenters agreed about the too high volume of traffic on sci.astro, and the frequent uninteresting posts, only three people were clearly in favour of the proposal. ⁸⁷

A modified Request for Discussion was posted on July 20, 1995;⁸⁸ the call for vote hasn't been found.

there are no strong objections to the final proposal. The CFV will give all the directions needed for voting." (ibid.). The author was Philippe Brieu.

⁸⁶https://web.archive.org/web/20230503133612/https://www.usenetarchives.com/view.php?id=news.announce.newgroups&mid=PDFscGM5MUIOTmpqMUByb2Rhbi5VVS5ORVQ%2B (this message hasn't been found on GG).

⁸⁷ Around the end of the discussion, a commenter wrote: "The thread on re-organization which ran in news.groups appears to have died. Looks like it's time for the the CFV. Personally, I feel that the RFD didn't even generate enough discussion to warrant a CFV" (ibid, 30 June 1995).
