General remarks

This document provides annotation guidelines for MaiBaam, a Bavarian corpus annotated with part-of-speech (POS) tags and syntactic dependencies. MaiBaam belongs to the Universal Dependencies (UD) project ([Zeman et al., 2023](#); [de Marneffe et al., 2021](#)), and our annotations elaborate on the general and German UD version 2 guidelines.

This document is structured broadly in the order we prepare and annotate sentences: first, preprocessing and tokenization ([§1](#)), then general recaps of POS tags ([§2](#)) and dependencies ([§3](#)), before we go into annotation decisions that would also apply to German ([§4](#)) and lastly decisions that are specific to Bavarian grammar ([§5](#)).

Many examples are written in German, since the standardized orthography makes it easier to search this PDF. We only annotate UD-style POS tags (UPOS tags) and dependencies and add the SpaceAfter=No feature where appropriate, but do not add any other information (no lemma, XPOS tags, morphological features, enhanced dependencies or miscellaneous annotations).

This document is primarily directed at present and future annotators of MaiBaam. We publish it to additionally allow others working with MaiBaam or annotating similar data to better understand the decisions we have made. These rules are not set in stone. If you are a MaiBaam annotator and annotating something and applying one of the rules here would make for an awkward and unintuitive annotation, please bring it up for discussion. Likewise, if you are unsure about how to annotate a word/phrase, please also raise it as a discussion point.

We use the following notation in this document:

- Part-of-speech tags: TAG in small caps; *tagged word in italics* TAG
- Dependency relations: name of dependency relation in sans-serif, head word underlined and **dependent** in boldface
- Where possible, we use arrows to show dependencies:
head → dependent

We reference the following UD treebanks in this document and/or used them for guidance/comparison:

- German: [GSD \(McDonald et al., 2013\)](#), [HDT \(Borges Völker et al., 2019\)](#), [PUD \(Zeman et al., 2017\)](#), [LIT \(Salomoni, 2017\)](#)
- Swiss German: [UZH \(Aepli and Clematide, 2018\)](#)
- Low Saxon: [LSDC \(Siewert et al., 2021\)](#)
- English: [GUM \(Zeldes, 2017\)](#), [EWT \(Silveira et al., 2014\)](#)

1 Preprocessing and tokenization

1.1 Preprocessing

We do not preserve or otherwise mimic the original formatting – italics, boldface, font size differences, etc. simply disappear. If there is a case where the original formatting actually is crucial, bring it up for discussion. In the context of Wikipedia discussion pages, we anonymize usernames by replacing them with USERNAME (§4.4).

When selecting sentences to annotate, pick full paragraphs if possible (that are then sentence-split). We skip lists in wiki articles, unless the lists contain full sentences. In that case, include the sentences as individual entries, and skip the bullet points. Examples for lists to be skipped are the lists of Munich boroughs and neighbouring municipalities [here](#). This is for two reasons: One, they are very long yet structurally not very interesting. Two, for the sentence still to make sense, we would either need to preserve formatting information (line breaks, bullets, even indentation in the case of the list of municipalities) or actually change the sentence by, e.g., adding commas.

We do not correct [typos](#) or punctuation errors.

1.2 Sentence-splitting

Sentence-splitting is for the most part straight-forward. Dialogue tags are generally part of the sentence, e.g., the following is a single sentence:

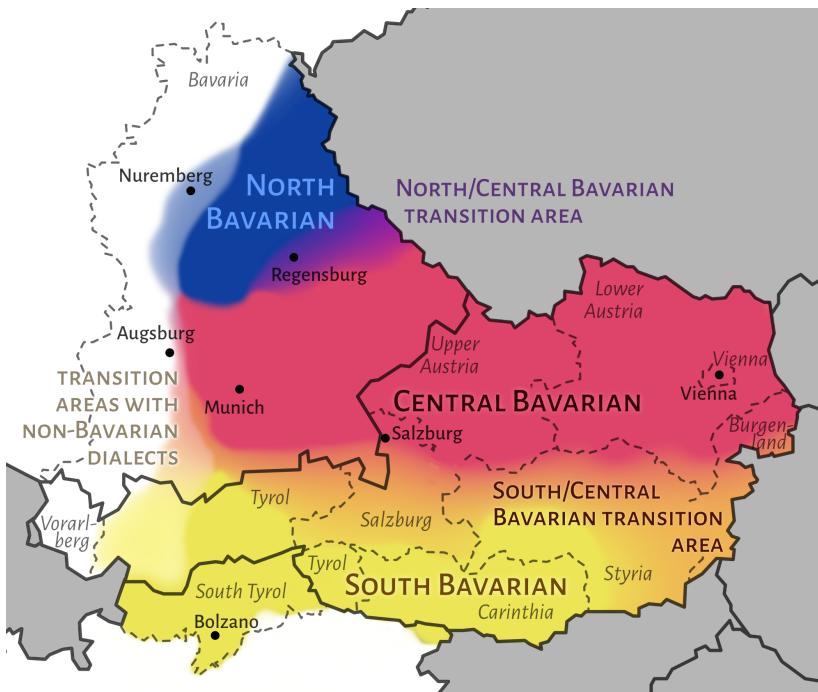

The father said: “Hänsel, go and fetch some wood.”

1.3 Metadata

We include the following sentence-level metadata:

- `sent_id`: Unique ID that also encodes the source of the sentence.
- `text`: The sentence.
- `text_en`: The original text (for sentences translated from English).
- `genre`: The text genre. Our genres currently are *wiki* (Wikipedia articles), *social* (Wikipedia discussions), *fiction* (fairy tales), *grammar examples* (Tatoeba sentences, example sentences from Wikipedia pages about grammar, other linguistic example sentences), and *non-fiction* (queries for virtual assistants).
- `dialect_group`: One of *north*, *northcentral*, *central*, *southcentral*, *south*, *unk* or a more precise elaboration on *unk* if possible, e.g., *unk (southcentral/south)*, with the options sorted from North to South. Use the map on the following page for guidance.
- `location`: The city or municipality if known, else the state or province, else the country, else *unk*. We use English location names.

- source: The URL of the Wikipedia or Tatoeba page.
- author: The username of a Tatoeba sentence's author.

Bavarian dialect areas, based on the classification by [Wiesinger \(1983\)](#), map 47.4).

1.4 General tokenization guidelines

We generally base tokenization decisions on whitespace and punctuation, with the following special cases:

- Do not split compound nouns: *Silben-Trennung* is a single token.
- Keep the whitespace-based tokenization for truncated words in cases like *Sonn-NOUN und CCONJ Feiertage-NOUN* ‘sun- and holidays’ (cf. §4.21).
- Split numbers and units: *8_NUM kg_NOUN*
- Split up ranges: *400_NUM –ADP 500_NUM*
- Split off the outer brackets or slashes around phonetic transcriptions, but no other punctuation marks inside the transcriptions:
 $[\text{PUNCT } \text{min}(:)\text{e}_x] \text{PUNCT}$
- For words erroneously split in the raw data (e.g., *zu mindest* instead of *zumindest* ‘at least’), follow the instructions in the [goeswith](#) documentation. See also the note at the end of §5.3.1.

Sandhi When a vowel-initial word is appended to a vowel-final word, a linking consonant can be inserted in between ([Merkle, 1993](#), pp. 30–33). In this case, we include the consonant with the first word (e.g., we analyze *wiera* ‘how he’ with its linking *-r-* as *wier* and *a*).

1.5 Multi-word tokens

Preposition + determiner We follow the [guidelines](#) for Standard German (see also [Grünewald and Friedrich, 2020](#)) and split fused prepositions and determiners into subtokens. This was also adopted by the guidelines for [Low Saxon](#), but not for [Swiss German](#). Since different writers use different orthographic styles and since there is variation also in the way determiners are pronounced, we simply split the words into substrings (rather than normalizing them to an arbitrary standard):

- *zum* → $zu_{ADP} m_{DET}$ ‘to the’
- *aus'n* → $aus_{ADP} 'n_{DET}$ ‘from the’

Sometimes, this can result in slightly awkward tokenizations:

- *im* → $i_{ADP} m_{DET}$ ‘in the’

Particle + determiner (zum) When *zum* (*zun*, *zan*, ...) is used in an infinitive construction, we treat it as a multi-word token ($zu_{PART} m_{DET}$). For more details, see §[5.2.2](#).

1.6 Split with SpaceAfter=No

Shortened determiners/adpositions in noun phrases We also split these off with SpaceAfter=No (instead of MWTs):

- *z'Minga* → $z'_{ADP} Minga_{PROPN}$ ‘in Munich’
- *d'neie* → $d'_{DET} neie_{ADJ}$ ‘the new [one]’
- *s 'Haus* → $s'_{DET} Haus_{NOUN}$ ‘the house’

This is analogous to how shortened determiners and prepositions are treated in French UD treebanks (*d'*, *l'*).

Verb/complementizer + pronoun(s) In sentences where a verb or conjunction is immediately followed by one or more pronouns, we use SpaceAfter=No to split them:

- *gibt* → $gibt_{VERB} s_{PRON}$ ‘there is’
- *håmas* → $hå_{VERB} ma_{PRON} s_{PRON}$ ‘we have it’

This is similar to how shortened pronouns are treated in French treebanks (e.g., in *je t'ai vu* ‘I saw you’, *t'*_{PRON} and *ai*_{AUX} get split apart).

⚠ Exception For conjunctions marked for 2SG, 2PL or 1PL, see §[5.3.1](#).

Other fused tokens In general, use SpaceAfter=No, but feel free to bring up such cases for discussion.

2 POS tags

The detailed general (U) and German (DE) guidelines are linked.

POS tag	Examples	Cases <i>not</i> covered by this tag
ADJ adjective (U)	<i>grün, französisch, zweites,</i> <i>reisend</i> (present participle used as adjective), [die] 80er [Jahre], [ein] paar	
ADP adposition (U)	<i>auf, in, bis,</i> split-off particles of particle verbs: [er gibt] <i>auf</i>	
ADV adverb (U)	<i>sehr, morgen, hinauf, wann/wie/warum,</i> <i>hier, irgendwo, immer, zuerst, zweimal,</i> <i>wodurch, gerne, selbst, dazu, gar, nimmer,</i> modal particles	<i>nicht</i> _{PART} , <i>wer/was</i> _{PRON}
AUX auxiliary (U)	<i>sollen/müssen/..., würde, copula (sein),</i> <i>haben/sein/werden</i> indicating tense, <i>werden</i> indicating passive voice	
CCONJ coordinating conjunction (U)	<i>und, oder, aber, sondern, weder noch,</i> [sowohl...] als [auch] <i>wie</i> when not used for interrogation/comparison	<i>noch</i> _{ADV} (on its own), <i>wie</i> _{ADV} ...?
DET determiner (U, DE)	articles, possessive pronouns (<i>ihr/sein/mein</i>), <i>jede, keine, dieselbe, selber, selbig, derjenige,</i> <i>welche, alle, viel(e), wenig(e), weniger, ander(e)</i> (also in DET+DET constructions: <i>die andere [Seite]</i>)	relative pronouns: <i>der/die/das</i> _{PRON}
INTJ interjection (U)	<i>hallo, ach, ja</i> (as a response)	<i>ja</i> as particle (ADV)
NOUN noun (U)	<i>Letzterer, kg</i>	
NUM numeral (U)	<i>4, vier</i>	<i>viertes/4.</i> _{ADJ} , <i>viermal</i> _{ADV}
PART particle (U)	<i>nicht; zu</i> when used with infinitives	verbal particles: ADP; modal particles: ADV
PRON pronoun (U, DE)	<i>ich/mich/mir, wer, jemand, etwas, man,</i> <i>jedermann, niemand, nichts, sich,</i> relative pronouns	<i>mein/dein/etc.</i> _{DET} , <i>einige</i> _{DET} , <i>irgendein</i> _{DET}
PROPN proper noun (U)	<i>Minga</i>	normal tags when possible
PUNCT punctuation (U)	<i>., ? ! /</i>	
SCONJ subordinating conjunction (U)	<i>dass, falls, damit, weil, wenn</i>	
SYM symbol (U)	<i>%</i>	
VERB verb (U)	[ansässig] <i>werden, [zu] finden sein, [etw.] haben</i>	
x other (U)	non-words/non-symbols, botanical/zoological names	PROPN when possible

3 Syntactic dependencies

3.1 Overview

The detailed general (U) and German (DE) guidelines are linked.

Predicate → noun-like

nsubj (U, DE)	subject of verb	Sie <u>schläft</u>
nsubj:pass (U, DE)	subject of passive construction	Sie wurde <u>gesehen</u>
obj (U, DE)	accusative object	Ich <u>gebe</u> dir das Bild
iobj (U, DE)	2nd accusative object	Das <u>kostet</u> mich einen Euro
obl (U, DE)	prepositional phrase	Das Paket <u>liegt</u> vor der Tür
obl:arg (U, DE)	dative object	Ich <u>gebe</u> dir das Bild
obl:agent (U, DE)	agent of passive construction	Sie wurde von mir <u>gesehen</u>
expl (U, DE)	dummy <i>es</i>	Es <u>macht</u> Spaß
expl:pv (U, DE)	lexicalized reflexive pronouns	Ich <u>bedanke</u> mich
vocative (U, DE)	addressed listener	Marie , <u>kommst</u> du mit?

Predicate → predicate

csubj (U, DE)	clausal subject	Ob das hilft , <u>weiß</u> ich nicht
csubj:pass (U, DE)	clausal subj. of passive clause	Ob das hilft , wurde mir nicht <u>gesagt</u>
ccomp (U, DE)	complement with own subject	Ich <u>wette</u> , dass du gewinnst
xcomp (U, DE)	complement with shared subj.	Ich <u>versuche</u> , den Text zu schreiben
advcl (U, DE)	adverbial clause	Ich <u>schreibe</u> , damit sie antwortet
advcl:relcl (DE)	relative clause modifying clause	Sie <u>tanzt</u> , was ich cool finde

Predicate → auxiliary

aux (U, DE)	auxiliary	Ich bin <u>gegangen</u>
aux:pass (U, DE)	passive auxiliary	Ich wurde <u>gesehen</u>
cop (U, DE)	copula	Du bist <u>groß</u>

Predicate → _____

mark (U, DE)	subordinating conjunction, <i>zu</i>	Ich wette, dass du <u>gewinnst</u>
compound:prt (U, DE)	particle belonging to verb	Ich <u>fange</u> an
dislocated (U, DE)	dislocated phrase	Das Bild , das <u>gebe</u> ich dir später
discourse (U)	interjections, fillers	Hey , <u>kommst</u> du mit?

... continued on the next page

Continued from the previous page

Noun-like → noun-like

nmod (U, DE)	noun modifying noun	das <u>Buch</u> von Maria
nmod:poss (U)	possessor	Marias <u>Buch</u>
appos (U, DE)	appositional noun phrase	das <u>Landeskriminalamt</u> (LKA)

Noun-like → predicate

acl (U, DE)	clausal modifier	<u>Versuche</u> , dies zu tun
acl:relcl (U, DE)	relative clause modifying NP	<u>Versuche</u> , die ich unternehme

Noun-like → ____

det (U, DE)	determiner	das <u>Buch</u>
det:poss (U, DE)	possessive pronoun	mein <u>Buch</u>
case (U, DE)	adposition, comparative word	an dem <u>Tisch</u>
amod (U, DE)	adjective	ein altes <u>Haus</u>
nummod (U, DE)	number	vier <u>Pferde</u>
flat (U, DE)	multi-word proper noun, date	König <u>Ludwig II</u>

____ → ____

conj (U, DE)	conjunct	<u>Anna</u> und Berta
cc (U, DE)	coordinating conjunction	Anna und <u>Berta</u>
punct (U)	punctuation	<u>Geht</u> sie ?
advmod (U, DE)	adverb, nicht	Das ist nicht <u>viel</u>
root (U)	root	Sie läuft
fixed (U, DE)	fixed expression	<u>nach</u> wie vor
parataxis (U, DE)	coequal clause	Es ist, sage ich, zu <u>warm</u>
compound (U, DE)	split compound word	Telefon <u>Buch</u>
goeswith (U)	randomly split word	<u>wer</u> den
orphan (U, DE)	ellipsis	Ich gehe raus und <u>du</u> rein
reparandum (U, DE)	disfluency	Nach re- , nach <u>links</u>
list (U)	entire sentence is a list	
dep (U)	ungrammatical relation	

3.2 Difficult cases: Which clausal relation?

Acl or not?

- If the clause modifies a noun → acl or acl:relcl
- If the clause modifies another clause → one of the options below (advcl, ccomp, xcomp)

Adverbial or not? (advcl vs. ccomp/xcomp)

- If you just drop the clause, is the overall sentence still fully grammatical and not “weird”? → advcl
- If you would need to replace the clause with a pronoun / if the dictionary entry for the head verb contains an *etwas/jemand* that refers to the clause → ccomp,xcomp
- Adverbial clauses often relate to: time (*nachdem, bevor, bis, während, seit, als*), place (*wo* – but *wo* also gets used as a relative marker!), manner (*indem, als ob*), cause (*weil*), purpose (*damit*), effect (*sodass*), contrast (*obwohl, auch wenn*), condition (*wenn, falls*), manner (*als ob*). More examples [here](#).

Ccomp or xcomp? If the dependent clause has its own subject, it is a ccomp. If its subject is that of the main clause, it is an xcomp. Additionally, xcomp is used for complements that are predicates without full clause structures (examples via [UD documentation](#)):

- Er ließ alle Demonstranten **verhaften**.
- Er blieb dort **stehen**.
- Ich lerne **tanzen**.
- Wir machen uns **selbstständig**.
- Ich fühle mich **gezwungen**, dies zu tun.

Examples

- “Auch für Probetermine nimmt sie sich sehr viel Zeit und zeichnet alles genaustens vor, **sodass man sich vorstellen kann, wie das Ergebnis ist.**” (GSD)
 - Can easily be dropped: “Auch für Probetermine nimmt sie sich sehr viel Zeit und zeichnet alles genaustens vor.” → advcl
 - Basic form: *sich Zeit nehmen* → advcl
- “Auch für Probetermine nimmt sie sich sehr viel Zeit und zeichnet alles genaustens vor, so dass man sich vorstellen kann, **wie das Ergebnis ist.**” (GSD)

- Cannot be dropped, needs to be replaced: "... dass man sich **das vorstellen** kann." → not advcl
- Basic form: *sich etwas vorstellen* → not advcl
- Subordinate clause has its own subject (*das Ergebnis*) → ccomp, not xcomp
- "Aber mal abwarten, **was sich in näherer Zukunft abspielt...**" (GSD)
basic form: *etwas abwarten* → not advcl
 - Can be dropped, but with the understanding that something is missing. A more typical shortened reformulation would be something like "**Das warten** wir ab" → not advcl
 - Subordinate clause has its own subject (*was*) → ccomp, not xcomp
- "Alle am Wort Gottes interessierte Personen sind herzlich eingeladen, Gottesdienst mit Liedern, Gebeten und Predigten mit den Mitgliedern zu **feiern.**" (GSD)
 - Can be dropped, but with the understanding that something is missing. A more typical shortened reformulation would be something like "Alle sind **dazu eingeladen**" → not advcl
 - Basic form: *jemanden zu etwas einladen*
 - The dependent clause has the same subject as the main clause: *alle ... Personen* → xcomp
- "Bei unserem nächsten Aufenthalt auf Sylt werden wir ganz bestimmt wieder hier **essen gehen!**" (GSD)
 - Can't be dropped → not advcl
 - Same subject as *gehen* → xcomp

3.3 Difficult cases: Parataxis or apposition?

Parataxis is typically between two clauses. The linked words are often predicates. Occasionally, noun phrases are involved. Typical cases:

- Reported speech where the speech tag interrupts the quote (otherwise: ccomp, see guidelines [[here](#)]))
- Two sentences that could also be separated with a full stop
- Interjections
- Affiliation bylines
- Question tags: "oder?", "nicht?"

An apposition is between two noun phrases; the linked words are nouns or noun-like. Typically, the head and dependent refer to the same entity and could be swapped.

Examples:

- “Aber über die Freundlichkeit, Zuverlässlichkeit und Komptenz des gesamten Team kann man nur eines sagen – **Perfektion**” (GSD)
 - Although you can’t swap the two words here, you can replace *eines* with *Perfektion* → appos
- “Auch das Servieren der Speisen ging auffallend schnell, also ich könnte nicht so schnell **kochen**.” (GSD)
 - Could be separated with a full stop → parataxis
 - Clauses, not nouns → parataxis
- das Landeskriminalamt (LKA)
 - Can easily be swapped: “das LKA (Landeskriminalamt)” → appos
- “Barbara Plank (LMU)”
 - Cannot be swapped → parataxis
- “Tatsächlich gibt es Bestrebungen, den Straßenverkehr sicherer zu **machen**.”
 - Head is a noun, dependent a clause → acl

We also use appos in cases like the following, where the second entity (dependent) encompasses the first one (head): *I live in Munich, Germany*.

For more use cases of appos, see §4.15 and §4.23.

4 General and German-related annotation decisions

This section contains annotation decisions that are not specific to Bavarian, but would also apply to Standard German and related dialects. The German treebanks currently handle some of these cases differently (e.g., §4.2).

4.1 Abbreviations

We split abbreviations when it makes sense (*z.B.*, *u.A.*) and tag the components as the POS tags of the individual words. In cases like *z.B. = zum Beispiel* ‘for example’) we use the POS tags of the words’ head subtokens and *do not* further analyze the structure of *zu+m*: *z. ADP B. NOUN*. One-word abbreviations (*bspw.*, *sog.*, *bzw.*) are simply tagged like we would tag the unabbreviated word form. The period stays attached to the abbreviation.

4.2 Additions to proper names

For titles (*Frau Müller*, *König Ludwig*) and suffixes (*Ludwig II*, *Max Mustermann Sr.*) of person names, as well as for ‘titles’ of administrative divisions (*Gemeinde X*, *Landkreis Y*), we use flat. This is in line with the [UD guidelines for flat](#), although in reality it is handled in various different ways by different treebanks ([Schneider and Zeldes, 2021](#)). The German treebanks currently disagree on whether flat, flat:name or compound should be used.

4.3 Adjectives used adverbially

Following the German treebanks, we tag adverbially used adjectives as `ADJ` and use the relation `advmod` for them: $schnäi_{ADJ} \leftarrow_{advmod} laffa_{VERB}$ ‘to run fast’. For guidance on distinguishing adjectives used this way from adverbs, we refer to the notes on discerning between the `ADJD` and `ADV` classes in the STTS guidelines ([Schiller et al., 1999](#), pp. 56–58).

4.4 Anonymized names

We replace usernames with `USERNAME`, which we tag as `PROPN`.

4.5 Comparatives

We use `SCONJ` for *wie/als*. If a noun phrase follows, *wie/als* gets case, and the following noun phrase is annotated as `obl` if attached to a phrase and `nmod` if attached to another noun phrase. If a clause follows, *wie/als* is a marker and the clause is an `advcl`.

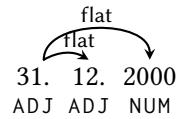

Additional notes Related links if we want to revisit this decision: [UD working group on comparatives](#); [GitHub issue regarding German](#).

4.6 Copula

Per UD guidelines, only variations of *sei* ‘to be’ can be annotated as copulas; *bleim* ‘to remain’, *wean* ‘to become’ and similar verbs are treated as full verbs. More details on copulas in UD can be found [here](#).

4.7 Dates and names of months, weekdays & holidays

We use `ADJ` for ordinal numbers and `NUM` for cardinal numbers. The relation between the day, month and year is flat. We use `NOUN` for months, weekdays and holidays, and `ADV` for derived adverbs *sonntags* ‘on Sundays’.

In other treebanks For an overview and discussion of how dates are handled in UD, see [Zeman \(2021\)](#). The German treebanks disagree on whether to use `NOUN` or `PROPN` for months, weekdays and holidays, and on whether to use `ADV` or `NOUN` for words like *sonntags* when they are capitalized.

4.8 Dative objects

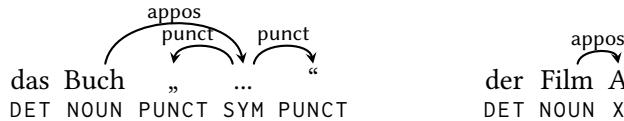

We currently follow the German guidelines, which reserve `iobj` for the (rare) second accusative object and instead prescribe `obl:arg` for dative objects. Note that the [Low Saxon](#) and [Swiss German documentation](#) instead suggest `iobj` for dative objects.

Case syncretism in
definite articles and
personal pronouns,
based on Merkle (1993,
pp. 85, 122).

	Stressed		Unstressed		Pronoun	
	DAT	Acc	DAT	Acc	DAT	Acc
MASC	dem/den	den	am/an	an	eahm	eahm/eahn
NEUT	dem/den	dees	am/an	as/s	eahm	es/dees
FEM	dera	de	da	d	ia/iar	sie/de

4.9 Dummy names: *Hast du X gesehen?*

If nominals get replaced with dummy sequences in sentences like *Gib dem Buach „...“ 5 Sterndal* ‘Give 5 stars to book ...’ or *Wann kimmtn der Film A?* ‘When is movie A on?’, we tag dummy tokens like *A*, *X* or *XZY* as *x*. If an ellipsis is used as the placeholder for a name (and saying the sentence out loud would likely involve saying something like *Punkt Punkt Punkt* ‘dot dot dot’ or *hm-hm-hm*), we tag it as *SYM*. Either way, if the placeholder is used as an apposition to a noun, we annotate it accordingly:

If a name is replaced with a token like *USERNAME*, we annotate it as if it were the original token (§4.4).

Other treebanks HDT uses *x* in phrases like *Nutzer A* ‘user A’, GSD uses *PROPN* (*eines Teams A* ‘of a team A’), EWT uses *NOUN* (*Party B*). We did not find any examples corresponding to our *book ...* in our reference treebanks.

4.10 Erroneously split words

We use *compound* for composite words (e.g., compound nouns) split across word boundaries, and *goeswith* for ‘randomly’ split words.

4.11 Fixed expressions

We use the fixed dependency for the following expressions:

- *ein paar* ‘a few’
- *ein wenig, ein bisschen* ‘a bit’
- *und zwar* ‘namely’

- *mehr/weniger als/wie* ‘more/less than’
- *ein und derselbe* ‘one and the same’
- *für des* ‘considering that’ in phrases like *für des dass a su olt ist* ‘considering his (old) age’
- *bis zu*

4.12 Modal particles

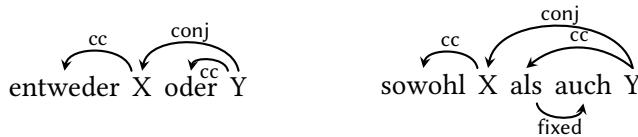

Because the [German UD guidelines](#) reserve PART only for *nicht* and *zu*, we treat modal particles like adverbs (which is what the German treebanks mostly do as well).

4.13 Multi-part conjunctions: *sowohl ... als auch*, etc.

We use the following POS tags for multi-part conjunctions:

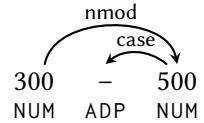

- *sowohl_{CCONJ} ... als_{CCONJ} auch_{ADV}* ‘both ... and’
- *entweder_{CCONJ} ... oder_{CCONJ}* ‘either ... or’
- *weder_{CCONJ} ... noch_{CCONJ}* ‘neither ... nor’

and annotate the dependencies as follows:

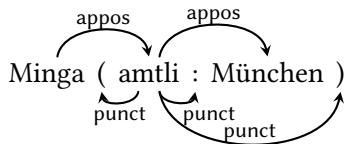

4.14 Numeric ranges

We treat numeric ranges like we treat the “full” version (i.e., if you were to replace – with the preposition *bis* ‘to’), following GUM and EWT.

4.15 Parenthetical key:value remarks

We annotate cases like *Minga (amtli: München)* ‘Minga (officially: Munich)’ as follows:

For other apposition types, see §3.3.

4.16 Participles: adjectives or verbs?

We follow the STTS guidelines for distinguishing adjectives from verbal participles ([Schiller et al., 1999](#), pp. 24–26).

4.17 Prepositional objects

Following the German UD guidelines and examples (`obl`, `obl:arg`), we use `obl` for prepositional phrases regardless of how core- or adjunct-like the phrase is.

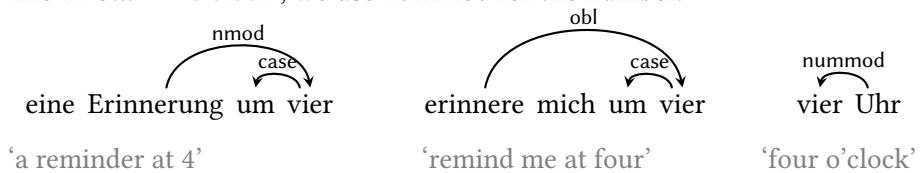

4.18 Pronouns as determiners

Possessive pronouns are considered to be determiners with the relation `det:poss`, per [UD guidelines](#).

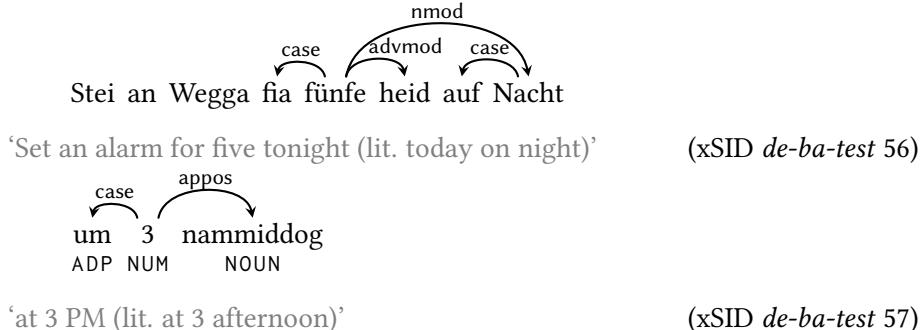

For cases like, *uns Linguisten* ‘us linguists’, *du Schmeichler* ‘you flatterer’, we tag the pronoun as `PRON` and, following the recommendation by [Höhn \(2021\)](#), label the relation `det`. See §5.1.4 for an example.

4.19 Time

Numbers are tagged as `NUM` regardless of whether they are written as digits or as words. The dependency for prepositional phrase with the time is `obl` or `nmod`, depending on whether it is attached to a predicate or noun. For phrases like *12 Uhr* ‘12 o’clock’, we use `nummod` for the number.

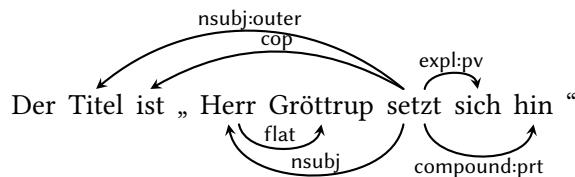

We annotate more complex or unusual structures as follows:

4.20 Titles of books/songs/etc.

If the title is *not* in Bavarian or a closely related language/dialect: treat the words as `PROPN`s connected with `flat`. Otherwise, use normal tags and dependencies. If the overall construction is a copular clause, we can use `nsubj:outer` (U, no cases like that in our treebank as of yet):

‘The title is “Mr Gröttrup sits down”’

If the sentence is non-copular, we treat the title like a nominal:

‘The short story is called “Mr Gröttrup sits down”’

If the title is replaced with a placeholder like *XYZ* or ..., see §4.9.

4.21 Truncated words

In a case like *Wirtschafts-, Vakeas- und Kuituazentren* ‘economic, traffic and cultural centres’, we treat *Wirtschafts-* as the head that *Vakeas-* and *Kuituazentren* are connected to via conj.

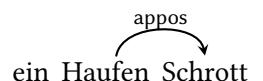

This is somewhat unsatisfactory in that we would otherwise analyze *-zentren* as the head of the compounds, but it aligns much better with how conjunctions are treated in UD. We also use this when the split-off morpheme technically belongs to a different part of speech: *be- und entladen* ‘to load and unload’ is tagged as VERB CCONJ VERB with *be-* as the head.

4.22 *Bitte*

If *bitte* is used to mean ‘you’re welcome,’ we tag it as INTJ. If it is used in a sentence like *Komm bitte mal her* ‘Please come over here’, we consider it an ADVerb. Note that it can also be an inflected verb or a noun.

4.23 *Ein Haufen* NOUN, *eine Menge* NOUN

In structures like *ein Haufen Formulare*, *eine Menge Formulare* ‘a ton/lot of garbage’, we connect the nouns with an apposition.

4.24 *Gar nicht*

We use *gar*_{ADV} ←advmmod→ *nicht*_{PART} ‘not at all’. The German treebanks disagree on how to annotate this phrase (attach *gar* to *nicht* or to *nicht*’s head).

4.25 *Selber/selbst*

We attach selber/selbst ‘him-/her-/themself’ to the preceding noun if it is an adnominal construction; otherwise we attach it to the clause. The relation is advmod either way. [Hole \(2002, p. 136\)](#) provides more details regarding the distinction between *selbst* as an adnominal or adverbial intensifier, the examples are from his paper:

- Adnominal: Der Koch **selbst** hat die Blaubeeren gepflückt. ‘The cook himself picked the blueberries.’
- Adverbial: Der Koch hat die Blaubeeren **selbst gepflückt**. ‘The cook picked the blueberries himself.’

Selber is a DETerminer per the [German guidelines](#), and the German treebanks agree that *selbst* is an ADverb.

4.26 *So ein* ADJ NOUN

In some sentences, the adverb modifying an adjective can be placed in multiple positions:

- *Das ist so ein schönes Buch.* ‘This is such a nice book.’
- *Das ist ein so schönes Buch.* (non-crossing)

We allow crossing dependencies, since *so* modifies the adjective either way. See §[5.1.1](#) for a related Bavarian-specific phenomenon *ein so ein schönes Buch*.

4.27 *Viel*

- *so_{ADV} + viel_{DET} + NOUN*: *so viel Musik, so viel Beifall* ‘so much music, so much applause’
- *so_{ADV} + viel_{DET} + wie_{SCONJ}* ‘as much as’
- *viel_{ADV} + ADJ*: *viel später, viel wert* ‘much later, worth a lot’
- *viel_{ADV} + VERB*: ADV since it modifies a verb
- *viel(e)_{DET} + NOUN*: *viele Babys, viel Gutes* ‘many babies, a lot of good’
- *viel(e)_{DET} + von_{ADP} + DET + NOUN*: *viele von den Beteiligten, viel von der Stadt* ‘many of those involved, much of the city’
- *viel(e)_{DET} + ADJ + NOUN*: *viele schöne Bilder* ‘many pretty pictures’
- *viel(e)_{DET}* without any noun (in accordance with the German treebanks): *viele sind zu der Feier gekommen* ‘many came to the party’

5 Bavarian-specific annotation decisions

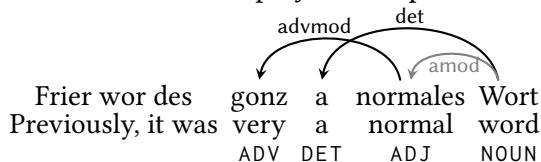

Although Bavarian is closely related to Standard German, there are some morphosyntactic differences. In the following, we show examples for these as they occur in our data and explain how to annotate such structures.

5.1 Noun phrase

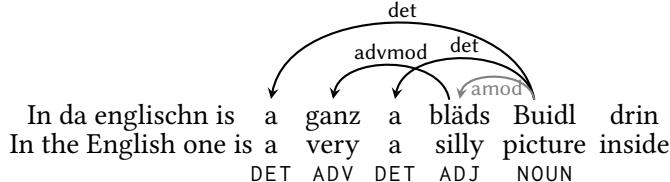

5.1.1 Order of determiner and adverb (*a ganz a...*)

In German, if an adverb modifies an adjective in a noun phrase, the adverb appears between the determiner and the adjective (see margin).

For a small set of Bavarian intensifiers, alternative orders are possible (typically when the determiner is indefinite): the order of adverb and determiner can be reversed (ADV DET ADJ NOUN) and the determiner can be doubled (DET ADV DET ADJ NOUN; Lenz et al., 2014; Merkle, 1993, pp. 89–90, 158). In such cases, we allow non-projective dependencies:

‘It used to be a completely normal word.’ (Wiki Walsch ‘Italian/Romance’)

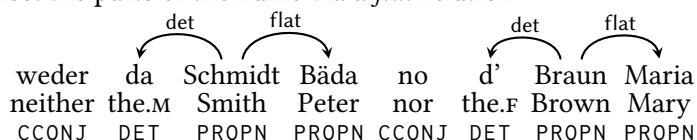

‘The English [wiki] contains a very silly picture [...]’

(Wiki discussion Ottoman ‘sofa’)

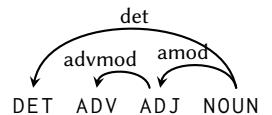

5.1.2 Personal names

In Bavarian, personal names are preceded by a determiner matching in case and gender (Weiβ, 1998, pp. 69–70), and the family name is often put before the given name (Weiβ, 1998, p. 71). Following the general UD guidelines, we connect the parts of the name via a *flat* relation:

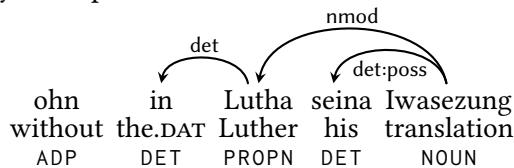

‘neither Peter Smith nor Mary Brown [...]’

(Cairo CICLing 12)

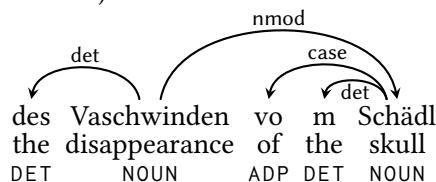

5.1.3 Possession

Bavarian, like many German dialects and colloquial variants, eschews the genitive in favour of analytic possessive constructions (Fleischer, 2019; Bülow et al., 2021). One example is the prenominal dative construction, in which we analyze the possessor as an *nmod*:

‘[...] without Luther’s translation [...]’ (Wiki discussion *Ödenburg* ‘Sopron’)

Alternatively, possession can be expressed with a prepositional phrase (common in colloquial German, and entirely parallel to the English *X of Y* construction):

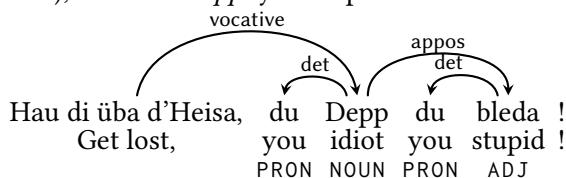

‘[...] the disappearance of the skull [...]’

(Wiki *Sauschädelstöhl* ‘Stealing pig’s heads (custom)’)

5.1.4 Postponed adjectives

For emphasis (and especially when voicing annoyance), phrases of the pattern (ADP) DET ADJ NOUN can be rearranged into (ADP) DET NOUN (ADP) DET ADJ (Merkle, 1993, p. 168). We consider the postponed adjective to be an apposition of the noun. In the following sentence in our corpus (pardon our Bavarian), *du bleda Depp* ‘you stupid idiot’ is re-arranged:

‘Get lost [lit. scram over the houses], you stupid idiot!’ (Tatoeba 5657152)

5.2 Verbs

5.2.1 Auxiliary *tua*

In addition to the auxiliary verbs named in the German guidelines, we include *tua/doa* ‘do’, which is used in several periphrastic constructions in conjunction

with a lexical verb, both in indicative and subjunctive constructions (Merkle, 1993, pp. 65–67).

<p>Waun i du wa, tarat i 'n frogn . If I were you, do.1SG.SBJV I him ask . AUX PRON PRON VERB</p>	<p>aux</p>
<p>'If I were you, I would ask him.'</p>	<p>(Tatoeba 5166978)</p>

5.2.2 Infinitives with $z(u)$

In German, many infinitive constructions require the marker zu_{PART} . In Bavarian, two similar constructions appear: one where a cliticized form of the marker (z) is followed by a verbal infinitive, and one where the marker is combined with a cliticized dative determiner (zum or zun) and a nominalized infinitive (Bayer, 1993; Bayer and Brandner, 2004). In both cases, we annotate $z(u)_{\text{PART}}$ with mark (as in the German treebanks), and in the latter, we separately annotate m/n_{DET} with det:

Ludwig van Beethoven hod de Gwohnheit ghobt,
 Ludwig van Beethoven had had the habit

<p>genau 60 Kafääbaunan zu m oozöön , exactly 60 coffee beans INF the count , PART DET NOUN</p>	<p>mark</p>
<p>um si draus a Schalal Mokka z mochn . so as to REFL out of it a cup of coffee INF make . PART VERB</p>	<p>mark</p>

'Ludwig van Beethoven had a habit of counting exactly 60 coffee beans in order to brew a cup of coffee from them' (Wiki *Kafää* ‘Coffee’)

5.3 Pronouns and inflection

See also §1.6 for general guidelines (when the pronoun is clearly its own entity, treat it as a token: $gibts \rightarrow gibt_{\text{VERB}} s_{\text{PRON}}$).

5.3.1 Complementizer agreement (*dassd*, *weilds*, ...)

In Bavarian, reduced forms of second person (and, optionally, 1PL) pronouns are used when they appear in the Wackernagel position immediately after complementizers ($-sd$ 2SG, $-ds$ 2PL, $-ma$ 1PL). These reduced forms are immediately attached to the previous word and can still be followed by a full pronoun for additional stress (Weiß, 1998, p. 119):

	Reduced pronoun	Full pronoun	Reduced + full
1SG	wenn e/i gäh	wenn i gäh (?)	—
2SG	wennsd af Minga kimmisd	—	wennsd du af Minga kimmisd
3SG	wenn a des duad	wenn ea des duad	—
1PL	wem ma af Minga fahrn	wenn mia af Minga fahrn	(wemma mia af Minga fahrn)
2PL	wennds af Minga kemds	—	wennds ees af Minga kemds
3PL	wenn s genga	wenn se genga (?)	—

Pronoun forms after complementizers. Our tokenization is indicated by whitespace.

Adapted from [Weiß \(1998, pp. 119, 126 – 1sc reduced, 2sc, 3SG, 1PL, 2PL\)](#) and [Merkle \(1993, p. 189 – 1sg reduced, 3PL reduced\)](#). ‘When I/they go; When you.SG/PL come to Munich; If he does that; When we go to Munich.’

Whether these constructions should be analyzed as a word followed by an enclitic pronoun or as inflected complementizers is debatable (for an overview of the different arguments, see [Weiß, 1998, pp. 123–133](#)). To what extent 1PL should be included in this analysis depends on the dialect and linguist (cf. [Weiß, 1998, p. 123, fn. 48](#)).

For our annotations, we follow [Bayer \(2013\)](#) and adopt the interpretation of inflection for the second person (and for *doubly marked* 1PL cases):

The endings *-sd* and *-ds* can also be attached to other words ([Merkle, 1993, pp. 127–128](#)); see the following examples (*ibid.*):

- *dees Bia, des wods neilich drungga habds* ‘the beer that.2PL you drank the other day’
- *i wui wissn, weasd du bisd* ‘I want to know who.2SG you are’
- *Du soisd sång, an wäichan Schuahsd wuisd.* ‘You have to say which shoe.2SG you want’
- *wia schnäisd fahsd* ‘how fast.2SG you go’ – this is often replaced with a *dass* construction (§5.4.1): *wia schnäi dassd fahsd*

If you encounter any such cases, please bring them up during a meeting.

⚠ There are a few cases where people write, e.g., *dass d* with a blank space in between. We solve this with *goeswith*.

5.3.2 1PL -ma

Double-marking (mia gemma) The 1PL.PRES inflection of verbs is typically identical to the infinitive form: *mia genga* ‘we go’. However, it is also possible to add *-ma* to the stem of the verb instead: *mia gemma* (Merkle, 1993, p. 127). (In this example, the nasal of the stem, *-ng*, assimilated to the *m*-). Although this ending historically comes from a cliticized form of the pronoun, we simply analyze it as inflection: *mia_{PRON} gemma_{VERB}*.

Whether to treat *-ma* as inflectional morpheme or clitic is controversial (Weiβ, 1998, p. 123, fn. 48). However, this annotation decision is consistent with how we annotate the 2nd person inflection of, e.g., *du gähsd* ‘you.SG go’ and *ees gähdds* ‘you.PL go’, although *-d* and *-s* also evolved from pronouns – a fact that Bavarian speakers are likely not aware of (Weiβ, 1998, p. 127). This decision also lends itself well to UD annotation: it is unclear what dependency label *-ma* should get, since the independent pronoun *mia* is already the nsubj.

The same applies to the *-t* in the Standard German 2sg ending *-st* (Weiβ, 1998, p. 127).

Only -ma, no other nsubj While we currently do not have any occurrences of this, Bavarian allows clauses that only have *-ma* and no other nsubj: in VS clauses like questions (e.g., *Hamma des?* ‘Do we have it?’) and in imperatives (*Gemma!* ‘Let’s go!’). If we come across these, we will have to decide how to treat them. The following seems sensible:

Imperatives (gemma!) Bayer (1984, pp. 253–254) argues that the imperative should be treated as inflection since no version without *-ma* exists (**Genga mia!*).

VS clauses (gemma?) The situation in verb-first clauses appears to be controversial (inflection or clitic?), especially as dialects in Lower Bavaria seem to differ from other Bavarian dialects with respect to *-ma* (Bayer, 1984, p. 252, Weiβ, 1998, p. 123, fn. 48, Altmann, 1984, p. 201). To keep our annotations straightforward and overall consistent, the most simple decision would be to split off *-ma* and treat it as a PRON and nsubj, unless there also is a separate *mia* (see above for such cases).

5.3.3 Dropped 2nd person pronouns

Second person pronouns can be omitted when they occur after a correspondingly inflected verb. Consider the table in the margin and compare the following two sentences:

case	obl	nsubj		aux	
Vo	wos	redst	Du ?	Kaunst	aufstehn ?
of	what	talk.2SG	you.SG ?	Can.2SG	get up.INF ?
ADP	PRON	VERB	PRON	AUX	VERB

‘What are you talking about?’
(Wiki *Konjunktiona* ‘Conjunctions’)

‘Can you get up?’
(Tatoeba 10673747c)

Personal pronouns before and after verbs, based on Merkle (1993, pp. 63–64).

SV	VS
i håb	håw i/a
du håsd	håsd
ea/sie/es håd	håd a/s
mia ham	hamma
ia habds	habds
de ham	ham s

This simply means that some sentences won’t have an nsubj.

We do *not* analyze this as an inflection ending *-s(d)* followed by or merged with a reduced pronoun *d* (or *-d(s)* and *s* for 2PL) – while this would be an etymological analysis of *-sd/ds*, it is unlikely speakers think of it that way (Weiβ, 1998, p. 127).

5.3.4 Dropped *es* after *-s*

In a few sentences in our treebank, the pronoun (*e*)*s* ‘it’ is dropped after (or merged with?) *-s* (e.g., *Is heid bewölkt?* ‘Is it cloudy today’; xSID *de-ba-test* 18). If a merge is indicated orthographically (e.g., the *iss* in *Im Nordboarischn dageeng iss mèjer wej im Standarddaitschn*. ‘In North Bavarian however, it is more like in Standard German.’; Wiki discussion *Boarische Umschrift* ‘Bavarian transcription’), we separate the sequence into two tokens (*is* and *s*). Otherwise, we leave the token as *is* – the sentence then lacks an nsubj (see also §5.3.3).

5.4 Other annotation decisions for Bavarian

5.4.1 Additional complementizer *dass*

The adverb, relative pronoun, or question word introducing a subordinate clause can be followed by an additional conjunction *dass* ‘that’ (Weiβ, 1998, pp. 29–30; Merkle, 1993, pp. 190–191), which we consider a marker:

admod		mark
admod		
Jezz mechad i owa wissn, wia lang das des no dauat.		
Now I’d like to know how long that this still takes.		
ADV ADJ SCONJ PRON ADV VERB		

‘Now I’d like to know how long this will still take.’

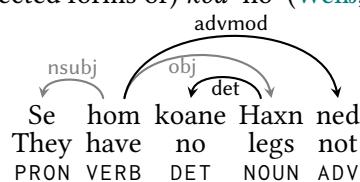

(Wiki *Pronomen* ‘Pronouns’)

5.4.2 Interjections

Some interjections evolved from words originally belonging to other parts of speech, but we annotate them as `INTJ`. This includes *gäi/gell* (and the optional polite version *gäins* or *gän* → *S*), which is derived from inflected forms of what corresponds to the German verb *gelten* ‘to be valid’ (Merkle, 1993, p. 197), *gäh/gö* lit. ‘go.IMP’ when used as an interjection (cf. Merkle, 1993, p. 76), and *mei* lit. ‘my’ (cf. Merkle, 1993, p. 142). When *sowas* is used as an interjection, we annotate it as such.

5.4.3 Negative concord

Unlike German, Bavarian allows for negative concord in constructions with (inflected forms of) *koia* ‘no’ (Weiß, 1998, pp. 167–168):

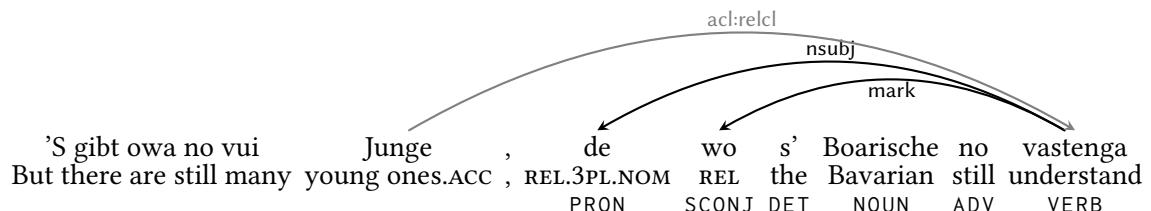

“They have no legs [...]”

(Wiki *Fiisch* ‘Fish’)

5.4.4 Relative pronouns and particles

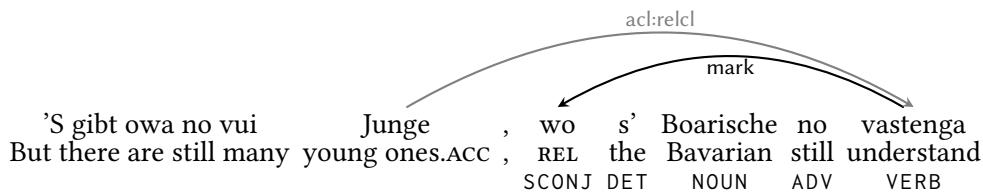

Where German uses the relative pronouns *der/die/das* ‘that, which’, Bavarian can append the invariant relative marker *wo* (Moser, 2023). In some dialects, the relative marker is expressed as *was* (Pittner, 1996), and in our data we also find *wie/wej* in northern regions. We tag the relative pronoun as `PRON` (as in the German treebanks) and the relative marker as `SCONJ` with the relation mark:

‘However, there are still many young people who still understand Bavarian’

(Wiki *Minga* ‘Munich’)

In certain situations, the relative pronoun can be dropped in Bavarian if the relative marker is present (Pittner, 1996). This can for instance happen when the case of the relative pronoun matches that of the modified noun, but also when the relative pronoun would be in the nominative case:

! *Wo* can also appear as a location adverb introducing a subordinate clause: *Der Ort, wo_{ADV}_advmod ich aufgewachsen_acl bin.* ‘The place where I grew up.’ vs. *Der Ort, (der) wo_{SCONJ}_mark gerade erwähnt_acl:relcl wurde.* ‘The place that just got mentioned.’

Additional notes The difference between a *relative pronoun* and a *relative marker* is that the pronoun might match the case/number/gender/animate... of the modified noun, whereas the marker does not inflect. English has both relative pronouns (*who(m)*, *which*) and a relative marker (*that*). [For reasons of practicality](#), *that* is however treated in UD as if it were a relative pronoun. However, in the same discussion, Chris Manning also writes:

There is an argument from Middle English that *that* should be analyzed as a complementizer while *who* and *which* are relative pronouns ... there are good arguments for this, including that you can get *both*:

Every word which that she of hire herde (Troilus and Criseyde, II.899)

This double relativization seems very similar to the situation in Bavarian. How do treebanks in other languages deal with relative markers?

- UZH considers *wo* a pronoun. However, in Swiss German (unlike Bavarian), *wo* is the sole relativizer ([Moser, 2023](#)).
- North Germanic languages use the invariant *som* (NOR, SWE, DAN), *sem* (ISL) and *sum* (FAO) to mark relative clauses (on its own, with no relative pronouns). The Norwegian and Icelandic treebanks treat it as *SCONJ*, the Swedish and Danish ones as *PRON*, and the Faroese treebanks are split between the two options.

5.4.5 Temporal expressions

For expressions like *um 3 Nachmittag*, see §4.19.
