# A family of Mordell curves with the rank of at least three 

Seiji Tomita

#### Abstract

We constructed a parametrized family of Mordell curves with the rank of at least three.

## 1 Introduction

$$
\begin{equation*}
y^{2}=x^{3}+d \tag{1}
\end{equation*}
$$

The elliptic curve represented by (1) is known as a Mordell curve. Choudry and Zargar [1] obtained a parametrized family of Mordell curves with the rank of at least three. They obtained the solution using a quadratic system of equations. Mina and Bacani[2] constructed two infinite families with the rank of at least three. They reduced the problem to an elliptic curve to get the third point. In this paper, we present an elementary construction for a parametrized family of Mordell curves with the rank of at least three.

$$
\begin{equation*}
E: y^{2}=x^{3}+a^{2} \tag{2}
\end{equation*}
$$

## 2 Main result

We shall construct a parametrized family of Mordell curves with the rank of at least three. Forcing a to be $x$-coodinates of the point on $E$. Then we get $a^{3}+a^{2}=a^{2}(a+1)=v^{2}$ for some rational number $v$. Then $a+1$ must be a square number. Let $a=m^{2}-1$ some rational number m . Thus we get a first point $P_{1}=\left(m^{2}-1, m\left(m^{2}-1\right)\right)$ on the elliptic curve

$$
y^{2}=x^{3}+\left(m^{2}-1\right)^{2}
$$

Now, we try to increase the rank by forcing the x-coordinates of the second point $P_{2}$ to be $x=m-1$.
This holds when $m(m+3)=u^{2}$ for some rational number $u$.
A simple calculation shows that $m-1=-\frac{-5+4 k}{(k-1)(k+1)}$.
Hence, the point

$$
P_{2}=\left(-\frac{-5+4 k}{(k-1)(k+1)}, \frac{(-5+4 k)(k-2)(2 k-1)}{(k-1)^{2}(k+1)^{2}}\right)
$$

is a rational point on

$$
y^{2}=x^{3}+\frac{(-5+4 k)^{2}\left(2 k^{2}-4 k+3\right)^{2}}{(k-1)^{4}(k+1)^{4}} .
$$

We try to increase the rank by forcing the x-coordinates of 3 rd point $P_{3}$ to be $x=-\frac{2 k^{2}-4 k+3}{(k-1)(k+1)}$. This holds when $-\left(2 k^{2}+4 k-7\right)$ is a perfect rational square number.
A simple calculation shows that

$$
x=\frac{\left(n^{2}-4 n+22\right)\left(n^{2}+4 n+6\right)}{4(4+n)(n-2)(n+1)} .
$$

Hence, the point

$$
P_{3}=\left(\frac{\left(n^{2}-4 n+22\right)\left(n^{2}+4 n+6\right)}{4(4+n)(n-2)(n+1)}, \frac{\left(n^{2}+4 n+6\right)\left(n^{2}+8 n-2\right)\left(n^{2}-4 n+22\right)\left(n^{2}+2 n+10\right)}{16(4+n)^{2}(n-2)^{2}(n+1)^{2}}\right)
$$

is a rational point on

$$
\begin{equation*}
y^{2}=x^{3}+\frac{\left(n^{2}+4 n+6\right)^{2}\left(34+n^{2}+8 n\right)^{2}\left(2+n^{2}\right)^{2}\left(n^{2}-4 n+22\right)^{2}}{256(4+n)^{4}(n-2)^{4}(n+1)^{4}} \tag{3}
\end{equation*}
$$

which contains the points,

$$
\begin{aligned}
P_{1}= & \left(\frac{\left(n^{2}+4 n+6\right)\left(34+n^{2}+8 n\right)\left(2+n^{2}\right)\left(n^{2}-4 n+22\right)}{16(4+n)^{2}(n-2)^{2}(n+1)^{2}},\right. \\
& \left.\frac{\left(n^{2}+2 n+10\right)^{2}\left(34+n^{2}+8 n\right)\left(n^{2}-4 n+22\right)\left(2+n^{2}\right)\left(n^{2}+4 n+6\right)}{64(4+n)^{3}(n-2)^{3}(n+1)^{3}}\right), \\
P_{2}= & \left(-\frac{\left(34+n^{2}+8 n\right)\left(2+n^{2}\right)}{4(4+n)(n-2)(n+1)}, \frac{\left(34+n^{2}+8 n\right)\left(n^{2}-4 n-14\right)\left(2+n^{2}\right)\left(n^{2}+2 n+10\right)}{16(4+n)^{2}(n-2)^{2}(n+1)^{2}}\right), \\
P_{3}= & \left(\frac{\left(n^{2}-4 n+22\right)\left(n^{2}+4 n+6\right)}{4(4+n)(n-2)(n+1)}, \frac{\left(n^{2}+4 n+6\right)\left(n^{2}+8 n-2\right)\left(n^{2}-4 n+22\right)\left(n^{2}+2 n+10\right)}{16(4+n)^{2}(n-2)^{2}(n+1)^{2}}\right) .
\end{aligned}
$$

Specialization to $n=3$ yields the elliptic curve

$$
y^{2}=x^{3}+\frac{142945242561}{157351936} .
$$

The points

$$
P_{1}=\left(\frac{378081}{12544}, \frac{236300625}{1404928}\right), P_{2}=\left(-\frac{737}{112},-\frac{313225}{12544}\right), P_{3}=\left(\frac{513}{112}, \frac{397575}{12544}\right)
$$

have regulator 83.3621963770719 by Sage[3], then the three points are independent, and Silverman's specialization theorem[4] shows the rank of the family of Mordell curves given by the parametric solution of (3) is at least three.

## 3 High rank examples

We calculated (3) for $n<100$ and found several elliptic curves of the rank 4, 5, 6, and 7 .

Table 1: High rank examples

| rank | $n$ |  |  |  |
| :---: | :---: | :---: | :---: | :---: |
| 4 | $1 / 3$, | $1 / 7$, | $1 / 8$, | $1 / 9, \cdots$ |
| 5 | $1 / 5$, | $2 / 11$, | $3 / 4$, | $4 / 9, \cdots$ |
| 6 | $1 / 14$, | $2 / 3$, | $5 / 22$, | $7 / 3, \cdots$ |
| 7 | $1 / 15$, | $15 / 7$, | $37 / 14$, | $41 / 22, \cdots$ |
