

A FOURIER INVERSION THEOREM FOR NORMAL FUNCTIONS

TRISTRAM DE PIRO

ABSTRACT. This paper proves an inversion theorem for the Fourier transform defined in [2], applied to the class of normal functions.

We recall the definition of the Fourier transform for quasi split normal functions, which includes normal functions, introduced in the paper [2], normalised by the factor $\frac{1}{2\pi}$ in dimension 2, and by $\frac{1}{(2\pi)^{\frac{3}{2}}}$ in dimension 3, which we denote by \mathcal{F} . The aim of this paper is to prove an inversion theorem for such functions. We first have the following;

Lemma 0.1. *Let $f : \mathcal{R}^2 \rightarrow \mathcal{R}$ be smooth and quasi split normal, then $\mathcal{F}(f) \in L^1(\mathcal{R}^2)$ and is of rapid decay, in the sense that, for $|\bar{k}| > 1$, $k_1 \neq 0, k_2 \neq 0$*

$$|\mathcal{F}(f)(\bar{k})| \leq \frac{C_n}{|\bar{k}|^n}$$

where $C_n \in \mathcal{R}$, $n \in \mathcal{N}$.

A similar result holds for smooth quasi split normal $f : \mathcal{R}^3 \rightarrow \mathcal{R}$, with $\mathcal{F}(f) \in L^1(\mathcal{R}^3)$, and for $|\bar{k}| > 1$, $k_1 \neq 0, k_2 \neq 0, k_3 \neq 0$

$$|\mathcal{F}(f)(\bar{k})| \leq \frac{C_n}{|\bar{k}|^n}$$

where $C_n \in \mathcal{R}$, $n \in \mathcal{N}$.

Proof. In dimension 2, by [2], we have that integration by parts is justified, for $k_1 \neq 0, k_2 \neq 0$, and we obtain that;

$$\mathcal{F}(\nabla^2(f))(\bar{k}) = -k^2 \mathcal{F}(f)(\bar{k})$$

$$\mathcal{F}((\nabla^2)^n f) = -k^{2n} \mathcal{F}(f)(\bar{k}) \quad (*)$$

By the definition of quasi split normality, $(\nabla^2)^n f$ is of moderate decrease $2n + 1$ and smooth, so that for $n \geq 1$, $(\nabla^2)^n f \in L^1(\mathcal{R}^2)$, and we have the trivial bound;

$$|\mathcal{F}((\nabla^2)^n f)| \leq \frac{\|(\nabla^2)^n f\|_{L^1(\mathcal{R}^2)}}{2\pi} = C_{2n}$$

Rearranging (*), we obtain that, for $|\bar{k}| > 1$, $k_1 \neq 0$, $k_2 \neq 0$;

$$|\mathcal{F}(f)(\bar{k})| \leq \frac{C_{2n}}{k^{2n}} \leq \frac{C_{2n}}{|\bar{k}|^m}, \text{ for } 1 \leq m \leq 2n.$$

The proof for $f : \mathcal{R}^3 \rightarrow \mathcal{R}$ is similar, noting that $(\nabla^2)^n f \in L^1(\mathcal{R}^3)$, for $n \geq 2$, and repeating the argument in three variables.

We have that, by the definition of quasi split normality, for $f : \mathcal{R}^2 \rightarrow \mathcal{R}$, $\{\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}\}$ are of moderate decrease 2, and smooth, so belong to $L^{\frac{3}{2}}(\mathcal{R}^2)$. By the Hausdorff-Young inequality, using the fact that $1 \leq \frac{3}{2} \leq 2$, we have that $\{\mathcal{F}(\frac{\partial f}{\partial x}), \mathcal{F}(\frac{\partial f}{\partial y})\} \subset L^3(\mathcal{R}^2)$, in particularly $\{\mathcal{F}(\frac{\partial f}{\partial x}), \mathcal{F}(\frac{\partial f}{\partial y}), |\mathcal{F}(\frac{\partial f}{\partial x})| + |\mathcal{F}(\frac{\partial f}{\partial y})|\} \subset L^3(B(\bar{0}, 1))$. A simple integration using polar coordinates, shows that $\frac{1}{k} \in L^{\frac{3}{2}}(B(\bar{0}, 1))$. As above, we have that, for $k_1 \neq 0, k_2 \neq 0$;

$$\mathcal{F}(f)(\bar{k}) = \frac{\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})}{ik_1} = \frac{\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})}{ik_2} \quad (A)$$

Observe that;

$$\frac{1}{k} = \frac{1}{|k_1|} \frac{1}{(1 + \frac{k_2^2}{k_1^2})^{\frac{1}{2}}} = \frac{1}{|k_2|} \frac{1}{(1 + \frac{k_1^2}{k_2^2})^{\frac{1}{2}}}$$

and;

$$1 \leq (1 + \frac{k_1^2}{k_2^2})^{\frac{1}{2}} \leq \sqrt{2}, \text{ for } |k_1| \leq |k_2|$$

$$1 \leq (1 + \frac{k_2^2}{k_1^2})^{\frac{1}{2}} \leq \sqrt{2}, \text{ for } |k_2| \leq |k_1|$$

so that $\frac{1}{|k_1|} \leq \frac{\sqrt{2}}{k}$, for $|k_2| \leq |k_1|$, $\frac{1}{|k_2|} \leq \frac{2}{k}$, for $|k_1| \leq |k_2|$, the cases being exhaustive, (B). Combining (A), (B), we obtain that;

$$|\mathcal{F}(f)(\bar{k})| \leq \sqrt{2} \left| \frac{\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})}{k} \right|, \text{ for } |k_2| \leq |k_1|$$

$$|\mathcal{F}(f)(\bar{k})| \leq \sqrt{2} \left| \frac{\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})}{k} \right|, \text{ for } |k_1| \leq |k_2|$$

$$\begin{aligned} |\mathcal{F}(f)(\bar{k})| &\leq \sqrt{2} \frac{\max(|\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})|, |\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})|)}{k} \\ &\leq \frac{\sqrt{2}(|\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})| + |\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})|)}{k} \end{aligned}$$

By Holder's inequality, we have that;

$$\frac{\sqrt{2}(|\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})| + |\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})|)}{k} \in L^1(B(\bar{0}, 1))$$

so that $\mathcal{F}(f)(\bar{k}) \in L^1(B(\bar{0}, 1))$. By the rapid decrease of $\mathcal{F}(f)$, for $|\bar{k}| > 1$, we have that $\mathcal{F}(f)(\bar{k}) \in L^1(\mathcal{R}^2 \setminus B(\bar{0}, 1))$, so that $\mathcal{F}(f)(\bar{k}) \in L^1(\mathcal{R}^2)$.

For $f : \mathcal{R}^3 \rightarrow \mathcal{R}$, $\{\frac{\partial f}{\partial x}, \frac{\partial f}{\partial y}, \frac{\partial f}{\partial z}\}$ are of moderate decrease 2, and smooth, so belong to $L^2(\mathcal{R}^3)$, and by classical theory;

$$\{\mathcal{F}(\frac{\partial f}{\partial x}), \mathcal{F}(\frac{\partial f}{\partial y}), \mathcal{F}(\frac{\partial f}{\partial z}), |\mathcal{F}(\frac{\partial f}{\partial x})| + |\mathcal{F}(\frac{\partial f}{\partial y})| + |\mathcal{F}(\frac{\partial f}{\partial z})|\} \subset L^2(\mathcal{R}^3)$$

as well. In particular;

$$\{\mathcal{F}(\frac{\partial f}{\partial x}), \mathcal{F}(\frac{\partial f}{\partial y}), \mathcal{F}(\frac{\partial f}{\partial z}), |\mathcal{F}(\frac{\partial f}{\partial x})| + |\mathcal{F}(\frac{\partial f}{\partial y})| + |\mathcal{F}(\frac{\partial f}{\partial z})|\} \subset L^2(B(\bar{0}, 1))$$

A simple integration using polar coordinates, shows that $\frac{1}{k} \in L^2(B(\bar{0}, 1))$. As above, we have that, for $k_1 \neq 0, k_2 \neq 0, k_3 \neq 0$;

$$\mathcal{F}(f)(\bar{k}) = \frac{\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})}{ik_1} = \frac{\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})}{ik_2} = \frac{\mathcal{F}(\frac{\partial f}{\partial z})(\bar{k})}{ik_3} \quad (AA)$$

Observe that;

$$\frac{1}{k} = \frac{1}{|k_1|} \frac{1}{(1 + \frac{k_2^2}{k_1^2} + \frac{k_3^2}{k_1^2})^{\frac{1}{2}}} = \frac{1}{|k_2|} \frac{1}{(1 + \frac{k_1^2}{k_2^2} + \frac{k_3^2}{k_2^2})^{\frac{1}{2}}} = \frac{1}{|k_3|} \frac{1}{(1 + \frac{k_1^2}{k_3^2} + \frac{k_2^2}{k_3^2})^{\frac{1}{2}}}$$

and;

$$1 \leq (1 + \frac{k_1^2}{k_2^2} + \frac{k_3^2}{k_2^2})^{\frac{1}{2}} \leq \sqrt{3}, \text{ for } \max(|k_1|, |k_3|) \leq |k_2|$$

$$1 \leq (1 + \frac{k_2^2}{k_1^2} + \frac{k_3^2}{k_1^2})^{\frac{1}{2}} \leq \sqrt{3}, \text{ for } \max(|k_2|, |k_3|) \leq |k_1|$$

$$1 \leq (1 + \frac{k_1^2}{k_3^2} + \frac{k_2^2}{k_3^2})^{\frac{1}{2}} \leq \sqrt{3}, \text{ for } \max(|k_1|, |k_2|) \leq |k_3|$$

so that $\frac{1}{|k_1|} \leq \frac{\sqrt{3}}{k}$, for $\max(|k_2|, |k_3|) \leq |k_1|$, $\frac{1}{|k_2|} \leq \frac{\sqrt{3}}{k}$, for $\max(|k_1|, |k_3|) \leq |k_2|$, $\frac{1}{|k_3|} \leq \frac{\sqrt{3}}{k}$, for $\max(|k_1|, |k_2|) \leq |k_3|$ the cases being exhaustive, (BB). Combining (AA), (BB), we obtain that;

$$|\mathcal{F}(f)(\bar{k})| \leq \sqrt{3} \left| \frac{\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})}{k} \right|, \text{ for } \max(|k_2|, |k_3|) \leq |k_1|$$

$$|\mathcal{F}(f)(\bar{k})| \leq \sqrt{3} \left| \frac{\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})}{k} \right|, \text{ for } \max(|k_1|, |k_3|) \leq |k_2|$$

$$|\mathcal{F}(f)(\bar{k})| \leq \sqrt{3} \left| \frac{\mathcal{F}(\frac{\partial f}{\partial z})(\bar{k})}{k} \right|, \text{ for } \max(|k_1|, |k_2|) \leq |k_3|$$

$$\begin{aligned} |\mathcal{F}(f)(\bar{k})| &\leq \sqrt{3} \frac{\max(|\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})|, |\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})|, |\mathcal{F}(\frac{\partial f}{\partial z})(\bar{k})|)}{k} \\ &\leq \frac{\sqrt{3}(|\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})| + |\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})| + |\mathcal{F}(\frac{\partial f}{\partial z})(\bar{k})|)}{k} \end{aligned}$$

By the Cauchy-Schwartz inequality, we have that;

$$\frac{\sqrt{3}(|\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})| + |\mathcal{F}(\frac{\partial f}{\partial y})(\bar{k})| + |\mathcal{F}(\frac{\partial f}{\partial z})(\bar{k})|)}{k} \in L^1(B(\bar{0}, 1))$$

so that $\mathcal{F}(f)(\bar{k}) \in L^1(B(\bar{0}, 1))$. By the rapid decrease of $\mathcal{F}(f)$, for $|\bar{k}| > 1$, we have that $\mathcal{F}(f)(\bar{k}) \in L^1(\mathcal{R}^3 \setminus B(\bar{0}, 1))$, so that $\mathcal{F}(f)(\bar{k}) \in L^1(\mathcal{R}^3)$.

□

Definition 0.2. Let $f \in C^\infty(\mathcal{R}^2)$ be quasi split normal with $\frac{\partial^{i_1+i_2} f}{\partial x^{i_1} \partial y^{i_2}}$ bounded for $0 \leq i_1 + i_2 \leq 27$. Let $C_m = \{(x, y) \in \mathcal{R}^2 : |x| \leq m, |y| \leq m\}$. Let;

$$Q_m = \mathcal{R}^2 \setminus (x = m \cup x = -m \cup y = m \cup y = -m)$$

$$C^{13,14,m}(\mathcal{R}^2) = \{h : \frac{\partial^{i+j} h}{\partial x^i \partial y^j}, 0 \leq i, j \leq 13, \text{ define continuous functions,}$$

$$\frac{\partial^{i+14} h}{\partial x^i \partial y^{14}}, \frac{\partial^{i+14} h}{\partial x^{14} \partial y^i}, 0 \leq i \leq 13, \text{ define bounded functions on } Q_m\}$$

Then we define an inflexionary approximation sequence $\{f_m : m \in \mathcal{N}\}$ by the requirements;

$$(i). f_m \in C^{13,14,m}(\mathcal{R}^2)$$

$$(ii). f_m|_{C_m} = f|_{C_m}$$

$$(iii) f_m|_{(\mathcal{R}^2 \setminus C_{m+\frac{1}{m^2}})} = 0$$

$$\text{Letting } g_m = f_m|_{[-m, m] \times [-m - \frac{1}{m^2}, m + \frac{1}{m^2}]};$$

$$(iv). \text{ For } |x| \leq m, \text{ for } 0 \leq i \leq 13;$$

$$\frac{\partial^i g_m}{\partial y^i} |_{(x, m)} = \frac{\partial^i f}{\partial y^i} |_{(x, m)}$$

$$\frac{\partial^i g_m}{\partial y^i} |_{(x, -m)} = \frac{\partial^i f}{\partial y^i} |_{(x, -m)}$$

$$\frac{\partial^i g_m}{\partial y^i} |_{(x, m + \frac{1}{m})} = 0$$

$$\frac{\partial^i g_m}{\partial y^i} |_{(x, -m - \frac{1}{m})} = 0$$

$$(v). \text{ For } |x| \leq m$$

$$\text{if } \frac{\partial^{14} f}{\partial y^{14}} |_{(x, m)} > 0, \frac{\partial^{14} g_m}{\partial y^{14}} |_{V_{x, m}} \geq 0$$

$$\text{if } \frac{\partial^{14} f}{\partial y^{14}} |_{(x, m)} < 0, \frac{\partial^{14} g_m}{\partial y^{14}} |_{V_{x, m}} \leq 0$$

$$\text{if } \frac{\partial^{14} f}{\partial y^{14}} |_{(x, -m)} > 0, \frac{\partial^{14} g_m}{\partial y^{14}} |_{V_{x, -m}} \geq 0$$

$$\text{if } \frac{\partial^{14} f}{\partial y^{14}} |_{(x, -m)} < 0, \frac{\partial^{14} g_m}{\partial y^{14}} |_{V_{x, -m}} \leq 0$$

The same property as (iv), (v) holding, replacing f and g_m with $\frac{\partial^i f}{\partial x^i}$ and $\frac{\partial g_m}{\partial x^i}$, for $0 \leq i \leq 13$.

$$(vi). \text{ For } |y| \leq m + \frac{1}{m^2}, 0 \leq i \leq 13$$

$$\frac{\partial^i f_m}{\partial x^i} |_{(m, y)} = \frac{\partial^i g_m}{\partial x^i} |_{(m, y)}$$

$$\frac{\partial^i f_m}{\partial x^i} |_{(-m, y)} = \frac{\partial^i g_m}{\partial x^i} |_{(-m, y)}$$

$$\frac{\partial^i f_m}{\partial x^i} |_{(m + \frac{1}{m}, y)} = 0$$

$$\frac{\partial^i f_m}{\partial x^i} |_{(-m - \frac{1}{m}, y)} = 0$$

$$(vii) \text{ For } |y| \leq m + \frac{1}{m^2}$$

$$\text{if } \frac{\partial^{14} g_m}{\partial x^{14}}|_{(m,y)} > 0, \frac{\partial^{14} f_m}{\partial x^{14}}|_{H_{m,y}} \geq 0$$

$$\text{if } \frac{\partial^{14} g_m}{\partial x^{14}}|_{(m,y)} < 0, \frac{\partial^{14} f_m}{\partial x^{14}}|_{H_{m,y}} \leq 0$$

$$\text{if } \frac{\partial^{14} g_m}{\partial x^{14}}|_{(-m,y)} > 0, \frac{\partial^{14} f_m}{\partial x^{14}}|_{H_{-m,y}} \geq 0$$

$$\text{if } \frac{\partial^{14} g_m}{\partial x^{14}}|_{(-m,y)} < 0, \frac{\partial^{14} f_m}{\partial x^{14}}|_{H_{-m,y}} \leq 0$$

The same property as (vi), (vii) holding, replacing f_m and g_m with $\frac{\partial^i f_m}{\partial y^i}$ and $\frac{\partial g_m}{\partial y^i}$, for $0 \leq i \leq 14$.

where;

$$V_{x,m} = \{(x, y) \in \mathcal{R}^2 : y \in (m, m + \frac{1}{m^2})\}$$

$$V_{x,-m} = \{(x, y) \in \mathcal{R}^2 : y \in (-m - \frac{1}{m^2}, -m)\}$$

$$H_{m,y} = \{(x, y) \in \mathcal{R}^2 : x \in (m, m + \frac{1}{m^2})\}$$

$$H_{-m,y} = \{(x, y) \in \mathcal{R}^2 : x \in (-m - \frac{1}{m^2}, -m)\}$$

Definition 0.3. Let $f \in C^\infty(\mathcal{R}^3)$ be quasi split normal with $\frac{\partial^{i_1+i_2+i_3} f}{\partial x^{i_1} \partial y^{i_2} \partial z^{i_3}}$ bounded for $0 \leq i_1 + i_2 + i_3 \leq 40$. Let $C_m = \{(x, y, z) \in \mathcal{R}^3 : |x| \leq m, |y| \leq m, |z| \leq m\}$. Let;

$$Q_m = \mathcal{R}^3 \setminus (x = m \cup x = -m \cup y = m \cup y = -m \cup z = m \cup z = -m)$$

$$C^{13,13,14,m}(\mathcal{R}^3) = \{h : \frac{\partial^{i+j+k} h}{\partial x^i \partial y^j \partial z^k}, 0 \leq i, j, k \leq 13, \text{ define continuous functions,}$$

$$\frac{\partial^{i+j+14} h}{\partial x^i \partial y^j \partial z^{14}}, \frac{\partial^{i+j+14} h}{\partial x^i \partial y^{14} \partial z^j}, \frac{\partial^{i+j+14} h}{\partial x^{14} \partial y^i \partial z^j}, 0 \leq i, j \leq 13, \text{ define bounded functions on } Q_m\}$$

Then we define an inflexionary approximation sequence $\{f_m : m \in \mathcal{N}\}$ by the requirements;

$$(i). f_m \in C^{13,13,14}(\mathcal{R}^3)$$

$$(ii). f_m|_{C_m} = f|_{C_m}$$

$$(iii). f_m|_{(\mathcal{R}^3 \setminus C_{m+\frac{1}{m^3}})} = 0$$

(iv). For $0 \leq |y| \leq m, 0 \leq |z| \leq m$, for $0 \leq i \leq 13$;

$$\frac{\partial^i f_m}{\partial x^i} |_{(m,y,z)} = \frac{\partial^i f}{\partial x^i} |_{(m,y,z)}$$

$$\frac{\partial^i f_m}{\partial x^i} |_{(-m,y,z)} = \frac{\partial^i f}{\partial x^i} |_{(-m,y,z)}$$

$$\frac{\partial^i f_m}{\partial x^i} |_{(m+\frac{1}{m},y,z)} = 0$$

$$\frac{\partial^i f_m}{\partial x^i} |_{(-m-\frac{1}{m},y,z)} = 0$$

(v). For $0 \leq |y| \leq m, 0 \leq |z| \leq m$

$$\text{if } \frac{\partial^{14} f}{\partial x^{14}} |_{(m,y,z)} > 0, \frac{\partial^{14} f_m}{\partial x^{14}} |_{H_{m,y,z}} \geq 0$$

$$\text{if } \frac{\partial^{14} f}{\partial y^{14}} |_{(m,y,z)} < 0, \frac{\partial^{14} f_m}{\partial x^{14}} |_{H_{m,y,z}} \leq 0$$

$$\text{if } \frac{\partial^{14} f}{\partial y^{14}} |_{(-m,y,z)} > 0, \frac{\partial^{14} f_m}{\partial x^{14}} |_{H_{-m,y,z}} \geq 0$$

$$\text{if } \frac{\partial^{14} f}{\partial y^{14}} |_{(-m,y,z)} < 0, \frac{\partial^{14} f_m}{\partial x^{14}} |_{H_{-m,y,z}} \leq 0$$

(vi). For $0 \leq |x| \leq m + \frac{1}{m^3}, 0 \leq |z| \leq m, 0 \leq i \leq 13$

$$\frac{\partial^i f_m}{\partial y^i} |_{(x,y,z)} = \frac{\partial^i f_m}{\partial y^i} |_{(x,m,z)}, m \leq y \leq m + \frac{1}{m}$$

$$\frac{\partial^i f_m}{\partial y^i} |_{(x,y,z)} = \frac{\partial^i f_m}{\partial y^i} |_{(x,-m,z)}, -m - \frac{1}{m} \leq y \leq -m$$

$$\frac{\partial^i f_m}{\partial y^i} |_{(x,m+\frac{1}{m^3},z)} = 0$$

$$\frac{\partial^i f_m}{\partial y^i} |_{(x,-m-\frac{1}{m^3},z)} = 0$$

(vii) For $0 \leq |x| \leq m + \frac{1}{m^3}, 0 \leq |z| \leq m$

$$\text{if } \frac{\partial^{14} f_m}{\partial y^{14}} |_{(x,m,z)} > 0, \frac{\partial^{14} f_m}{\partial y^{14}} |_{V_{x,m,z}} \geq 0$$

$$\text{if } \frac{\partial^{14} f_m}{\partial y^{14}} |_{(x,m,z)} < 0, \frac{\partial^{14} f_m}{\partial y^{14}} |_{V_{x,m,z}} \leq 0$$

$$\text{if } \frac{\partial^{14} f_m}{\partial y^{14}} |_{(x,-m,z)} > 0, \frac{\partial^{14} f_m}{\partial y^{14}} |_{V_{x,-m,z}} \geq 0$$

$$\text{if } \frac{\partial^{14} f_m}{\partial y^{14}} |_{(x,-m,z)} < 0, \frac{\partial^{14} f_m}{\partial y^{14}} |_{V_{x,-m,z}} \leq 0$$

(viii). For $0 \leq |x| \leq m + \frac{1}{m^3}, 0 \leq |y| \leq m + \frac{1}{m^3}, 0 \leq i \leq 13$

$$\begin{aligned} \frac{\partial^i f_m}{\partial z^i} \Big|_{(x,y,z)} &= \frac{\partial^i f_m}{\partial z^i} \Big|_{(x,y,m)}, \quad m \leq z \leq m + \frac{1}{m^3} \\ \frac{\partial^i f_m}{\partial z^i} \Big|_{(x,y,z)} &= \frac{\partial^i f_m}{\partial z^i} \Big|_{(x,y,-m)}, \quad -m - \frac{1}{m^3} \leq z \leq -m \\ \frac{\partial^i f_m}{\partial z^i} \Big|_{(x,y,m+\frac{1}{m^3})} &= 0 \\ \frac{\partial^i f_m}{\partial z^i} \Big|_{(x,y,-m-\frac{1}{m^3})} &= 0 \\ (ix) \text{ For } 0 \leq |x| \leq m + \frac{1}{m^3}, \quad 0 \leq |y| \leq m + \frac{1}{m^3} \end{aligned}$$

$$\begin{aligned} \text{if } \frac{\partial^{14} f_m}{\partial z^{14}} \Big|_{(x,y,m)} > 0, \quad \frac{\partial^{14} f_m}{\partial z^{14}} \Big|_{D_{x,y,m}} &\geq 0 \\ \text{if } \frac{\partial^{14} f}{\partial z^{14}} \Big|_{(x,y,m)} < 0, \quad \frac{\partial^{14} f_m}{\partial z^{14}} \Big|_{D_{x,y,m}} &\leq 0 \\ \text{if } \frac{\partial^{14} f}{\partial z^{14}} \Big|_{(x,y,-m)} > 0, \quad \frac{\partial^{14} f_m}{\partial z^{14}} \Big|_{D_{x,y,-m}} &\geq 0 \\ \text{if } \frac{\partial^{14} f}{\partial z^{14}} \Big|_{(x,y,-m)} < 0, \quad \frac{\partial^{14} f_m}{\partial z^{14}} \Big|_{D_{x,y,-m}} &\leq 0 \end{aligned}$$

where;

$$\begin{aligned} H_{m,y,z} &= \{(x, y, z) \in \mathcal{R}^3 : x \in (m, m + \frac{1}{m^3})\} \\ H_{-m,y,z} &= \{(x, y, z) \in \mathcal{R}^3 : x \in (-m - \frac{1}{m^3}, -m)\} \\ V_{x,m,z} &= \{(x, y, z) \in \mathcal{R}^3 : y \in (m, m + \frac{1}{m^3})\} \\ V_{x,-m,z} &= \{(x, y, z) \in \mathcal{R}^3 : y \in (-m - \frac{1}{m^3}, -m)\} \\ D_{x,y,m} &= \{(x, y, z) \in \mathcal{R}^3 : z \in (m, m + \frac{1}{m^3})\} \\ D_{x,y,-m} &= \{(x, y, z) \in \mathcal{R}^3 : z \in (-m - \frac{1}{m^3}, -m)\} \end{aligned}$$

We now address the issue of the construction of inflexionary approximation sequences in the 2 and 3 dimensional cases.

Lemma 0.4. *The results of Lemma 0.5 in [3] hold, replacing the intervals $[m, m + \frac{1}{m}]$ with $[m, m + \frac{1}{m^2}]$ and $[m, m + \frac{1}{m^3}]$.*

Proof. In the proof of Lemma 0.5 in [3], observe that the coefficients of the polynomial p , depend only on the $\frac{1}{m}$ term, so we can obtain the new coefficients for p by substituting m^2 or m^3 for m . We then calculate in

the $\frac{1}{m^3}$ case, that;

$$\begin{aligned} h'''(x) &= (-360a_0m^{15} + O(m^{12}))x^2 + (288a_0m^{18} + O(m^{16}))x \\ &+ (-36a_0m^{21} + O(m^{19})) \end{aligned}$$

which has roots when;

$$x \simeq \frac{-288a_0 + \sqrt{-176a_0m^{18} + O(m^{16})}}{-720a_0m^{15} + O(m^{12})} = O(m^3) + O(m) > 0$$

Clearly, we can then assume that for sufficiently large m , $h'''(x)$ has no roots in the interval $[-m - \frac{1}{m^3}] \cup [m, m + \frac{1}{m^3}]$. For the final calculation, with $|h|_{[m + \frac{1}{m^3}]}$, we can replace m by m^3 throughout the proof, to get the same result, that $|h|_{[m + \frac{1}{m^3}]} \leq C$, independently of $m > 1$. The case with m^2 replacing m is left to the reader. \square

Lemma 0.5. *If $[a, b] \subset \mathcal{R}$, with a, b finite, and $\{g, g_1, g_2\} \subset C^\infty([a, b])$, then, if $m \in \mathcal{R}_{>0}$ is sufficiently large, there exists $h \in C^\infty([m, m + \frac{1}{m^2}] \times [a, b])$, with the property that;*

$$h(m, y) = g(y), \quad \frac{\partial h}{\partial x}|_{(m, y)} = g_1(y), \quad \frac{\partial^2 h}{\partial x^2}|_{(m, y)} = g_2(y), \quad y \in [a, b], \quad (i)$$

$$h(m + \frac{1}{m^2}, y) = \frac{\partial h}{\partial x}(m + \frac{1}{m^2}, y) = \frac{\partial^2 h}{\partial x^2}(m + \frac{1}{m^2}, y) = 0, \quad y \in [a, b], \quad (ii)$$

$$|h|_{[m, m + \frac{1}{m^2}] \times [a, b]} \leq C$$

for some $C \in \mathcal{R}_{>0}$, independent of m sufficiently large, and, if $\frac{\partial^3 h}{\partial x^3}(m, y) > 0$, $\frac{\partial^3 h}{\partial x^3}(x, y) > 0$, for $x \in [m, m + \frac{1}{m^2}]$, and if $\frac{\partial^3 h}{\partial x^3}(m, y) < 0$, $\frac{\partial^3 h}{\partial x^3}(x, y) < 0$, for $x \in [m, m + \frac{1}{m^2}]$, (*). In particular;

$$\int_m^{m + \frac{1}{m^2}} |\frac{\partial^3 h}{\partial x^3}|_{(x, y)} dx = |g_2(y)|$$

Moreover, for $i \in \mathcal{N}$, $\frac{\partial^i h}{\partial y^i}$ has the property that;

$$\frac{\partial^i h}{\partial y^i}(m, y) = g^{(i)}(y), \quad \frac{\partial^{i+1} h}{\partial y^i \partial x}|_{(m, y)} = g_1^{(i)}(y), \quad \frac{\partial^{i+2} h}{\partial y^i \partial x^2}|_{(m, y)} = g_2^{(i)}(y)$$

$$y \in [a, b], \quad (i)'$$

$$\frac{\partial^i h}{\partial y^i}(m + \frac{1}{m^2}, y) = \frac{\partial^{i+1} h}{\partial y^i \partial x}(m + \frac{1}{m^2}, y) = \frac{\partial^{i+2} h}{\partial y^i \partial x^2}(m + \frac{1}{m^2}, y) = 0$$

$$y \in [a, b], (ii)'$$

$$\left| \frac{\partial^i h}{\partial y^i} \Big|_{[m, m + \frac{1}{m^2}] \times [a, b]} \right| \leq C_i$$

for some $C_i \in \mathcal{R}_{>0}$, independent of m sufficiently large, and, if $\frac{\partial^{i+3} h}{\partial y^i \partial x^3}(m, y) > 0$, $\frac{\partial^{i+3} h}{\partial y^i \partial x^3}(x, y) > 0$, for $x \in [m, m + \frac{1}{m^2}]$, and if $\frac{\partial^{i+3} h}{\partial y^i \partial x^3}(m, y) < 0$, $\frac{\partial^{i+3} h}{\partial y^i \partial x^3}(x, y) < 0$, for $x \in [m, m + \frac{1}{m^2}]$, (**). In particularly;

$$\int_m^{m + \frac{1}{m^2}} \left| \frac{\partial^{i+3} h}{\partial y^i \partial x^3} \Big|_{(x, y)} \right| dx = |g_2^{(i)}(y)|$$

Proof. For the construction of h in the first part, just use the proof of Lemma 0.4 and Lemma 0.5 in [3], replacing the constant coefficients $\{a_0, a_1, a_2\} \subset \mathcal{R}$ with the data $\{g(y), g_1(y), g_2(y)\}$. The properties (i), (ii) are then clear. Noting that $[a, b]$ is a finite interval and $\{g, g_1, g_2\} \subset C^\infty([a, b])$, by continuity, there exists a constant D , with $\max(|g(y)|, |g_1(y)|, |g_2(y)| : y \in [a, b]) \leq D$, so, as in the proof of Lemma 0.4 and Lemma 0.5 in [3], we can use the bound $C = 16D + 7D + D = 24D$, for $m > 1$. The proof of (*) follows uniformly in y , as in the proof of 0.4 and Lemma 0.5 in [3], for sufficiently large m , again using the fact that the data $\{g(y), g_1(y), g_2(y) : y \in [a, b]\}$ is bounded. The next claim is just the FTC again. For the second part, when we calculate $\frac{\partial^i h}{\partial y^i}$, for $i \in \mathcal{N}$, we are just differentiating the coefficients which are linear in the data $\{g(y), g_1(y), g_2(y)\}$, so we obtain a function which fits the data $\{g^{(i)}(y), g_1^{(i)}(y), g_2^{(i)}(y)\}$ and (i)', (ii)' follow. Noting that, for $i \in \mathcal{N}$, $\{g^{(i)}, g_1^{(i)}, g_2^{(i)}\} \subset C^\infty([a, b])$, again by continuity, there exists constants D_i , with $\max(|g^{(i)}(y)|, |g_1^{(i)}(y)|, |g_2^{(i)}(y)| : y \in [a, b]) \leq D_i$, so, again, as in the proof of Lemma ??, we can use the bound $C_i = 16D_i + 7D_i + D_i = 24D_i$, for $m > 1$. The proof of (**) follows uniformly in y , for each $i \in \mathcal{N}$, as in the proof of Lemma 0.4 and Lemma 0.5 in [3], for sufficiently large m , again using the fact that the data $\{g^{(i)}(y), g_1^{(i)}(y), g_2^{(i)}(y) : y \in [a, b]\}$ is bounded. The last claim is again just the FTC. \square

Lemma 0.6. *Conjecture*

Fix $n \in \mathcal{N}$, with $n \geq 3$. If $m \in \mathcal{R}_{>0}$ is sufficiently large, $\{a_i : 0 \leq i \leq n - 1\} \subset \mathcal{R}$, there exists $h \in \mathcal{R}[x]$ of degree $2n - 1$, with the property that;

$$h^{(i)}(m) = a_i, 0 \leq i \leq n - 1 \quad (i)$$

$$h^{(i)}\left(m + \frac{1}{m}\right) = 0, \quad 0 \leq i \leq n - 1 \quad (ii)$$

$$|h|_{[m, m + \frac{1}{m}]} \leq C$$

for some $C \in \mathcal{R}_{>0}$, independent of m sufficiently large, and, if $h^{(n)}(m) > 0$, $h^{(n)}(x)|_{[m, m + \frac{1}{m}]} > 0$, if $h^{(n)}(m) < 0$, $h^{(n)}|_{[m, m + \frac{1}{m}]} < 0$. In particular;

$$\int_m^{m + \frac{1}{m}} |h^{(n)}(x)| dx = |a_{n-1}|, \quad (A)$$

The same conjecture applies with $\frac{1}{m^2}$ and $\frac{1}{m^3}$ replacing $\frac{1}{m}$.

Proof. We sketch a proof based on the special case $n = 3$, which was shown in Lemma 0.5 of [3], leaving the details to the reader, ⁽²⁾. We have that $h(x) = (x - (m + \frac{1}{m}))^n p(x)$ where $p(x)$ is a polynomial satisfies condition (ii). Computing the derivatives $h^{(i)}(m)$, for $0 \leq i \leq n - 1$, we obtain n linear equations involving the unknowns $p^{(i)}(m)$, $0 \leq i \leq n - 1$, of the form;

$$\sum_{k=0}^i \frac{d_{ik} p^{(k)}(m)}{m^{n-i+k}} = a_i, \quad (0 \leq i \leq n - 1) \quad (*)$$

which we can solve for $p^{(i)}(m)$, $0 \leq i \leq n - 1$, using the fact that the matrix $(d_{ik})_{0 \leq i \leq n-1, 0 \leq k \leq i}$ is lower triangular and $|d_{ii}| = 1$,

¹ If $a_0 > 0$, $a_1 > 0$, there does not exist a smooth function h on the interval $(m, m + \frac{1}{m})$, with $h(m) = a_0$, $h'(m) = a_1$, $h(m + \frac{1}{m}) = 0$, $h'(m + \frac{1}{m}) = 0$, such that $h'' > 0$ or $h'' < 0$. To see this, if $h'' > 0$, using the MVT, we have that $h'(x) > h'(m) > 0$, for $x \in (m, m + \frac{1}{m})$, contradicting the fact that $h'(m + \frac{1}{m}) = 0$. If $h'' < 0$, and $h'(x)$ has no roots in the interval $(m, m + \frac{1}{m})$, then as $h'(m) > 0$, $h'(x) > 0$ on $(m, m + \frac{1}{m})$, and h is increasing on $(m, m + \frac{1}{m})$, so that $h(m + \frac{1}{m}) > h(m) = a_0 > 0$, contradicting the fact that $h(m + \frac{1}{m}) = 0$. Otherwise, if $h'(x)$ has a root in the interval $(m, m + \frac{1}{m})$, as $h'' < 0$, it attains a maximum at $x_0 \in (m, m + \frac{1}{m})$. Using the MVT again, we must have that for $y \in (x_0, m + \frac{1}{m})$, $h'(y) < h'(x_0) = 0$, so that $h'(m + \frac{1}{m}) < 0$, contradicting the fact that $h'(m + \frac{1}{m}) = 0$.

² One step requires the verification that for a computable polynomial r_n of degree $n - 1$, $r_n(1) \neq 0$, which is highly unlikely on generic grounds and the fact that $r_3(1) \neq 1$, although $r_2(1) = 1$, see footnote 1. The geometric idea is that allowing for inflexionary type curves, where we can have points $x_{0,i} \in (m, m + \frac{1}{m})$ for which $h^{(i)}(x_{0,i}) = 0$, where $2 \leq i \leq n - 1$, the end conditions can be satisfied while still having $h^{(n)}|_{(m, m + \frac{1}{m})} > 0$ or $h^{(n)}|_{(m, m + \frac{1}{m})} < 0$. However, you still need to do a concrete calculation, which in the case of verifying the conjecture for all $n \in \mathcal{N}$, $n \geq 3$, would involve finding the exact pattern in the coefficients obtained in the proof of Lemma 0.5 of [3]. We actually only need the result for some $n \geq 14$ in the rest of this paper.

for $0 \leq i \leq n - 1$. Then we can take;

$$p(x) = \sum_{i=0}^{n-1} p^{(i)}(m)(x - m)^i$$

so that h has degree $n + (n - 1) = 2n - 1$. It is clear from (*), that we have;

$$p^{(i)}(m) = \sum_{k=0}^i c_{ik} a_{i-k} m^{n+k}, \quad (0 \leq i \leq n - 1)$$

where $(c_{ik})_{0 \leq i \leq n-1, 0 \leq k \leq i}$ is a real matrix, so that $p(x)$ has the form;

$$p(x) = \sum_{i=0}^{n-1} v_i x^i \quad (**)$$

where;

$$v_{n-1-i} = \sum_{k=0}^{n-1} r_{ik} m^{n+k} + \sum_{l=0}^i s_{il} m^{2n-1+l}, \quad (0 \leq i \leq n - 1)$$

for real matrices $(r_{ik})_{0 \leq i \leq n-1, 0 \leq k \leq n-1}$ and $(s_{il})_{0 \leq i \leq n-1, 0 \leq l \leq i}$.

It is then clear, using the product rule and (**), that;

$$h^{(n)}(x) = \sum_{k=0}^{n-1} w_k x^k$$

where $w_k = z_k a_0 m^{3n-2-k} + O(m^{3n-3-k})$, $(0 \leq k \leq n - 1)$

By homogeneity, it is then clear that the real roots of $h^{(n)}(x)$ are of the form $t_{s_0} m + O(1)$, where $t_{s_0} \in \mathcal{R}$, $1 \leq s_0 \leq n - 1$, and t_{s_0} satisfies a polynomial $r(x)$ of degree $n - 1$, which is effectively computable for given n . We can exclude any roots in the interval $[m, m + \frac{1}{m}]$, for sufficiently large m , provided $t_{s_0} \neq 1$, for $1 \leq s_0 \leq n - 1$, which we can check by showing that $r(1) \neq 0$. We have that;

$$\begin{aligned} |h|_{(m, m + \frac{1}{m})} &= |(x - (m + \frac{1}{m}))^n p(x)| \\ &\leq \frac{1}{m^n} |\sum_{i=0}^{n-1} p^{(i)}(m)(x - m)^i| \\ &\leq \frac{1}{m^n} \sum_{i=0}^{n-1} \frac{|p^{(i)}(m)|}{m^i} \\ &\leq \sum_{i=0}^{n-1} \sum_{k=0}^i |c_{ik}| a_{i-k} \frac{m^{n+k}}{m^{n+i}} \end{aligned}$$

$$\leq \sum_{i=0}^{n-1} \sum_{k=0}^i |c_{ik}| a_{i-k} = C, \quad (m > 1)$$

The last claim is just the FTC.

□

Lemma 0.7. *If $[a, b] \subset \mathcal{R}$, with a, b finite, $n \geq 3$, and $\{g_j : 0 \leq j \leq n-1\} \subset C^\infty([a, b])$, then, if $m \in \mathcal{R}_{>0}$ is sufficiently large, there exists $h \in C^\infty([m, m + \frac{1}{m^2}] \times [a, b])$, with the property that;*

$$\frac{\partial^{(j)} h}{\partial x^j} |_{(m,y)} = g_j(y), \quad y \in [a, b], \quad (i)$$

$$\frac{\partial h^j}{\partial x^j} (m + \frac{1}{m^2}, y) = 0, \quad y \in [a, b], \quad (ii)$$

$$|h|_{[m, m + \frac{1}{m^2}] \times [a, b]} \leq C$$

for some $C \in \mathcal{R}_{>0}$, independent of m sufficiently large, and, if $\frac{\partial^n h}{\partial x^n}(m, y) > 0$, $\frac{\partial^n h}{\partial x^n}(x, y) > 0$, for $x \in [m, m + \frac{1}{m^2}]$, and if $\frac{\partial^n h}{\partial x^n}(m, y) < 0$, $\frac{\partial^n h}{\partial x^n}(x, y) < 0$, for $x \in [m, m + \frac{1}{m^2}]$, (*). In particular;

$$\int_m^{m + \frac{1}{m^2}} \left| \frac{\partial^n h}{\partial x^n} \right|_{(x,y)} dx = |g_{n-1}(y)|$$

Moreover, for $i \in \mathcal{N}$, $\frac{\partial^i h}{\partial y^i}$ has the property that;

$$\frac{\partial^{i+j} h}{\partial x^j \partial y^i} (m, y) = g_j^{(i)}(y), \quad y \in [a, b], \quad (i)'$$

$$\frac{\partial^{i+j} h}{\partial x^j \partial y^i} (m + \frac{1}{m^2}, y) = 0, \quad y \in [a, b], \quad (ii)'$$

$$\left| \frac{\partial^i h}{\partial y^i} \right|_{[m, m + \frac{1}{m^2}] \times [a, b]} \leq C_i$$

for some $C_i \in \mathcal{R}_{>0}$, independent of m sufficiently large, and, if $\frac{\partial^{i+n} h}{\partial y^i \partial x^n}(m, y) > 0$, $\frac{\partial^{i+n} h}{\partial y^i \partial x^n}(x, y) > 0$, for $x \in [m, m + \frac{1}{m^2}]$, and if $\frac{\partial^{i+n} h}{\partial y^i \partial x^n}(m, y) < 0$, $\frac{\partial^{i+n} h}{\partial y^i \partial x^n}(x, y) < 0$, for $x \in [m, m + \frac{1}{m^2}]$, (**). In particular;

$$\int_m^{m + \frac{1}{m^2}} \left| \frac{\partial^{i+n} h}{\partial y^i \partial x^n} \right|_{(x,y)} dx = |g_{n-1}^{(i)}(y)|$$

Proof. For the construction of h in the first part, just use the proof of Lemma 0.6, replacing the constant coefficients $\{a_j : 0 \leq j \leq n-1\} \subset \mathcal{R}$ with the data $\{g_j(y) : 0 \leq j \leq n-1\}$. The properties (i), (ii) are then clear. Noting that $[a, b]$ is a finite interval and $\{g_j : 0 \leq j \leq n-1\} \subset C^\infty([a, b])$, by continuity, there exists a constant D , with

$\max(|g_j(y)| : 0 \leq j \leq n-1, y \in [a, b]) \leq D$, so, as in the proof of Lemma 0.5 in [3], we can use the bound $C = \sum_{0 \leq j \leq n-1} L_j D$, for $m > 1$. The proof of (*) follows uniformly in y , as in the proof of Lemma 0.5 in [3], for sufficiently large m , again using the fact that the data $\{g_j(y) : 0 \leq j \leq n-1, y \in [a, b]\}$ is bounded. The next claim is just the FTC again. For the second part, when we calculate $\frac{\partial^i h}{\partial y^i}$, for $i \in \mathcal{N}$, we are just differentiating the coefficients which are linear in the data $\{g_j(y) : 0 \leq j \leq n-1\}$, so we obtain a function which fits the data $\{g_j^{(i)}(y) : 0 \leq j \leq n-1\}$ and $(i)'$, $(ii)'$ follow. Noting that, for $i \in \mathcal{N}$, $\{g_j^{(i)} : 0 \leq j \leq n-1\} \subset C^\infty([a, b])$, again by continuity, there exist constants D_i , with $\max(|g_j^{(i)}(y)| : 0 \leq j \leq n-1, y \in [a, b]) \leq D_i$, so, again, as in the proof of Lemma 0.5 in [3], we can use the bound $C_i = \sum_{0 \leq j \leq n-1} L_j D_i$, for $m > 1$. The proof of (***) follows uniformly in y , for each $i \in \mathcal{N}$, as in the proof of Lemma 0.5 in [3], for sufficiently large m , again using the fact that the data $\{g_j^{(i)}(y) : 0 \leq j \leq n-1, y \in [a, b]\}$ is bounded. The last claim is again just the FTC. \square

Lemma 0.8. *If $[a, b] \subset \mathcal{R}$, $[c, d] \subset \mathcal{R}$, with a, b, c, d finite, $n \geq 3$, and $\{g_j : 0 \leq j \leq n-1\} \subset C^\infty([a, b] \times [c, d])$, then, if $m \in \mathcal{R}_{>0}$ is sufficiently large, there exists $h \in C^\infty([m, m + \frac{1}{m^3}] \times [a, b] \times [c, d])$, with the property that;*

$$\frac{\partial^{(j)} h}{\partial x^j} \Big|_{(m, y, z)} = g_j(y, z), \quad (y, z) \in [a, b] \times [c, d], \quad (i)$$

$$\frac{\partial h^j}{\partial x^j} \left(m + \frac{1}{m^3}, y, z \right) = 0, \quad (y, z) \in [a, b] \times [c, d], \quad (ii)$$

$$|h|_{[m, m + \frac{1}{m^3}] \times [a, b] \times [c, d]} \leq C$$

for some $C \in \mathcal{R}_{>0}$, independent of m sufficiently large, and, if $\frac{\partial^n h}{\partial x^n}(m, y, z) > 0$, $\frac{\partial^n h}{\partial x^n}(x, y, z) > 0$, for $x \in [m, m + \frac{1}{m^3}]$, and if $\frac{\partial^n h}{\partial x^n}(m, y, z) < 0$, $\frac{\partial^n h}{\partial x^n}(x, y, z) < 0$, for $x \in [m, m + \frac{1}{m^3}]$, (*). In particular;

$$\int_m^{m + \frac{1}{m^3}} \left| \frac{\partial^n h}{\partial x^n} \Big|_{(x, y, z)} \right| dx = |g_{n-1}(y, z)|$$

Moreover, for $(i, k) \subset \mathcal{N}^2$, $0 \leq j \leq n-1$, $\frac{\partial^{i+k} h}{\partial y^i \partial z^k}$, has the property that;

$$\frac{\partial^{i+j+k} h}{\partial x^j \partial y^i \partial z^k} (m, y, z) = \frac{\partial^{i+k} g_j}{\partial y^i \partial z^k} (y, z), \quad (y, z) \in [a, b] \times [c, d], \quad (i)'$$

$$\frac{\partial^{i+j+k} h}{\partial x^j \partial y^i \partial z^k} \left(m + \frac{1}{m^3}, y, z \right) = 0, \quad (y, z) \in [a, b] \times [c, d], \quad (ii)'$$

$$\left| \frac{\partial^{i+k} h}{\partial y^i \partial z^k} \right|_{[m, m + \frac{1}{m^3}] \times [a, b] \times [c, d]} \leq C_{i,k}$$

for some $C_{i,k} \in \mathcal{R}_{>0}$, independent of m sufficiently large, and, if $\frac{\partial^{i+k+n} h}{\partial y^i \partial z^k \partial x^n}(m, y, z) > 0$, $\frac{\partial^{i+k+n} h}{\partial y^i \partial z^k \partial x^n}(x, y, z) > 0$, for $x \in [m, m + \frac{1}{m^3}]$, and if $\frac{\partial^{i+k+n} h}{\partial y^i \partial z^k \partial x^n}(m, y) < 0$, $\frac{\partial^{i+k+n} h}{\partial y^i \partial z^k \partial x^n}(x, y, z) < 0$, for $x \in [m, m + \frac{1}{m^3}]$, (**). In particular;

$$\int_m^{m + \frac{1}{m^3}} \left| \frac{\partial^{i+k+n} h}{\partial y^i \partial z^k \partial x^n} \right|_{(x,y,z)} dx = \left| \frac{\partial^{i+k} g_{n-1}}{\partial y^i \partial z^k} \right|(y, z)$$

Proof. For the construction of h in the first part, just use the proof of Lemma 0.6, replacing the constant coefficients $\{a_j : 0 \leq j \leq n-1\} \subset \mathcal{R}$ with the data $\{g_j(y, z) : 0 \leq j \leq n-1\}$. The properties (i), (ii) are then clear. Noting that $[a, b] \times [c, d]$ is compact and $\{g_j : 0 \leq j \leq n-1\} \subset C^\infty([a, b] \times [c, d])$, by continuity, there exists a constant D , with $\max(|g_j(y, z)| : 0 \leq j \leq n-1, (y, z) \in [a, b] \times [c, d]) \leq D$, so, as in the proof of Lemma 0.6, we can use the bound $C = \sum_{0 \leq j \leq n-1} L_j D$, for $m > 1$. The proof of (*) follows uniformly in y , as in the proof of 0.6, for sufficiently large m , again using the fact that the data $\{g_j(y, z) : 0 \leq j \leq n-1, (y, z) \in [a, b]\}$ is bounded. The next claim is just the FTC again. For the second part, when we calculate $\frac{\partial^{i+k} h}{\partial y^i \partial z^k}$, for $(i, j \in \mathcal{N}^2$, we are just differentiating the coefficients which are linear in the data $\{g_j(y, z) : 0 \leq j \leq n-1\}$, so we obtain a function which fits the data $\{\frac{\partial^{i+k} g_j}{\partial y^i \partial z^k}(y, z) : 0 \leq j \leq n-1\}$ and (i)', (ii)' follow. Noting that, for $(i, k) \in \mathcal{N}^2$, $\{\frac{\partial^{i+k} g_j}{\partial y^i \partial z^k} : 0 \leq j \leq n-1\} \subset C^\infty([a, b] \times [c, d])$, again by continuity, there exist constants $D_{i,k}$, with $\max(|\frac{\partial^{i+k} g_j}{\partial y^i \partial z^k}(y, z)| : 0 \leq j \leq n-1, y \in [a, b] \times [c, d]) \leq D_{i,k}$, so, again, as in the proof of Lemma 0.6, we can use the bound $C_{i,k} = \sum_{0 \leq j \leq n-1} L_j D_{i,k}$, for $m > 1$. The proof of (**) follows uniformly in (y, z) , for each $(i, k) \in \mathcal{N}^2$, as in the proof of Lemma 0.6, for sufficiently large m , again using the fact that the data $\{\frac{\partial^{i+k} g_j}{\partial y^i \partial z^k}(y) : 0 \leq j \leq n-1, (y, z) \in [a, b] \times [c, d]\}$ is bounded. The last claim is again just the FTC. \square

Lemma 0.9. For $f \in C^\infty(\mathcal{R}^2)$ with $\frac{\partial^{i_1+i_2} f}{\partial x^{i_1} \partial y^{i_2}}$ bounded by some constant $F \in \mathcal{R}_{>0}$, for $0 \leq i_1 + i_2 \leq 27$. Then for sufficiently large m , there exists an inflexionary approximation sequence $\{f_m : m \in \mathcal{N}\}$, with the property that;

$$\max(\int_{\mathcal{R}^2} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy, \int_{\mathcal{R}^2} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy) \leq Gm^2$$

for some $G \in \mathcal{R}_{>0}$, for sufficiently large m .

Proof. Define $f_m = f$ on C_m , so that (ii) of Definition 0.2 is satisfied. Using two applications of Lemma 0.7 with $n = 14$, changing to a vertical rather than horizontal orientation, and the fact that, for $0 \leq i \leq 13$, $|x| \leq m$, $\frac{\partial^i f}{\partial y^i}|_{(x,m)}$ and $\frac{\partial^i f}{\partial y^i}|_{(x,-m)}$ define smooth functions on $[-m, m]$, we can extend f_m to $R = \{(x, y) : |x| \leq m, m \leq |y| \leq m + \frac{1}{m^2}\}$, such that $f_m|_{R_1}$ satisfies conditions (iv), (v) of Definition 0.2, where $R_1 = \{(x, y) : |x| \leq m, 0 \leq |y| \leq m + \frac{1}{m^2}\}$. Again, using two applications of Lemma 0.7 with $n = 14$, and the original horizontal orientation, and the fact that, for $0 \leq i \leq 13$, $0 \leq |y| \leq m + \frac{1}{m^2}$, $\frac{\partial^i f_m}{\partial x^i}|_{(m,y)}$ and $\frac{\partial^i f}{\partial x^i}|_{(-m,y)}$ define smooth functions on $[-m - \frac{1}{m^2}, m + \frac{1}{m^2}]$, we can extend f_m to $S = \{(x, y) : m \leq |x| \leq m + \frac{1}{m^2}, 0 \leq |y| \leq m + \frac{1}{m^2}\}$, such that $f_m|_{C_{m+\frac{1}{m^2}}}$ satisfies conditions (vi), (vii) of Definition 0.2. Conditions (i), (iii) are then clear. We then have, using (iii), that;

$$\begin{aligned}
\int_{\mathcal{R}^2} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy &= \int_{C_{m+\frac{1}{m^2}}} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy \\
&= \int_{|x| \leq m, |y| \leq m} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy + \int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^2}} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy + \int_{m \leq |x| \leq m + \frac{1}{m^2}, |y| \leq m} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy \\
&\quad + \int_{m \leq |x| \leq m + \frac{1}{m^2}, m \leq |y| \leq m + \frac{1}{m^2}} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy \\
\int_{\mathcal{R}^2} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy &= \int_{C_{m+\frac{1}{m^2}}} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy \\
&= \int_{|x| \leq m, |y| \leq m} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy + \int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^2}} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy + \int_{m \leq |x| \leq m + \frac{1}{m^2}, |y| \leq m} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy \\
&\quad + \int_{m \leq |x| \leq m + \frac{1}{m^2}, m \leq |y| \leq m + \frac{1}{m^2}} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy \quad (*)
\end{aligned}$$

We then have the following cases, using the second clause in Lemma 0.7 repeatedly with the appropriate orientations;

Case 1;

$$\begin{aligned}
&\int_{|x| \leq m, |y| \leq m} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx dy \\
&= \int_{|x| \leq m, |y| \leq m} \left| \frac{\partial^{14} f}{\partial x^{14}} \right| dx dy \leq F m^2 \\
&\int_{|x| \leq m, |y| \leq m} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dx dy
\end{aligned}$$

$$= \int_{|x| \leq m, |y| \leq m} \left| \frac{\partial^{14} f}{\partial y^{14}} \right| dx dy \leq F m^2$$

Case 2;

$$\begin{aligned} & \int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx dy \\ &= \int_{|x| \leq m} \left(\int_{|y| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dy \right) dx \\ &\leq \frac{2}{m^2} \int_{|x| \leq m} C_{14} dx \\ &\leq 2m \frac{2}{m^2} C_{14} \\ &= 4 \frac{C_{14}}{m} \end{aligned}$$

Case 3;

$$\begin{aligned} & \int_{m \leq |x| \leq m + \frac{1}{m^2}, |y| \leq m} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx dy \\ &= \int_{|y| \leq m} \left(\int_{m \leq |x| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx \right) dy \\ &= \int_{|y| \leq m} \left(\left| \frac{\partial^{13} f}{\partial x^{13}} \right|_{(m,y)} + \left| \frac{\partial^{13} f}{\partial x^{13}} \right|_{(-m,y)} \right) dy \\ &\leq 4mF \end{aligned}$$

Case 4.

$$\begin{aligned} & \int_{m \leq |x| \leq m + \frac{1}{m^2}, m \leq |y| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx dy \\ &= \int_{m \leq |y| \leq m + \frac{1}{m^2}} \left(\int_{m \leq |x| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx \right) dy \\ &= \int_{m \leq |y| \leq m + \frac{1}{m^2}} \left(\left| \frac{\partial^{13} f_m}{\partial x^{13}} \right|_{(m,y)} + \left| \frac{\partial^{13} f_m}{\partial x^{13}} \right|_{(-m,y)} \right) dy \\ &\leq \int_{m \leq y \leq m + \frac{1}{m^2}} C_{13,1} dy + \int_{-m - \frac{1}{m^2} \leq -m} C_{13,2} dy \\ &\leq \frac{\max(C_{13,1}, C_{13,2})}{m^2} \text{ (the constants } \{C_{13,1}, C_{13,2}\} \text{ coming from the two} \\ &\text{ applications of Lemma 0.7 at the two boundaries)} \end{aligned}$$

Case 5;

$$\int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dx dy$$

$$\begin{aligned}
&= \int_{|x| \leq m} \left(\int_{m \leq |y| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dy \right) dx \\
&= \int_{|x| \leq m} \left(\left| \frac{\partial f}{\partial y^{13}} \right| (x, m) + \left| \frac{\partial f(x, y)}{\partial y^{13}} \right| (x, -m) \right) dx \\
&\leq 4mF
\end{aligned}$$

Case 6;

$$\begin{aligned}
&\int_{|y| \leq m, m \leq |x| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dx dy \\
&= \int_{|y| \leq m} \left(\int_{m \leq |x| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dx \right) dy \\
&\leq \frac{1}{m^2} \int_{|y| \leq m} \left(\left| \sum_{i=0}^{13} D_i \left| \frac{\partial^i \partial^{14} f}{\partial y^{14} \partial x^i} \right| (m, y) + \left| \sum_{i=0}^{13} D_i \left| \frac{\partial^i \partial^{14} f}{\partial y^{14} \partial x^i} \right| (-m, y) \right| \right) dy \\
&\leq \frac{2}{m^2} (2m) F \left(\sum_{i=0}^{13} D_i \right) \\
&= 4F \frac{(\sum_{i=0}^{13} D_i)}{m}
\end{aligned}$$

Case 7.

$$\begin{aligned}
&\int_{m \leq |x| \leq m + \frac{1}{m^2}, m \leq |y| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dx dy \\
&= \int_{m \leq |y| \leq m + \frac{1}{m^2}} \left(\int_{m \leq |x| \leq m + \frac{1}{m^2}} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dx \right) dy \\
&\leq \frac{1}{m^2} \int_{m \leq |y| \leq m + \frac{1}{m^2}} \left(\sum_{i=0}^{13} L_{i,14} \left| \frac{\partial^{i+14} f_m}{\partial x^i \partial y^{14}} \right| (m, y) + L_{i,14} \left| \frac{\partial^{i+14} f_m}{\partial x^i \partial y^{14}} \right| (-m, y) \right) dy \\
&= \frac{1}{m^2} \sum_{i=0}^{13} L_{i,14} \left(\left| \frac{\partial^{i+13} f}{\partial x^i \partial y^{13}} \right| (m, m) + \left| \frac{\partial^{i+13} f}{\partial x^i \partial y^{13}} \right| (m, -m) + \left| \frac{\partial^{i+13} f}{\partial x^i \partial y^{13}} \right| (-m, m) + \left| \frac{\partial^{i+13} f}{\partial x^i \partial y^{13}} \right| (-m, -m) \right) \\
&\leq \frac{4F(\sum_{i=0}^{13} L_{i,14})}{m^2} \text{ (the constants } L_{i,14}, 0 \leq i \leq 13 \text{ coming from the proof of Lemma 0.7)}
\end{aligned}$$

Combining the seven cases and (*), we obtain, for sufficiently large m , that;

$$\begin{aligned}
\int_{\mathcal{R}^2} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy &\leq Fm^2 + 4 \frac{C_{14}}{m} + 4mF + \frac{\max(C_{13,1}, C_{13,2})}{m^2} \leq Gm^2 \\
\int_{\mathcal{R}^2} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy &\leq Fm^2 + 4mF + 4F \frac{(\sum_{i=0}^{13} D_i)}{m} + \frac{4F(\sum_{i=0}^{13} L_{i,14})}{m^2} \leq Gm^2
\end{aligned}$$

□

Lemma 0.10. For $f \in C^{40}(\mathcal{R}^3)$ with $\frac{\partial^{i_1+i_2+i_3} f}{\partial x^{i_1} \partial y^{i_2} \partial z^{i_3}}$ bounded by some constant $F \in \mathcal{R}_{>0}$, for $0 \leq i_1 + i_2 + i_3 \leq 40$. Then for sufficiently large m , there exists an inflexionary approximation sequence $\{f_m : m \in \mathcal{N}\}$, with the property that;

$$\max(\int_{\mathcal{R}^3} |\frac{\partial f_m}{\partial x^{14}}| dx dy dz, \int_{\mathcal{R}^3} |\frac{\partial f_m}{\partial y^{14}}| dx dy dz, \int_{\mathcal{R}^3} |\frac{\partial f_m}{\partial z^{14}}| dx dy dz) \leq Gm^3$$

for some $G \in \mathcal{R}_{>0}$, for sufficiently large m .

Proof. Define $f_m = f$ on W_m , so that (ii) of Definition 0.3 is satisfied. Using two applications of Lemma 0.8 with $n = 14$, with a horizontal orientation, and the fact that, for $0 \leq i \leq 13$, $0 \leq |y| \leq m$, $0 \leq |z| \leq m$ $\frac{\partial^i f}{\partial x^i}|_{(m,y,z)}$ and $\frac{\partial^i f}{\partial x^i}|_{(-m,y,z)}$ define smooth functions on $[-m, m]^2$, we can extend f_m to $A_1 = \{(x, y, z) : m \leq |x| \leq m + \frac{1}{m^3}, 0 \leq |y| \leq m, 0 \leq |z| \leq m\}$, such that $f_m|_{A_1}$ satisfies conditions (iv), (v) of Definition 0.3, where $A_2 = \{(x, y, z) : 0 \leq |x| \leq m + \frac{1}{m^3}, 0 \leq |y| \leq m, 0 \leq |z| \leq m\}$. Again, using two applications of Lemma 0.8 with $n = 14$ again, this time with a vertical orientation, and the fact that, for $0 \leq i \leq 13$, $0 \leq |x| \leq m + \frac{1}{m^3}$, $0 \leq |z| \leq m$, $\frac{\partial^i f_m}{\partial y^i}|_{(x,m,z)}$ and $\frac{\partial^i f_m}{\partial y^i}|_{(x,-m,z)}$ define smooth functions on $[-m - \frac{1}{m^3}, m + \frac{1}{m^3}] \times [-m, m]$, we can extend f_m to $A_3 = \{(x, y, z) : 0 \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}, 0 \leq |z| \leq m\}$, such that $f_m|_{A_3}$ satisfies conditions (vi), (vii) of Definition 0.3, where $A_4 = \{(x, y, z) : 0 \leq |x| \leq m + \frac{1}{m^3}, 0 \leq |y| \leq m + \frac{1}{m^3}, 0 \leq |z| \leq m\}$. Again, using two applications of Lemma 0.8 with $n = 14$ again, this time with a lateral orientation, and the fact that, for $0 \leq i \leq 13$, $0 \leq |x| \leq m + \frac{1}{m^3}$, $0 \leq |y| \leq m + \frac{1}{m^3}$, $\frac{\partial^i f_m}{\partial z^i}|_{(x,y,m)}$ and $\frac{\partial^i f_m}{\partial z^i}|_{(x,y,-m)}$ define smooth functions on $[-m - \frac{1}{m^3}, m + \frac{1}{m^3}]^2$, we can extend f_m to $W_{m+\frac{1}{m^3}}$ such that $f_m|_{W_{m+\frac{1}{m^3}}}$ satisfies conditions (viii), (ix) of Definition 0.3.

Conditions (i), (iii) are then clear. We then have, using (iii), that;

$$\begin{aligned} (a). \int_{\mathcal{R}^3} |\frac{\partial f_m}{\partial x^{14}}| dx dy dz &= \int_{W_{m+\frac{1}{m^3}}} |\frac{\partial f_m}{\partial x^{14}}| dx dy dz \\ &= \int_{|x| \leq m, |y| \leq m, |z| \leq m} |\frac{\partial f_m}{\partial x^{14}}| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, |y| \leq m, |z| \leq m} |\frac{\partial f_m}{\partial x^{14}}| dx dy dz \\ &+ \int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^3}, |z| \leq m} |\frac{\partial f_m}{\partial x^{14}}| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}, |z| \leq m} |\frac{\partial f_m}{\partial x^{14}}| dx dy dz \\ &+ \int_{|x| \leq m, |y| \leq m, m \leq |z| \leq m + \frac{1}{m^3}} |\frac{\partial f_m}{\partial x^{14}}| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, |y| \leq m, m \leq |z| \leq m + \frac{1}{m^3}} |\frac{\partial f_m}{\partial x^{14}}| dx dy dz \end{aligned}$$

$$\begin{aligned}
& + \int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^3}, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy dz \\
(b). \quad & \int_{\mathcal{R}^3} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz = \int_{W_{m + \frac{1}{m^3}}} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz \\
& = \int_{|x| \leq m, |y| \leq m, |z| \leq m} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, |y| \leq m, |z| \leq m} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz \\
& + \int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^3}, |z| \leq m} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}, |z| \leq m} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz \\
& + \int_{|x| \leq m, |y| \leq m, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, |y| \leq m, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz \\
& + \int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^3}, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz \\
(c). \quad & \int_{\mathcal{R}^3} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz = \int_{W_{m + \frac{1}{m^3}}} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz \\
& = \int_{|x| \leq m, |y| \leq m, |z| \leq m} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, |y| \leq m, |z| \leq m} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz \\
& + \int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^3}, |z| \leq m} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}, |z| \leq m} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz \\
& + \int_{|x| \leq m, |y| \leq m, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, |y| \leq m, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz \\
& + \int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^3}, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz + \int_{m \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz \\
& (*)
\end{aligned}$$

We then have the following cases, using the second clause in Lemma 0.8 repeatedly with the appropriate orientations;

Case 1;

$$\begin{aligned}
& \int_{|x| \leq m, |y| \leq m, |z| \leq m} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx dy dz \\
& = \int_{|x| \leq m, |y| \leq m, |z| \leq m} \left| \frac{\partial^{14} f}{\partial x^{14}} \right| dx dy dz \leq F m^3 \\
& \int_{|x| \leq m, |y| \leq m, |z| \leq m} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dx dy dz \\
& = \int_{|x| \leq m, |y| \leq m, |z| \leq m} \left| \frac{\partial^{14} f}{\partial y^{14}} \right| dx dy dz \leq F m^3 \\
& \int_{|x| \leq m, |y| \leq m, |z| \leq m} \left| \frac{\partial^{14} f_m}{\partial z^{14}} \right| dx dy dz \\
& = \int_{|x| \leq m, |y| \leq m, |z| \leq m} \left| \frac{\partial^{14} f}{\partial z^{14}} \right| dx dy dz \leq F m^3
\end{aligned}$$

Case 2;

$$\begin{aligned}
 & \int_{m \leq |x| \leq m + \frac{1}{m^3}, |y| \leq m, |z| \leq m} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx dy dz \\
 &= \int_{|y| \leq m, |z| \leq m} \left(\int_{m \leq |x| \leq m + \frac{1}{m^3}} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx \right) dy dz \\
 &= \int_{|y| \leq m, |z| \leq m} \left(\left| \frac{\partial^{13} f}{\partial x^{13}} \right|(m, y, z) + \left| \frac{\partial^{13} f}{\partial x^{13}} \right|(-m, y, z) \right) dy dz \\
 &\leq 2(2m)^2 F \\
 &= 8m^2 F
 \end{aligned}$$

Case 3;

$$\begin{aligned}
 & \int_{m \leq |x| \leq m + \frac{1}{m^3}, |y| \leq m, |z| \leq m} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dx dy dz \\
 &= \int_{|y| \leq m, |z| \leq m} \left(\int_{m \leq |x| \leq m + \frac{1}{m^3}} \left| \frac{\partial^{14} f_m}{\partial y^{14}} \right| dx \right) dy dz \\
 &\leq \frac{1}{m^3} \int_{|y| \leq m, |z| \leq m} \left(\left| \sum_{i=0}^{13} D_i \left| \frac{\partial^i \partial^{14} f}{\partial y^{14} \partial x^i} \right|(m, y, z) + \left| \sum_{i=0}^{13} D_i \left| \frac{\partial^i \partial^{14} f}{\partial y^{14} \partial x^i} \right|(-m, y, z) \right| \right) dy dz \\
 &\leq \frac{2}{m^3} (2m)^2 F \left(\sum_{i=0}^{13} D_i \right) \\
 &= \frac{8F \left(\sum_{i=0}^{13} D_i \right)}{m}
 \end{aligned}$$

Case 4;

$$\begin{aligned}
 & \int_{m \leq |x| \leq m + \frac{1}{m^3}, |y| \leq m, |z| \leq m} \left| \frac{\partial^{14} f_m}{\partial z^{14}} \right| dx dy dz \\
 &= \int_{|y| \leq m, |z| \leq m} \left(\int_{m \leq |x| \leq m + \frac{1}{m^3}} \left| \frac{\partial^{14} f_m}{\partial z^{14}} \right| dx \right) dy dz \\
 &\leq \frac{1}{m^3} \int_{|y| \leq m, |z| \leq m} \left(\left| \sum_{i=0}^{13} D_i \left| \frac{\partial^i \partial^{14} f}{\partial z^{14} \partial x^i} \right|(m, y, z) + \left| \sum_{i=0}^{13} D_i \left| \frac{\partial^i \partial^{14} f}{\partial z^{14} \partial x^i} \right|(-m, y, z) \right| \right) dy dz \\
 &\leq \frac{2}{m^3} (2m)^2 F \left(\sum_{i=0}^{13} D_i \right) \\
 &= \frac{8F \left(\sum_{i=0}^{13} D_i \right)}{m}
 \end{aligned}$$

Case 5.

$$\int_{|x| \leq m, m \leq |y| \leq m + \frac{1}{m^3}, |z| \leq m} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dx dy dz$$

$$\begin{aligned}
&= \int_{|x| \leq m, |z| \leq m} \left(\int_{|y| \leq m + \frac{1}{m^3}} \left| \frac{\partial^{14} f_m}{\partial x^{14}} \right| dy \right) dx dz \\
&\leq \frac{2}{m^3} \int_{|x| \leq m, |z| \leq m} C_{14} dx \\
&= (2m)^2 \frac{2}{m^3} C_{14,0} \\
&= \frac{8C_{14,0}}{m}
\end{aligned}$$

Csse 6.

$$\begin{aligned}

&\leq \frac{1}{m^6} \left(\sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,14} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial z^i \partial y^{13}} \right| (m, m, m) + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,14} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial z^i \partial y^{13}} \right| (-m, m, m) \right. \\
&\quad + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,14} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial z^i \partial y^{13}} \right| (m, -m, m) + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,14} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial z^i \partial y^{13}} \right| (-m, -m, m) \\
&\quad + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,14} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial z^i \partial y^{13}} \right| (m, m, -m) + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,14} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial z^i \partial y^{13}} \right| (-m, m, -m) \\
&\quad + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,14} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial z^i \partial y^{13}} \right| (m, -m, -m) \\
&\quad \left. + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,14} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial z^i \partial y^{13}} \right| (-m, -m, -m) \right) \\
&\leq \frac{8F \left(\sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,14} L_{i,j,13} \right)}{m^6}
\end{aligned}$$

Case 22.

$$\begin{aligned}
&\int_{m \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}, m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial^{14} f_m}{\partial z^{14}} \right| dx dy dz \\
&= \int_{m \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}} \left(\int_{m \leq |z| \leq m + \frac{1}{m^3}} \left| \frac{\partial^{14} f_m}{\partial z^{14}} \right| dz \right) dx dy \\
&= \int_{m \leq |x| \leq m + \frac{1}{m^3}, m \leq |y| \leq m + \frac{1}{m^3}} \left(\left| \frac{\partial^{13} f_m}{\partial z^{13}} \right| (x, y, m) + \left| \frac{\partial^{13} f_m}{\partial z^{13}} \right| (x, y, -m) \right) dx dy \\
&= \int_{m \leq |x| \leq m + \frac{1}{m^3}} \left(\int_{m \leq |y| \leq m + \frac{1}{m^3}} \left(\left| \frac{\partial^{13} f_m}{\partial z^{13}} \right| (x, y, m) + \left| \frac{\partial^{13} f_m}{\partial z^{13}} \right| (x, y, -m) \right) dy \right) dx \\
&\leq \frac{1}{m^3} \int_{|x| \leq m + \frac{1}{m^3}} \left(\sum_{i=0}^{13} L_{i,13} \left| \frac{\partial^{i+13} f_m}{\partial y^i \partial z^{13}} \right| (x, m, m) \right. \\
&\quad + \sum_{i=0}^{13} L_{i,13} \left| \frac{\partial^{i+13} f_m}{\partial y^i \partial z^{13}} \right| (x, -m, m) \\
&\quad \left. + \sum_{i=0}^{13} L_{i,13} \left| \frac{\partial^{i+13} f_m}{\partial y^i \partial z^{13}} \right| (x, m, -m) \right) dx
\end{aligned}$$

$$\begin{aligned}
 & + \sum_{i=0}^{13} L_{i,13} \left| \frac{\partial^{i+13} f_m}{\partial y^i \partial z^{13}} \right| (x, -m, -m) dx \\
 & \leq \frac{1}{m^6} \left(\sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,13} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial y^i \partial z^{13}} \right| (m, m, m) + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,13} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial y^i \partial z^{13}} \right| (-m, m, m) \right. \\
 & + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,13} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial y^i \partial z^{13}} \right| (m, -m, m) + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,13} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial y^i \partial z^{13}} \right| (-m, -m, m) \\
 & + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,13} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial y^i \partial z^{13}} \right| (m, m, -m) + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,13} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial y^i \partial z^{13}} \right| (-m, m, -m) \\
 & + \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,13} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial y^i \partial z^{13}} \right| (m, -m, -m) \\
 & + \left. \sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,13} L_{i,j,13} \left| \frac{\partial^{i+j+13} f}{\partial x^j \partial y^i \partial z^{13}} \right| (-m, -m, -m) \right) \\
 & \leq \frac{8F(\sum_{j=0}^{13} \sum_{i=0}^{13} L_{i,13} L_{i,j,13})}{m^6}
 \end{aligned}$$

It is then clear from (*), summing the bounds from the individual cases 1-19, as at the end of the proof of Lemma 0.9, that there exists a constant $G \in \mathcal{R}_{>0}$ with;

$$\max(\int_{\mathcal{R}^3} \left| \frac{\partial f_m}{\partial x^{14}} \right| dx dy dz, \int_{\mathcal{R}^3} \left| \frac{\partial f_m}{\partial y^{14}} \right| dx dy dz, \int_{\mathcal{R}^3} \left| \frac{\partial f_m}{\partial z^{14}} \right| dx dy dz) \leq Gm^3$$

for sufficiently large m .

□

Lemma 0.11. *Let $\{f_m : m \in \mathcal{N}\}$ be the inflexionary sequence constructed in Lemma 0.10, then for $\bar{k} \in \mathcal{R}^3$, $\bar{k} \neq \bar{0}$, sufficiently large m , we have that there exists $D \in \mathcal{R}_{>0}$, independent of m , with;*

$$|\mathcal{F}(f_m)(\bar{k})| \leq \frac{Dm^3}{|\bar{k}|^{14}}$$

Moreover, for sufficiently large m , $\mathcal{F}(f_m) \in L^1(\mathcal{R}^3)$.

A similar result holds for the inflexionary sequence $\{f_m : m \in \mathcal{N}\}$, constructed in Lemma 0.9, for $\bar{k} \neq 0$, sufficiently large m , we have that there exists $D \in \mathcal{R}_{>0}$, independent of m , with;

$$|\mathcal{F}(f_m)(\bar{k})| \leq \frac{Dm^2}{|\bar{k}|^{14}}$$

Moreover, for sufficiently large m , $\mathcal{F}(f_m) \in L^1(\mathcal{R}^3)$.

Proof. For $(k_1, k_2, k_3) \in \mathcal{R}^3$, using repeated integration by parts, and the fact that;

$$\left\{ \frac{\partial f_m}{\partial x^{14}}, \frac{\partial f_m}{\partial y^{14}}, \frac{\partial f_m}{\partial z^{14}} \right\} \subset L^1(\mathcal{R}^3)$$

$$\left\{ \frac{\partial f_m}{\partial x^i}, \frac{\partial f_m}{\partial y^i}, \frac{\partial f_m}{\partial z^i} \right\} \subset C_c(\mathcal{R}^3), \text{ for } 1 \leq i \leq 13$$

where $C_c(\mathcal{R}^3)$ is the space of continuous functions with compact support, we have, for $m \in \mathcal{N}$;

$$\begin{aligned} & \mathcal{F}\left(\frac{\partial^{14} f_m}{\partial x^{14}} + \frac{\partial^{14} f_m}{\partial y^{14}} + \frac{\partial^{14} f_m}{\partial z^{14}}\right)(\bar{k}) \\ &= \frac{1}{(2\pi)^{\frac{3}{2}}} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \left(\frac{\partial^{14} f_m}{\partial x^{14}} + \frac{\partial^{14} f_m}{\partial y^{14}} + \frac{\partial^{14} f_m}{\partial z^{14}}\right) e^{-ik_1 x} e^{-ik_2 y} e^{-ik_3 z} dx dy dz \\ &= ((ik_1)^{14} + (ik_2)^{14} + (ik_3)^{14}) \frac{1}{(2\pi)^{\frac{3}{2}}} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} \int_{-\infty}^{\infty} f_m(x, y, z) e^{-ik_1 x} e^{-ik_2 y} e^{-ik_3 z} dx dy dz \\ &= (-k_1^{14} - k_2^{14} - k_3^{14}) \mathcal{F}(f_m)(\bar{k}) \end{aligned}$$

so that, for $\bar{k} \neq \bar{0}$;

$$|\mathcal{F}(f_m)(\bar{k})| \leq \frac{|\mathcal{F}\left(\frac{\partial^{14} f_m}{\partial x^{14}} + \frac{\partial^{14} f_m}{\partial y^{14}} + \frac{\partial^{14} f_m}{\partial z^{14}}\right)(\bar{k})|}{(k_1^{14} + k_2^{14} + k_3^{14})} \quad (\dagger)$$

We have, using the result of Lemma 0.10, for sufficiently large m , that;

$$\begin{aligned} & \left| \mathcal{F}\left(\frac{\partial^{14} f_m}{\partial x^{14}} + \frac{\partial^{14} f_m}{\partial y^{14}} + \frac{\partial^{14} f_m}{\partial z^{14}}\right)(\bar{k}) \right| \\ & \frac{1}{(2\pi)^{\frac{3}{2}}} \left| \int_{\mathcal{R}^3} \left(\frac{\partial^{14} f_m}{\partial x^{14}} + \frac{\partial^{14} f_m}{\partial y^{14}} + \frac{\partial^{14} f_m}{\partial z^{14}}\right) e^{-ik_1 x} e^{-ik_2 y} e^{-ik_3 z} dx dy dz \right| \\ & \leq \frac{1}{(2\pi)^{\frac{3}{2}}} \int_{\mathcal{R}^3} (|\frac{\partial f_m}{\partial x^{14}}| + |\frac{\partial f_m}{\partial y^{14}}| + |\frac{\partial f_m}{\partial z^{14}}|) dx dy dz \\ & \leq \frac{3G}{(2\pi)^{\frac{3}{2}}} m^3 \quad (\dagger\dagger) \end{aligned}$$

so that, combining (\dagger) and $(\dagger\dagger)$, we have, for $\bar{k} \neq \bar{0}$, sufficiently large m ;

$$|\mathcal{F}(f_m)(\bar{k})| \leq \frac{3G}{(2\pi)^{\frac{3}{2}}} \frac{m^3}{(k_1^{14} + k_2^{14} + k_3^{14})} \quad (*)$$

Using polar coordinates $k_1 = r \sin(\theta) \cos(\phi)$, $k_2 = r \sin(\theta) \sin(\phi)$, $k_3 = r \cos(\theta)$, $0 \leq \theta \leq \pi$, $-\pi < \phi \leq \pi$, we have that;

$$\frac{1}{(k_1^{14} + k_2^{14} + k_3^{14})} = \frac{1}{r^{14}} \frac{1}{\alpha(\theta, \phi)}$$

where $\alpha(\theta, \phi) = \sin^{14}(\theta)(\cos^{14}(\phi) + \sin^{14}(\phi)) + \cos^{14}(\theta)$

We have that, in the range $0 \leq \theta \leq \pi$, $-\pi \leq \phi \leq \pi$, with $\theta \neq \frac{\pi}{2}$, $|\phi| \neq \frac{\pi}{2}$;

$$\alpha(\theta, \phi) = 0$$

$$\text{iff } \tan^{14}(\theta)(1 + \tan^{14}(\phi)) + \frac{1}{\cos^{14}(\phi)} = 0$$

$$\text{iff } \tan^{14}(\theta)(1 + \tan^{14}(\phi)) = -\frac{1}{\cos^{14}(\phi)}$$

which has no solution, as the two sides of the equation have opposite signs.

and, with $\theta = \frac{\pi}{2}$, , $|\phi| \neq \frac{\pi}{2}$

$$\alpha(\theta, \phi) = 0$$

$$\text{iff } \cos^{14}(\phi) + \sin^{14}(\phi) = 0$$

$$\text{iff } \tan^{14}(\phi) = -1$$

which has no solution, as the two sides of the equation have opposite signs.

and, with $\theta \neq \frac{\pi}{2}$, , $|\phi| = \frac{\pi}{2}$

$$\alpha(\theta, \phi) = 0$$

$$\text{iff } \cos^{14}(\theta) + \sin^{14}(\theta) = 0$$

$$\text{iff } \tan^{14}(\theta) = -1$$

which has no solution, as the two sides of the equation have opposite signs.

and, with $\theta = \frac{\pi}{2}$, , $|\phi| = \frac{\pi}{2}$

$$\alpha(\theta, \phi) = 0$$

$$\text{iff } 1 = 0$$

which is not the case. It follows that $\alpha(\theta, \phi) = 0$ has no solution in the range $0 \leq \theta \leq \pi$, $-\pi \leq \phi \leq \pi$. By continuity, compactness of $[0, \pi] \times [-\pi, \pi]$ and the fact that $\alpha(\frac{\pi}{2}, \frac{\pi}{2}) = 1$, restricting the interval $[-\pi, \pi]$, there exists $\epsilon > 0$, with $\alpha(\theta, \phi) \geq \epsilon$, for $0 \leq \theta \leq \pi$, $-\pi < \phi \leq \pi$. In particular;

$$\begin{aligned} \frac{1}{(k_1^{14} + k_2^{14} + k_3^{14})} &\leq \frac{1}{\epsilon r^{14}} \\ &= \frac{1}{\epsilon |\bar{k}|^{14}} \end{aligned}$$

so that, from (*);

$$\begin{aligned} |\mathcal{F}(f_m)(\bar{k})| &\leq \frac{3G}{(2\pi)^{\frac{3}{2}}} \frac{m^3}{\epsilon |\bar{k}|^{14}} \\ &= \frac{Dm^3}{|\bar{k}|^{14}} \end{aligned}$$

$$\text{where } D = \frac{3G}{\epsilon(2\pi)^{\frac{3}{2}}}$$

For the final claim, we have, for $1 \leq i \leq 3$, $m \in \mathcal{N}$, as f_m is supported on $W_{m+\frac{1}{m}}$ and continuous, that $x_i f_m \in L^1(\mathcal{R}^3)$ and, differentiating under the integral sign;

$$\begin{aligned} \left| \frac{\partial \mathcal{F}(f_m)(\bar{k})}{\partial k^i} \right| &= \left| \frac{\partial}{\partial k^i} \left(\frac{1}{(2\pi)^{\frac{3}{2}}} \int_{\mathcal{R}^3} f_m(\bar{x}) e^{-i\bar{k} \cdot \bar{x}} d\bar{x} \right) \right| \\ &= \left| \frac{-i}{(2\pi)^{\frac{3}{2}}} \int_{\mathcal{R}^3} x_i f_m(\bar{x}) e^{-i\bar{k} \cdot \bar{x}} d\bar{x} \right| \\ &\leq \frac{1}{(2\pi)^{\frac{3}{2}}} \int_{\mathcal{R}^3} |x_i f_m(\bar{x})| d\bar{x} \\ &= \frac{1}{(2\pi)^{\frac{3}{2}}} \|x_i f_m(\bar{x})\|_1 \end{aligned}$$

so that $\frac{\partial \mathcal{F}(f_m)(\bar{k})}{\partial k^i}$ is bounded, and, in particular, $\mathcal{F}(f_m)$ is continuous, for $m \in \mathcal{N}$. It follows, using the first result, and polar coordinates, that, for $n > 1$, sufficiently large m ;

$$\left| \int_{\mathcal{R}^3} \mathcal{F}(f_m)(\bar{k}) d\bar{k} \right| \leq \int_{B(\bar{0}, n)} |\mathcal{F}(f_m)(\bar{k})| d\bar{k} + \int_{\mathcal{R}^3 \setminus B(\bar{0}, n)} |\mathcal{F}(f_m)(\bar{k})| d\bar{k}$$

$$\begin{aligned}
 &\leq \frac{4C_n\pi^3}{3} + \int_{\mathcal{R}^3 \setminus B(\bar{0}, n)} \frac{Dm^3}{|k|^{14}} \\
 &\leq \frac{4C_n\pi^3}{3} + \int_0^\pi \int_{-\pi}^\pi \int_n^\infty \frac{Dm^3}{r^{14}} |r^2 \sin(\theta)| dr d\theta d\phi \\
 &\leq \frac{4C_n\pi^3}{3} + 2D\pi^2 m^3 \int_n^\infty \frac{dr}{r^{12}} \\
 &\leq \frac{4C_n\pi^3}{3} + 2D\pi^2 m^3 \left[\frac{-1}{11r^{11}} \right]_n^\infty \\
 &= \frac{4C_n\pi^3}{3} + \frac{2D\pi^2 m^3}{11n^{11}}
 \end{aligned}$$

where $C_n = \|\mathcal{F}(f_m)|_{B(\bar{0}, n)}\|_\infty$, so that $\mathcal{F}(f_m) \in L^1(\mathcal{R}^3)$.

A similar proof works in the two dimensional case. □

Lemma 0.12. *Let $\{f_m : m \in \mathcal{N}\}$ be the inflexionary sequences constructed in Lemmas 0.9 and 0.10, then;*

$$\int_{[-m - \frac{1}{m^2}, m + \frac{1}{m^2}]^2 \setminus [-m, m]^2} |f_m| dx dy \leq \frac{E}{m}$$

for sufficiently large $m \in \mathcal{N}$, where $E \in \mathcal{R}_{>0}$.

$$\int_{[-m - \frac{1}{m^3}, m + \frac{1}{m^3}]^3 \setminus [-m, m]^3} |f_m| dx dy dz \leq \frac{E}{m}$$

for sufficiently large $m \in \mathcal{N}$, where $E \in \mathcal{R}_{>0}$.

Proof. By the construction, we obtain the result that for an inflexionary approximation sequence f_m in \mathcal{R}^2 or \mathcal{R}^3 ;

$$|f_m|_{[-m - \frac{1}{m^2}, m + \frac{1}{m^2}]^2 \setminus [-m, m]^2} \leq D$$

$$|f_m|_{[-m - \frac{1}{m^3}, m + \frac{1}{m^3}]^3 \setminus [-m, m]^3} \leq D \quad (*)$$

independently of m . We give the proof of $(*)$ in the 3-dimensional case. We have that, for $m \leq x \leq m + \frac{1}{m^3}$, $m \leq y \leq m + \frac{1}{m^3}$, $m \leq z \leq m + \frac{1}{m^3}$;

$$|f_m|(x, y, z) \leq \sum_{i=0}^{13} D_i \left| \frac{\partial^i f_m}{\partial z^i} \right|(x, y, m)$$

$$\leq \sum_{i=0}^{13} D_i \sum_{j=0}^{13} D_{ij} \left| \frac{\partial^{i+j} f_m}{\partial y^j \partial z^i} \right|(x, m, m)$$

$$\begin{aligned}
&\leq \sum_{i=0}^{13} D_i \sum_{j=0}^{13} D_{ij} \sum_{k=0}^{13} D_{ijk} \frac{\partial^{i+j+k} f_m}{\partial x^k \partial y^j \partial z^i} |(m, m, m) \\
&= \sum_{i=0}^{13} D_i \sum_{j=0}^{13} D_{ij} \sum_{k=0}^{13} D_{ijk} \frac{\partial^{i+j+k} f}{\partial x^k \partial y^j \partial z^i} |(m, m, m) \\
&\leq C \sum_{i,j,k=0}^{13} D_i D_{ij} D_{ijk} \\
&= C \sum_{i,j,k=0}^{13} D_i D_j D_k = D
\end{aligned}$$

The proof of the bound for the other regions is similar and left to the reader, as is the two dimensional case. It follows that, using the binomial theorem;

$$\begin{aligned}
&\int_{[-m-\frac{1}{m^2}, m+\frac{1}{m^2}]^2 \setminus [-m, m]^2} |f_m| dx dy \\
&\leq D \text{area}([-m-\frac{1}{m^2}, m+\frac{1}{m^2}]^2 \setminus [-m, m]^2) \\
&= 4D((m+\frac{1}{m^2})^2 - m^2) \\
&4D(m^2 + \frac{2m}{m^2} + \frac{1}{m^4} - m^2) \\
&\leq \frac{E}{m}
\end{aligned}$$

and;

$$\begin{aligned}
&\int_{[-m-\frac{1}{m^3}, m+\frac{1}{m^3}]^3 \setminus [-m, m]^3} |f_m| dx dy dz \\
&\leq D \text{vol}([-m-\frac{1}{m^3}, m+\frac{1}{m^3}]^3 \setminus [-m, m]^3) \\
&= 8D((m+\frac{1}{m^3})^3 - m^3) \\
&8D(m^3 + \frac{3m^2}{m^3} + \frac{3m}{m^6} + \frac{1}{m^9} - m^3) \\
&\leq \frac{E}{m}
\end{aligned}$$

for m sufficiently large, where $E \in \mathcal{R}_{>0}$.

□

Lemma 0.13. *Let $f \in C^\infty(\mathcal{R}^3)$ be quasi split normal, with the Fourier transform \mathcal{F} defined in [2]. Let $\{f_m : m \in \mathcal{N}\}$ be the inflexionary sequence constructed in Lemma 0.10. Let \mathcal{F} be the ordinary Fourier transform, defined for each f_m , then, for any (k_{01}, k_{02}, k_{03}) , with $k_{01} \neq$*

0, $k_{02} \neq 0$, $k_{03} \neq 0$, the sequence $\{\mathcal{F}(f_m) : m \in \mathcal{N}\}$ converges pointwise and uniformly to $\mathcal{F}(f)$ on $\mathcal{R}^3 \setminus (|k_1| < k_{01}) \cup (|k_2| < k_{02}) \cup (|k_3| < k_{03})$. In particular, $\mathcal{F}(f) \in C(\mathcal{R}^3 \setminus \{k_1 = 0 \cup k_2 = 0 \cup k_3 = 0\})$. A corresponding result holds in dimension 2.

Proof. For $g \in C_c(\mathcal{R}^3)$ or g quasi split normal, and $m \in \mathcal{N}$, define;

$$\mathcal{F}_m(g)(\bar{k}) = \frac{1}{(2\pi)^{\frac{3}{2}}} \int_{C_m} g(\bar{x}) e^{-i\bar{k} \cdot \bar{x}} d\bar{x}$$

For $\bar{k} \in \mathcal{R}^3 \setminus (|k_1| < k_{01}) \cup (|k_2| < k_{02}) \cup (|k_3| < k_{03})$, $m \in \mathcal{N}$, $\epsilon > 0$, we have, using Lemma 0.12;

$$\begin{aligned} |\mathcal{F}(f)(\bar{k}) - \mathcal{F}(f_m)(\bar{k})| &\leq |\mathcal{F}(f)(\bar{k}) - \mathcal{F}_m(f)(\bar{k})| + |\mathcal{F}_m(f)(\bar{k}) - \mathcal{F}_m(f_m)(\bar{k})| \\ &+ |\mathcal{F}_m(f_m)(\bar{k}) - \mathcal{F}(f_m)(\bar{k})| \\ &= |\mathcal{F}(f)(\bar{k}) - \mathcal{F}_m(f)(\bar{k})| + |\mathcal{F}_m(f_m)(\bar{k}) - \mathcal{F}(f_m)(\bar{k})| \\ &\leq |\mathcal{F}(f)(\bar{k}) - \mathcal{F}_m(f)(\bar{k})| + \left| \int_{\mathcal{R}^3 \setminus C_m} f_m(\bar{x}) e^{-i\bar{k} \cdot \bar{x}} d\bar{x} \right| \\ &\leq |\mathcal{F}(f)(\bar{k}) - \mathcal{F}_m(f)(\bar{k})| + \int_{C_{m+\frac{1}{m^3}} \setminus C_m} |f_m(\bar{x})| d\bar{x} \\ &\leq |\mathcal{F}(f)(\bar{k}) - \mathcal{F}_m(f)(\bar{k})| + \frac{E}{m} (BB) \end{aligned}$$

By the result in [2], we have that, for sufficiently large m ;

$$|\mathcal{F}(f)(\bar{k}) - \mathcal{F}_m(f)(\bar{k})| \leq \frac{C_{k_{01}, k_{02}, k_{03}}}{m} (B)$$

Combining (B) and (BB), we obtain that;

$$\begin{aligned} |\mathcal{F}(f)(\bar{k}) - \mathcal{F}(f_m)(\bar{k})| &\leq \frac{C_{k_{01}, k_{02}, k_{03}} + E}{m} \\ &\leq \epsilon \end{aligned}$$

for $m \geq \frac{C_{k_{01}, k_{02}, k_{03}} + E}{\epsilon}$. As $\epsilon > 0$ was arbitrary, we obtain the first result. The fact that each $\mathcal{F}(f_m)$ is continuous, follows from the differentiability $\mathcal{F}(f_m)$, which is a consequence of the fact that $x_i f_m(\bar{x})$ has compact support, for $1 \leq i \leq 3$. The last result then follows immediately from the fact that $k_{01} \neq 0$, $k_{02} \neq 0$, $k_{03} \neq 0$ were arbitrary and the uniform limit of continuous functions is continuous. The last claim

is similar.

□

Lemma 0.14. *Let $f \in C^\infty(\mathcal{R}^3)$, with $\frac{\partial^{i_1+i_2+i_3}}{\partial x^{i_1} \partial y^{i_2} \partial z^{i_3}}$ bounded for $0 \leq i_1 + i_2 + i_3 \leq 40$, f quasi split normal, and of moderate decrease. Then;*

$$f(\bar{x}) = \mathcal{F}^{-1}(\mathcal{F}(f))(\bar{x}), (\bar{x} \in \mathcal{R}^3)$$

where, for $g \in L^1(\mathcal{R}^3)$;

$$\mathcal{F}^{-1}(g)(\bar{x}) = \frac{1}{(2\pi)^{\frac{3}{2}}} \int_{\mathcal{R}^3} g(\bar{k}) e^{i\bar{k} \cdot \bar{x}} d\bar{k}$$

The same claim holds in dimension 2.

Proof. By Lemma 0.1, we have that $\mathcal{F}(f) \in L^1(\mathcal{R}^3)$. Let $\{f_m : m \in \mathcal{N}\}$ be the inflexionary approximating sequence, given by Lemma 0.9, then, for sufficiently large m , $f_m \in L^1(\mathcal{R}^3)$ and $\mathcal{F}(f_m) \in L^1(\mathcal{R}^3)$ by Lemma 0.11. It follows, see [1] or the method of [4], that for such m , $f_m = \mathcal{F}^{-1}(\mathcal{F}(f_m))$, (**), By the proof of Lemma 0.13, we have that, for \bar{k} with $\min(|k_1|, |k_2|, |k_3|) > \epsilon > 0$, $|\mathcal{F}(f)(\bar{k}) - \mathcal{F}(f_m)(\bar{k})| \leq \frac{\epsilon}{m}$, (B). By the fact that f is of very moderate decrease, we have that $\mathcal{F}(f) - \mathcal{F}(f_m) \in L^2(\mathcal{R}^3)$, and by the classical theory, and by the proof of Lemma 0.12, we have that;

$$\begin{aligned} & \| \mathcal{F}(f) - \mathcal{F}(f_m) \|_{L^2(\mathcal{R}^3)}^2 \\ &= \| f - f_m \|_{L^2(\mathcal{R}^3)}^2 \\ &\leq \int_{\mathcal{R}^3 \setminus C_m} |f|^2 d\bar{x} + \int_{C_{m+\frac{1}{m^3}} \setminus C_m} |f_m|^2 d\bar{x} \\ &\leq \int_{\mathcal{R}^3 \setminus B(\bar{0}, m)} |f|^2 d\bar{x} + \frac{G}{m} \\ &\leq \int_{\mathcal{R}^3 \setminus B(\bar{0}, m)} \frac{C}{|\bar{x}|^4} d\bar{x} + \frac{G}{m} \\ &\leq 2\pi^2 \int_m^\infty \frac{C}{r^2} dr + \frac{G}{m} \\ &\leq \frac{C}{m} + \frac{G}{m} \\ &\leq \frac{F}{m} \end{aligned}$$

where $\{C, F, G\} \subset \mathcal{R}_{>0}$. It follows that $\|\mathcal{F}(f) - \mathcal{F}(f_m)\|_{L^2(\mathcal{R}^3)} \rightarrow 0$ as $m \rightarrow \infty$. In particular, there exists a constant $H \in \mathcal{R}_{>0}$ with $\|\mathcal{F}(f) - \mathcal{F}(f_m)\|_{L^2(\mathcal{R}^3)} \leq H$, for sufficiently large m . By the Cauchy Schwarz inequality, we have that, for m sufficiently large;

$$\begin{aligned}
 & \|\mathcal{F}(f) - \mathcal{F}(f_m)\|_{L^1(B(\bar{0}, n))} \\
 & \leq \|(\mathcal{F}(f) - \mathcal{F}(f_m))|_{B(\bar{0}, n)}\|_{L^2(B(\bar{0}, n))} \|1_{B(\bar{0}, n)}\|_{L^2(B(\bar{0}, n))} \\
 & \leq \frac{\sqrt{F}}{\sqrt{m}} \|1_{B(\bar{0}, n)}\|_{L^2(B(\bar{0}, n))} \\
 & = \frac{2\sqrt{F\pi n}^{\frac{3}{2}}}{\sqrt{3m}} \\
 & = \frac{Kn^{\frac{3}{2}}}{m^{\frac{1}{2}}}, \quad (A)
 \end{aligned}$$

Using the fact from Lemma 0.1, that $\mathcal{F}(f) \in L^1(\mathcal{R})$, and of rapid decrease, for $\delta > 0$ arbitrary, we have that;

$$\int_{\mathcal{R}^3 \setminus B(\bar{0}, n)} |\mathcal{F}(f)(\bar{k})| d\bar{k} < \delta$$

for $n \in \mathcal{N}$, sufficiently large, $n \geq n_0$. Choosing $n \in \mathcal{N}$, with $m = \lfloor n^{\frac{10}{3}} \rfloor$, and using (A), Lemma 0.11, we have, for $\bar{x} \in \mathcal{R}^3$, that;

$$\begin{aligned}
 & |\mathcal{F}^{-1}(\mathcal{F}(f))(\bar{x}) - \mathcal{F}^{-1}(\mathcal{F}(f_m))(\bar{x})| = |\mathcal{F}^{-1}(\mathcal{F}(f)(\bar{k}) - \mathcal{F}(f_m)(\bar{k}))| \\
 & = \frac{1}{(2\pi)^{\frac{3}{2}}} \left| \int_{B(\bar{0}, n)} (\mathcal{F}(f)(\bar{k}) - \mathcal{F}(f_m)(\bar{k})) e^{i\bar{k} \cdot \bar{x}} d\bar{k} \right. \\
 & \quad \left. + \int_{\mathcal{R}^3 \setminus B(\bar{0}, n)} (\mathcal{F}(f)(\bar{k}) - \mathcal{F}(f_m)(\bar{k})) e^{i\bar{k} \cdot \bar{x}} d\bar{k} \right| \\
 & \leq \frac{1}{(2\pi)^{\frac{3}{2}}} \left(\int_{B(\bar{0}, n)} |\mathcal{F}(f)(\bar{k}) - \mathcal{F}(f_m)(\bar{k})| d\bar{k} \right. \\
 & \quad \left. + \int_{\mathcal{R}^3 \setminus B(\bar{0}, n)} |\mathcal{F}(f)(\bar{k})| d\bar{k} + \int_{\mathcal{R}^3 \setminus B(\bar{0}, n)} |\mathcal{F}(f_m)(\bar{k})| d\bar{k} \right) \\
 & \leq \frac{1}{(2\pi)^{\frac{3}{2}}} \left(\int_{B(\bar{0}, n)} |\mathcal{F}(f)(\bar{k}) - \mathcal{F}(f_m)(\bar{k})| d\bar{k} + \delta + \int_{\mathcal{R}^3 \setminus B(\bar{0}, n)} \frac{Dm^3}{|k|^{14}} d\bar{k} \right) \\
 & \leq \frac{1}{(2\pi)^{\frac{3}{2}}} \left(\frac{Kn^{\frac{3}{2}}}{3m^{\frac{1}{2}}} + \delta + \int_{\mathcal{R}^3 \setminus B(\bar{0}, n)} \frac{Dm^3}{|k|^{14}} d\bar{k} \right) \\
 & \leq \frac{1}{(2\pi)^{\frac{3}{2}}} \left(\frac{Kn^{\frac{3}{2}}}{[n^{\frac{10}{3}}]^{\frac{1}{2}}} + \delta + \int_{\mathcal{R}^3 \setminus B(\bar{0}, n)} \frac{Dn^{10}}{|k|^{14}} d\bar{k} \right) \\
 & \leq \frac{1}{(2\pi)^{\frac{3}{2}}} \left(\frac{K}{n^{\frac{1}{6}}} + \delta + 2\pi^2 \int_{r>n} \frac{Dn^{10}}{r^{14}} dr \right)
 \end{aligned}$$

$$\begin{aligned}
&= \frac{1}{(2\pi)^{\frac{3}{2}}} \left(\frac{K}{n^{\frac{1}{6}}} + \delta + 2D\pi^2 n^{10} \lfloor \frac{-1}{13r^{13}} \rfloor n^\infty \right) \\
&= \frac{1}{(2\pi)^{\frac{3}{2}}} \left(\frac{K}{n^{\frac{1}{6}}} + \delta + \frac{2D\pi^2}{13n^3} \right) \\
&< \frac{2\delta}{(2\pi)^{\frac{3}{2}}}
\end{aligned}$$

for sufficiently large $n \geq n_0$, or $m \geq m_0$, so that, as $\epsilon > 0$ and $\delta > 0$ were arbitrary, for $\bar{x} \in \mathcal{R}^3$;

$$\lim_{m \rightarrow \infty} \mathcal{F}^{-1}(\mathcal{F}(f_m))(\bar{x}) = \mathcal{F}^{-1}\mathcal{F}(f)(\bar{x}), (***)$$

and, by Definition 0.3, (**), (***);

$$f(\bar{x}) = \lim_{m \rightarrow \infty} f_m(\bar{x}) = \lim_{m \rightarrow \infty} \mathcal{F}^{-1}(\mathcal{F}(f_m))(\bar{x}) = \mathcal{F}^{-1}\mathcal{F}(f)(\bar{x})$$

The proof of the final claim in dimension 2 is identical.

□

The following results are not required for the proof of the inversion theorem but are required in [4].

Definition 0.15. *We say that $f : \mathcal{R}^3 \rightarrow \mathcal{R}$ is of very moderate decrease if $|f(\bar{x})| \leq \frac{C}{|\bar{x}|}$ for $|\bar{x}| > C$, $C \in \mathcal{R}_{>0}$. We say that $f : \mathcal{R}^3 \rightarrow \mathcal{R}$ is of moderate decrease n if $|f(\bar{x})| \leq \frac{C}{|\bar{x}|^n}$ for $|\bar{x}| > C$, $C \in \mathcal{R}_{>0}$, $n \geq 2$. We just say that f is of moderate decrease if f is of moderate decrease 2. We call $\{\theta, \phi\}$ generic if $\sin(\theta)\cos(\phi) \neq 0$, $\sin(\theta)\sin(\phi) \neq 0$, $\cos(\theta) \neq 0$*

Lemma 0.16. *Let f be of very moderate decrease and quasi split normal, $f \in C^{41}(\mathcal{R}^3)$, such that the partial derivatives $\{\frac{\partial f^{i+j+k}}{\partial x^i \partial y^j \partial z^k} : 1 \leq i+j+k \leq 41\}$ are of moderate decrease, and of moderate decrease $i+j+k+1$, then for $1 \leq i \leq 3$;*

$$k_i \mathcal{F}(f)(\bar{k}) \in C^1(\mathcal{R}^3 \setminus (k_1 = 0 \cup k_2 = 0 \cup k_3 = 0))$$

$$\lim_{\bar{k} \rightarrow 0, \bar{k} \notin (k_1=0 \cup k_2=0 \cup k_3=0)} k_i \mathcal{F}(f)(\bar{k}) = 0$$

The same results hold for $k_i \mathcal{F}(\frac{\partial f}{\partial x_i})$, $1 \leq i \leq j \leq 3$, when $f \in C^{42}(\mathcal{R}^3)$.

Making a polar coordinate change, for $\{\theta, \phi\}$ generic, $r\mathcal{F}(f)_{\theta, \phi}(r) \in C^1(\mathcal{R}_{>0})$, $\lim_{r \rightarrow 0} r\mathcal{F}(f)_{\theta, \phi}(r) = 0$, and similarly for $r\mathcal{F}(\frac{\partial f}{\partial x_j})$, $1 \leq j \leq 3$.

We have that $\mathcal{F}(f)(\bar{k}) \in L^1(\mathcal{R}^3)$, $\{\frac{\mathcal{F}(\frac{\partial f}{\partial x_j})(\bar{k})}{|\bar{k}|} : 1 \leq j \leq 3\} \subset L^1(\mathcal{R}^3)$

and $\{\frac{\mathcal{F}(\frac{\partial^2 f}{\partial x_i \partial x_j})(\bar{k})}{|\bar{k}|^2} : 1 \leq i, j \leq 3\} \subset L^1(\mathcal{R}^3)$

For any given $\epsilon > 0$, there exists $\delta > 0$, for $1 \leq j \leq 3$, such that for a generic translation \bar{l} with $l_1 \neq 0$, $l_2 \neq 0$, $l_3 \neq 0$;

$$\max(|\int_0^\delta r\mathcal{F}_{\theta, \phi, \bar{l}}(\frac{\partial f}{\partial x_j})(r)dr|, |\int_0^\delta \frac{d}{dr}(r\mathcal{F}_{\theta, \phi, \bar{l}}(\frac{\partial f}{\partial x_j})(r))dr|) < \epsilon$$

uniformly in $\{\theta, \phi\}$.

Proof. As $\frac{\partial f}{\partial x}$ is of moderate decrease and quasi split normal, for fixed y, z , $f_{y,z}$ is of very moderate decrease and analytic at infinity, we have for $k_1 \neq 0$, $k_2 \neq 0$, $k_3 \neq 0$;

$$\begin{aligned} \mathcal{F}(\frac{\partial f}{\partial x}) &= \frac{1}{(2\pi)^{\frac{3}{2}}} \lim_{r_1 \rightarrow \infty} \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_1}^{r_1} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} \frac{\partial f}{\partial x}(\bar{x}) e^{-i\bar{k}\cdot\bar{x}} dx_1 dx_2 dx_3 \\ &= \frac{1}{(2\pi)^{\frac{3}{2}}} \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} (\lim_{r_1 \rightarrow \infty} \int_{-r_1}^{r_1} \frac{\partial f}{\partial x}(\bar{x}) e^{-ik_1 x_1} dx_1) e^{-i(k_2 x_2 + k_3 x_3)} dx_2 dx_3 \\ &= \frac{1}{(2\pi)^{\frac{3}{2}}} \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} (\lim_{r_1 \rightarrow \infty} ([f e^{-ik_1 x_1}]_{-r_1}^{r_1} + ik_1 \int_{-r_1}^{r_1} f(\bar{x}) e^{-ik_1 x_1} dx_1) \\ &\quad e^{-i(k_2 x_2 + k_3 x_3)} dx_2 dx_3 \\ &= ik_1 \frac{1}{(2\pi)^{\frac{3}{2}}} \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} (\lim_{r_1 \rightarrow \infty} \int_{-r_1}^{r_1} f(\bar{x}) e^{-ik_1 x_1} dx_1) e^{-i(k_2 x_2 + k_3 x_3)} dx_2 dx_3 \\ &= ik_1 \frac{1}{(2\pi)^{\frac{3}{2}}} \lim_{r_1 \rightarrow \infty} \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_1}^{r_1} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} f(\bar{x}) e^{-i\bar{k}\cdot\bar{x}} dx_1 dx_2 dx_3 \\ &= ik_1 \mathcal{F}(f)(\bar{k}) \quad (TT) \end{aligned}$$

the limit interchange being justified by the calculation in [2]. It follows that, for $k_1 \neq 0$, $k_2 \neq 0$, $k_3 \neq 0$, we have that;

$$k_1 \mathcal{F}(f)(\bar{k}) = -i \mathcal{F}(\frac{\partial f}{\partial x})$$

and similarly;

$$k_i \mathcal{F}(f)(\bar{k}) = -i \mathcal{F}\left(\frac{\partial f}{\partial x_i}\right)(A), \text{ for } 1 \leq i \leq 3 \text{ and } k_1 \neq 0, k_2 \neq 0, k_3 \neq 0.$$

It follows that, using the fact that;

$$F(x_1, k_2, k_3) = \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} \frac{\partial f}{\partial x}(x_1, x_2, x_3) e^{-ik_2 x_2} e^{-ik_3 x_3} dx_2 dx_3$$

is of moderate decrease, the DCT and the FTC, and the fact that $f_{y,z}$ is of very moderate decrease;

$$\begin{aligned} & \lim_{\bar{k} \rightarrow 0, \bar{k} \notin (k_1=0 \cup k_2=0 \cup k_3=0)} k_1 \mathcal{F}(f)(\bar{k}) \\ & - i \lim_{\bar{k} \rightarrow 0, \bar{k} \notin (k_1=0 \cup k_2=0 \cup k_3=0)} \mathcal{F}(f)\left(\frac{\partial f}{\partial x}\right)(\bar{k}) \\ & = \frac{-i}{(2\pi)^{\frac{3}{2}}} \lim_{\bar{k} \rightarrow 0, \bar{k} \notin (k_1=0 \cup k_2=0 \cup k_3=0)} \lim_{r_1 \rightarrow \infty} \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_1}^{r_1} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} \frac{\partial f}{\partial x}(\bar{x}) e^{-i\bar{k} \cdot \bar{x}} dx_1 dx_2 dx_3 \\ & = \frac{1}{(2\pi)^{\frac{3}{2}}} \lim_{k_2 \rightarrow 0, k_3 \rightarrow 0, k_2 \neq 0, k_3 \neq 0} \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} \left(\lim_{k_1 \rightarrow 0} \int_{-\infty}^{\infty} \frac{\partial f}{\partial x}(\bar{x}) e^{-ik_1 x_1} dx_1 \right) \\ & e^{-i(k_2 x_2 + k_3 x_3)} dx_2 dx_3 \\ & = \frac{1}{(2\pi)^{\frac{3}{2}}} \lim_{k_2 \rightarrow 0, k_3 \rightarrow 0, k_2 \neq 0, k_3 \neq 0} \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} \left(\int_{-\infty}^{\infty} \frac{\partial f}{\partial x}(\bar{x}) dx_1 \right) e^{-i(k_2 x_2 + k_3 x_3)} dx_2 dx_3 \\ & = \frac{1}{(2\pi)^{\frac{3}{2}}} \lim_{k_2 \rightarrow 0, k_3 \rightarrow 0, k_2 \neq 0, k_3 \neq 0} \lim_{r_2 \rightarrow \infty} \lim_{r_3 \rightarrow \infty} \int_{-r_2}^{r_2} \int_{-r_3}^{r_3} ([f]_{-\infty}^{\infty}) e^{-i(k_2 x_2 + k_3 x_3)} dx_2 dx_3 \\ & = 0 \quad (E) \end{aligned}$$

Similarly;

$$\lim_{\bar{k} \rightarrow 0, \bar{k} \notin (k_1=0 \cup k_2=0 \cup k_3=0)} k_i \mathcal{F}(f)(\bar{k}) = 0, \quad 1 \leq i \leq 3$$

As $f \in C^{41}(\mathcal{R}^3)$, we have, by the product rule, that $x_i \frac{\partial f}{\partial x_j} \in C^{40}(\mathcal{R}^3)$, $1 \leq i \leq j \leq 3$. As f is of very moderate decrease and;

$$\left\{ \frac{\partial f^{l+m+n}}{\partial x_1^l \partial x_2^m \partial x_3^n} : 1 \leq l+m+n \leq 40 \right\}$$

are of very moderate decrease, we have, by repeated application of the product rule again, that;

$$\left\{ \frac{\partial^{l+m+n} x_i \frac{\partial f}{\partial x_j}}{\partial x_1^l \partial x_2^m \partial x_3^n} : 0 \leq l+m+n \leq 40 \right\}, \quad 1 \leq i \leq j \leq 3$$

are bounded. By Lemma 0.4, there exists an inflexionary approximation sequence g_m for $x\frac{\partial f}{\partial x}$ with the properties that;

- (i) $g_m \in C^{13,13,14}(\mathcal{R}^3)$
- (ii). $g_m|_{[-m,m]^3} = x\frac{\partial f}{\partial x}|_{[-m,m]^3}$
- (iii). $\int_{[-m-\frac{1}{m^3}, m+\frac{1}{m^3}]^3 \setminus [-m,m]^3} |g_m(\bar{x})d\bar{x}| \leq \frac{E}{m}$
- (iv). $g_m|_{\mathcal{R}^3 \setminus [-m-\frac{1}{m^3}, m+\frac{1}{m^3}]^3} = 0$

By the construction of g_m , we have that $f_m = \frac{g_m}{x}$ is an approximation sequence for $\frac{\partial f}{\partial x}$, with the property that;

- (i)' $f_m \in C^{13,13,14}(\mathcal{R}^3)$
- (ii)'. $f_m|_{[-m,m]^3} = \frac{\partial f}{\partial x}|_{[-m,m]^3}$
- (iii)'. $\int_{[-m-\frac{1}{m^3}, m+\frac{1}{m^3}]^3 \setminus [-m,m]^3} |f_m(\bar{x})d\bar{x}| \leq \frac{E'}{m}$
- (iv)'. $f_m|_{\mathcal{R}^3 \setminus [-m-\frac{1}{m^3}, m+\frac{1}{m^3}]^3} = 0$

Following through the proof of Lemma 0.13, as $\frac{\partial f}{\partial x}$ is quasi split normal of moderate decrease and, therefore, of very moderate decrease, we have that $\mathcal{F}(f_m)$ converges uniformly to $\mathcal{F}(\frac{\partial f}{\partial x})$ on compact subsets of $\mathcal{R}^3 \setminus (k_1 = 0 \cup k_2 = 0 \cup k_3 = 0)$, so that $\mathcal{F}(\frac{\partial f}{\partial x}) \in C(\mathcal{R}^3 \setminus (k_1 = 0 \cup k_2 = 0 \cup k_3 = 0))$, As $x_i x_j f_m \in L^1(\mathcal{R}^3)$, for $1 \leq i \leq j \leq 3$, we have that $\mathcal{F}(f_m)$ is twice differentiable, in particular, $\mathcal{F}(f_m) \in C^1(\mathcal{R}^3)$. As f is quasi split normal, so is $\frac{\partial f}{\partial x}$ and $x\frac{\partial f}{\partial x}$. It follows that for $\{m, n\} \subset \mathcal{N}$, with $m \geq n$, differentiating under the integral sign, using the DCT, property (iii) of an inflexionary approximating sequence, and the fact that $x\frac{\partial f}{\partial x}$ is of very moderate decrease and quasi split normal, for $|k_1| \geq \epsilon_1 > 0$, $|k_2| \geq \epsilon_2 > 0$, $|k_3| \geq \epsilon_3 > 0$, we have that;

$$\begin{aligned} & \left| \frac{\partial \mathcal{F}(f_m)}{\partial k_1} - \frac{\partial \mathcal{F}(f_n)}{\partial k_1} \right| \\ &= \frac{1}{(2\pi)^{\frac{3}{2}}} \left| \frac{\partial}{\partial k_1} \left(\int_{\mathcal{R}^3} f_m(\bar{x}) e^{-i\bar{k} \cdot \bar{x}} d\bar{x} \right) - \frac{\partial}{\partial k_1} \int_{\mathcal{R}^3} f_n(\bar{x}) e^{-i\bar{k} \cdot \bar{x}} d\bar{x} \right| \\ &= \frac{1}{(2\pi)^{\frac{3}{2}}} \left| \int_{\mathcal{R}^3} -ix_1 f_m(\bar{x}) e^{-i\bar{k} \cdot \bar{x}} d\bar{x} - \int_{\mathcal{R}^3} -ix_1 f_n(\bar{x}) e^{-i\bar{k} \cdot \bar{x}} d\bar{x} \right| \end{aligned}$$

$$\begin{aligned}
&= \frac{1}{(2\pi)^{\frac{3}{2}}} \left| \int_{\mathcal{R}^3} (g_m - g_n)(\bar{x}) e^{-i\bar{k}\cdot\bar{x}} d\bar{x} \right| \\
&\leq \frac{1}{(2\pi)^{\frac{3}{2}}} \left(\int_{[-m-\frac{1}{m^3}, m+\frac{1}{m^3}]^3 \setminus [-m, m]^3} |g_m(\bar{x})| d\bar{x} + \int_{[-m-\frac{1}{m^3}, m+\frac{1}{m^3}]^3 \setminus [-m, m]^3} |g_n(\bar{x})| d\bar{x} \right) \\
&+ \left| \int_{[-m, m]^3 \setminus [-n, n]^3} x_1 \frac{\partial f}{\partial x_1} e^{-i\bar{k}\cdot\bar{x}} d\bar{x} \right| \\
&\leq \frac{E}{m} + \frac{E}{n} + \frac{C(\bar{k})}{n} \quad (*)
\end{aligned}$$

where $C(\bar{k})$ is uniformly bounded on the region $|k_1| \geq \epsilon_1 > 0$, $|k_2| \geq \epsilon_2 > 0$, $|k_3| \geq \epsilon_3 > 0$. It follows that the sequence $\{\frac{\partial \mathcal{F}(f_m)}{\partial k_1} : m \in \mathcal{N}\}$ is uniformly Cauchy on the region $|k_1| \geq \epsilon_1 > 0$, $|k_2| \geq \epsilon_2 > 0$, $|k_3| \geq \epsilon_3 > 0$, and converges uniformly. By considering inflexionary sequences for $y \frac{\partial f}{\partial x}$ and $z \frac{\partial f}{\partial x}$, we can similarly show that the sequences $\{\frac{\partial \mathcal{F}(f_m)}{\partial k_2} : m \in \mathcal{N}\}$ and $\{\frac{\partial \mathcal{F}(f_m)}{\partial k_3} : m \in \mathcal{N}\}$ are uniformly Cauchy on the region $|k_1| \geq \epsilon_1 > 0$, $|k_2| \geq \epsilon_2 > 0$, $|k_3| \geq \epsilon_3 > 0$, and converge uniformly. As $\mathcal{F}(f_m)$ converges uniformly to $\mathcal{F}(\frac{\partial f}{\partial x})$ on the regions $|k_1| \geq \epsilon_1 > 0$, $|k_2| \geq \epsilon_2 > 0$, $|k_3| \geq \epsilon_3 > 0$, it follows that $\mathcal{F}(\frac{\partial f}{\partial x}) \in C^1(\mathcal{R}^3 \setminus (k_1 = 0 \cup k_2 = 0 \cup k_3 = 0))$. The same result holds for $\mathcal{F}(\frac{\partial f}{\partial y})$ and $\mathcal{F}(\frac{\partial f}{\partial z})$, so by (A);

$$\{k_1 \mathcal{F}(f)(\bar{k}), k_2 \mathcal{F}(f)(\bar{k}), k_3 \mathcal{F}(f)(\bar{k})\} \subset C^1(\mathcal{R}^3 \setminus (k_1 = 0 \cup k_2 = 0 \cup k_3 = 0))$$

(B)

It follows that, changing to polars;

$$\begin{aligned}
\frac{\partial r \mathcal{F}(f)(\bar{k})}{\partial r} &= \left(\frac{\partial}{\partial k_1} \frac{k_1}{r} + \frac{\partial}{\partial k_2} \frac{k_2}{r} + \frac{\partial}{\partial k_3} \frac{k_3}{r} \right) (r \mathcal{F}(f)(\bar{k})) \\
&= \frac{\partial k_1 \mathcal{F}(f)(\bar{k})}{\partial k_1} + \frac{\partial k_2 \mathcal{F}(f)(\bar{k})}{\partial k_2} + \frac{\partial k_3 \mathcal{F}(f)(\bar{k})}{\partial k_3} \quad (WW)
\end{aligned}$$

so that, for generic $\{\theta, \phi\}$, $r \mathcal{F}(f)(r)_{\theta, \phi} \in C^1(\mathcal{R}_{>0})$, by (B). Moreover;

$$\begin{aligned}
&\lim_{r \rightarrow 0} r \mathcal{F}(f)(r)_{\theta, \phi} \\
&= \lim_{\bar{k}(\theta, \phi) \rightarrow 0} \frac{r}{k_1} \lim_{\bar{k}(\theta, \phi) \rightarrow \bar{0}, k_1 \neq 0, k_2 \neq 0, k_3 \neq 0} k_1 \mathcal{F}(f)(\bar{k}) \\
&= \lim_{\bar{k}(\theta, \phi) \rightarrow 0} \frac{r}{k_2} \lim_{\bar{k}(\theta, \phi) \rightarrow \bar{0}, k_1 \neq 0, k_2 \neq 0, k_3 \neq 0} k_2 \mathcal{F}(f)(\bar{k}) \\
&= \lim_{\bar{k}(\theta, \phi) \rightarrow 0} \frac{r}{k_3} \lim_{\bar{k}(\theta, \phi) \rightarrow \bar{0}, k_1 \neq 0, k_2 \neq 0, k_3 \neq 0} k_3 \mathcal{F}(f)(\bar{k})
\end{aligned}$$

$$\begin{aligned}
 &= \lim_{\bar{k}(\theta, \phi) \rightarrow 0} \text{sign}(k_1) \left(1 + \frac{k_2^2}{k_1^2} + \frac{k_3^2}{k_1^2}\right) \lim_{\bar{k}(\theta, \phi) \rightarrow \bar{0}, k_1 \neq 0, k_2 \neq 0, k_3 \neq 0} k_1 \mathcal{F}(f)(\bar{k}) \\
 &= \lim_{\bar{k}(\theta, \phi) \rightarrow 0} \text{sign}(k_2) \left(1 + \frac{k_1^2}{k_2^2} + \frac{k_3^2}{k_2^2}\right) \lim_{\bar{k}(\theta, \phi) \rightarrow \bar{0}, k_1 \neq 0, k_2 \neq 0, k_3 \neq 0} k_2 \mathcal{F}(f)(\bar{k}) \\
 &= \lim_{\bar{k}(\theta, \phi) \rightarrow 0} \text{sign}(k_3) \left(1 + \frac{k_1^2}{k_3^2} + \frac{k_2^2}{k_3^2}\right) \lim_{\bar{k}(\theta, \phi) \rightarrow \bar{0}, k_1 \neq 0, k_2 \neq 0, k_3 \neq 0} k_3 \mathcal{F}(f)(\bar{k}) \\
 &= 0
 \end{aligned}$$

as the cases $\max(|k_2|, |k_3|) \leq |k_1|$, $\max(|k_1|, |k_3|) \leq |k_2|$ and $\max(|k_1|, |k_2|) \leq |k_3|$ are exhaustive.

Clearly, we can repeat the above arguments for $\frac{\partial f}{\partial x_i}$, $1 \leq i \leq 3$, and $f \in C^{42}(\mathcal{R}^3)$, using the fact that $\frac{\partial f}{\partial x_i}$ is of moderate decrease, in particular of very moderate decrease, with the higher derivatives $\frac{\partial^{l+m+n} \frac{\partial f}{\partial x_i}}{\partial x^l y^m z^n}$ of moderate decrease $l+m+n+2$, in particular of moderate decrease $l+m+n+1$.

For the next claim, we have, $\mathcal{F}(f) \in L^1(\mathcal{R}^3)$, (R), by Lemma 0.1. A similar calculation shows that, as $\frac{\partial f}{\partial x}$ is of moderate decrease 2, that $f \in L^{\frac{3}{2}+\epsilon}(\mathcal{R}^3)$, for $\epsilon > 0$. Applying the Hausdorff-Young inequality, $\mathcal{F}(\frac{\partial f}{\partial x}) \in L^{3-\delta}(\mathcal{R}^3)$, for $\delta > 0$. In particular, due to the decay again, $\mathcal{F}(\frac{\partial f}{\partial x}) \in L^2(\mathcal{R}^3)$. Locally, on $B(\bar{0}, 1)$, for $\delta > 0$;

$$\begin{aligned}
 &\int_{B(\bar{0}, 1)} \frac{1}{|\bar{k}|^{3-\delta}} d\bar{k} \\
 &= \int_{0 \leq \theta \leq \pi, -\pi \leq \phi \leq \phi} \int_0^1 \frac{r^2}{r^{3-\delta}} dr d\theta d\phi \\
 &\leq 2\pi^2 [r^\delta]_0^1 \\
 &= 2\pi^2 < \infty
 \end{aligned}$$

so that $\frac{1}{|\bar{k}|} \in L^{3-\delta}(B(\bar{0}, 1))$, in particular $\frac{1}{|\bar{k}|} \in L^2(B(\bar{0}, 1))$. As $\mathcal{F}(\frac{\partial f}{\partial x}) \in L^2(B(\bar{0}, 1))$, by the Cauchy Schwarz inequality, we obtain that $\frac{\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})}{|\bar{k}|} \in L^1(B(\bar{0}, 1))$, and by the decay, we have that $\frac{\mathcal{F}(\frac{\partial f}{\partial x})(\bar{k})}{|\bar{k}|} \in L^1(\mathcal{R}^3)$. Similar arguments show that $\frac{\mathcal{F}(\frac{\partial f}{\partial x_i})(\bar{k})}{|\bar{k}|} \in L^1(\mathcal{R}^3)$, for $1 \leq i \leq 3$. We also have, using the fact that $\frac{\partial^2 f}{\partial x_i \partial x_j}$ is of moderate decrease and quasi split normal, $1 \leq i \leq j \leq 3$, using the argument (TT) twice, that

for $k_1 \neq 0, k_2 \neq 0, k_3 \neq 0$;

$$\begin{aligned}\mathcal{F}\left(\frac{\partial^2 f}{\partial x_i \partial x_j}\right) &= (ik_i)(ik_j)\mathcal{F}(f)(\bar{k}) \\ &= -k_i k_j \mathcal{F}(f)(\bar{k})\end{aligned}$$

so that;

$$\frac{\mathcal{F}\left(\frac{\partial^2 f}{\partial x_i \partial x_j}\right)(\bar{k})}{|\bar{k}|^2} = \frac{-k_i k_j}{|\bar{k}|^2} \mathcal{F}(f)(\bar{k})$$

with, for $k_i \neq 0, k_j \neq 0$;

$$\left| \frac{-k_i k_j}{|\bar{k}|^2} \right| = |\text{sign}(k_1)\text{sign}(k_2)| \left| \frac{1}{\left(1 + \frac{k_2^2}{k_1^2} + \frac{k_3^2}{k_1^2}\right)^{\frac{1}{2}}} \right| \left| \frac{1}{\left(1 + \frac{k_1^2}{k_2^2} + \frac{k_3^2}{k_2^2}\right)^{\frac{1}{2}}} \right| \leq 1$$

so that;

$$\left| \frac{\mathcal{F}\left(\frac{\partial^2 f}{\partial x_i \partial x_j}\right)(\bar{k})}{|\bar{k}|^2} \right| \leq |\mathcal{F}(f)(\bar{k})|$$

and, by (R), $\mathcal{F}(f)(\bar{k}) \in L^1(\mathcal{R}^3)$, so that $\frac{\mathcal{F}\left(\frac{\partial^2 f}{\partial x_i \partial x_j}\right)(\bar{k})}{|\bar{k}|^2} \in L^1(\mathcal{R}^3)$.

The last claim follows from the fact that, for \bar{l} , with $l_1 \neq 0, l_2 \neq 0, l_3 \neq 0$, the translation $\mathcal{F}_{\bar{l}}\left(\frac{\partial f}{\partial x_i}\right)(\bar{k}) \in C^1(B(\bar{0}, \epsilon'))$, for some $\epsilon' > 0$. In particular, given $\epsilon > 0$, there exists $\delta > 0$, such that;

$$\max\left(|\int_0^\delta r \mathcal{F}_{\theta, \phi, \bar{l}}\left(\frac{\partial f}{\partial x_j}\right)(r) dr|, \left|\int_0^\delta \frac{d}{dr}(r \mathcal{F}_{\theta, \phi, \bar{l}}\left(\frac{\partial f}{\partial x_j}\right)(r)) dr\right|\right) < \epsilon$$

uniformly in $\{\theta, \phi\}$.
