#### Abstract

A well-known result of Nosal states that a graph $G$ with $m$ edges and $\lambda(G)>\sqrt{m}$ contains a triangle. Nikiforov [Combin. Probab. Comput. 11 (2002)] extended this result to cliques by showing that if $\lambda(G)>\sqrt{2 m(1-1 / r)}$, then $G$ contains a copy of $K_{r+1}$. Let $C_{k}^{+}$be the graph obtained from a cycle $C_{k}$ by adding an edge to two vertices with distance two, and let $F_{k}$ be the friendship graph consisting of $k$ triangles that share a common vertex. Recently, Zhai, Lin and Shu [European J. Combin. 95 (2021)], Sun, Li and Wei [Discrete Math. 346 (2023)], and Li, Lu and Peng [Discrete Math. 346 (2023)] proved that if $m \geq 8$ and $\lambda(G) \geq \frac{1}{2}(1+\sqrt{4 m-3})$, then $G$ contains a copy of $C_{5}, C_{5}^{+}$and $F_{2}$, respectively, unless $G=K_{2} \vee \frac{m-1}{2} K_{1}$. In this paper, we give a unified extension by showing that such a graph contains a copy of $V_{5}$, where $V_{5}=K_{1} \vee P_{4}$ is the join of a vertex and a path on four vertices. Our result extends the aforementioned results since $C_{5}, C_{5}^{+}$and $F_{2}$ are proper subgraphs of $V_{5}$. In addition, we prove that if $m \geq 33$ and $\lambda(G) \geq 1+\sqrt{m-2}$, then $G$ contains a copy of $F_{3}$, unless $G=K_{3} \vee \frac{m-3}{3} K_{1}$. This confirms a conjecture on the friendship graph $F_{k}$ in the case $k=3$. Finally, we conclude some spectral extremal graph problems concerning the large fan graphs and wheel graphs.

Keywords: Extremal graph theory; spectral radius; cycles; friendship graphs.

## 1 Introduction

Let $K_{n}$ be the complete graph on $n$ vertices, and $K_{s, t}$ be the complete bipartite graph with parts of sizes $s$ and $t$. We write $C_{n}$ and $P_{n}$ for the cycle and path on $n$ vertices respectively. Let $k G$ be the union of $k$ disjoint copies of $G$. Let $G \vee H$ be the join graph obtained from $G$ and $H$ by joining each vertex of $G$ to each vertex of $H$.

Dating back to 1970, Nosal [26] (see, e.g., 24] for alternative proofs) showed that for every triangle-free graph $G$ with $m$ edges, we have $\lambda(G) \leq \sqrt{m}$. Later, Nikiforov [18, 19, 21] extended Nosal's result by proving that if $G$ is $K_{r+1}$-free, then

$$
\begin{equation*}
\lambda(G) \leq \sqrt{2 m\left(1-\frac{1}{r}\right)} \tag{1}
\end{equation*}
$$

Moreover, the equality holds if and only if $G$ is a complete bipartite graph for $r=2$, or a regular complete $r$-partite graph for each $r \geq 3$. Turán's theorem can be derived from (11). Indeed, using Rayleigh's inequality, we have $\frac{2 m}{n} \leq \lambda(G) \leq\left(1-\frac{1}{r}\right)^{1 / 2} \sqrt{2 m}$, which yields $m \leq\left(1-\frac{1}{r}\right) \frac{n^{2}}{2}$. Thus, (11) could be viewed as a spectral extension of Turán's theorem. Moreover, since each tree is triangle-free, (1) implies a result of Lovász and Pelikán [6], which asserts that if $G$ is a tree on $n$ vertices, then $\lambda(G) \leq \sqrt{n-1}$, with equality if and only if $G$ is a star. Furthermore, Bollobás and Nikiforov [2] conjectured that if $G$ is a $K_{r+1}$-free graph of order at least $r+1$ with $m$ edges, then

$$
\begin{equation*}
\lambda_{1}^{2}(G)+\lambda_{2}^{2}(G) \leq 2 m\left(1-\frac{1}{r}\right) . \tag{2}
\end{equation*}
$$

This conjecture was firstly confirmed by Ando and Lin 1 for $r$-partite graphs. In 2021, the case $r=2$ was confirmed by Lin, Ning and Wu [14] by using doubly stochastic matrix theory. Later, Nikiforov [23] provided a simple proof by using elementary inequalities. In 2022, Li, Sun and Yu [7] proved an extension for $\left\{C_{3}, C_{5}, \ldots, C_{2 k+1}\right\}$-free graphs. In 2024, Zhang [32] proved the conjecture for all regular graphs. Nevertheless this intriguing problem remains open, we refer the readers to [3] for two related conjectures. As an application of the triangle case of (21), Lin, Ning and Wu [14] stimulated an interesting question to investigate the spectral problems for non-bipartite triangle-free graphs; see [31, 15, 9, 11, 28] for some recent developments.

Both (1) and (2) boosted the great interest of studying the maximum spectral radius for an $F$-free graph with given number of edges. For example, see [22, 31, 28] for $C_{4}$-free graphs, 30 for $K_{2, r+1}$-free graphs, [30, 17] for $C_{5}$-free or $C_{6}$-free graphs, [16] for $C_{7}$-free graphs, [27, 5, 13 ] for $C_{5}^{+}$-free and $C_{6}^{+}$-free graphs and in general, 8] for $C_{k}^{+}$-free graphs, where $C_{k}^{+}$is a graph on $k$ vertices obtained from $C_{k}$ by adding a chord between two
vertices with distance two; see [23] for $B_{k}$-free graphs, where $B_{k}$ denotes the book graph which consists of $k$ triangles sharing a common edge, [10] for $F_{2}$-free graphs with given number of edges, where $F_{2}$ is the friendship graph consisting of two triangles intersecting in a common vertex. In particular, Zhai, Lin and Shu [30] proved the following result for $C_{5}$-free or $C_{6}$-free graphs.

Theorem 1.1 (Zhai-Lin-Shu [30], 2021) If $G$ is a $C_{5}$-free graph with $m \geq 8$ edges, then

$$
\lambda(G) \leq \frac{1+\sqrt{4 m-3}}{2}
$$

where the equality holds if and only if $G=K_{2} \vee \frac{m-1}{2} K_{1}$.
Recall that $C_{t}^{+}$denotes the graph on $t$ vertices obtained from $C_{t}$ by adding a chord between two vertices of distance two. Observe that $C_{4}^{+}=B_{2}$ is the book graph on 4 vertices, and it was studied in [23]. Note that $C_{5}^{+} \nsubseteq K_{2} \vee \frac{m-1}{2} K_{1}$, but $C_{5}^{+} \subseteq K_{3} \vee \frac{m-3}{3} K_{1}$. The following result was proved by Li, Sun and Wei [27].

Theorem 1.2 (Sun-Li-Wei [27], 2023) If $G$ is a $C_{5}^{+}$-free graph with $m \geq 8$ edges, then

$$
\lambda(G) \leq \frac{1+\sqrt{4 m-3}}{2}
$$

equality holds if and only if $G=K_{2} \vee \frac{m-1}{2} K_{1}$.
Observe that $C_{t} \subseteq C_{t}^{+}$, so Theorem 1.2 can imply Theorem 1.1.
Theorem 1.3 (Li-Lu-Peng [10], 2023) If $m \geq 8$ and $G$ is an $F_{2}$-free graph with $m$ edges, then

$$
\lambda(G) \leq \frac{1+\sqrt{4 m-3}}{2}
$$

where the equality holds if and only if $G=K_{2} \vee \frac{m-1}{2} K_{1}$.
Let $V_{k}=K_{1} \vee P_{k-1}$ be the fan graph on $k$ vertices. It is worth noting that $V_{3}$ is a triangle and $V_{4}$ is a book on 4 vertices, which were studied by Nosal [26], Nikiforov [18, 23] and Ning and Zhai [25]. In addition, we can see that $V_{5}$ is the power of a path $P_{5}$. Recently, the $n$-vertex $V_{5}$-free graph with maximal spectral radius was also studied by Zhao and Park [33]. Observe that every $C_{5}$-free, $C_{5}^{+}$-free or $F_{2}$-free graph must be $V_{5}$-free. In this paper, we shall investigate the $V_{5}$-free graphs with given size $m$ (instead of the order $n$ ), and we give a unified extension on Theorems 1.1, 1.2 and 1.3,

Theorem 1.4 If $G$ is a $V_{5}$-free graph with $m \geq 8$ edges, then

$$
\lambda(G) \leq \frac{1+\sqrt{4 m-3}}{2}
$$

and the equality holds if and only if $G=K_{2} \vee \frac{m-1}{2} K_{1}$.
Recently, Li, Lu and Peng [10] proposed a conjecture for $F_{k}$-free graphs.
Conjecture 1.5 (Li-Lu-Peng, 2023) Let $k \geq 2$ be fixed and $m$ be large enough. If $G$ is an $F_{k}$-free graph with $m$ edges, then

$$
\lambda(G) \leq \frac{k-1+\sqrt{4 m-k^{2}+1}}{2}
$$

and equality holds if and only if $G=K_{k} \vee \frac{1}{k}\left(m-\binom{k}{2}\right) K_{1}$.
In this paper, we confirm Conjecture 1.5 in the case $k=3$.
Theorem 1.6 If $G$ is an $F_{3}$-free graph with $m \geq 33$ edges, then

$$
\lambda(G) \leq 1+\sqrt{m-2}
$$

and the equality holds if and only if $G=K_{3} \vee \frac{m-3}{3} K_{1}$.

## 2 Preliminaries

Throughout this paper, we use the following notations. For each forbidden graph $F$, let $G^{*}$ denote an extremal graph attaining maximum spectral radius among all $F$-free graphs with $m$ edges. An extremal vertex of $G^{*}$, denoted by $u^{*}$, is a vertex corresponding to the maximum coordinate of the Perron vector of $G^{*}$. Given a vertex $u \in V(G)$, let $N_{G}(u)$ be the set of neighbors of $u$, and $d_{G}(u)$ be the degree of $u$ in $G$. Moreover, we denote $N_{G}[u]=N_{G}(u) \cup\{u\}$. Sometimes, we will eliminate the subscript and write $N(u)$ and $d(u)$ if not necessary. For a subset $U \subseteq V(G)$, we write $e(U)$ for the number of edges with two endpoints in $U$. For two disjoint sets $U, W$, we write $e(U, W)$ for the number of edges between $U$ and $W$. For simplicity, we denote by $N_{U}(u)$ the set of vertices of $U$ that are adjacent to $u$, i.e, $N_{U}(u)=N_{G}(u) \cap U$, and let $d_{U}(u)$ be the number of vertices of $N_{U}(u)$.

Lemma 2.1 (Wu-Xiao-Hong [29], 2005) Let $G$ be a connected graph and $\left(x_{1}, \ldots, x_{n}\right)^{T}$ be a Perron vector of $G$, where the coordinate $x_{i}$ corresponds to the vertex $v_{i}$. Assume that $v_{i}, v_{j} \in V(G)$ are vertices such that $x_{i} \geq x_{j}$, and $S \subseteq N_{G}\left(v_{j}\right) \backslash N_{G}\left(v_{i}\right)$ is non-empty. Denote $G^{\prime}=G-\left\{v_{j} v: v \in S\right\}+\left\{v_{i} v: v \in S\right\}$. Then $\lambda(G)<\lambda\left(G^{\prime}\right)$.

Lemma 2.2 (Zhai-Lin-Shu [30], 2021) If $F$ is a 2 -connected graph, then $G^{*}$ is connected. Moreover, there is no cut vertex in $V\left(G^{*}\right) \backslash\left\{u^{*}\right\}$. Furthermore, we have $d(u) \geq 2$ for any vertex $u \in V\left(G^{*}\right) \backslash N\left[u^{*}\right]$.

Let $R_{s, t}$ be the graph obtained from $s$ copies of $K_{4}$ and $t$ independent edges sharing a common vertex. Namely, we have $R_{s, t}=K_{1} \vee\left(s K_{3} \cup t K_{1}\right)$.

Lemma 2.3 (Zhai-Lin-Shu [30], 2021) If $k \geq 1$ and $m=6 s+t$, then

$$
\lambda\left(R_{s, t}\right)<\frac{1+\sqrt{4 m-3}}{2} .
$$

Lemma 2.4 (Liu-Peng-Zhao [12], 2006) A graph $G$ contains no induced subgraph isomorphic to $P_{6}$ if and only if each connected induced subgraph of $G$ contains a dominating induced $C_{6}$ or a dominating complete bipartite graph.

Lemma 2.5 (Erdős-Gallai [4], 1959) Let $G$ be $a(k+1) K_{2}$-free graph of order $n$. Then

$$
e(G) \leq \max \left\{\binom{2 k+1}{2},\binom{k}{2}+(n-k) k\right\} .
$$

and the equality holds if and only if $G=K_{2 k+1}$ or $K_{k} \vee(n-k) K_{1}$.

## 3 Proof of Theorem 1.4

In this section, we will consider the maximum spectral radius of $V_{5}$-free graphs with $m$ edges. Recall that $G^{*}$ is a spectral extremal graph for the fan graph $V_{5}$, and $u^{*}$ is an extremal vertex of $G^{*}$. For convenience, we will use $\lambda$ and $\mathbf{x}$ to denote the spectral radius and the Perron vector of $G^{*}$. Let $U=N\left(u^{*}\right)$ and $W=V\left(G^{*}\right) \backslash N\left[u^{*}\right]$. Since $V_{5}$ is 2-connected, by Lemma [2.2, we know that $G^{*}$ is connected. In addition, we get $\lambda \geq \lambda\left(K_{2} \vee \frac{m-1}{2} K_{1}\right)=\frac{1+\sqrt{4 m-3}}{2}$ since $K_{2} \vee \frac{k-1}{2} K_{1}$ is $V_{5}$-free. Hence $\lambda^{2}-\lambda \geq m-1$. Since

$$
\lambda^{2} x_{u^{*}}=|U| x_{u^{*}}+\sum_{u \in U} d_{U}(u) x_{u}+\sum_{w \in W} d_{U}(w) x_{w}
$$

which together with $\lambda x_{u^{*}}=\sum_{u \in U} x_{u}$ yields

$$
\left(\lambda^{2}-\lambda\right) x_{u^{*}}=|U| x_{u^{*}}+\sum_{u \in U}\left(d_{U}(u)-1\right) x_{u}+\sum_{w \in W} d_{U}(w) x_{w} .
$$

Note that $\lambda^{2}-\lambda \geq m-1=|U|+e(U)+e(U, W)+e(W)-1$. Then

$$
\begin{equation*}
(e(U)+e(W)+e(U, W)-1) x_{u^{*}} \leq \sum_{u \in U}\left(d_{U}(u)-1\right) x_{u}+\sum_{w \in W} d_{U}(w) x_{w} \tag{3}
\end{equation*}
$$

By simplifying, we can get

$$
\begin{equation*}
e(W) \leq \sum_{u \in U}\left(d_{U}(u)-1\right) \frac{x_{u}}{x_{u^{*}}}-e(U)+\sum_{w \in W} d_{U}(w) \frac{x_{w}}{x_{u^{*}}}-e(U, W)+1 \tag{4}
\end{equation*}
$$

where the equality holds if and only if $\lambda^{2}-\lambda=m-1$.
Claim $1 e(U) \geq 1$.
Proof. As $\lambda \geq \frac{1+\sqrt{4 m-3}}{2}>\sqrt{m}$ when $m>1$, we have

$$
\begin{aligned}
m x_{u^{*}} & <\lambda^{2} x_{u^{*}}=|U| x_{u^{*}}+\sum_{u \in U} d_{U}(u) x_{u}+\sum_{w \in W} d_{U}(w) x_{w} \\
& \leq|U| x_{u^{*}}+2 e(U) x_{u^{*}}+e(U, W) x_{u^{*}}
\end{aligned}
$$

Observe that $m=|U|+e(U)+e(U, W)+e(W)$. Therefore, the above inequality implies that $e(W)<e(U)$. If $e(U)=0$, then $e(W)<0$, a contradiction. Thus, $e(U) \geq 1$.

An isolated vertex in $G^{*}[U]$ is called a trivial component. Let $U_{0}$ denote the set of isolated vertices in $G^{*}[U]$. By Claim 1, there exists at least one non-trivial component in $G^{*}[U]$. Let $\mathcal{H}$ be the set of all non-trivial components in $G^{*}[U]$. For each non-trivial component $H \in \mathcal{H}$, we define

$$
\begin{equation*}
\eta_{1}(H):=\sum_{u \in V(H)}\left(d_{H}(u)-1\right) \frac{x_{u}}{x_{u^{*}}}-e(H) \tag{5}
\end{equation*}
$$

Clearly, we have $\eta_{1}(H) \leq e(H)-|V(H)|$. Then (4) implies

$$
\begin{equation*}
e(W) \leq \sum_{u \in U}\left(d_{U}(u)-1\right) \frac{x_{u}}{x_{u^{*}}}-e(U)+1=\sum_{H \in \mathcal{H}} \eta_{1}(H)-\sum_{u \in U_{0}} \frac{x_{u}}{x_{u^{*}}}+1 \tag{6}
\end{equation*}
$$

with equality if and only if $\lambda^{2}-\lambda=m-1$ and $x_{w}=x_{u^{*}}$ for any $w \in W$ with $d_{U}(w) \geq 1$.
Recall that $G^{*}$ is $V_{5}$-free, we know that $G^{*}[U]$ is $P_{4}$-free. It implies that any nontrivial component of $\mathcal{H}$ is isomorphic to a triangle or a star. Observe that $\eta_{1}\left(K_{3}\right) \leq 0$ and $\eta_{1}\left(K_{1, s}\right) \leq-1$ for each $s \geq 1$. Next, we will prove that $e(W)=0$, and then we show that not all components of $G^{*}[U]$ are isomorphic to $K_{3}$.

Claim 2 If $W \neq \varnothing$, then $e(W)=0$.
Proof. First of all, for any component $H \in \mathcal{H}$, we know that $H$ is isomorphic to $K_{3}$ or $K_{1, s}$ for some $s \geq 1$. Then

$$
\eta_{1}(H)=\sum_{u \in V(H)}\left(d_{H}(u)-1\right) \frac{x_{u}}{x_{u^{*}}}-e(H) \leq 0
$$

and the equality holds if and only if $H=K_{3}$ and $x_{u}=x_{u^{*}}$ for any $u \in V(H)$. By (6), we get $e(W) \leq 1$. Suppose on the contrary that $e(W) \geq 1$, then $e(W)=1$. Consequently, we have $\eta_{1}(H)=0$ for any $H \in \mathcal{H}$, and so $H$ is isomorphic to $K_{3}$. Moreover, the equality in (6) leads to $U_{0}=\varnothing$ and $G^{*}[U]=t K_{3}$ for some $t \geq 1$. In addition, we have $x_{u}=x_{u^{*}}$ for any $u \in U$ with $d_{U}(u) \geq 2$, and $x_{w}=x_{u^{*}}$ for any $w \in W$ with $d_{U}(w) \geq 1$ in view of (44). Let $w_{1}, w_{2} \in W$ and $w_{1} w_{2} \in E\left(G^{*}\right)$. By Lemma 2.2, we have $d_{U}\left(w_{1}\right) \geq 1$ and $d_{U}\left(w_{2}\right) \geq 1$. Since $G^{*}$ is $V_{5}$-free, we get $\left|N_{G^{*}}(w) \cap V(H)\right| \leq 1$ for any $w \in W$ and for any $H \in \mathcal{H}$. Then we get

$$
\lambda x_{w_{1}}=\sum_{u \in N_{U}\left(w_{1}\right)} x_{u}+x_{w_{2}} \leq \sum_{u \in U} x_{u}-2 x_{u}^{*}+x_{w_{2}}<\lambda x_{u^{*}},
$$

which leads to $x_{w_{1}}<x_{u^{*}}$, a contradiction. Therefore, we have proved Claim 2,
Claim 3 There exists a component $H \in \mathcal{H}$ such that $H$ is isomorphic to a star.
Proof. Suppose on the contrary that every non-trivial connected component of $G^{*}[U]$ is isomorphic to $K_{3}$. Let $t$ be the number of copies of $K_{3}$ in $\mathcal{H}$. Then

$$
G^{*}[U]=t K_{3} \cup(|U|-3 t) K_{1} .
$$

Note that $t \geq 1$ by Claim 1. Firstly, we claim that $W \neq \varnothing$. Otherwise, we have $G^{*}=R_{t,|U|-3 t}$. Then by Lemma 2.3, we get $\lambda<\frac{1+\sqrt{4 m-3}}{2}$, a contradiction.

For each non-trivial component $H \in \mathcal{H}$, we denote

$$
W_{H}=\bigcup_{u \in V(H)} N_{W}(u)
$$

Let $W_{U_{0}}$ be the set of vertices of $W$ which are adjacent to a vertex of $U_{0}$. Namely,

$$
W_{U_{0}}=\bigcup_{u \in U_{0}} N_{W}(u) .
$$

In view of (3) and Claim 2, we obtain

$$
\begin{align*}
(e(U)+e(U, W)-1) x_{u^{*}} & \leq \sum_{u \in U}\left(d_{U}(u)-1\right) x_{u}+\sum_{w \in W} d_{U}(w) x_{w} \\
& =\sum_{H \in \mathcal{H}} \sum_{u \in V(H)} x_{u}-\sum_{u \in U_{0}} x_{u}+\sum_{w \in W} d_{U}(w) x_{w} \\
& \leq \sum_{H \in \mathcal{H}}\left(\sum_{u \in V(H)} x_{u}+\sum_{w \in W_{H}} d_{H}(w) x_{w}\right)+\sum_{w \in W_{U_{0}}} d_{U_{0}}(w) x_{w} \tag{7}
\end{align*}
$$

Observe that

$$
\begin{equation*}
\sum_{w \in W_{U_{0}}} d_{U_{0}}(w) x_{w} \leq e\left(U_{0}, W\right) x_{u^{*}} \tag{8}
\end{equation*}
$$

and

$$
\begin{equation*}
e(U)+e(U, W)=\sum_{H \in \mathcal{H}}(e(H)+e(V(H), W))+e\left(U_{0}, W\right) . \tag{9}
\end{equation*}
$$

Combining (7), (8) and (9), we have

$$
\begin{equation*}
\sum_{H \in \mathcal{H}}(e(H)+e(V(H), W)) x_{u^{*}}-x_{u^{*}} \leq \sum_{H \in \mathcal{H}}\left(\sum_{u \in V(H)} x_{u}+\sum_{w \in W_{H}} d_{H}(w) x_{w}\right) . \tag{10}
\end{equation*}
$$

Since each component $H \in \mathcal{H}$ is isomorphic to a triangle, we have

$$
\sum_{u \in V(H)} x_{u}+\sum_{w \in W_{H}} d_{H}(w) x_{w} \leq(e(H)+e(V(H), W)) x_{u^{*}}
$$

To show a contradiction with (10), it suffices to prove that there exists a component $H \in \mathcal{H}$ satisfying the following strict inequality:

$$
\sum_{u \in V(H)} x_{u}+\sum_{w \in W_{H}} d_{H}(w) x_{w}<(e(H)+e(V(H), W)-1) x_{u^{*}} .
$$

To begin with, we fix any one triangle $H \in \mathcal{H}$ with $V(H)=\left\{u_{1}, u_{2}, u_{3}\right\}$. Next, we start with a discussion of two simple situations.

Case 1. If $H$ contains at least two vertices adjacent to some vertices of $W$, then we can assume that $N_{W}\left(u_{1}\right) \neq \varnothing$ and $N_{W}\left(u_{2}\right) \neq \varnothing$. Since $G^{*}$ is $V_{5}$-free, $N_{W}\left(u_{1}\right) \cap N_{W}\left(u_{2}\right)=\varnothing$. Suppose that $x_{u_{1}} \geq x_{u_{2}}$. In this case, we can move the edges from $u_{2}$ to $u_{1}$, i.e., we construct a graph $G^{\prime}$ such that $V\left(G^{\prime}\right)=V\left(G^{*}\right)$ and

$$
E\left(G^{\prime}\right)=E\left(G^{*}\right)-\left\{u_{2} w: w \in N_{W}\left(u_{2}\right)\right\}+\left\{u_{1} w: w \in N_{W}\left(u_{2}\right)\right\}
$$

Obviously, the graph $G^{\prime}$ is $V_{5}$-free. By Lemma 2.1, we get $\lambda\left(G^{\prime}\right)>\lambda$, a contradiction.
Case 2. If $H$ contains no vertex adjacent to vertices of $W$, then $d_{H}(w)=0$ for any $w \in W$. By symmetry, we know that $x_{u_{1}}=x_{u_{2}}=x_{u_{3}}$. By $\lambda x_{u_{1}}=x_{u^{*}}+2 x_{u_{1}}$, we get $x_{u_{1}} \leq \frac{1}{\lambda-2} x_{u^{*}}$. Since $W \neq \varnothing$ and each vertex of $W$ has at least two neighbors in $U$ by Lemma 2.2 and Claim 2, we must have $m \geq 10$. Recall that $\lambda \geq \frac{1+\sqrt{4 m-3}}{2}>\frac{7}{2}$, we have
$\frac{1}{\lambda-2}<\frac{2}{3}$. It follows that $x_{u_{1}}<\frac{2}{3} x_{u^{*}}$ and

$$
\begin{aligned}
\sum_{u \in V(H)} x_{u}+\sum_{w \in W_{H}} d_{H}(w) x_{w} & =3 x_{u_{1}}+\sum_{w \in W_{H}} d_{H}(w) x_{w} \\
& <2 x_{u^{*}}+\sum_{w \in W_{H}} d_{H}(w) x_{w} \\
& \leq(e(H)+e(V(H), W)-1) x_{u^{*}}
\end{aligned}
$$

So $H$ is the desired component contradicting with (10).
Case 3. From the above discussion, we can assume that every component $H$ contains exactly one vertex adjacent to some vertices of $W$. Without loss of generality, we may assume that $N_{W}\left(u_{1}\right) \neq \varnothing$ and $N_{W}\left(u_{2}\right)=N_{W}\left(u_{3}\right)=\varnothing$. Then $x_{u_{2}}=x_{u_{3}}$. First of all, we assume that $m \geq 22$. Using $\lambda x_{u_{2}}=x_{u^{*}}+x_{u_{1}}+x_{u_{2}}$, we get $x_{u_{2}}=x_{u_{3}} \leq \frac{2}{\lambda-1} x_{u^{*}}<\frac{1}{2} x_{u^{*}}$ as $m \geq 22$. Thus, we have

$$
\sum_{u \in V(H)} x_{u}+\sum_{w \in W_{H}} d_{H}(w) x_{w}<2 x_{u^{*}}+\sum_{w \in W_{H}} d_{H}(w) x_{w} \leq(e(H)+e(V(H), W)-1) x_{u^{*}}
$$

Thus, we conclude that $H$ is a desired component contradicting with (10). Next, we suppose that $8 \leq m \leq 21$. In this case, we know that $G^{*}[U]$ contains at most three triangles and some isolated vertices.

Subcase 3.1. If $G^{*}[U]$ contains at least two triangles, then we have $m \geq 14$ using $W \neq \varnothing$ and Lemma 2.2. Let $H_{1}$ and $H_{2}$ be two non-trivial components of $G^{*}[U]$, with $V\left(H_{1}\right)=\left\{u_{1}, u_{2}, u_{3}\right\}$ and $V\left(H_{2}\right)=\left\{v_{1}, v_{2}, v_{3}\right\}$, where $d_{W}\left(u_{1}\right) \geq 1$ and $d_{W}\left(v_{1}\right) \geq 1$. By symmetry, we have $x_{u_{2}}=x_{u_{3}}=x_{v_{2}}=x_{v_{3}}$. Using $\lambda x_{u_{2}}=x_{u^{*}}+x_{u_{1}}+x_{u_{2}}$, we get $x_{u_{2}}=x_{u_{3}}=x_{v_{2}}=x_{v_{3}} \leq \frac{2}{\lambda-1} x_{u^{*}}<0.64 x_{u^{*}}$ as $m \geq 14$. One can verify that

$$
\sum_{i=1}^{2}\left(\sum_{u \in V\left(H_{i}\right)} x_{u}+\sum_{w \in W_{H_{i}}} d_{H_{i}}(w) x_{w}\right)<\left(\sum_{i=1}^{2} e\left(H_{i}\right)+e\left(V\left(H_{i}\right), W\right)\right) x_{u^{*}}-x_{u^{*}}
$$

Moreover, we get

$$
\sum_{H \in \mathcal{H}}\left(\sum_{u \in V(H)} x_{u}+\sum_{w \in W_{H}} d_{H}(w) x_{w}\right)<\left(\sum_{H \in \mathcal{H}} e(H)+e(V(H), W)\right) x_{u^{*}}-x_{u^{*}}
$$

This is a contradiction to (10).
Subcase 3.2. If $G^{*}[U]$ contains exactly one triangle, then by $W \neq \varnothing$ and Lemma 2.2, we know that $\left|U_{0}\right| \geq 1$ and $m \geq 9$. Let $H$ be the unique triangle of $G^{*}[U]$. Let $V(H)=$ $\left\{u_{1}, u_{2}, u_{3}\right\}$ and $d_{W}\left(u_{1}\right) \geq 1$. Hence, we have $x_{u_{2}}=x_{u_{3}}$. Using $\lambda x_{u_{2}}=x_{u^{*}}+x_{u_{1}}+x_{u_{2}}$,

Figure 1: The graphs $G_{1}$ and $G_{2}$.
we get $x_{u_{2}}=x_{u_{3}} \leq \frac{2}{\lambda-1} x_{u^{*}}<0.85 x_{u^{*}}$ as $m \geq 9$. If there exists a vertex $w \in W$ with $d_{G^{*}}(w)=2$, then $x_{w} \leq \frac{2}{\lambda} x_{u^{*}}<0.6 x_{u^{*}}$ as $m \geq 9$. However, in this case, it is easy to check that

$$
\begin{aligned}
\sum_{u \in U}\left(d_{U}(u)-1\right) x_{u}+\sum_{w \in W} d_{U}(w) x_{w} & <1.7 x_{u^{*}}+x_{u_{1}}+1.2 x_{u^{*}}+(e(U, W)-2) x_{u^{*}} \\
& <(e(U)+e(U, W)-1) x_{u^{*}}
\end{aligned}
$$

a contradiction to (7). Hence, there exists no vertex of $W$ with degree two. Combining with Lemma 2.2, for any $w \in W$, we have $d_{G^{*}}(w) \geq 3$. It follows that $\left|U_{0}\right| \geq 2$ and $m \geq 11$ from $d_{W}\left(u_{2}\right)=d_{W}\left(u_{3}\right)=0$. If $m=11$ or 12 , then $G^{*}=G_{1}$ or $G_{2}$, respectively; see Figure 1. By simple calculation, we obtain $\lambda\left(G_{1}\right) \approx 3.408<\frac{1+\sqrt{4 m-3}}{2} \approx 3.701$ and $\lambda\left(G_{2}\right) \approx 3.487<\frac{1+\sqrt{4 m-3}}{2} \approx 3.854$, a contradiction. If $m \geq 13$, then we get $x_{u_{2}}=x_{u_{3}} \leq \frac{2}{\lambda-1} x_{u^{*}}<0.67 x_{u^{*}}$. Since $V_{5} \subseteq K_{5}$ and $G^{*}$ is $K_{5}$-free, we get from (11) that $\lambda \leq \sqrt{(1-1 / 4) 2 m}$. Thus, for any $u \in U_{0}$, we obtain $x_{u} \geq \frac{1}{\lambda} x_{u^{*}} \geq \frac{1}{\sqrt{(1-1 / 4) 2 m}} x_{u^{*}} \geq$ $0.178 x_{u^{*}}$ as $m \leq 21$. It is easy to verify that

$$
\sum_{u \in U}\left(d_{U}(u)-1\right) x_{u}+\sum_{w \in W} d_{U}(w) x_{w}<(e(U)+e(U, W)-1) x_{u^{*}},
$$

which is a contradiction to (7).
Therefore, we have deduced a contradiction in all cases. We conclude that there exists at least one non-trivial connected component isomorphic to a star in $G^{*}[U]$.

From Claim[3, $G^{*}[U]$ contains at least one non-trivial connected component isomorphic to a star. From the definition in (5), we have $\eta_{1}\left(K_{3}\right) \leq 0$ and $\eta_{1}\left(K_{1, s}\right) \leq-1$ for any $s \geq 1$. It follows from (6) that there is exactly one non-trivial connected component isomorphic to a star in $G^{*}[U]$. Let $H^{\prime}=K_{1, s}$ be such a star for some $s \geq 1$, and let $t$ be number of triangles in $G^{*}[U]$. Note that the equality in (6) holds, which implies the following:
(a) $e(W)=0, U_{0}=\varnothing$ and $G^{*}[U]=t K_{3} \cup K_{1, s}$ for $s \geq 1$ and $t \geq 0$;
(b) $x_{u}=x_{u^{*}}$ for any $u \in U$ with $d_{U}(u) \geq 2$;
(c) $x_{w}=x_{u^{*}}$ for any $w \in W$ with $d_{U}(w) \geq 1$.

Claim $4 W=\varnothing$.
Proof. Suppose on the contrary that $W \neq \varnothing$. We fix a vertex $w \in W$. Let $V\left(H^{\prime}\right)=$ $\left\{v_{0}, v_{1}, \ldots, v_{s}\right\}$, where $v_{0}$ is the central vertex of $H^{\prime}$. If $s \geq 2$, then $w$ can not be adjacent to all vertices of $\left\{v_{0}, v_{1}, v_{2}\right\}$. Since $e(W)=0$, we have $\lambda x_{w}=\sum_{u \in N_{U}(w)} x_{u}<\sum_{u \in U} x_{u}=$ $\lambda x_{u^{*}}$, which leads to $x_{w}<x_{u^{*}}$. This contradicts with (c). If $s=1$ and $t=0$, then it follows from (a) that $\lambda x_{u^{*}}=\sum_{u \in U} x_{u} \leq 2 x_{u^{*}}$, which implies that $\lambda \leq 2<\frac{1+\sqrt{4 m-3}}{2}$ when $m \geq 8$, a contradiction. If $s=1$ and $t \geq 1$, then the vertex $w$ can not be adjacent to all vertices of a copy of $K_{3}$ in $G^{*}[U]$ since $G^{*}$ is $V_{5}$-free. Similarly, we have $\lambda x_{w}=\sum_{u \in N_{U}(w)} x_{u}<\sum_{u \in U} x_{u}=\lambda x_{u^{*}}$, which leads to $x_{w}<x_{u^{*}}$. It is a contradiction to (c). with (c).

To sum up, we know that $G^{*}=K_{1} \vee\left(K_{1, s} \cup t K_{3}\right)$. If $t \neq 0$, then $x_{u}=x_{u^{*}}$ does not hold for any vertex $u$ in the component of $G^{*}[U]$ which is isomorphic to $K_{3}$, contradicting with (b). Thus, we get $t=0$ and so $G^{*}=K_{1} \vee K_{1, s}$. Observe that $2 s+1=m$. Then $G^{*}=K_{2} \vee \frac{m-1}{2} K_{1}$. We complete the proof of Theorem 1.4.

## 4 Proof of Theorem 1.6

In this section, we will consider the maximum spectral radius of $F_{3}$-free graphs with $m$ edges. In this case, $G^{*}$ is a spectral extremal graph for the graph $F_{3}$, and $u^{*}$ is an extremal vertex of $G^{*}$. Let $\lambda\left(G^{*}\right)=\lambda$ and $\mathbf{x}$ be the Perron vector of $G^{*}$ with coordinate $x_{u}$ corresponding to the vertex $u \in V(G)$. For simplicity, let $U=N\left(u^{*}\right)$ and $W=$ $V\left(G^{*}\right) \backslash N\left[u^{*}\right]$. Since $G^{*}$ is $F_{3}$-free, we know that $G^{*}[U]$ does not contain a matching consisting of three edges.

Claim $5 G^{*}$ is connected.
Proof. Otherwise, let $H_{1}$ and $H_{2}$ be two non-trivial components of $G^{*}$ with $\lambda\left(H_{1}\right)=$ $\lambda\left(G^{*}\right)$. Choosing a vertex $v \in V\left(H_{1}\right)$ and an edge $w_{1} w_{2} \in E\left(H_{2}\right)$, we construct a new graph $G^{\prime}=G^{*}-w_{1} w_{2}+v w_{1}$. Clearly $G^{\prime}$ is still $F_{3}$-free and $\lambda\left(G^{*}\right)<\lambda\left(G^{\prime}\right)$, a contradiction.

Since $G^{*}$ is connected, $\mathbf{x}$ is a positive real vector. Note that $K_{3} \vee \frac{m-3}{3} K_{1}$ is $F_{3}$-free. Then $\lambda \geq \lambda\left(K_{3} \vee \frac{m-3}{3} K_{1}\right)=1+\sqrt{m-2}$. Hence, we get $\lambda^{2}-2 \lambda \geq m-3$. Recall that

$$
\lambda^{2} x_{u^{*}}=|U| x_{u^{*}}+\sum_{u \in U} d_{U}(u) x_{u}+\sum_{w \in W} d_{U}(w) x_{w} .
$$

Combining with $\lambda=\sum_{u \in U} x_{u}$, we obtain

$$
\left(\lambda^{2}-2 \lambda\right) x_{u^{*}}=|U| x_{u^{*}}+\sum_{u \in U} d_{U}(u) x_{u}+\sum_{w \in W} d_{U}(w) x_{w}-\sum_{u \in U} 2 x_{u} .
$$

Notice that $\lambda^{2}-2 \lambda \geq m-3=|U|+e(U)+e(W)+e(U, W)-3$. Then

$$
(e(U)+e(W)+e(U, W)-3) x_{u^{*}} \leq \sum_{u \in U}\left(d_{U}(u)-2\right) x_{u}+\sum_{w \in W} d_{U}(w) x_{w} .
$$

By simplifying, we have

$$
\begin{align*}
e(W) & \leq \sum_{u \in U}\left(d_{U}(u)-2\right) \frac{x_{u}}{x_{u^{*}}}-e(U)+\sum_{w \in W} d_{U}(w) \frac{x_{w}}{x_{u^{*}}}-e(U, W)+3 \\
& \leq \sum_{u \in U}\left(d_{U}(u)-2\right) \frac{x_{u}}{x_{u^{*}}}-e(U)+3 \tag{11}
\end{align*}
$$

and the equality occurs if and only if $\lambda^{2}-2 \lambda=m-3$ and $x_{w}=x_{u^{*}}$ holds for each vertex $w \in W$ with $d_{U}(w) \geq 1$.

Claim $6 \lambda \leq \frac{1}{2}(e(U)+3)$.
Proof. Since $\lambda x_{u^{*}}=\sum_{u \in U} x_{u}$ and $e(W) \geq 0$, it follows from (11) that

$$
2 \lambda=2 \sum_{u \in U} \frac{x_{u}}{x_{u^{*}}} \leq \sum_{u \in U} d_{U}(u) \frac{x_{u}}{x_{u^{*}}}-e(U)+3 \leq e(U)+3
$$

The proof is completed.
Claim $7 G^{*}[U]$ contains one or two non-trivial components.
Proof. Observe that $\lambda=1+\sqrt{m-2}>\sqrt{m}$. We have

$$
\begin{aligned}
m x_{u^{*}} & <\lambda^{2} x_{u^{*}}=|U| x_{u^{*}}+\sum_{u \in U} d_{U}(u) x_{u}+\sum_{w \in W} d_{U}(w) x_{w} \\
& \leq|U| x_{u^{*}}+2 e(U) x_{u^{*}}+e(U, W) x_{u^{*}}
\end{aligned}
$$

Notice that $m=|U|+e(U)+e(W)+e(U, W)$. Thus, we get $e(W)<e(U)$. If $e(U)=0$, then $e(W)<0$, a contradiction. Hence, $G^{*}[U]$ contains at least one non-trivial component. Since $G^{*}$ is $F_{3}$-free, there are not three non-trivial components in $G^{*}[U]$. Therefore, $G^{*}[U]$ contains one or two non-trivial components, as desired.

By Claim [7, $G^{*}[U]$ contains one or two non-trivial components. Let $\mathcal{H}$ be the set of the non-trivial components of $G^{*}[U]$. For each $H \in \mathcal{H}$, we denote

$$
\eta_{2}(H):=\sum_{u \in V(H)}\left(d_{H}(u)-2\right) \frac{x_{u}}{x_{u^{*}}}-e(H) .
$$

Let $U_{0}=\left\{u \in U \mid d_{U}(u)=0\right\}$. Then (11) can be rewritten as

$$
\begin{equation*}
e(W) \leq \sum_{H \in \mathcal{H}} \eta_{2}(H)-2 \sum_{u \in U_{0}} \frac{x_{u}}{x_{u^{*}}}+3 \tag{12}
\end{equation*}
$$

Furthermore, since $e(W) \geq 0$, we can get

$$
\begin{equation*}
\sum_{H \in \mathcal{H}} \eta_{2}(H) \geq e(W)+2 \sum_{u \in U_{0}} \frac{x_{u}}{x_{u^{*}}}-3 \geq-3 \tag{13}
\end{equation*}
$$

and the last equality holds if and only if $e(W)=0$ and $U_{0}=\varnothing$.

Claim $8 G^{*}[U]$ contains exactly one non-trivial connected component.

Proof. According to Claim 7, we assume on the contrary that $G^{*}[U]$ contains two nontrivial connected components. As $G^{*}[U]$ is $3 K_{2}$-free, each non-trivial component $H \in \mathcal{H}$ is $2 K_{2}$-free. Thus, $H$ is isomorphic to either triangle or star. Note that $\eta_{2}\left(K_{3}\right)=-3$ and $\eta_{2}\left(K_{1, t}\right)<-2$ for any $t \geq 1$. It follows that $\sum_{H \in \mathcal{H}} \eta_{2}(H)<-4$, contradicting with (13).

By Claim 8, there is exactly one non-trivial connected component. We denote it by $H^{*}$. Then (12) can be transformed to

$$
\begin{equation*}
e(W) \leq \eta_{2}\left(H^{*}\right)-2 \sum_{u \in U_{0}} \frac{x_{u}}{x_{u^{*}}}+3 \tag{14}
\end{equation*}
$$

And we have to emphasize that from (13), we get

$$
\begin{equation*}
\eta_{2}\left(H^{*}\right) \geq-3 \tag{15}
\end{equation*}
$$

and the equality holds if and only if $\lambda^{2}-2 \lambda=m-3, x_{w}=x_{u^{*}}$ holds for any $w \in W$ with $d_{U}(w) \geq 1, e(W)=0$ and $U_{0}=\varnothing$.

Claim $9 \delta\left(H^{*}\right) \geq 2$ for $m \geq 28$.

Proof. Otherwise, suppose on the contrary that $\delta\left(H^{*}\right)=1$. Note that $G^{*}$ is $F_{3}$-free, $H^{*}$ is $3 K_{2}$-free. From Lemma 2.4, we know that $H^{*}$ contains a dominating complete bipartite subgraph. Choose a maximal dominating complete bipartite subgraph and denote the two color classes of this bipartite subgraph by $S$ and $T$, where $|S|=s$ and $|T|=t$. Without loss of generality, assume that $1 \leq s \leq t$. Since $H^{*}$ is $3 K_{2}$-free, we get $s \leq 2$ immediately. In what follows, we denote $X=S \cup T$ and $Y=V\left(H^{*}\right) \backslash X$.

Case 1. $s=2$.
Since $\delta\left(H^{*}\right)=1$ and $d_{H^{*}}(u) \geq 2$ for any $u \in X$, we know that $Y$ must contain a vertex with degree one in $H^{*}$. Notice that $H^{*}$ is $3 K_{2}$-free, so there is no edge in $H^{*}[Y]$.

Figure 2: Forms of $H^{*}$ when $\delta\left(H^{*}\right)=1$.

If $t \geq 3$, then each vertex $y \in Y$ can not be adjacent to a vertex of $T$ as $H^{*}$ is $3 K_{2}$-free. Since $H^{*}[S, T]$ is a maximal dominating complete subgraph, $y$ is adjacent to exactly one vertex of $S$. Hence, $d_{H^{*}}(y)=1$ holds for each $y \in Y$. Furthermore, $H^{*}$ is isomorphic to $D_{1}$ or $D_{2}$ in Figure 2, However, by simple calculation, we have $\eta_{2}\left(D_{1}\right)<-3$ and $\eta_{2}\left(D_{2}\right)<-4$, a contradiction to (15).

If $t=2$, then because of the maximality of $H^{*}[S, T]$ and the fact that $Y$ has a vertex of degree one in $H^{*}$, we can easily deduce that $d_{H^{*}}(y)=1$ for any $y \in Y$. Furthermore, we observe that $H^{*}$ is isomorphic to one of $\left\{D_{3}, D_{4}, D_{5}, D_{6}, D_{7}\right\}$ in Figure 2, By straightforward computations, we know that $\eta_{2}\left(D_{4}\right)<-3, \eta_{2}\left(D_{5}\right)<-3, \eta_{2}\left(D_{6}\right)<-3$ and $\eta_{2}\left(D_{7}\right)<-4$. This is a contradiction to (15). In this case, we obtain that $H^{*}$ is isomorphic to $D_{3}$.

In what follows, we deduce a contradiction whenever $H^{*}$ is isomorphic to $D_{3}$. Let $u_{1}$ be the vertex with maximum degree in $H^{*}$. Let $u_{i}$ and $v_{j}$ be the vertex of degree 3 and of degree 1 in $H^{*}$ for $2 \leq i \leq 4$ and $1 \leq j \leq \ell$, respectively; see Figure 2. Then in view of (14), we know

$$
\begin{aligned}
0 \leq e(W) & \leq \eta_{2}\left(H^{*}\right)-2 \sum_{u \in U_{0}} \frac{x_{u}}{x_{u^{*}}}+3 \\
& =\sum_{i=2}^{4} \frac{x_{u_{i}}}{x_{u^{*}}}+(\ell+1) \frac{x_{u_{1}}}{x_{u^{*}}}-\sum_{i=1}^{\ell} \frac{x_{v_{i}}}{x_{u^{*}}}-(\ell+6)-2 \sum_{u \in U_{0}} \frac{x_{u}}{x_{u^{*}}}+3 .
\end{aligned}
$$

The above inequality implies that

$$
\sum_{i=1}^{\ell} x_{v_{i}}+2 \sum_{u \in U_{0}} x_{u} \leq \sum_{i=2}^{4} x_{u_{i}}+(\ell+1) x_{u_{1}}-(\ell+3) x_{u^{*}} \leq 2 x_{u^{*}}
$$

Moreover, we get

$$
\lambda x_{u^{*}}=\sum_{i=1}^{4} x_{u_{i}}+\sum_{i=1}^{\ell} x_{v_{i}}+\sum_{u \in U_{0}} x_{u} \leq 6 x_{u^{*}} .
$$

Hence, we have $\lambda \leq 6$, which is a contradiction since $\lambda \geq 1+\sqrt{m-2}$ and $m \geq 28$.
Case 2. $s=1$.
We may assume that $S=\left\{u^{\prime}\right\}$. From the maximality of $H^{*}[S, T]$, there is no vertex of $Y$ adjacent to $u^{\prime}$. Since $H^{*}$ is $3 K_{2}$-free and $\delta\left(H^{*}\right)=1$, we obtain that $H^{*}[T]$ is $P_{4}$-free.

Subcase 2.1. $H^{*}[T]$ contains a $P_{3}$. Let $v_{1} v_{2} v_{3}$ be a path of length 2 in $H^{*}[T]$. Since $H^{*}$ is $3 K_{2}$-free, $H^{*}[Y]$ contains no edge. If $v_{1}$ is adjacent to $v_{3}$, then we can get that $H^{*}$ has the form of $D_{3}$. However, it's impossible as the proof in Case 1 shows. Thus, $v_{1}$ is not adjacent to $v_{3}$. In this case, if $t=3$, then $H^{*}$ has the form of $D_{4}$ or $D_{5}$. It is also impossible as $\eta_{2}\left(D_{4}\right)<-3$ and $\eta_{2}\left(D_{5}\right)<-3$. Hence, $t \geq 4$. Then since $H^{*}$ is $3 K_{2}$-free and $\delta\left(H^{*}\right)=1, H\left[T \backslash\left\{v_{1}, v_{2}, v_{3}\right\}\right]$ contains no edge. Furthermore, we have that $y$ is only adjacent to $v_{2}$ for any $y \in Y$. Now we can get that $H^{*}$ has the form of $D_{1}$. However, we have $\eta_{2}\left(D_{1}\right)<-3$, a contradiction to (15).

Subcase 2.2. $H^{*}[T]$ contains no $P_{3}$, but contains a $P_{2}$. Since $H^{*}$ is $3 K_{2}$-free and $\delta\left(H^{*}\right)=1, H^{*}[T]$ contains no $2 P_{2}$. Therefore, $H^{*}[T]$ induces exactly one edge. We denote the unique edge by $v_{1} v_{2}$.

If $t \geq 3$, we get that $H^{*}[Y]$ contains no edge as $H^{*}$ is $3 K_{2}$-free. Besides, we can know that $d_{T}(y) \leq 2$ holds for any $y \in Y$. Otherwise, $H^{*}$ will contain a $3 K_{2}$. If there exists a vertex $y^{\prime} \in Y$ such that $d_{T}\left(y^{\prime}\right)=2$, then $N_{T}\left(y^{\prime}\right)=\left\{v_{1}, v_{2}\right\}$ as $H^{*}$ is $3 K_{2}$-free and $\delta\left(H^{*}\right)=1$. Furthermore, $\left|N_{T}(y)\right|=1$ for any $y \in Y \backslash\left\{y^{\prime}\right\}$. Hence, $H^{*}$ has the form of $D_{4}$. Similarly, we know $\eta_{2}\left(D_{4}\right)<-3$, and it is contradicted to (15). Therefore, $\left|N_{T}(y)\right|=1$ for any $y \in Y$ or $Y=\varnothing$. It follows that $H^{*}$ has the form of $D_{8}$ or $D_{9}$. However, it is easy to calculate that $\eta_{2}\left(D_{8}\right)<-3$ and $\eta_{2}\left(D_{9}\right)<-4$, a contradiction to (15). So we have $t=2$.

However, now we will obtain a $K_{1,3}$ which dominates $H^{*}$. It contradicts to the maximality of $H^{*}[S, T]$.

Subcase 2.3. $H^{*}[T]$ contains no $P_{2}$. If $Y=\varnothing$, then $H^{*}=K_{1, t}$. If $t=1$, then by Claim 6, we have $\lambda \leq \frac{1}{2}(e(U)+3)=2<1+\sqrt{m-2}$, a contradiction. If $t \geq 2$, then let
$v$ be the central vertex of $H^{*}$, and $v_{i}$ be the leaf vertex of $H^{*}$ for each $1 \leq i \leq t$. In view of (14), we have

$$
\begin{aligned}
0 \leq e(W) & \leq \eta_{2}\left(H^{*}\right)-2 \sum_{u \in U_{0}} \frac{x_{u}}{x_{u^{*}}}+3 \\
& =(t-2) \frac{x_{v}}{x_{u^{*}}}-\sum_{i=1}^{t} \frac{x_{v_{i}}}{x_{u^{*}}}-t-2 \sum_{u \in U_{0}} \frac{x_{u}}{x_{u^{*}}}+3
\end{aligned}
$$

It follows that

$$
\sum_{i=1}^{t} x_{v_{i}}+2 \sum_{u \in U_{0}} x_{u} \leq(t-2) x_{v}-t x_{u^{*}}+3 x_{u^{*}} \leq x_{u^{*}}
$$

Furthermore, we obtain

$$
\lambda x_{u^{*}}=x_{v}+\sum_{i=1}^{t} x_{v_{i}}+\sum_{u \in U_{0}} x_{u} \leq 2 x_{u^{*}}
$$

which leads to $\lambda \leq 2<1+\sqrt{m-2}$, a contradiction. Hence, $Y \neq \varnothing$.
Recall that $H^{*}$ is $3 K_{2}$-free and $H^{*}[S, T]$ is the maximal bipartite subgraph of $H^{*}$, so $H^{*}[Y]$ contains no $P_{3}$ and $2 K_{2}$. If $H^{*}[Y]$ contains exactly one edge, denote it by $y_{1} y_{2}$, then since $H^{*}$ is $3 K_{2}$-free and $\delta\left(H^{*}\right)=1, Y \backslash\left\{y_{1}, y_{2}\right\}=\varnothing, d_{T}\left(y_{1}\right)=d_{T}\left(y_{2}\right)=1$ and $N_{T}\left(y_{1}\right)=N_{T}\left(y_{2}\right)$ which implies that $H^{*}$ has the form of $D_{9}$. Similarly, by calculation, $\eta_{2}\left(D_{9}\right)<-4$, a contradiction to (15). Hence, $H^{*}[Y]$ contains no edge.

We claim that there are some vertices of $Y$ which have at least two neighbors in $T$, Otherwise, if $d_{T}(y)=1$ holds for any $y \in Y$, then $H^{*}$ has the form of $D_{10}$ or $D_{11}$. However, $\eta_{2}\left(D_{10}\right)<-3$ and $\eta_{2}\left(D_{11}\right)<-4$, a contradiction. Let $y_{1}$ be a vertex of $Y$ such that $d_{T}\left(y_{1}\right) \geq 2$. On the one hand, if $T=N_{T}\left(y_{1}\right)$, then we find a larger dominating complete bipartite subgraph containing $H^{*}[S, T]$, which contradicts to the maximality of $H^{*}[S, T]$. So we know that $N_{T}\left(y_{1}\right) \subsetneq T$, which can imply that $t \geq 3$. On the other hand, if there exists a vertex $y_{2} \in Y \backslash\left\{y_{1}\right\}$, then since $H^{*}[S, T]$ is a dominating subgraph, $H^{*}$ will contains a $3 K_{2}$. Thus, $Y=\left\{y_{1}\right\}$. Hence, we conclude that $H^{*}$ has the form of $D_{12}$. However, one can verify that $\eta_{2}\left(D_{12}\right)<-4$, a contradiction to (15).

By the discussion of Cases 1 and 2, we conclude that $\delta\left(H^{*}\right) \geq 2$.
Claim $10 G^{*}=K_{3} \vee \frac{m-3}{3} K_{1}$ for $m \geq 33$.
Proof. Let $\left|V\left(H^{*}\right)\right|=v\left(H^{*}\right)$. Since $\delta\left(H^{*}\right) \geq 2$, we obtain

$$
\begin{equation*}
\eta_{2}\left(H^{*}\right)=\sum_{u \in V(H)}\left(d_{H^{*}}(u)-2\right) \frac{x_{u}}{x_{u^{*}}}-e\left(H^{*}\right) \leq e\left(H^{*}\right)-2 v\left(H^{*}\right) \tag{16}
\end{equation*}
$$

where the equality occurs if and only if $x_{u}=x_{u^{*}}$ for any $u \in V\left(H^{*}\right)$ with $d_{H^{*}}(u) \geq 3$. We claim that $v\left(H^{*}\right) \geq 6$. Otherwise, if $e(U)=e\left(H^{*}\right) \leq 10$, then by Claim 6,

$$
\lambda \leq \frac{1}{2}(e(U)+3) \leq \frac{13}{2}<1+\sqrt{m-2},
$$

a contradiction when $m \geq 33$. Therefore, by Lemma 2.5,

$$
\begin{equation*}
e\left(H^{*}\right) \leq 2 v\left(H^{*}\right)-3, \tag{17}
\end{equation*}
$$

and the equality holds if and only if $H^{*}=K_{2} \vee\left(v\left(H^{*}\right)-2\right) K_{1}$. Combined it with (16), we get $\eta_{2}\left(H^{*}\right) \leq-3$. Recall that $\eta_{2}\left(H^{*}\right) \geq-3$, so $\eta_{2}\left(H^{*}\right)=-3$. Note that the equalities in (15), (16) and (17) hold, which implies that
(d) $e(W)=0, U_{0}=\varnothing$ and $H^{*}=K_{2} \vee\left(v\left(H^{*}\right)-2\right) K_{1}$;
(e) $x_{u}=x_{u^{*}}$ for any $u \in U$ with $d_{U}(u) \geq 3$;
(f) $x_{w}=x_{u^{*}}$ for any $w \in W$ with $d_{U}(w) \geq 1$.

We claim that $W=\varnothing$. If the claim holds, then we get $G^{*}=K_{3} \vee \frac{m-3}{3} K_{1}$ immediately. Otherwise, if $W \neq \varnothing$, then fix a vertex $w \in W$. Obviously, $N_{G^{*}}(w) \subsetneq N_{G^{*}}\left(u^{*}\right)$, otherwise, $G^{*}$ contains a $F_{3}$. Since $e(W)=0$, we have

$$
\lambda x_{w}=\sum_{u \in N_{G^{*}}(w)} x_{u}<\sum_{u \in N_{G^{*}}\left(u^{*}\right)} x_{u}=\lambda x_{u^{*}} .
$$

It follows that $x_{w}<x_{u^{*}}$, which is a contradiction to (f).

## 5 Concluding remarks

In this paper, we have studied the spectral extremal graph problems for graphs of given size with forbidden subgraphs. We determined the spectral extremal graphs for $V_{5}$ and $F_{3}$. Our result is a unified extension on some recent results on cycles.

In this section, we present some related spectral extremal problems for interested readers. Recall that $V_{k+1}=K_{1} \vee P_{k}$ denotes the fan graph on $k+1$ vertices.

Conjecture 5.1 Let $k \geq 2$ be fixed and $m$ be sufficiently large. If $G$ is a $V_{2 k+1}$-free or $V_{2 k+2}$-free graph with $m$ edges, then

$$
\lambda(G) \leq \frac{k-1+\sqrt{4 m-k^{2}+1}}{2}
$$

where the equality holds if and only if $G=K_{k} \vee\left(\frac{m}{k}-\frac{k-1}{2}\right) K_{1}$.

We write $W_{k+1}=K_{1} \vee C_{k}$ for the wheel graph on $k+1$ vertices.
Conjecture 5.2 Let $k \geq 2$ be fixed and $m$ be sufficiently large. If $G$ is a $W_{2 k+1}$-free graph with $m$ edges, then

$$
\lambda(G) \leq \frac{k-1+\sqrt{4 m-k^{2}+1}}{2}
$$

where the equality holds if and only if $G=K_{k} \vee\left(\frac{m}{k}-\frac{k-1}{2}\right) K_{1}$.
Observe that $W_{2 k+2}$ is color-critical and $\chi\left(W_{2 k+2}\right)=4$.
Conjecture 5.3 Let $k \geq 2$ be fixed and $m$ be large enough. If $G$ is a $W_{2 k+2}$-free graph with $m$ edges, then

$$
\lambda(G) \leq \sqrt{4 m / 3}
$$

with equality if and only if $G$ is a regular complete 3-partite graph.
