

# ON THE EXTENSION OF POSITIVE MAPS TO HAAGERUP NON-COMMUTATIVE $L^p$ -SPACES

CHRISTIAN LE MERDY AND SAFOURA ZADEH

ABSTRACT. Let  $M$  be a von Neumann algebra, let  $\varphi$  be a normal faithful state on  $M$  and let  $L^p(M, \varphi)$  be the associated Haagerup non-commutative  $L^p$ -spaces, for  $1 \leq p \leq \infty$ . Let  $D \in L^1(M, \varphi)$  be the density of  $\varphi$ . Given a positive map  $T: M \rightarrow M$  such that  $\varphi \circ T \leq C_1 \varphi$  for some  $C_1 \geq 0$ , we study the boundedness of the  $L^p$ -extension  $T_{p,\theta}: D^{\frac{1-\theta}{p}} M D^{\frac{\theta}{p}} \rightarrow L^p(M, \varphi)$  which maps  $D^{\frac{1-\theta}{p}} x D^{\frac{\theta}{p}}$  to  $D^{\frac{1-\theta}{p}} T(x) D^{\frac{\theta}{p}}$  for all  $x \in M$ . Haagerup-Junge-Xu showed that  $T_{p, \frac{1}{2}}$  is always bounded and left open the question whether  $T_{p,\theta}$  is bounded for  $\theta \neq \frac{1}{2}$ . We show that for any  $1 \leq p < 2$  and any  $\theta \in [0, 2^{-1}(1 - \sqrt{p-1})] \cup [2^{-1}(1 + \sqrt{p-1}), 1]$ , there exists a completely positive  $T$  such that  $T_{p,\theta}$  is unbounded. We also show that if  $T$  is 2-positive, then  $T_{p,\theta}$  is bounded provided that  $p \geq 2$  or  $1 \leq p < 2$  and  $\theta \in [1 - p/2, p/2]$ .

## 1. INTRODUCTION

Let  $M$  be a von Neumann algebra equipped with a normal faithful state  $\varphi$ . Let  $T: M \rightarrow M$  be a positive map such that  $\varphi \circ T \leq C_1 \varphi$  on the positive cone  $M^+$ , for some constant  $C_1 \geq 0$ . Assume first that  $\varphi$  is a trace (that is,  $\varphi(xy) = \varphi(yx)$  for all  $x, y \in M$ ) and consider the associated non-commutative  $L^p$ -spaces  $\mathcal{L}^p(M, \varphi)$  (see e.g. [6, 19] or [10, Chapter 4]). Let  $C_\infty = \|T\|$ . Then for all  $1 \leq p < \infty$ ,  $T$  extends to a bounded map on  $\mathcal{L}^p(M, \varphi)$ , with

$$(1.1) \quad \|T: \mathcal{L}^p(M, \varphi) \longrightarrow \mathcal{L}^p(M, \varphi)\| \leq C_\infty^{1-\frac{1}{p}} C_1^{\frac{1}{p}},$$

see [16, Lemma 1.1]. This extension result plays a significant role in various aspects of operator theory on non-commutative  $L^p$ -spaces, in particular for the study of diffusion operators or semigroups on those spaces, see for example [1, 7, 11] or [14, Chapter 5].

Let us now drop the tracial assumption on  $\varphi$ . For any  $1 \leq p \leq \infty$ , let  $L^p(M, \varphi)$  denote the Haagerup non-commutative  $L^p$ -space  $L^p(M, \varphi)$  associated with  $\varphi$  [8, 9, 10, 22]. These spaces extend the tracial non-commutative  $L^p$ -spaces  $\mathcal{L}^p(\dots)$  in a very beautiful way and many topics in operator theory which had been first studied on tracial non-commutative  $L^p$ -spaces were/are investigated on Haagerup non-commutative  $L^p$ -spaces. This has led to several major advances, see in particular [9], [16, Section 7], [4], [2] and [13].

The question of extending a positive map  $T: M \rightarrow M$  to  $L^p(M, \varphi)$  was first considered in [16, Section 7] and [9, Section 5]. Let  $D \in L^1(M, \varphi)$  be the density of  $\varphi$ , let  $1 \leq p < \infty$  and

---

*Date*: April 9, 2024.

let  $\theta \in [0, 1]$ . Let  $T_{p,\theta}: D^{\frac{1-\theta}{p}} M D^{\frac{\theta}{p}} \rightarrow L^p(M, \varphi)$  be defined by

$$(1.2) \quad T_{p,\theta} \left( D^{\frac{1-\theta}{p}} x D^{\frac{\theta}{p}} \right) = D^{\frac{1-\theta}{p}} T(x) D^{\frac{\theta}{p}}, \quad x \in M.$$

(See Section 2 for the necessary background on  $D$  and the above definition.) Then [9, Theorem 5.1] shows that if  $\varphi \circ T \leq C_1 \varphi$ , then  $T_{p,\frac{1}{2}}$  extends to a bounded map on  $L^p(M, \varphi)$ , with

$$\|T_{p,\frac{1}{2}}: L^p(M, \varphi) \longrightarrow L^p(M, \varphi)\| \leq C_\infty^{1-\frac{1}{p}} C_1^{\frac{1}{p}}.$$

This extends the tracial case (1.1), see Remark 2.5. Furthermore, [9, Proposition 5.5] shows that if  $T$  commutes with the modular automorphism group of  $\varphi$ , then  $T_{p,\theta} = T_{p,\frac{1}{2}}$  for all  $\theta \in [0, 1]$ .

In addition to the above results, Haagerup-Junge-Xu stated as an open problem the question whether  $T_{p,\theta}$  is always bounded for  $\theta \neq \frac{1}{2}$  (see [9, Section 5]). The main result of the present paper is a negative answer to this question. More precisely, we show that if  $1 \leq p < 2$  and if either  $0 \leq \theta < 2^{-1}(1 - \sqrt{p-1})$  or  $2^{-1}(1 + \sqrt{p-1}) < \theta \leq 1$ , then there exists  $M, \varphi$  as above and a unital completely positive map  $T: M \rightarrow M$  such that  $\varphi \circ T = \varphi$  and  $T_{p,\theta}$  is unbounded, see Theorem 6.1.

We also show that for any  $M, \varphi$  as above and for any 2-positive map  $T: M \rightarrow M$  such that  $\varphi \circ T \leq C_1 \varphi$  for some  $C_1 \geq 0$ , then  $T_{p,\theta}$  is bounded for all  $p \geq 2$  and all  $\theta \in [0, 1]$ , see Theorem 4.1. In other words, the Haagerup-Junge-Xu problem has a positive solution for  $p \geq 2$ , provided that we restrict to 2-positive maps. We also show, under the same assumptions, that  $T_{p,\theta}$  is bounded for all  $1 \leq p \leq 2$  and all  $\theta \in [1 - p/2, p/2]$ , see Theorem 4.3.

Section 2 contains preliminaries on the  $L^p(M, \varphi)$  and on the question whether  $T_{p,\theta}$  is bounded. Section 3 presents a way to compute  $\|T_{p,\theta}\|$  in the case when  $M = M_n$  is a matrix algebra, which plays a key role in the last part of the paper. Section 4 contains the extension results stated in the previous paragraph. Finally, Sections 5 and 6 are devoted to the construction of examples for which  $T_{p,\theta}$  is unbounded.

## 2. THE EXTENSION PROBLEM

Throughout we consider a von Neumann algebra  $M$  and we let  $M_*$  denote its predual. We let  $M^+$  and  $M_*^+$  denote the positive cones of  $M$  and  $M_*$ , respectively.

**2.1. Haagerup non-commutative  $L^p$ -spaces.** Assume that  $M$  is  $\sigma$ -finite and let  $\varphi$  be a normal faithful state on  $M$ . We shall briefly recall the definition of the Haagerup non-commutative  $L^p$ -spaces  $L^p(M, \varphi)$  associated with  $\varphi$ , as well as some of their main features. We refer the reader to [8], [9, Section 1], [10, Chapter 9] and [22] for details and complements. We note that  $L^p(M, \varphi)$  can actually be defined when  $\varphi$  is any normal faithful weight on  $M$ . The assumption that  $\varphi$  is a state makes the description below a little simpler.

Let  $(\sigma_t^\varphi)_{t \in \mathbb{R}}$  be the modular automorphism group of  $\varphi$  [20, Chapter VIII] and let

$$\mathcal{R} = M \rtimes_{\sigma^\varphi} \mathbb{R} \subset M \overline{\otimes} B(L^2(\mathbb{R}))$$

be the resulting crossed product, see e.g. [20, Chapter X]. We regard  $M$  as a sub-von Neumann algebra of  $\mathcal{R}$  in the natural way. Let  $\widehat{\sigma}^\varphi: \mathbb{R} \simeq \widehat{\mathbb{R}} \rightarrow \text{Aut}(\mathcal{R})$  be the dual action of  $\sigma^\varphi$  [20, § VIII.2]. Then for any  $x \in \mathcal{R}$ ,  $\widehat{\sigma}_t^\varphi(x) = x$  for all  $t \in \mathbb{R}$  if and only if  $x \in M$ .

There exists a unique normal semi-finite trace  $\tau_0$  on  $\mathcal{R}$  such that

$$\tau_0 \circ \widehat{\sigma}_t^\varphi = e^{-t} \tau_0, \quad t \in \mathbb{R}.$$

This trace gives rise to the  $*$ -algebra  $L^0(\mathcal{R}, \tau_0)$  of  $\tau_0$ -measurable operators [10, Chapter 4]. Then for any  $1 \leq p \leq \infty$ , the Haagerup  $L^p$ -space  $L^p(M, \varphi)$  is defined as

$$L^p(M, \varphi) = \{y \in L^0(\mathcal{R}, \tau_0) : \widehat{\sigma}_t^\varphi(y) = e^{-\frac{t}{p}} y \text{ for all } t \in \mathbb{R}\}.$$

At this stage, this is just a  $*$ -subspace of  $L^0(\mathcal{R}, \tau_0)$  (with no norm). One defines its positive cone as

$$L^p(M, \varphi)^+ = L^p(M, \varphi) \cap L^0(\mathcal{R}, \tau_0)^+.$$

It follows from above that  $L^\infty(M, \varphi) = M$ .

Let  $\psi \in M_*^+$ , that we regard as a normal weight on  $M$  and let  $\widehat{\psi}$  be its dual weight on  $\mathcal{R}$  [20, § VIII.1]. Let  $h_\psi$  be the Radon-Nikodym derivative of  $\psi$  with respect to  $\tau_0$ . That is,  $h_\psi$  is the unique positive operator affiliated with  $\mathcal{R}$  such that

$$\widehat{\psi}(y) = \tau_0\left(h_\psi^{\frac{1}{2}} y h_\psi^{\frac{1}{2}}\right), \quad y \in \mathcal{R}_+.$$

It turns out that  $h_\psi$  belongs to  $L^1(M, \varphi)^+$  for all  $\psi \in M_*^+$  and that the mapping  $\psi \mapsto h_\psi$  is a bijection from  $M_*^+$  onto  $L^1(M, \varphi)^+$ . This bijection readily extends to a linear isomorphism  $M_* \rightarrow L^1(M, \varphi)$ , still denoted by  $\psi \mapsto h_\psi$ . Then  $L^1(M, \varphi)$  is equipped with the norm  $\|\cdot\|_1$  inherited from  $M_*$ , that is,  $\|h_\psi\|_1 = \|\psi\|_{M_*}$  for all  $\psi \in M_*$ . Next, for any  $1 \leq p < \infty$  and any  $y \in L^p(M, \varphi)$ , the positive operator  $|y|$  belongs to  $L^p(M, \varphi)$  as well (thanks to the polar decomposition) and hence  $|y|^p$  belongs to  $L^1(M, \varphi)$ . This allows to define  $\|y\|_p = \| |y|^p \|_1^{\frac{1}{p}}$  for all  $y \in L^p(M, \varphi)$ . Then  $\|\cdot\|_p$  is a complete norm on  $L^p(M, \varphi)$ .

The Banach spaces  $L^p(M, \varphi)$ ,  $1 \leq p \leq \infty$ , satisfy the following version of Hölder's inequality (see e.g. [10, Proposition 9.17]).

**Lemma 2.1.** *Let  $1 \leq p, q, r \leq \infty$  such that  $p^{-1} + q^{-1} = r^{-1}$ . Then for all  $x \in L^p(M, \varphi)$  and all  $y \in L^q(M, \varphi)$ , the product  $xy$  belongs to  $L^r(M, \varphi)$  and  $\|xy\|_r \leq \|x\|_p \|y\|_q$ .*

Let  $D$  be the Radon-Nikodym derivative of  $\varphi$  with respect to  $\tau_0$  and recall that  $D \in L^1(M, \varphi)^+$ . This operator is called the density of  $\varphi$ . Recall that we regard  $M$  as a sub-von Neumann algebra of  $\mathcal{R}$ . Then  $D^{it}$  is a unitary of  $M$  for all  $t \in \mathbb{R}$  and  $D$  satisfies the following:

$$(2.1) \quad \sigma_t^\varphi(x) = D^{it} x D^{-it}, \quad t \in \mathbb{R}, \quad x \in M.$$

Let  $\text{Tr}: L^1(M, \varphi) \rightarrow \mathbb{C}$  be defined by  $\text{Tr}(h_\psi) = \psi(1)$  for all  $\psi \in M_*$ . This functional has two remarkable properties. First, for all  $x \in M$  and all  $\psi \in M_*$ , we have

$$(2.2) \quad \text{Tr}(h_\psi x) = \psi(x).$$

Second if  $1 \leq p, q \leq \infty$  are such that  $p^{-1} + q^{-1} = 1$ , then for all  $x \in L^p(M, \varphi)$  and all  $y \in L^q(M, \varphi)$ , we have

$$\text{Tr}(xy) = \text{Tr}(yx).$$

This tracial property will be used without any further comment in the paper.

It follows from the definition of  $\|\cdot\|_1$  and (2.2) that the duality pairing  $\langle x, y \rangle = \text{Tr}(xy)$  for  $x \in M$  and  $y \in L^1(M, \varphi)$  yields an isometric isomorphism

$$(2.3) \quad L^1(M, \varphi)^* \simeq M.$$

As a special case of (2.2), we have

$$(2.4) \quad \varphi(x) = \text{Tr}(Dx), \quad x \in M.$$

We note that  $L^2(M, \varphi)$  is a Hilbert space for the inner product  $(x|y) = \text{Tr}(y^*x)$ . Moreover by (2.4), we have

$$(2.5) \quad \varphi(x^*x) = \|xD^{\frac{1}{2}}\|_2^2 \quad \text{and} \quad \varphi(xx^*) = \|D^{\frac{1}{2}}x\|_2^2, \quad x \in M.$$

We finally mention a useful tool. Let  $M_a \subset M$  be the subset of all  $x \in M$  such that  $t \mapsto \sigma_t^\varphi(x)$  extends to an entire function  $z \in \mathbb{C} \mapsto \sigma_z^\varphi(x) \in M$ . (Such elements are called analytic). It is well-known that  $M_a$  is a  $w^*$ -dense  $*$ -sub-algebra of  $M$  [20, Section XII.2]. Furthermore,

$$(2.6) \quad \sigma_{i\theta}(x) = D^{-\theta}xD^\theta,$$

for all  $x \in M_a$  and all  $\theta \in [0, 1]$ , and  $M_a D^{\frac{1}{p}} = D^{\frac{1}{p}}M_a$  is dense in  $L^p(M, \varphi)$ , for all  $1 \leq p < \infty$ . See [15, Lemma 1.1] and its proof for these properties.

**2.2. Extension of maps  $M \rightarrow M$ .** Given any linear map  $T: M \rightarrow M$ , we say that  $T$  is positive if  $T(M^+) \subset M^+$ . This implies that  $T$  is bounded. For any  $n \geq 1$ , we say that  $T$  is  $n$ -positive if the tensor extension map  $I_{M_n} \otimes T: M_n \overline{\otimes} M \rightarrow M_n \overline{\otimes} M$  is positive. (Here  $M_n$  is the algebra of  $n \times n$  matrices.) Next, we say that  $T$  is completely positive if  $T$  is  $n$ -positive for all  $n \geq 1$ . See e.g. [18] for basics on these notions.

Consider any  $\theta \in [0, 1]$  and  $1 \leq p < \infty$ . It follows from Lemma 2.1 that  $D^{\frac{1-\theta}{p}}xD^{\frac{\theta}{p}}$  belongs to  $L^p(M, \varphi)$  for all  $x \in M$ . We set

$$(2.7) \quad \mathcal{A}_{p,\theta} = D^{\frac{(1-\theta)}{p}}MD^{\frac{\theta}{p}} \subset L^p(M, \varphi).$$

It turns out that this is a dense subspace, see [15, Lemma 1.1].

Let  $T: M \rightarrow M$  be any bounded linear map. For any  $(p, \theta)$  as above, define a linear map  $T_{p,\theta}: \mathcal{A}_{p,\theta} \rightarrow \mathcal{A}_{p,\theta}$  by (1.2). The question we consider in this paper is whether  $T_{p,\theta}$  extends to a bounded map  $L^p(M, \varphi) \rightarrow L^p(M, \varphi)$  in the case when  $T$  is 2-positive and  $\varphi \circ T \leq \varphi$  on  $M_+$ . More precisely, we consider the following:

**Question 2.2.** *Determine the pairs  $(p, \theta) \in [1, \infty) \times [0, 1]$  such that*

$$T_{p,\theta}: L^p(M, \varphi) \longrightarrow L^p(M, \varphi)$$

*is bounded for all  $(M, \varphi)$  as above and all 2-positive maps  $T: M \rightarrow M$  satisfying  $\varphi \circ T \leq \varphi$  on  $M_+$ .*

As in the introduction, we could consider maps such that  $\varphi \circ T \leq C_1\varphi$  for some  $C_1 \geq 0$ . However by an obvious scaling, there is no loss in considering  $C_1 = 1$  only.

**Remark 2.3.** Question 2.2 originates from the Haagerup-Junge-Xu paper [9]. In Section 5 of the latter paper, the authors consider two von Neumann algebras  $M, N$ , and normal faithful states  $\varphi \in M_*$  and  $\psi \in N_*$  with respective densities  $D_\varphi \in L^1(M, \varphi)$  and  $D_\psi \in L^1(N, \psi)$ . Then they consider a positive map  $T: M \rightarrow N$  such that  $\psi \circ T \leq C_1 \varphi$  for some  $C_1 > 0$ . Given any  $(p, \theta) \in [1, \infty) \times [0, 1]$ , they define  $T_{p, \theta}: D_\varphi^{\frac{1-\theta}{p}} M D_\varphi^{\frac{\theta}{p}} \rightarrow L^p(N, \psi)$  by

$$T_{p, \theta} \left( D_\varphi^{\frac{1-\theta}{p}} x D_\varphi^{\frac{\theta}{p}} \right) = D_\psi^{\frac{1-\theta}{p}} T(x) D_\psi^{\frac{\theta}{p}}, \quad x \in M.$$

In [9, Theorem 5.1], they show that  $T_{p, \frac{1}{2}}$  is bounded and that setting  $C_\infty = \|T\|$ , we have  $\|T_{p, \frac{1}{2}}: L^p(M, \varphi) \rightarrow L^p(N, \psi)\| \leq C_\infty^{1-\frac{1}{p}} C_1^{\frac{1}{p}}$ . Then after the statement of [9, Proposition 5.4], they mention that the boundedness of  $T_{p, \theta}$  for  $\theta \neq \frac{1}{2}$  is an open question.

**Remark 2.4.** We wish to point out a special case which will be used in Section 5. Let  $B$  be a von Neumann algebra equipped with a normal faithful state  $\psi$ . Let  $A \subset B$  be a sub-von Neumann algebra which is stable under the modular automorphism group of  $\psi$  (i.e.  $\sigma_t^\psi(A) \subset A$  for all  $t \in \mathbb{R}$ ). Let  $\varphi = \psi|_A$  be the restriction of  $\psi$  to  $A$ . Let  $D \in L^1(A, \varphi)$  and  $\Delta \in L^1(B, \psi)$  be the densities of  $\varphi$  and  $\psi$ , respectively. On the one hand, it follows from [9, Theorem 5.1] (see Remark 2.3) that there exists, for every  $1 \leq p < \infty$ , a contraction

$$\Lambda(p): L^p(A, \varphi) \longrightarrow L^p(B, \psi)$$

such that  $[\Lambda(p)](D^{\frac{1}{2p}} x D^{\frac{1}{2p}}) = \Delta^{\frac{1}{2p}} x \Delta^{\frac{1}{2p}}$  for all  $x \in A$ .

On the other hand, there exists a unique normal conditional expectation  $E: B \rightarrow A$  such that  $\psi = \varphi \circ E$  on  $B$ , by [20, Theorem IX.4.2]. Moreover it is easy to check that under the natural identifications  $L^1(A, \varphi)^* \simeq A$  and  $L^1(B, \psi)^* \simeq B$ , see (2.3) and the discussion preceding it, we have

$$\Lambda(1)^* = E.$$

Now using [9, Theorem 5.1] again, there exists, for every  $1 \leq p < \infty$ , a contraction  $E(p): L^p(B, \psi) \rightarrow L^p(A, \varphi)$  such that  $[E(p)](\Delta^{\frac{1}{2p}} y \Delta^{\frac{1}{2p}}) = D^{\frac{1}{2p}} E(y) D^{\frac{1}{2p}}$  for all  $y \in B$ . It is clear that  $E(p) \circ \Lambda(p) = I_{L^p(A, \varphi)}$ . Consequently,  $\Lambda(p)$  is an isometry.

We refer to [15, Section 2] for more on this.

**Remark 2.5.** Let  $T: M \rightarrow M$  be a positive map and let  $\varphi, D$  as in Subsection 2.1. Assume that  $\varphi$  is tracial and for any  $1 \leq p < \infty$ , let  $\mathcal{L}^p(M, \varphi)$  be the (classical) non-commutative  $L^p$ -space with respect to the trace  $\varphi$  [10, Section 4.3]. That is,  $\mathcal{L}^p(M, \varphi)$  is the completion of  $M$  for the norm

$$\|x\|_{\mathcal{L}^p(M, \varphi)} = (\varphi(|x|^p))^{\frac{1}{p}}, \quad x \in M.$$

In this case,  $D$  commutes with  $M$  and

$$\|D^{\frac{1}{p}} x\|_{\mathcal{L}^p(M, \varphi)} = \|x\|_{\mathcal{L}^p(M, \varphi)}, \quad x \in M,$$

see e.g. [10, Example 9.11]. Hence,  $T_{p, \theta} = T_{p, 0}$  for all  $1 \leq p < \infty$  and all  $\theta \in [0, 1]$  and moreover,  $T_{p, 0}$  is bounded if and only if  $T$  extends to a bounded map  $\mathcal{L}^p(M, \varphi) \rightarrow \mathcal{L}^p(M, \varphi)$ . Thus, in the tracial case, the fact that  $T_{p, 0}$  is bounded under the assumption  $\varphi \circ T \leq C_1 \varphi$  is equivalent to the result mentioned in the first paragraph of Section 1, see (1.1).

3. COMPUTING  $\|T_{p,\theta}\|$  ON SEMIFINITE VON NEUMANN ALGEBRAS

As in the previous section, we let  $M$  be a von Neumann algebra equipped with a normal faithful state  $\varphi$  and we let  $D \in L^1(M, \varphi)^+$  be the density of  $\varphi$ . We assume further that  $M$  is semifinite and we let  $\tau$  be a distinguished normal semifinite faithful trace on  $M$ . For any  $1 \leq p \leq \infty$ , we let  $\mathcal{L}^p(M, \tau)$  be the non-commutative  $L^p$ -space with respect to  $\tau$ . Although  $\mathcal{L}^p(M, \tau)$  is isometrically isomorphic to the Haagerup  $L^p$ -space  $L^p(M, \tau)$ , it is necessary for our purpose to consider  $\mathcal{L}^p(M, \tau)$  as such.

Let us give a brief account, for which we refer e.g. to [10, Section 4.3]. Let  $\mathcal{L}^0(M, \tau)$  be the  $*$ -algebra of all  $\tau$ -measurable operators on  $M$ . For any  $p < \infty$ ,  $\mathcal{L}^p(M, \tau)$  is the Banach space of all  $x \in \mathcal{L}^0(M, \tau)$  such that  $\tau(|x|^p) < \infty$ , equipped with the norm

$$\|x\|_{\mathcal{L}^p(M, \tau)} = (\tau(|x|^p))^{\frac{1}{p}}, \quad x \in \mathcal{L}^p(M, \tau).$$

Moreover  $\mathcal{L}^\infty(M, \tau) = M$ . The following analogue of Lemma 2.1 holds true: whenever  $1 \leq p, q, r \leq \infty$  are such that  $p^{-1} + q^{-1} = r^{-1}$ , then for all  $x \in \mathcal{L}^p(M, \tau)$  and  $y \in \mathcal{L}^q(M, \tau)$ ,  $xy$  belongs to  $\mathcal{L}^r(M, \tau)$ , with  $\|xy\|_r \leq \|x\|_p \|y\|_q$  (Hölder's inequality). Furthermore, we have an isometric identification

$$(3.1) \quad \mathcal{L}^1(M, \tau)^* \simeq M$$

for the duality pairing given by  $\langle x, y \rangle = \tau(yx)$  for all  $x \in M$  and  $y \in \mathcal{L}^1(M, \tau)$ .

Let  $\gamma \in \mathcal{L}^1(M, \tau)$  be associated with  $\varphi$  in the identification (3.1), that is,

$$(3.2) \quad \varphi(x) = \tau(\gamma x), \quad x \in M.$$

Then  $\gamma$  is positive and it is clear from Hölder's inequality that for any  $1 \leq p < \infty$ ,  $\theta \in [0, 1]$  and  $x \in M$ , the product  $\gamma^{\frac{1-\theta}{p}} x \gamma^{\frac{\theta}{p}}$  belongs to  $\mathcal{L}^p(M, \tau)$ .

It is well-known that  $\mathcal{L}^p(M, \tau)$  and  $L^p(M, \varphi)$  are isometrically isomorphic (apply Remark 9.10 and Example 9.11 in [10]). The following lemma provides concrete isometric isomorphisms between these two spaces.

**Lemma 3.1.** *Let  $1 \leq p < \infty$  and  $\theta \in [0, 1]$ . Then for all  $x \in M$ , we have*

$$\|\gamma^{\frac{1-\theta}{p}} x \gamma^{\frac{\theta}{p}}\|_{\mathcal{L}^p(M, \tau)} = \|D^{\frac{1-\theta}{p}} x D^{\frac{\theta}{p}}\|_{L^p(M, \varphi)}.$$

Before giving the proof of this lemma, we recall a classical tool. For any  $\theta \in [0, 1]$ , define an embedding  $J_\theta: M \rightarrow L^1(M, \varphi)$  by letting

$$J_\theta(x) = D^{1-\theta} x D^\theta, \quad x \in M.$$

Consider  $(J_\theta(M), L^1(M, \varphi))$  as an interpolation couple, the norm on  $J_\theta(M)$  being given by the norm on  $M$ , that is,

$$(3.3) \quad \|D^{1-\theta} x D^\theta\|_{J_\theta(M)} = \|x\|_M, \quad x \in M.$$

For any  $1 \leq p \leq \infty$ , let

$$(3.4) \quad C(p, \theta) = [J_\theta(M), L^1(M, \varphi)]_{\frac{1}{p}}$$

be the resulting interpolation space provided by the complex interpolation method [3, Chapter 4]. Regard  $C(p, \theta)$  as a subspace of  $L^1(M, \varphi)$  in the natural way. Then Kosaki's

theorem [17, Theorem 9.1] (see also [10, Theorem 9.36]) asserts that  $C(p, \theta)$  is equal to  $D^{\frac{1-\theta}{p'}} L^p(M, \varphi) D^{\frac{\theta}{p'}}$  and that

$$(3.5) \quad \left\| D^{\frac{1-\theta}{p'}} y D^{\frac{\theta}{p'}} \right\|_{C(p, \theta)} = \|y\|_{L^p(M, \varphi)}, \quad y \in L^p(M, \varphi).$$

Here  $p'$  is the conjugate index of  $p$ , so that  $D^{\frac{1-\theta}{p'}} y D^{\frac{\theta}{p'}}$  belongs to  $L^1(M, \varphi)$  provided that  $y$  belongs to  $L^p(M, \varphi)$ .

Likewise, let  $j_\theta: M \rightarrow \mathcal{L}^1(M, \tau)$  be defined by  $j_\theta(x) = \gamma^{1-\theta} x \gamma^\theta$  for all  $x \in M$ . Consider  $(j_\theta(M), \mathcal{L}^1(M, \tau))$  as an interpolation couple, the norm on  $j_\theta(M)$  being given by the norm on  $M$ , and set

$$(3.6) \quad c(p, \theta) = [j_\theta(M), \mathcal{L}^1(M, \tau)]_{\frac{1}{p}},$$

regarded as a subspace of  $\mathcal{L}^1(M, \tau)$ . Then arguing as in the proof of [17, Theorem 9.1], one obtains that  $c(p, \theta)$  is equal to  $\gamma^{\frac{1-\theta}{p'}} \mathcal{L}^p(M, \tau) \gamma^{\frac{\theta}{p'}}$  and that

$$(3.7) \quad \left\| \gamma^{\frac{1-\theta}{p'}} y \gamma^{\frac{\theta}{p'}} \right\|_{c(p, \theta)} = \|y\|_{\mathcal{L}^p(M, \tau)}, \quad y \in \mathcal{L}^p(M, \tau).$$

*Proof of Lemma 3.1.* We fix some  $\theta \in [0, 1]$ . We start with the case  $p = 1$ . Let  $x \in M$ . For any  $x' \in M$ , we have  $\tau(\gamma x x') = \text{Tr}(D x x')$  and hence  $|\tau(\gamma x x')| = |\text{Tr}(D x x')|$ , by (2.4) and (3.2). Taking the supremum over all  $x' \in M$  with  $\|x'\|_M \leq 1$ , it therefore follows from (2.3) and (3.1) that

$$(3.8) \quad \|\gamma x\|_{\mathcal{L}^1(M, \tau)} = \|D x\|_{L^1(M, \varphi)}, \quad x \in M.$$

Now assume that  $x \in M_a$  (the space of analytic elements of  $M$ ). According to (2.6), we have  $D \sigma_{i\theta}^\varphi(x) = D^{1-\theta} x D^\theta$ . Likewise,  $\sigma_t^\varphi(x) = \gamma^{it} x \gamma^{-it}$  for all  $t \in \mathbb{R}$ , by [20, Theorem VIII.2.11], hence  $\sigma_{i\theta}^\varphi(x) = \gamma^{-\theta} x \gamma^\theta$ . Hence we have  $\gamma \sigma_{i\theta}^\varphi(x) = \gamma^{1-\theta} x \gamma^\theta$ . Applying (3.8) with  $\sigma_{i\theta}^\varphi(x)$  in place of  $x$ , we deduce that

$$(3.9) \quad \|\gamma^{(1-\theta)} x \gamma^\theta\|_{\mathcal{L}^1(M, \tau)} = \|D^{(1-\theta)} x D^\theta\|_{L^1(M, \varphi)}.$$

Consider the standard representation  $M \hookrightarrow B(L^2(M, \varphi))$  and consider an arbitrary  $x \in M$ . There exists a net  $(x_i)_i$  in  $M_a$  such that  $x_i \rightarrow x$  strongly. Then by [12, Lemma 2.3],  $D^{1-\theta} x_i D^\theta$  converges to  $D^{1-\theta} x D^\theta$  in  $L^1(M, \varphi)$ . A similar argument shows that  $\gamma^{1-\theta} x_i \gamma^\theta$  converges to  $\gamma^{1-\theta} x \gamma^\theta$  in  $\mathcal{L}^1(M, \tau)$ . Consequently, (3.9) holds true for  $x$ . This proves the result when  $p = 1$ .

We further note that the proof that  $\mathcal{A}_{1, \theta} = D^{(1-\theta)} M D^\theta$  is dense in  $L^1(M, \varphi)$  shows as well that the space  $\gamma^{1-\theta} M \gamma^\theta$  is dense in  $\mathcal{L}^1(M, \tau)$ . Thus, (3.9) provides an isometric isomorphism

$$\Phi: L^1(M, \varphi) \longrightarrow \mathcal{L}^1(M, \tau)$$

such that

$$\Phi(D^{1-\theta} x D^\theta) = \gamma^{1-\theta} x \gamma^\theta, \quad x \in M.$$

Now let  $p > 1$  and consider the interpolation spaces  $C(p, \theta)$  and  $c(p, \theta)$  defined by (3.4) and (3.6). Since  $j_\theta = \Phi \circ J_\theta$ , the mapping  $\Phi$  restricts to an isometric isomorphism from

$C(p, \theta)$  onto  $c(p, \theta)$ . Let  $x \in M$ . Applying (3.7) and (3.5), we deduce that

$$\begin{aligned} \left\| \gamma^{\frac{1-\theta}{p}} x \gamma^{\frac{\theta}{p}} \right\|_{\mathcal{L}^p(M, \tau)} &= \left\| \gamma^{1-\theta} x \gamma^\theta \right\|_{c(p, \theta)} \\ &= \left\| D^{1-\theta} x D^\theta \right\|_{C(p, \theta)} \\ &= \left\| D^{\frac{1-\theta}{p}} x D^{\frac{\theta}{p}} \right\|_{L^p(M, \varphi)}, \end{aligned}$$

which proves the result.  $\square$

The following is a straightforward consequence of Lemma 3.1. Given any  $T: M \rightarrow M$ , it provides a concrete way to compute the norm of the operator  $T_{p, \theta}$  associated with  $\varphi$ . Note that in this statement, this norm may be infinite.

**Corollary 3.2.** *Let  $1 \leq p < \infty$ , let  $\theta \in [0, 1]$  and let  $T: M \rightarrow M$  be any bounded map. Then*

$$\|T_{p, \theta}\| = \sup \left\{ \left\| \gamma^{\frac{1-\theta}{p}} T(x) \gamma^{\frac{\theta}{p}} \right\|_p : x \in M, \left\| \gamma^{\frac{1-\theta}{p}} x \gamma^{\frac{\theta}{p}} \right\|_p \leq 1 \right\}.$$

Let  $n \geq 1$  be an integer and consider the special case when  $M = M_n$ , equipped with its usual trace  $\text{tr}$ . For any  $\varphi$  and  $T: M_n \rightarrow M_n$  as above,  $T_{p, \theta}$  is trivially bounded for all  $1 \leq p < \infty$  and  $\theta$  since  $L^p(M_n, \varphi)$  is finite dimensional. However we will see in Sections 5 and 6 that finding (lower) estimates of the norm of  $T_{p, \theta}$  in this setting will be instrumental to devise counter-examples on infinite dimensional von Neumann algebras. This is why we give a version of the preceding corollary in this specific case.

For any  $1 \leq p < \infty$ , let  $S_n^p = \mathcal{L}^p(M_n, \text{tr})$  denote the  $p$ -Schatten class over  $M_n$ .

**Proposition 3.3.** *Let  $\Gamma \in M_n$  be a positive definite matrix such that  $\text{tr}(\Gamma) = 1$  and let  $\varphi$  be the faithful state on  $M_n$  associated with  $\Gamma$ , that is,  $\varphi(X) = \text{tr}(\Gamma X)$  for all  $X \in M_n$ . Let  $T: M_n \rightarrow M_n$  be any linear map. For any  $p \in [1, \infty)$  and  $\theta \in [0, 1]$ , let  $U_{p, \theta}: S_n^p \rightarrow S_n^p$  be defined by*

$$(3.10) \quad U_{p, \theta}(Y) = \Gamma^{\frac{1-\theta}{p}} T(\Gamma^{-\frac{1-\theta}{p}} Y \Gamma^{-\frac{\theta}{p}}) \Gamma^{\frac{\theta}{p}}, \quad Y \in S_n^p.$$

Then

$$\|T_{p, \theta}: L^p(M_n, \varphi) \longrightarrow L^p(M_n, \varphi)\| = \|U_{p, \theta}: S_n^p \longrightarrow S_n^p\|.$$

#### 4. EXTENSION RESULTS

This section is devoted to two cases for which Question 2.2 has a positive answer. Let  $M$  be a von Neumann algebra equipped with a faithful normal state  $\varphi$  and let  $D \in L^1(M, \varphi)^+$  denote its density.

**Theorem 4.1.** *Let  $T: M \rightarrow M$  be a 2-positive map such that  $\varphi \circ T \leq \varphi$ . For any  $p \geq 2$  and for any  $\theta \in [0, 1]$ , the mapping  $T_{p, \theta}: \mathcal{A}_{p, \theta} \rightarrow \mathcal{A}_{p, \theta}$  defined by (1.2) extends to a bounded map  $L^p(M, \varphi) \rightarrow L^p(M, \varphi)$ .*

*Proof.* Consider a completely positive  $T: M \rightarrow M$  such that  $\varphi \circ T \leq \varphi$ . We start with the case  $p = 2$ . For any  $x \in M$ , we have

$$T(x)^* T(x) \leq \|T\| T(x^* x),$$

by the Kadison-Schwarz inequality [5]. By (2.5), we have

$$\|T(x)D^{\frac{1}{2}}\|_2^2 = \varphi(T(x)^*T(x)) \leq \|T\|\varphi(T(x^*x)) \leq \|T\|\varphi(x^*x) = \|T\|\|xD^{\frac{1}{2}}\|_2^2.$$

This shows that  $T_{2,1}$  is bounded. The proof that  $T_{2,0}$  is bounded is similar.

Now let  $\theta \in (0, 1)$  and let us show that  $T_{2,\theta}$  is bounded. Consider the open strip

$$\mathcal{S} = \{z \in \mathbb{C} : 0 < \operatorname{Re}(z) < 1\}.$$

Let  $x, a \in M_a$  and define  $F: \overline{\mathcal{S}} \rightarrow \mathbb{C}$  by

$$F(z) = \operatorname{Tr}\left(T\left(\sigma_{\frac{i}{2}(1-z)}^\varphi(x)\right)D^{\frac{1}{2}}\sigma_{-\frac{iz}{2}}^\varphi(a)D^{\frac{1}{2}}\right).$$

This is a well-defined function which is actually the restriction to  $\overline{\mathcal{S}}$  of an entire function. For all  $t \in \mathbb{R}$ , we have

$$\begin{aligned} F(it) &= \operatorname{Tr}\left(D^{\frac{1}{2}}T\left(\sigma_{\frac{i}{2}}^\varphi\left(\sigma_{\frac{i}{2}}^\varphi(x)\right)\right)D^{\frac{1}{2}}\sigma_{\frac{it}{2}}^\varphi(a)\right) \\ &= \operatorname{Tr}\left(D^{\frac{1}{2}}T\left(D^{-\frac{1}{2}}\sigma_{\frac{i}{2}}^\varphi(x)D^{\frac{1}{2}}\right)D^{\frac{1}{2}}\sigma_{\frac{it}{2}}^\varphi(a)\right) \\ &= \operatorname{Tr}\left(T_{2,0}\left(\sigma_{\frac{i}{2}}^\varphi(x)D^{\frac{1}{2}}\right)D^{\frac{1}{2}}\sigma_{\frac{it}{2}}^\varphi(a)\right), \end{aligned}$$

by (2.6). Hence by (2.1),

$$\begin{aligned} |F(it)| &\leq \left\|T_{2,0}\left(\sigma_{\frac{i}{2}}^\varphi(x)D^{\frac{1}{2}}\right)\right\|_2 \left\|D^{\frac{1}{2}}\sigma_{\frac{it}{2}}^\varphi(a)\right\|_2 \\ &\leq \|T_{2,0}\| \left\|D^{\frac{it}{2}}(xD^{\frac{1}{2}})D^{-\frac{it}{2}}\right\|_2 \left\|D^{\frac{it}{2}}(D^{\frac{1}{2}}a)D^{-\frac{it}{2}}\right\|_2 \\ &= \|T_{2,0}\| \left\|xD^{\frac{1}{2}}\right\|_2 \left\|D^{\frac{1}{2}}a\right\|_2. \end{aligned}$$

Likewise,

$$F(1+it) = \operatorname{Tr}\left(T_{2,1}\left(\sigma_{\frac{i}{2}}^\varphi(x)D^{\frac{1}{2}}\right)D^{\frac{1}{2}}\sigma_{\frac{it}{2}}^\varphi(a)\right),$$

hence

$$|F(1+it)| \leq \|T_{2,1}\| \left\|xD^{\frac{1}{2}}\right\|_2 \left\|D^{\frac{1}{2}}a\right\|_2.$$

By the three lines lemma, we deduce that

$$|F(\theta)| \leq \|T_{2,0}\|^{1-\theta} \|T_{2,1}\|^\theta \left\|xD^{\frac{1}{2}}\right\|_2 \left\|D^{\frac{1}{2}}a\right\|_2.$$

To calculate  $F(\theta)$ , we apply (2.6) again and we obtain

$$\begin{aligned} F(\theta) &= \operatorname{Tr}\left(T\left(D^{-\frac{1-\theta}{2}}xD^{\frac{1-\theta}{2}}\right)D^{\frac{1}{2}}D^{\frac{\theta}{2}}aD^{-\frac{\theta}{2}}D^{\frac{1}{2}}\right) \\ &= \operatorname{Tr}\left(D^{\frac{1-\theta}{2}}T\left(D^{-\frac{1-\theta}{2}}xD^{\frac{1}{2}}D^{-\frac{\theta}{2}}\right)D^{\frac{\theta}{2}}D^{\frac{1}{2}}a\right) \\ &= \operatorname{Tr}\left(T_{2,\theta}(xD^{\frac{1}{2}})D^{\frac{1}{2}}a\right). \end{aligned}$$

Thus,

$$\left|\operatorname{Tr}\left(T_{2,\theta}(xD^{\frac{1}{2}})D^{\frac{1}{2}}a\right)\right| \leq \|T_{2,0}\|^{1-\theta} \|T_{2,1}\|^\theta \left\|xD^{\frac{1}{2}}\right\|_2 \left\|D^{\frac{1}{2}}a\right\|_2.$$

Since  $M_a D^{\frac{1}{2}}$  and  $D^{\frac{1}{2}} M_a$  are both dense in  $L^2(M, \varphi)$ , this estimate shows that  $T_{2,\theta}$  is bounded, with  $\|T_{2,\theta}\| \leq \|T_{2,0}\|^{1-\theta} \|T_{2,1}\|^\theta$ .

We now let  $p \in (2, \infty)$ . The proof in this case is a variant of the proof of [9, Theorem 5.1]. We use Kosaki's theorem which is presented after Lemma 3.1, see (3.4) and (3.5). Let  $\theta \in [0, 1]$ . Let  $\mathfrak{J}_\theta: M \rightarrow L^2(M, \varphi)$  be defined by  $\mathfrak{J}_\theta(x) = D^{\frac{1-\theta}{2}} x D^{\frac{\theta}{2}}$  for all  $x \in M$ . Equip  $\mathfrak{J}_\theta(M)$  with

$$(4.1) \quad \left\| D^{\frac{1-\theta}{2}} x D^{\frac{\theta}{2}} \right\|_{\mathfrak{J}_\theta(M)} = \|x\|_M, \quad x \in M.$$

Consider  $(\mathfrak{J}_\theta(M), L^2(M, \varphi))$  as an interpolation couple. In analogy with (3.4), we set

$$E(p, \theta) = [\mathfrak{J}_\theta(M), L^2(M, \varphi)]_{\frac{2}{p}},$$

subspace of  $L^2(M, \varphi)$  given by the complex interpolation method. Let  $q \in (2, \infty)$  such that

$$\frac{1}{p} + \frac{1}{q} = \frac{1}{2}.$$

We introduce one more mapping  $U_\theta: L^2(M, \varphi) \rightarrow L^1(M, \varphi)$  defined by

$$U_\theta(\zeta) = D^{\frac{1-\theta}{2}} \zeta D^{\frac{\theta}{2}}, \quad \zeta \in L^2(M, \varphi).$$

By (3.5),  $U_\theta$  is an isometric isomorphism from  $L^2(M, \varphi)$  onto  $C(2, \theta)$ . Since  $U_\theta$  restricts to an isometric isomorphism from  $\mathfrak{J}_\theta(M)$  onto  $J_\theta(M)$ , by (3.3) and (4.1), it induces an isometric isomorphism from  $E(p, \theta)$  onto  $[J_\theta(M), C(2, \theta)]_{\frac{2}{p}}$ . By (3.4) and the reiteration theorem for complex interpolation (see [3, Theorem 4.6.1]), the latter is equal to  $C(p, \theta)$ . Hence  $U_\theta$  actually induces an isometric isomorphism

$$(4.2) \quad E(p, \theta) \stackrel{U_\theta}{\simeq} C(p, \theta).$$

Since  $\frac{1}{p'} = \frac{1}{2} + \frac{1}{q}$ , we have

$$U_\theta(D^{\frac{1-\theta}{q}} y D^{\frac{\theta}{q}}) = D^{\frac{1-\theta}{p'}} y D^{\frac{\theta}{p'}}$$

for all  $y \in L^p(M, \varphi)$ . Applying (3.5) and (4.2), we deduce that

$$E(p, \theta) = D^{\frac{1-\theta}{q}} L^p(M, \varphi) D^{\frac{\theta}{q}},$$

with

$$(4.3) \quad \left\| D^{\frac{1-\theta}{q}} y D^{\frac{\theta}{q}} \right\|_{E(p, \theta)} = \|y\|_{L^p(M, \varphi)}, \quad y \in L^p(M, \varphi).$$

Now let

$$S = T_{2, \theta}: L^2(M, \varphi) \longrightarrow L^2(M, \varphi)$$

be given by the first part of the proof (boundedness of  $T_{2, \theta}$ ). By (4.1),  $S$  is bounded on  $\mathfrak{J}_\theta(M)$ . Hence by the interpolation theorem,  $S$  is bounded on  $E(p, \theta)$ .

Using (4.3), we deduce that for all  $x \in M$ ,

$$\begin{aligned} \left\| D^{\frac{1-\theta}{p}} T(x) D^{\frac{\theta}{p}} \right\|_{L^p(M, \varphi)} &= \left\| D^{\frac{1-\theta}{2}} T(x) D^{\frac{\theta}{2}} \right\|_{E(p, \theta)} \\ &\leq \|S: E(p, \theta) \rightarrow E(p, \theta)\| \left\| D^{\frac{1-\theta}{2}} x D^{\frac{\theta}{2}} \right\|_{E(p, \theta)} \\ &= \|S: E(p, \theta) \rightarrow E(p, \theta)\| \left\| D^{\frac{1-\theta}{p}} x D^{\frac{\theta}{p}} \right\|_{L^p(M, \varphi)}. \end{aligned}$$

This proves that  $T_{p, \theta}$  is bounded and completes the proof.  $\square$

**Remark 4.2.** Let  $T: M \rightarrow M$  be a 2-positive map such that  $\varphi \circ T \leq C_1 T$  for some  $C_1 \geq 0$  and let  $C_\infty = \|T\|$ . It follows from the above proof and an obvious scaling that for any  $p \geq 2$  and any  $\theta \in [0, 1]$ , we have

$$\|T_{p,\theta}: L^p(M, \varphi) \longrightarrow L^p(M, \varphi)\| \leq C_\infty^{1-\frac{1}{p}} C_1^{\frac{1}{p}}.$$

**Theorem 4.3.** *Let  $T: M \rightarrow M$  be a 2-positive map such that  $\varphi \circ T \leq \varphi$  and let  $1 \leq p \leq 2$ . If*

$$1 - \frac{p}{2} \leq \theta \leq \frac{p}{2},$$

*then  $T_{p,\theta}: \mathcal{A}_{p,\theta} \rightarrow \mathcal{A}_{p,\theta}$  extends to a bounded map  $L^p(M, \varphi) \rightarrow L^p(M, \varphi)$ .*

*Proof.* We will use the boundedness of  $T_{2,0}$  and  $T_{2,1}$ , given by Theorem 4.1, as well as the fact that  $T_{1,\frac{1}{2}}$  is bounded, see [9, Lemma 5.3] or Remark 2.3. We set

$$S = T_{1,\frac{1}{2}}: L^1(M, \varphi) \longrightarrow L^1(M, \varphi).$$

Let  $V: L^2(M, \varphi) \rightarrow L^1(M, \varphi)$  defined by  $V(y) = yD^{\frac{1}{2}}$  for all  $y \in L^2(M, \varphi)$ . According to (3.5),  $V$  is an isometric isomorphism from  $L^2(M, \varphi)$  onto  $C(2, 1)$ . Hence for all  $x \in M$ , we have

$$\begin{aligned} \|S(D^{\frac{1}{2}}xD^{\frac{1}{2}})\|_{C(2,1)} &= \|D^{\frac{1}{2}}T(x)D^{\frac{1}{2}}\|_{C(2,1)} \\ &= \|D^{\frac{1}{2}}T(x)\|_{L^2(M,\varphi)} \\ &\leq \|T_{2,0}\| \|D^{\frac{1}{2}}x\|_{L^2(M,\varphi)} \\ &= \|T_{2,0}\| \|D^{\frac{1}{2}}xD^{\frac{1}{2}}\|_{C(2,1)}. \end{aligned}$$

This proves that  $S$  is bounded on  $C(2, 1)$ .

Let  $1 \leq p \leq 2$ . By (3.4) and the reiteration theorem, we have

$$C(p, 1) = [C(2, 1), L^1(M, \varphi)]_{\frac{2}{p}-1}.$$

Therefore,  $S$  is bounded on  $C(p, 1)$ . Using (3.5) again, we deduce that for any  $x \in M$ ,

$$\begin{aligned} \|D^{\frac{1}{2}}T(x)D^{\frac{1}{2}-\frac{1}{p'}}\|_{L^p(M,\varphi)} &= \|D^{\frac{1}{2}}T(x)D^{\frac{1}{2}}\|_{C(p,1)} \\ &\leq \|S: C(p, 1) \rightarrow C(p, 1)\| \|D^{\frac{1}{2}}xD^{\frac{1}{2}}\|_{C(p,1)} \\ &= \|S: C(p, 1) \rightarrow C(p, 1)\| \|D^{\frac{1}{2}}xD^{\frac{1}{2}-\frac{1}{p'}}\|_{L^p(M,\varphi)}. \end{aligned}$$

Let  $\theta_0 = 1 - \frac{p}{2}$ . Then

$$\frac{1}{2} = \frac{1 - \theta_0}{2} \quad \text{and} \quad \frac{\theta_0}{2} = \frac{1}{2} - \frac{1}{p'}.$$

Hence the above estimate shows that  $T_{p,\theta_0}$  is bounded.

Now let  $\theta_1 = \frac{p}{2}$ . Using the boundedness of  $T_{2,1}$ , a similar proof shows as well that  $T_{p,\theta_1}$  is bounded.

Finally, we deduce that  $T_{p,\theta}$  is bounded for any  $\theta \in [\theta_0, \theta_1]$  by an argument similar to the one used in the proof of Theorem 4.1 to show that  $T_{2,\theta}$  is bounded for any  $\theta \in [0, 1]$ . We skip the details.  $\square$

## 5. THE USE OF INFINITE TENSOR PRODUCTS

In this section, we show how to reduce the problem of constructing a unital completely positive map  $T: (M, \varphi) \rightarrow (M, \varphi)$  such that  $\varphi \circ T = \varphi$  and  $T_{p,\theta}$  is unbounded, for a certain pair  $(p, \theta)$ , to a finite dimensional question. In the sequel, by a matrix algebra  $A$ , we mean an algebra  $A = M_n$  for some  $n \geq 1$ .

**Lemma 5.1.** *Let  $A_1, A_2$  be two matrix algebras and for  $i = 1, 2$ , consider a faithful state  $\varphi_i$  on  $A_i$ . Let  $B = A_1 \otimes_{\min} A_2$  and consider the faithful state  $\psi = \varphi_1 \otimes \varphi_2$  on  $B$ . Let  $T_i: A_i \rightarrow A_i$  be a linear map, for  $i = 1, 2$ , and consider  $T = T_1 \otimes T_2: B \rightarrow B$ . Then for any  $1 \leq p < \infty$  and any  $\theta \in [0, 1]$ , we have*

$$\|T_{p,\theta}: L^p(B, \psi) \rightarrow L^p(B, \psi)\| \geq \left\| \{T_1\}_{p,\theta}: L^p(A_1, \varphi_1) \rightarrow L^p(A_1, \varphi_1) \right\| \left\| \{T_2\}_{p,\theta}: L^p(A_2, \varphi_2) \rightarrow L^p(A_2, \varphi_2) \right\|.$$

*Proof.* Let  $n_1, n_2 \geq 1$  such that  $A_1 = M_{n_1}$  and  $A_2 = M_{n_2}$  and let  $n = n_1 n_2$ . For  $i = 1, 2$ , let  $\Gamma_i \in M_{n_i}$  such that  $\varphi_i(X_i) = \text{tr}(\Gamma_i X_i)$  for all  $X_i \in M_{n_i}$ . As in Proposition 3.3, consider the mapping  $\{U_i\}_{p,\theta}: S_{n_i}^p \rightarrow S_{n_i}^p$  defined by  $\{U_i\}_{p,\theta}(Y_i) = \Gamma_i^{\frac{1-\theta}{p}} T_i(\Gamma_i^{-\frac{1-\theta}{p}} Y_i \Gamma_i^{-\frac{\theta}{p}}) \Gamma_i^{\frac{\theta}{p}}$  for all  $Y_i \in S_{n_i}^p$ . Using the standard identification

$$(5.1) \quad B = M_{n_1} \otimes_{\min} M_{n_2} \simeq M_n,$$

we observe that  $\psi(X) = \text{tr}((\Gamma_1 \otimes \Gamma_2)X)$  for all  $X \in M_n$ . Hence using the identification  $S_n^p = S_{n_1}^p \otimes S_{n_2}^p$  inherited from (5.1), we obtain the the mapping  $U_{p,\theta}$  defined by (3.10) is actually given by

$$U_{p,\theta} = \{U_1\}_{p,\theta} \otimes \{U_2\}_{p,\theta}.$$

For any  $Y_1 \in S_{n_1}^p$  and  $Y_2 \in S_{n_2}^p$ , we have  $\|Y_1 \otimes Y_2\|_p = \|Y_1\|_p \|Y_2\|_p$ . Hence we deduce

$$\begin{aligned} \|\{U_1\}_{p,\theta}(Y_1)\| \|\{U_2\}_{p,\theta}(Y_2)\| &= \|\{U_1\}_{p,\theta}(Y_1) \otimes \{U_2\}_{p,\theta}(Y_2)\| \\ &= \|U_{p,\theta}(Y_1 \otimes Y_2)\| \\ &\leq \|U_{p,\theta}\| \|Y_1\|_p \|Y_2\|_p. \end{aligned}$$

This implies that  $\|\{U_1\}_{p,\theta}\| \|\{U_2\}_{p,\theta}\| \leq \|U_{p,\theta}\|$ . Applying Proposition 3.3, we obtain the requested inequality.  $\square$

Throughout the rest of this section, we let  $(A_k)_{k \geq 1}$  be a sequence of matrix algebras. For any  $k \geq 1$ , let  $\varphi_k$  be a faithful state on  $A_k$ . Let

$$(M, \varphi) = \overline{\otimes}_{k \geq 1} (A_k, \varphi_k)$$

be the infinite tensor product associated with the  $(A_k, \varphi_k)$ . We refer to [21, Section XIV.1] for the construction and the properties of this tensor product. We merely recall that if we regard  $(A_1 \otimes \cdots \otimes A_n)_{n \geq 1}$  as an increasing sequence of (finite-dimensional) algebras in the natural way, then

$$(5.2) \quad \mathcal{B} := \bigcup_{n \geq 1} A_1 \otimes \cdots \otimes A_n$$

is  $w^*$ -dense in  $M$ . Further,  $\varphi$  is a normal faithful state on  $M$  such that

$$\varphi_1 \otimes \cdots \otimes \varphi_n = \varphi|_{A_1 \otimes \cdots \otimes A_n},$$

for all  $n \geq 1$ .

**Proposition 5.2.** *Let  $1 \leq p < \infty$  and  $\theta \in [0, 1]$ . For any  $k \geq 1$ , let  $T_k: A_k \rightarrow A_k$  be a unital completely positive map such that  $\varphi_k \circ T_k = \varphi_k$ . Assume that*

$$\prod_{k=1}^n \|\{T_k\}_{p,\theta}: L^p(A_k, \varphi_k) \rightarrow L^p(A_k, \varphi_k)\| \longrightarrow \infty \quad \text{when } n \rightarrow \infty.$$

*Then there exists a unital completely positive map  $T: M \rightarrow M$  such that  $\varphi \circ T = \varphi$  and  $T_{p,\theta}$  is unbounded.*

*Proof.* For any  $n \geq 1$ , we introduce  $B_n = A_1 \otimes_{\min} \cdots \otimes_{\min} A_n$  and the faithful state

$$\psi_n = \varphi_1 \otimes \cdots \otimes \varphi_n$$

on  $B_n$ . According to [21, Proposition XIV.1.11], the modular automorphism group of  $\varphi$  preserves  $B_n$ . Consequently (see Remark 2.4), there exists a unique normal conditional expectation  $E_n: M \rightarrow B_n$  such that  $\varphi = \psi_n \circ E_n$ , and the pre-adjoint of  $E_n$  yields an isometric embedding

$$L^1(B_n, \psi_n) \hookrightarrow L^1(M, \varphi).$$

Likewise, let  $F_n: B_{n+1} \rightarrow B_n$  be the conditional expectation defined by

$$(5.3) \quad F_n(a_1 \otimes \cdots \otimes a_n \otimes a_{n+1}) = \varphi_{n+1}(a_{n+1}) a_1 \otimes \cdots \otimes a_n,$$

for all  $a_1 \in A_1, \dots, a_n \in A_n, a_{n+1} \in A_{n+1}$ . Then the pre-adjoint of  $F_n$  yields an isometric embedding

$$J_n: L^1(B_n, \psi_n) \hookrightarrow L^1(B_{n+1}, \psi_{n+1}).$$

We can therefore consider  $(L^1(B_n, \psi_n))_{n \geq 1}$  as an increasing sequence of subspaces of  $L^1(M, \varphi)$ .

We introduce

$$\mathcal{L} := \bigcup_{n \geq 1} L^1(B_n, \psi_n) \subset L^1(M, \varphi).$$

Let  $D \in L^1(M, \varphi)$  be the density of  $\varphi$ . It follows from Remark 2.4 that

$$\mathcal{L} = D^{\frac{1}{2}} \mathcal{B} D^{\frac{1}{2}},$$

where  $\mathcal{B}$  is defined by (5.2). Since  $\mathcal{B}$  is  $w^*$ -dense, it is dense in  $M$  for the strong operator topology given by the standard representation  $M \hookrightarrow B(L^2(M, \varphi))$ . Hence by [12, Lemma 2.2],  $\mathcal{B} D^{\frac{1}{2}}$  is dense in  $L^2(M, \varphi)$ . This implies that  $\mathcal{L}$  is dense in  $L^1(M, \varphi)$ .

For any  $n \geq 1$ , let

$$V(n) := T_1 \otimes \cdots \otimes T_n: B_n \longrightarrow B_n.$$

This is a unital completely positive map. Hence its norm is equal to 1. Let

$$S_n = V(n)_*: L^1(B_n, \psi_n) \longrightarrow L^1(B_n, \psi_n)$$

be the pre-adjoint of  $V(n)$ . Then  $\|S_n\| = 1$ . We observe that

$$(5.4) \quad J_n \circ S_n = S_{n+1} \circ J_n.$$

Indeed by duality, this amounts to show that  $V(n) \circ F_n = F_n \circ V(n+1)$ , where  $F_n$  is given by (5.3). The latter is true because  $\varphi_{n+1} \circ T_{n+1} = \varphi_{n+1}$ .

Thanks to (5.4), one may define

$$\mathcal{S}: \mathcal{L} \longrightarrow \mathcal{L}$$

by letting  $\mathcal{S}(\eta) = S_n(\eta)$  if  $\eta \in L^1(B_n, \psi_n)$ . Then  $\mathcal{S}$  is bounded, with  $\|\mathcal{S}\| = 1$ . Owing to the density of  $\mathcal{L}$ , there exists a unique bounded  $S: L^1(M, \varphi) \rightarrow L^1(M, \varphi)$  extending  $\mathcal{S}$ . Using the duality (2.3), we set

$$T = S^*: M \longrightarrow M.$$

By construction,  $T$  is a contraction. Furthermore, for each  $n \geq 1$ ,  $S_n^* = V(n)$  is a unital completely positive map and  $\psi_n \circ S_n^* = \psi_n$ . We deduce that  $T$  is unital and completely positive and that

$$\varphi \circ T = \varphi.$$

Let  $1 \leq p < \infty$  and let  $\theta \in [0, 1]$ . Let us use the isometric embedding

$$(5.5) \quad L^p(B_n, \psi_n) \hookrightarrow L^p(M, \varphi)$$

as explained in Remark 2.4. If  $D_n$  denotes the density of  $\psi_n$ , then it follows from [9, Proposition 5.5] that the embedding (5.5) maps  $D_n^{\frac{1-\theta}{p}} x D_n^{\frac{\theta}{p}}$  to  $D^{\frac{1-\theta}{p}} x D^{\frac{\theta}{p}}$  for all  $x \in B_n$ . Then the restriction of  $T_{p,\theta}: \mathcal{A}_{p,\theta} \rightarrow L^p(M, \varphi)$  coincides with

$$V(n)_{p,\theta}: L^p(B_n, \psi_n) \longrightarrow L^p(B_n, \psi_n).$$

Finally we observe that by a simple iteration of Lemma 5.1, we have

$$\|V(n)_{p,\theta}\| \geq \prod_{k=1}^n \|\{T_k\}_{p,\theta}: L^p(A_k, \varphi_k) \rightarrow L^p(A_k, \varphi_k)\|.$$

The assumption that this product of norms tends to  $\infty$  therefore implies that the operator  $T_{p,\theta}$  is unbounded.  $\square$

## 6. NON-EXTENSION RESULTS

The aim of this section is to show the following.

**Theorem 6.1.** *Let  $1 \leq p < 2$ . If either*

$$(6.1) \quad 0 \leq \theta < \frac{1}{2}(1 - \sqrt{p-1}) \quad \text{or} \quad \frac{1}{2}(1 + \sqrt{p-1}) < \theta \leq 1,$$

*then there exist a von Neumann algebra  $M$  equipped with a normal faithful state  $\varphi$ , as well as a unital completely positive map  $T: M \rightarrow M$  such that  $\varphi \circ T = \varphi$  and the mapping  $T_{p,\theta}: \mathcal{A}_{p,\theta} \rightarrow \mathcal{A}_{p,\theta}$  defined by (1.2) is unbounded.*

This result will be proved at the end of this section, as a simple combination of Proposition 5.2 and the following key result. Recall that  $M_2$  denotes the space of  $2 \times 2$  matrices.

**Proposition 6.2.** *Let  $1 \leq p < 2$  and let  $\theta \in [0, 1]$  be satisfying (6.1). Then there exist a unital completely positive map  $T: M_2 \rightarrow M_2$  and a faithful state  $\varphi$  on  $M_2$  such that  $\varphi \circ T = \varphi$  and  $\|T_{p,\theta}\| > 1$ .*

*Proof.* Let  $c \in (0, 1)$  and consider

$$\Gamma = \begin{pmatrix} 1-c & 0 \\ 0 & c \end{pmatrix}.$$

This is a positive invertible matrix with trace equal to 1. We let  $\varphi$  denote its associated faithful state on  $M_2$ , that is,  $\varphi(X) = \text{tr}(\Gamma X) = (1-c)x_{11} + cx_{22}$ , for all  $X = \begin{pmatrix} x_{11} & x_{12} \\ x_{21} & x_{22} \end{pmatrix}$  in  $M_2$ .

Let  $E_{i,j}$ ,  $1 \leq i, j \leq 2$ , denote the standard matrix units of  $M_2$ . Let  $T: M_2 \rightarrow M_2$  be the linear map defined by

$$T(E_{11}) = (1-c)I_2, \quad T(E_{22}) = cI_2, \quad \text{and} \quad T(E_{21}) = T(E_{12}) = (c(1-c))^{\frac{1}{2}}(E_{12} + E_{21}).$$

Let  $A = [T(E_{ij})]_{1 \leq i, j \leq 2} \in M_2(M_2)$ . If we regard  $A$  as an element of  $M_4$ , we have

$$A = \begin{pmatrix} 1-c & 0 & 0 & (c(1-c))^{\frac{1}{2}} \\ 0 & 1-c & (c(1-c))^{\frac{1}{2}} & 0 \\ 0 & (c(1-c))^{\frac{1}{2}} & c & 0 \\ (c(1-c))^{\frac{1}{2}} & 0 & 0 & c \end{pmatrix}.$$

Clearly  $A$  is unitarily equivalent to  $B \otimes I_2$ , with

$$B = \begin{pmatrix} 1-c & (c(1-c))^{\frac{1}{2}} \\ (c(1-c))^{\frac{1}{2}} & c \end{pmatrix}.$$

It is plain that  $B$  is positive. Consequently,  $A$  is positive. Hence  $T$  is completely positive, by Choi's theorem (see e.g. [18, Theorem 3.14]). Furthermore,  $T$  is unital. We note that  $\varphi(T(E_{11})) = \varphi(E_{11}) = 1-c$ ,  $\varphi(T(E_{22})) = \varphi(E_{22}) = c$ ,  $\varphi(T(E_{12})) = \varphi(E_{12}) = 0$  and  $\varphi(T(E_{21})) = \varphi(E_{21}) = 0$ . Thus,

$$\varphi \circ T = \varphi.$$

Our aim is now to estimate  $\|T_{p,\theta}\|$ , using Proposition 3.3. We let  $U_{p,\theta}: S_2^p \rightarrow S_2^p$  be defined by (3.10). We shall focus on the action of  $U_{p,\theta}$  on the anti-diagonal part of  $S_2^p$ . First, we have

$$\Gamma^{-\frac{1-\theta}{p}} E_{12} \Gamma^{-\frac{\theta}{p}} = (1-c)^{-\frac{1-\theta}{p}} c^{-\frac{\theta}{p}} E_{12}.$$

Hence

$$\begin{aligned} T(\Gamma^{-\frac{1-\theta}{p}} E_{12} \Gamma^{-\frac{\theta}{p}}) &= (1-c)^{-\frac{1-\theta}{p}} c^{-\frac{\theta}{p}} T(E_{12}) \\ &= (1-c)^{-\frac{1-\theta}{p}} c^{-\frac{\theta}{p}} (c(1-c))^{\frac{1}{2}} (E_{12} + E_{21}). \end{aligned}$$

Hence

$$\begin{aligned} U_{p,\theta}(E_{12}) &= (1-c)^{-\frac{1-\theta}{p}} c^{-\frac{\theta}{p}} (c(1-c))^{\frac{1}{2}} \left( \Gamma^{-\frac{1-\theta}{p}} E_{12} \Gamma^{\frac{\theta}{p}} + \Gamma^{-\frac{1-\theta}{p}} E_{21} \Gamma^{\frac{\theta}{p}} \right) \\ &= (1-c)^{-\frac{1-\theta}{p}} c^{-\frac{\theta}{p}} (c(1-c))^{\frac{1}{2}} \left( (1-c)^{\frac{1-\theta}{p}} c^{\frac{\theta}{p}} E_{12} + c^{\frac{1-\theta}{p}} (1-c)^{\frac{\theta}{p}} E_{21} \right) \\ &= (c(1-c))^{\frac{1}{2}} \left( E_{12} + \left( \frac{1-c}{c} \right)^{\frac{2\theta-1}{p}} E_{21} \right). \end{aligned}$$

Likewise, we have

$$U_{p,\theta}(E_{21}) = (c(1-c))^{\frac{1}{2}} \left( \left( \frac{c}{1-c} \right)^{\frac{2\theta-1}{p}} E_{12} + E_{21} \right).$$

Set

$$(6.2) \quad \delta = \left( \frac{1-c}{c} \right)^{\frac{2\theta-1}{p}}.$$

Consider

$$Y = \begin{pmatrix} 0 & a \\ b & 0 \end{pmatrix} \quad \text{with} \quad |a|^p + |b|^p = 1,$$

so that  $\|Y\|_p = 1$ . Then

$$\begin{aligned} U_{p,\theta}(Y) &= (c(1-c))^{\frac{1}{2}} (aE_{12} + a\delta E_{21} + b\delta^{-1}E_{12} + bE_{21}) \\ &= (c(1-c))^{\frac{1}{2}} ((a + b\delta^{-1})E_{12} + (a\delta + b)E_{21}). \end{aligned}$$

Hence

$$(6.3) \quad \|U_{p,\theta}(Y)\|_p^p = (c(1-c))^{\frac{p}{2}} ((a + b\delta^{-1})^p + (a\delta + b)^p).$$

To prove Proposition 6.2, it therefore suffices to show that for any  $1 \leq p < 2$  and  $\theta \in [0, 1]$  satisfying (6.1), there exist  $a, b > 0$  and  $c \in (0, 1)$  such that

$$a^p + b^p = 1 \quad \text{and} \quad (c(1-c))^{\frac{p}{2}} ((a + b\delta^{-1})^p + (a\delta + b)^p) > 1,$$

where  $\delta$  is given by (6.2).

We first assume that  $p > 1$ . We let  $q = \frac{p}{p-1}$  denote its conjugate exponent. Given  $c \in (0, 1)$  and  $\delta$  as above, we define

$$(6.4) \quad a = \left( \frac{\delta^q}{1 + \delta^q} \right)^{\frac{1}{p}} \quad \text{and} \quad b = \left( \frac{1}{1 + \delta^q} \right)^{\frac{1}{p}}.$$

They satisfy  $a^p + b^p = 1$  as required. Note that these values of  $(a, b)$  are chosen in order to maximize the quantity  $(c(1-c))^{\frac{p}{2}} ((a + b\delta^{-1})^p + (a\delta + b)^p)$ , according to the Lagrange multiplier method.

We set

$$c_t = \frac{1}{2} + t, \quad -\frac{1}{2} < t < \frac{1}{2}.$$

Then we denote by  $\delta_t, a_t, b_t$  the real numbers  $\delta, a, b$  defined by (6.2) and (6.4) when  $c = c_t$ . Also we set

$$\gamma_t = (c_t(1-c_t))^{\frac{p}{2}} \quad \text{and} \quad \mathbf{m}_t = \gamma_t ((a_t + b_t\delta_t^{-1})^p + (a_t\delta_t + b_t)^p).$$

It follows from above that it suffices to show that  $\mathbf{m}_t > 1$  for some  $t \in (0, \frac{1}{2})$ . We will prove this property by writing the second order Taylor expansion of  $\mathbf{m}_t$ .

We have

$$(a_t + b_t\delta_t^{-1})^p + (a_t\delta_t + b_t)^p = (1 + \delta_t^{-p})(a_t\delta_t + b_t)^p.$$

Moreover

$$a_t \delta_t = \frac{\delta_t^{\frac{q}{p}+1}}{(1 + \delta_t^q)^{\frac{1}{p}}} = \frac{\delta_t^q}{(1 + \delta_t^q)^{\frac{1}{p}}}.$$

Hence

$$(a_t + b_t \delta_t^{-1})^p + (a_t \delta_t + b_t)^p = (1 + \delta_t^{-p})(1 + \delta_t^q)^{p-1}.$$

Consequently,

$$\mathbf{m}_t = \gamma_t (1 + \delta_t^{-p})(\delta_t^q + 1)^{p-1}.$$

In the sequel, we write

$$f_t \equiv g_t$$

when  $f_t = g_t + o(t^2)$  when  $t \rightarrow 0$ .

We note that  $c_t(1 - c_t) = (\frac{1}{2} + t)(\frac{1}{2} - t) = \frac{1}{4}(1 - 4t^2)$ . We deduce that

$$(6.5) \quad \gamma_t \equiv \frac{1}{2^p}(1 - 2pt^2).$$

We set  $\lambda = 2\theta - 1$  for convenience. Then we have

$$\begin{aligned} \delta_t &= \left(\frac{1 - 2t}{1 + 2t}\right)^{\frac{\lambda}{p}} \\ &\equiv ((1 - 2t)(1 - 2t + 4t^2))^{\frac{\lambda}{p}} \\ &\equiv (1 - 4t + 8t^2)^{\frac{\lambda}{p}} \\ &\equiv 1 - \frac{4\lambda}{p}t + \frac{8\lambda}{p}t^2 + \frac{1}{2} \frac{\lambda}{p} \left(\frac{\lambda}{p} - 1\right) (4t)^2 \\ &\equiv 1 - \frac{4\lambda}{p}t + \frac{8\lambda^2}{p^2}t^2. \end{aligned}$$

This implies that

$$\begin{aligned} \delta_t^q &\equiv 1 - \frac{4\lambda q}{p}t + \frac{8\lambda^2 q}{p^2}t^2 + \frac{1}{2} q(q - 1) \left(\frac{4\lambda}{p}\right)^2 t^2 \\ &\equiv 1 - \frac{4\lambda q}{p}t + \frac{8\lambda^2 q^2}{p^2}t^2. \end{aligned}$$

Likewise,

$$(6.6) \quad \delta_t^{-p} \equiv 1 + 4\lambda t + 8\lambda^2 t^2.$$

Since  $p - 1 = \frac{p}{q}$ , we have

$$\begin{aligned} (1 + \delta_t^q)^{p-1} &\equiv 2^{\frac{p}{q}} \left(1 - \frac{2\lambda q}{p}t + \frac{4\lambda^2 q^2}{p^2}t^2\right)^{\frac{p}{q}} \\ &\equiv 2^{\frac{p}{q}} \left(1 - 2\lambda t + \frac{4\lambda^2 q}{p}t^2 + \frac{1}{2} \frac{p}{q} \left(\frac{p}{q} - 1\right) \left(\frac{2\lambda q}{p}\right)^2 t^2\right) \\ &\equiv 2^{\frac{p}{q}} (1 - 2\lambda t + 2\lambda^2 q t^2). \end{aligned}$$

Combining this expansion with (6.5) and (6.6), we deduce that

$$\begin{aligned}\mathbf{m}_t &\equiv \frac{1}{2^p}(1 - 2pt^2) \cdot 2(1 + 2\lambda t + 4\lambda^2 t^2) \cdot 2^{\frac{p}{q}}(1 - 2\lambda t + 2\lambda^2 qt^2) \\ &\equiv (1 - 2pt^2)(1 + 2\lambda^2 qt^2).\end{aligned}$$

Consequently,

$$(6.7) \quad \mathbf{m}_t \equiv 1 + \alpha t^2 \quad \text{with} \quad \alpha = 2(\lambda^2 q - p).$$

The second order coefficient  $\alpha$  can be written as

$$\begin{aligned}\alpha &= 2q \left( (2\theta - 1)^2 - \frac{p}{q} \right) \\ &= 8q \left( \theta^2 - \theta + \frac{q - p}{4q} \right) \\ &= 8q(\theta - \theta_0)(\theta - \theta_1),\end{aligned}$$

with

$$\theta_0 = \frac{1}{2}(1 - \sqrt{p-1}) \quad \text{and} \quad \theta_1 = \frac{1}{2}(1 + \sqrt{p-1}).$$

Now assume (6.1). Then  $\alpha > 0$ . Hence (6.7) ensures the existence of  $t > 0$  such that  $\mathbf{m}_t > 1$ , which concludes the proof (in the case  $p > 1$ ).

We now consider the case  $p = 1$ . We apply the same method as before, with

$$a = 1 \quad \text{and} \quad b = 0.$$

According to (6.3), it will suffice to show that whenever  $\theta \neq \frac{1}{2}$ , there exists  $c \in (0, 1)$  such that  $(c(1 - c))^{\frac{1}{2}}(1 + \delta) > 1$ .

Again we set  $c_t = \frac{1}{2} + t$ , for  $-\frac{1}{2} < t < \frac{1}{2}$ , we define  $\delta_t$  accordingly and we set

$$\mathbf{m}_t = (c_t(1 - c_t))^{\frac{1}{2}}(1 + \delta_t).$$

It follows from the previous calculations that

$$(c_t(1 - c_t))^{\frac{1}{2}} = \frac{1}{2} + o(t) \quad \text{and} \quad \delta_t = 1 - 4(2\theta - 1)t + o(t).$$

Consequently

$$\mathbf{m}_t = 1 - 2(2\theta - 1)t + o(t).$$

This order one expansion ensures that if  $\theta \neq \frac{1}{2}$ , then there exists  $t \in (-\frac{1}{2}, \frac{1}{2})$  such that  $\mathbf{m}(t) > 1$ , which concludes the proof (in the case  $p = 1$ ).  $\square$

*Proof of Theorem 6.1.* Let  $(p, \theta)$  satisfying (6.1). Thanks to Proposition 6.2, let  $T_0: M_2 \rightarrow M_2$  and let  $\varphi_0$  be a faithful state on  $M_2$  such that  $\varphi_0 \circ T_0 = \varphi_0$  and  $\|\{T_0\}_{p, \theta}\| > 1$ . We apply Proposition 5.2 with  $(A_k, \varphi_k, T_k) = (M_2, \varphi_0, T_0)$  for all  $k \geq 1$ . In this case,

$$\prod_{k=1}^n \|\{T_k\}_{p, \theta}\| = \|\{T_0\}_{p, \theta}\|^n,$$

and the latter goes to  $\infty$  when  $n \rightarrow \infty$ . Hence  $T_{p, \theta}$  is unbounded.  $\square$

**Remark 6.3.** With Theorem 4.1, Theorem 4.3 and Theorem 6.1, we have solved Question 2.2 in the following cases: (i)  $p \geq 2$  and  $\theta \in [0, 1]$ ; (ii)  $1 \leq p < 2$  and  $\theta \in [1 - p/2, p/2]$ ; (iii)  $1 \leq p < 2$  and  $\theta \in [0, 2^{-1}(1 - \sqrt{p-1})]$ ; (iv)  $1 \leq p < 2$  and  $\theta \in (2^{-1}(1 + \sqrt{p-1}), 1]$ .

However we do not know the answer to Question 2.2 when  $1 \leq p < 2$  and

$$\theta \in [2^{-1}(1 - \sqrt{p-1}), 1 - p/2) \quad \text{or} \quad \theta \in (p/2, 2^{-1}(1 + \sqrt{p-1})].$$

Writing a (+) when Question 2.2 has a positive answer, a (-) when it has a negative answer and a (?) when we do not know the answer, we obtain the following diagram:
