# INTERIOR HARNACK INEQUALITY AND HÖLDER ESTIMATES FOR LINEARIZED MONGE-AMPĖRE EQUATIONS IN DIVERGENCE FORM WITH DRIFT 

YOUNG HO KIM

#### Abstract

In this paper, we study interior estimates for solutions to linearized MongeAmpère equations in divergence form with drift terms and the right-hand side containing the divergence of a bounded vector field. Equations of this type appear in the study of semigeostrophic equations in meteorology and the solvability of singular Abreu equations in the calculus of variations with a convexity constraint. We prove an interior Harnack inequality and Hölder estimates for solutions to equations of this type in two dimensions, and under an integrability assumption on the Hessian matrix of the Monge-Ampère potential in higher dimensions. Our results extend those of Le (Analysis of Monge-Ampère equations, Graduate Studies in Mathematics, vol.240, American Mathematical Society, 2024) to equations with drift terms.

## 1. Introduction and Statements of the Main Results

In this paper, we are interested in the interior estimates for solutions $u: \Omega \rightarrow \mathbb{R}$ to linearized Monge-Ampère equations of the form

$$
\begin{equation*}
-\operatorname{div}(\Phi D u+u \mathbf{B})+\mathbf{b} \cdot D u=f-\operatorname{div} \mathbf{F} \tag{1.1}
\end{equation*}
$$

in a bounded domain $\Omega \subset \mathbb{R}^{n}, n \geq 2$, where $\mathbf{b}, \mathbf{B}, \mathbf{F}: \Omega \rightarrow \mathbb{R}^{n}$ are bounded vector fields, $f \in L^{n}$, and

$$
\begin{equation*}
\Phi=\left(\Phi^{i j}\right)_{1 \leq i, j \leq n}=\left(\operatorname{det} D^{2} \varphi\right)\left(D^{2} \varphi\right)^{-1} \tag{1.2}
\end{equation*}
$$

is the cofactor matrix of the Hessian matrix

$$
D^{2} \varphi=\left(D_{i j} \varphi\right)_{1 \leq i, j \leq n}=\left(\frac{\partial^{2} \varphi}{\partial x_{i} \partial x_{j}}\right)_{1 \leq i, j \leq n} .
$$

Here $\varphi$ is a $C^{3}$ convex Monge-Ampère potential satisfying

$$
\begin{equation*}
0<\lambda \leq \operatorname{det} D^{2} \varphi \leq \Lambda \quad \text { in } \Omega \tag{1.3}
\end{equation*}
$$

As the cofactor matrix $\Phi$ is divergence-free, that is, $D_{i} \Phi^{i j}=0$ for all $j$, the left-hand side of (1.1) can also be written in nondivergence form and we have

$$
-\Phi^{i j} D_{i j} u+(\mathbf{b}-\mathbf{B}) \cdot D u-(\operatorname{div} \mathbf{B}) u=f-\operatorname{div} \mathbf{F} .
$$

We will focus on the divergence form and the case when $\mathbf{F} \neq 0$, and obtain interior estimates for $u$ using its integral information.

[^0]1.1. Linearized Monge-Ampère Equations. Linearized Monge-Ampère equations arise in several contexts such as affine maximal surface equation in affine geometry [TW00, TW05, TW08b, Kähler metrics of constant scalar curvature in complex geometry CHLS14, CLS12, Don05, FS11, solvability of Abreu type equations in complex geometry and in the calculus of variations with a convexity constraint Abr98, Zho12, CW15, CR19, Le20, Le21, LZ21, KLWZ, WZ23, and semigeostrophic equations in meteorology ACDPF12, Fig18, Loe05, Le18a.

For a strictly convex function $\varphi \in C^{2}(\Omega)$ satisfying (1.3), the cofactor matrix $\Phi$ is positive definite, but we cannot expect structural bounds on its eigenvalues. Hence, the linearized Monge-Ampère operator is an elliptic operator that can be degenerate and singular.

Starting with the seminal result of Caffarelli-Gutiérrez [CG97] on the homogeneous equation

$$
\Phi^{i j} D_{i j} u=\operatorname{div}(\Phi D u)=0,
$$

linearized Monge-Ampère equations have been studied by many authors GN11, GN15, Le17, Le23, LN14, LN17, LS13, Sav10, Mal14a, Mal14b, Mal17, TZ22. The term div F in (1.1) appears in the study of semigeostrophic equations in meteorology. Specifically, we have equations of the form

$$
\begin{equation*}
\operatorname{div}(\Phi D u)=\operatorname{div} \mathbf{F} \tag{1.4}
\end{equation*}
$$

For equations of this type, Loeper [Loe05] proved the Hölder estimate of solutions using integral information of $u$ under the assumption that $\operatorname{det} D^{2} \varphi$ is close to a constant. Roughly speaking, Loeper needed this condition to apply the results of Murty-Stampacchia MS68] and Trudinger [Tru73]; see Section 1.3 for more information. Le Le18a] proved the same result when $n=2$ with just the assumption in (1.3). Le [Le24, Theorem 15.6] also proved the Hölder estimate when $n \geq 3$ under an integrability assumption on the Hessian matrix $D^{2} \varphi$, that is, $D^{2} \varphi \in L^{s}$ for $s>n(n-1) / 2$. This equation was also studied by Wang [Wan24], where the Hölder estimate is proved under an integrability assumption on $\left(D^{2} \varphi\right)^{1 / 2} \mathbf{F}$; more precisely, when $\left(D^{2} \varphi\right)^{1 / 2} \mathbf{F} \in L^{q}, q>n$. In Wang Wan24], the upper bound for the Hölder norm contains the $L^{\infty}$ norm of the solution $u$, while in Le [Le24], the $L^{p}$ norm ( $p>1$ ) is used.

The main difference between (1.1) and (1.4) is the existence of drift terms $-\operatorname{div}(u \mathbf{B})$ and $\mathbf{b} \cdot D u$. When $\mathbf{F}=0$, equations of the form (1.1) with nonzero drift terms $(\mathbf{b}, \mathbf{B} \neq 0)$ have been studied by Maldonado [Mal14a, Mal18, Mal19] and Le [Le18b, Le23]. These appear in the solvability of singular Abreu equations in higher dimensions in complex geometry and in the calculus of variations with a convexity constraint [KLWZ].
1.2. The Main Results. In this paper, we will consider equations of type (1.1) that have both the drift terms, and also div $\mathbf{F}$, in dimension two and under an integrability assumption on $D^{2} \varphi$ in higher dimensions. Our main results are the following theorems on interior Harnack inequality and Hölder estimates. They extend the result of Le Le24 to equations with drift terms.

Our first result is the following Harnack inequality.
Theorem 1.1 (Harnack inequality). Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Suppose that $\mathbf{F}, \mathbf{b}, \mathbf{B} \in W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right) \cap L_{\mathrm{loc}}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\mathrm{loc}}^{n}(\Omega), r>n / 2$, and $\operatorname{div} \mathbf{B} \leq 0$. Assume that $S_{\varphi}\left(x_{0}, 2 h\right) \Subset \Omega$, where $S_{\varphi}\left(x_{0}, \cdot\right)$ is the section defined in Definition [2.1. Let
$u \in W^{2, n}\left(S_{\varphi}\left(x_{0}, h\right)\right)$ be a nonnegative solution to (1.1) in $S_{\varphi}\left(x_{0}, h\right)$ and let $t \leq h / 2$. Further assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n}{2}$, where $\varepsilon^{*}$ is the exponent in the interior $W^{2,1+\varepsilon}$ estimate for the Monge-Ampère equation in Theorem 2.7.
Then, there are positive constants $C$ and $\gamma$ such that

$$
\sup _{S_{\varphi}\left(x_{0}, t\right)} u \leq C\left(\left(\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, h\right)\right)}\right) t^{\gamma}+\inf _{S_{\varphi}\left(x_{0}, t\right)} u\right) .
$$

Here the constants $C$ and $\gamma$ are given by
$\gamma=\gamma(n, \lambda, \Lambda, r)>0, \quad$ and
$C=C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)},\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, h\right)\right)}, h, \operatorname{diam}\left(S_{\varphi}\left(x_{0}, 2 h\right)\right)\right)$.
We will prove Theorem 1.1 in Section 4.
From the Harnack inequality, we have the following interior Hölder estimates.
Corollary 1.2 (Hölder estimates with $L^{\infty}$ norms). Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Assume that $\mathbf{F}, \mathbf{B}, \mathbf{b} \in L_{\mathrm{loc}}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\mathrm{loc}}^{n}(\Omega)$, $\operatorname{div} \mathbf{B} \leq 0$, $n / 2<r<\infty$, and $S_{\varphi}\left(x_{0}, 4 h_{0}\right) \Subset \Omega$. Let $u \in W_{\mathrm{loc}}^{2, n}\left(S_{\varphi}\left(x_{0}, 4 h_{0}\right)\right)$ be a solution to (1.1) in $S_{\varphi}\left(x_{0}, 4 h_{0}\right)$. Further assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n}{2}$, where $\varepsilon^{*}$ is the exponent in the interior $W^{2,1+\varepsilon}$ estimate for the Monge-Ampère equation in Theorem 2.7,
Then, there are positive constants $C$ and $\gamma$ such that for all $x, y \in S_{\varphi}\left(x_{0}, h_{0}\right)$, we have

$$
\begin{equation*}
|u(x)-u(y)| \leq C\left(\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)}\right)|x-y|^{\gamma} . \tag{1.5}
\end{equation*}
$$

Here $\gamma$ depends on $n, \lambda, \Lambda, \varepsilon^{*},\|(\mathbf{b}, \mathbf{B})\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)},\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}, \operatorname{diam}\left(S_{\varphi}\left(x_{0}, 4 h_{0}\right)\right)$, and $h_{0}$, and $C$ depends on $\|(\mathbf{b}, \mathbf{B})\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)},\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}, \operatorname{diam}\left(S_{\varphi}\left(x_{0}, 4 h_{0}\right)\right), n$, $\lambda, \Lambda, r, \varepsilon^{*}$, and $h_{0}$.

We will prove Corollary 1.2 in Section 6.
With stronger assumptions on the integrability of the Hessian matrix $D^{2} \varphi$ in higher dimensions, we can obtain the following interior Hölder estimate, where the $L^{\infty}$ norm of the solution $u$ in Corollary 1.2 is replaced by its $L^{2}$ norm.
Theorem 1.3 (Hölder estimates with $L^{2}$ norm). Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Assume that $\mathbf{F}, \mathbf{B}, \mathbf{b} \in L_{\mathrm{loc}}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\mathrm{loc}}^{n}(\Omega)$, $\operatorname{div} \mathbf{B} \leq 0$, $n / 2<r<\infty$, and $S_{\varphi}\left(x_{0}, 4 h_{0}\right) \Subset \Omega$. Let $u \in W_{\text {loc }}^{2, n}\left(S_{\varphi}\left(x_{0}, 4 h_{0}\right)\right)$ be a solution to (1.1) in $S_{\varphi}\left(x_{0}, 4 h_{0}\right)$. Further assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n(n-1)}{2}$, where $\varepsilon^{*}$ is the exponent in the interior $W^{2,1+\varepsilon}$ estimate for the Monge-Ampère equation in Theorem [2.7.
Then, there are positive constants $C$ and $\gamma$, where $\gamma$ depends on $n, \lambda, \Lambda, \varepsilon^{*}, \operatorname{diam}\left(S_{\varphi}\left(x_{0}, 4 h_{0}\right)\right)$, $\|(\mathbf{b}, \mathbf{B})\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}$, and $h_{0}$, and $C$ depends on $n, \lambda, \Lambda, r, \varepsilon^{*},\|(\mathbf{b}, \mathbf{B})\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}, h_{0}$, and $\operatorname{diam}\left(S_{\varphi}\left(x_{0}, 4 h_{0}\right)\right)$, such that for all $x, y \in S_{\varphi}\left(x_{0}, h_{0}\right)$, we have

$$
\begin{equation*}
|u(x)-u(y)| \leq C\left(\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|u\|_{L^{2}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}\right)|x-y|^{\gamma} \tag{1.6}
\end{equation*}
$$

We will prove Theorem 1.3 in Section 6.
Remark 1.4. In Theorem 1.3, we use the $L^{2}$ norm of the solution $u$ in the estimate (in fact, any $L^{p}$ norm for $p>0$ can be used); in Corollary 1.2, the $L^{\infty}$ norm of $u$ is used in the estimate. The improvement in Theorem 1.3 comes at the cost of having to assume stronger integrability of $D^{2} \varphi$ when $n \geq 3$, namely, $1+\varepsilon^{*}>\frac{n(n-1)}{2}$. This is because we need this condition in the proof of the interior estimate in Lemma 5.1. It would be interesting to see if the condition $1+\varepsilon^{*}>\frac{n(n-1)}{2}$ can be relaxed in Theorem 1.3.
Remark 1.5. Note that, by Caffarelli [Caf90] (also see [Le24, Theorem 6.13]), for any $p>1$ and any convex function $\varphi$ satisfying (1.3), we have $D^{2} \varphi \in L_{\mathrm{loc}}^{p}(\Omega)$, provided that $\Lambda / \lambda-1 \leq e^{-C(n) p}$ for some large constant $C(n)>1$.

Remark 1.6. In our theorems, we require $\varphi$ to be $C^{3}$ in the domain. However, our estimates do not depend on the regularity of $\varphi$ but only on the constants $\lambda, \Lambda$, and $n$. The functions $\mathbf{F}, \mathbf{b}, \mathbf{B}$ are assumed to be in $L_{\text {loc }}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\text {loc }}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right)$ and $f$ to be in $L_{\text {loc }}^{n}(\Omega)$, but the estimates depend only on the quantities stated.
1.3. Related Results for Equations in Divergence Form. Divergence form equations

$$
\begin{equation*}
-\operatorname{div}(a D u+u \mathbf{B})+\mathbf{b} \cdot D u+c u=f-\operatorname{div} \mathbf{F} \quad \text { in } \Omega \subset \mathbb{R}^{n} \tag{1.7}
\end{equation*}
$$

have been studied in the case when the symmetric coefficient matrix $a=a(x)$ is not uniformly elliptic, but instead satisfies

$$
\rho(x) I_{n} \leq a(x) \leq \mu(x) I_{n}
$$

for nonnegative functions $\rho$ and $\mu$, where $I_{n}$ is the $n \times n$ identity matrix. Murty-Stampacchia [MS68] and Trudinger Tru73] proved $L^{\infty}$ and Hölder estimates for solutions to equations of the form (1.7) with integrability assumptions on $\mu$ and $\rho^{-1}$. Specifically, it is assumed that $\mu \in L^{p}$ and $\rho^{-1} \in L^{q}$, where $\frac{1}{p}+\frac{1}{q}<\frac{2}{n}$. These extend the classical results of De Giorgi [DG57], Nash [Nas58], and Moser [Mos61] for uniformly elliptic equations, when $\rho$ and $\mu$ are positive constants.

Bella-Schäffner [BS21] extended the above results in the case of equations of the form

$$
-\operatorname{div}(a D u)=0
$$

in $\Omega \subset \mathbb{R}^{n}$, under the assumption that $\frac{1}{p}+\frac{1}{q}<\frac{2}{n-1}$. This result is essentially sharp, as Franchi-Serapioni-Serra Cassano [FSSC98, Theorem 2] proved that a counterexample exists if $n \geq 4$ and $\frac{1}{p}+\frac{1}{q}>\frac{2}{n-1}$.

In the case when the matrix $a=\Phi$ is the cofactor matrix of the Hessian matrix $D^{2} \varphi$, where $\varphi$ satisfies (1.3), we have

$$
a=\left(\operatorname{det} D^{2} \varphi\right)\left(D^{2} \varphi\right)^{-1} \geq \frac{\operatorname{det} D^{2} \varphi}{\left\|D^{2} \varphi\right\|} I_{n} .
$$

As $\operatorname{det} D^{2} \varphi \geq \lambda$ and $D^{2} \varphi \in L^{1+\varepsilon^{*}}$ by the $W^{2,1+\varepsilon}$ estimate for Monge-Ampère equations (see Theorem 2.7), $\rho^{-1} \in L^{1+\varepsilon^{*}}$. Furthermore, $\rho^{n-1} \mu$ is bounded by (1.3), and thus $\mu \in$ $L^{\left(1+\varepsilon^{*}\right) /(n-1)}$. Therefore, we get

$$
\frac{1}{p}+\frac{1}{q}=\frac{1}{1+\varepsilon^{*}}+\frac{n-1}{1+\varepsilon^{*}}=\frac{n}{1+\varepsilon^{*}}
$$

Note that, with only the assumption that $\varepsilon^{*}>0$, this is smaller than $\frac{2}{n-1}$ only when $n=2$. When $n \geq 3$, the assumption $1+\varepsilon^{*}>n(n-1) / 2$ in Theorem 1.3 and in Le [Le24] corresponds
to $\frac{n}{1+\varepsilon^{*}}<\frac{2}{n-1}$. Compared to the results of Bella-Schäffner, these cover the equations with nonzero right-hand side (especially the case when $\mathbf{F} \neq 0$ ), with the assumption that the matrix $a=\left(\operatorname{det} D^{2} \varphi\right)\left(D^{2} \varphi\right)^{-1}$.
1.4. Methods of the proofs. We briefly discuss the differences in the proofs of the results in this paper, the results of Le Le18a, Le24, and the results of Wang [Wan24].

The proof of interior Hölder estimates in Le [Le18a, Le24] used the fine properties of the Green's function for the linearized Monge-Ampère operator Le16, Le17. Other tools used in the proof are De Philippis-Figalli-Savin and Schmidt's $W^{2,1+\varepsilon}$ estimate [DPFS13, Sch13] in the case $n=2$, and the Monge-Ampère Sobolev inequality. The $W^{2,1+\varepsilon}$ estimate is replaced by an integrability assumption for $D^{2} \varphi$ when $n \geq 3$. The results for the Green's function for the linearized Monge-Ampère operator with drift terms are not available, so we take an alternative approach in our proofs.

Wang Wan24 uses the De Giorgi iteration technique, in addition to the Monge-Ampère Sobolev inequality, in the proof of interior Hölder estimates. We will use the Moser iteration techniques similar to the ones in Gilbarg-Trudinger [GT01, Chapter 8] and Trudinger [Tru73], and the Monge-Ampère Sobolev inequality in our proofs.

The rest of this paper is organized as follows. In Section 2, we present definitions and prior results used in the proofs of the results. In Section 3, we establish global $L^{\infty}$ estimates for solutions to (1.1). In Section 4, we prove the interior Harnack inequality in Theorem 1.1. In Section 5, we establish interior estimates for solutions to (1.1). Finally, in Section 6, we prove the Hölder estimates in Corollary 1.2 and Theorem 1.3 ,

## 2. Preliminaries

In this section, we introduce some notations, definitions, and background results on the Monge-Ampère equations and the linearized Monge-Ampère equations that will be used in this paper.

Notation. We will use the following notations throughout the paper.

- $B_{r}(x):=\left\{y \in \mathbb{R}^{n}:|y-x|<r\right\}$,
- $B_{r}:=B_{r}(0)$,
- $u^{ \pm}:=\max \{ \pm u, 0\}$,
- $I_{n}:=n \times n$ identity matrix.
- $\operatorname{diam}(E):=$ diameter of a set $E$.
- $|\Omega|:=$ the Lebesgue measure of a Lebesgue measurable set $\Omega \subset \mathbb{R}^{n}$.

Unless otherwise stated, our convex domains are assumed to have nonempty interior.
Definition 2.1 (Sections). Let $\varphi$ be a $C^{1}$ convex function in $\bar{\Omega}$. Then the section of $\varphi$ centered at $x \in \bar{\Omega}$ with height $h>0$ is defined as

$$
S_{\varphi}(x, h)=\{y \in \bar{\Omega}: \varphi(y)<\varphi(x)+D \varphi(x) \cdot(y-x)+h\} .
$$

Theorem 2.2 (John's lemma Joh48). Let $\Omega \subset \mathbb{R}^{n}$ be a nonempty bounded convex domain. Then, there is an affine transformation $T: \mathbb{R}^{n} \rightarrow \mathbb{R}^{n}$ such that $B_{1} \subset T^{-1} \Omega \subset B_{n}$.

Definition 2.3 (Normalized convex sets). An open convex set $K \subset \mathbb{R}^{n}$ is called normalized if $B_{1} \subset K \subset B_{n}$.

We will use the following Monge-Ampère Sobolev inequality. It was proved by Tian-Wang [TW08a, Theroem 3.1] when $n \geq 3$, and by Le [Le18a, Proposition 2.6] when $n=2$; see also [Le24, Theorem 14.15].

Theorem 2.4 (Monge-Ampère Sobolev inequality). Let $\varphi$ be a $C^{2}$ convex function satisfying (1.3), and define $\Phi$ as in (1.2). Suppose $S_{\varphi}\left(x_{0}, 2 h\right) \Subset \Omega$, and $S_{\varphi}\left(x_{0}, h\right)$ is a normalized section. Then for any $u \in C_{c}^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)$,

$$
\|u\|_{L^{p}\left(S_{\varphi}\left(x_{0}, h\right)\right)} \leq C\left[\int_{S_{\varphi}\left(x_{0}, h\right)} \Phi D u \cdot D u d x\right]^{1 / 2},
$$

where
(1) $p \in(2, \infty)$ and $C=C(p, \lambda, \Lambda)$ if $n=2$, and
(2) $p=\frac{2 n}{n-2}$ and $C=C(n, \lambda, \Lambda)$ if $n \geq 3$.

Theorem 2.5 (Caffarelli's interior $C^{1, \alpha}$ estimate [Caf91]). Let $\varphi$ be a strictly convex solution to the Monge-Ampère equation $\operatorname{det} D^{2} \varphi=f$ in a convex domain $\Omega \subset \mathbb{R}^{n}$, where $\lambda \leq f \leq \Lambda$ for positive constants $\lambda$ and $\Lambda$. If $S_{\varphi}(x, h) \Subset \Omega$ is a normalized section, then for all $y, z \in$ $S_{\varphi}(x, h / 2)$, we have

$$
|D \varphi(y)-D \varphi(z)| \leq C|y-z|^{\alpha},
$$

where

$$
\begin{equation*}
C=C(n, \lambda, \Lambda)>0 \quad \text { and } \alpha=\alpha(n, \lambda, \Lambda)>0 . \tag{2.1}
\end{equation*}
$$

This $C^{1, \alpha}$ estimate implies that sections contain balls with the same center.
Corollary 2.6. With the same assumptions as in Theorem [2.5, if $t \leq h / 2$ we have

$$
B_{c t^{1 /(1+\alpha)}}(x) \subset S_{\varphi}(x, t),
$$

where $\alpha$ is defined in (2.1) and $c=c(n, \lambda, \Lambda)>0$.
We will also use the interior $W^{2,1+\varepsilon}$ estimate of De Philippis-Figalli-Savin DPFS13 and Schmidt [Sch13] for the Monge-Ampère equation. We will use the following formulation for compactly supported sections (see [Le24, Corollary 6.26]).
Theorem 2.7 (Interior $W^{2,1+\varepsilon}$ estimate). Let $\Omega$ be a convex domain in $\mathbb{R}^{n}$. Let $\varphi: \Omega \rightarrow \mathbb{R}$ be a continuous convex solution to the Monge-Ampère equation

$$
\operatorname{det} D^{2} \varphi=f \quad \text { in } \Omega, \quad 0<\lambda \leq f \leq \Lambda
$$

Suppose $S_{\varphi}\left(x_{0}, h\right)$ is a normalized section, and $S_{\varphi}\left(x_{0}, 2 h\right) \Subset \Omega$. Then, for $\varepsilon=\varepsilon^{*}(n, \lambda, \Lambda)>0$ and $C=C(n, \lambda, \Lambda)>0$, we have

$$
\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon}\left(S_{\varphi}\left(x_{0}, h\right)\right)} \leq C .
$$

We have the following volume estimates for sections (see [Le24, Lemma 5.6(i)]).
Lemma 2.8 (Volume estimate for sections). Suppose $\varphi$ is a $C^{1}$ convex solution to $\lambda \leq$ $\operatorname{det} D^{2} \varphi \leq \Lambda$ for positive constants $\lambda$ and $\Lambda$ in $\Omega \subset \mathbb{R}^{n}$. If $S_{\varphi}(x, h) \Subset \Omega$, then

$$
c(\Lambda, n) h^{n / 2} \leq\left|S_{\varphi}(x, h)\right| \leq C(\lambda, n) h^{n / 2}
$$

for positive constants $c$ and $C$.

We will also use the following Harnack inequality for linearized Monge-Ampère equations with drift from Le [Le18b, Theorem 1.1].

Theorem 2.9 (Harnack inequality for linearized Monge-Ampère equations). Let $\Omega \subset \mathbb{R}^{n}$ be a bounded convex domain. Assume that $\varphi$ satisfies (1.3), and define $\Phi=\left(\Phi^{i j}\right)_{1 \leq i, j \leq n}$ as in (1.2). Suppose that $v \geq 0$ is a $W_{\text {loc }}^{2, n}(\Omega)$ solution of

$$
\begin{equation*}
\Phi^{i j} D_{i j} v+\mathbf{b} \cdot D v+c v=f \tag{2.2}
\end{equation*}
$$

in a section $S:=S_{\varphi}\left(x_{0}, 2 h\right) \Subset \Omega$, where $h \leq h_{0}$ for a positive, fixed $h_{0}, f \in L_{\text {loc }}^{n}(\Omega)$, $c \in L_{\text {loc }}^{n}(\Omega)$, and $\mathbf{b} \in L_{\text {loc }}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right)$. Then

$$
\begin{equation*}
\sup _{S_{\varphi}\left(x_{0}, h\right)} v \leq C\left(\inf _{S_{\varphi}\left(x_{0}, h\right)} v+h^{1 / 2}\|f\|_{L^{n}(S)}\right), \tag{2.3}
\end{equation*}
$$

where $C$ is a positive constant depending on $n, \lambda, \Lambda, h_{0},\|\mathbf{b}\|_{L^{\infty}(S)}$, and $\|c\|_{L^{n}(S)}$.
Definition 2.10 (Subsolutions to equation (1.1) in a domain $S$ ). Let $\Omega \subset \mathbb{R}^{n}$ be a bounded domain, and $S$ be a domain contained in $\Omega$. Suppose $\mathbf{F}, \mathbf{B}, \mathbf{b} \in L_{\mathrm{loc}}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right)$ and $f \in L_{\text {loc }}^{n}(\Omega)$. We say that $u \in W^{1,2}(S)$ is a (weak) subsolution to (1.1) if for all $v \in W_{0}^{1,2}(S)$ with $v \geq 0$ in $S$, we have

$$
\begin{equation*}
\int_{S} \Phi D u \cdot D v d x+\int_{S} u \mathbf{B} \cdot D v d x+\int_{S}(\mathbf{b} \cdot D u) v d x \leq \int_{S} \mathbf{F} \cdot D v d x+\int_{S} f v d x \tag{2.4}
\end{equation*}
$$

## 3. Global Estimates

In this section, we prove global estimates for solutions to equation (1.1) with zero boundary data on sections. We start by proving the following lemma for subsolutions to (1.1) in a normalized section.

Lemma 3.1. Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Suppose $\mathbf{F}, \mathbf{B}, \mathbf{b} \in$ $L_{\text {loc }}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\text {loc }}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\text {loc }}^{n}(\Omega)$, and $n / 2<r<\infty$. Suppose $S=S_{\varphi}(x, t)$ is a normalized section, and $S_{\varphi}(x, 2 t) \Subset \Omega$. Suppose $u \in W^{1,2}(S) \cap C(\bar{S})$ is a subsolution to (1.1) in $S$ satisfying $u \leq 0$ on $\partial S$. Assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n}{2}$, where $\varepsilon^{*}$ is as in Theorem 2.7.

Then,

$$
\begin{equation*}
\sup _{S} u^{+} \leq C\left(\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)}+\left\|u^{+}\right\|_{L^{2}(S)}\right) \tag{3.1}
\end{equation*}
$$

where

$$
C=C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)},\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}\right)
$$

Proof. We define the test function $v$ as in Gilbarg-Trudinger [GT01, Section 8.5]. Set

$$
k=\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)},
$$

and for $\beta \geq 1$ and $N \geq k$, define $H \in C^{1}([k, \infty))$ by

$$
H(z)= \begin{cases}z^{\beta}-k^{\beta} & \text { if } k \leq z \leq N \\ \beta N^{\beta-1}(z-N)+\left(N^{\beta}-k^{\beta}\right) & \text { if } N<z\end{cases}
$$

Let $w=u^{+}+k \geq k$, and define

$$
v=G(w):=\int_{k}^{w}\left|H^{\prime}(s)\right|^{2} d s \geq 0
$$

Then, using $v \in W_{0}^{1,2}(S)$ as a test function in (1.1), we get

$$
\begin{equation*}
\int_{S} \Phi D u \cdot D v d x+\int_{S} u \mathbf{B} \cdot D v d x+\int_{S}(\mathbf{b} \cdot D u) v d x \leq \int_{S} \mathbf{F} \cdot D v d x+\int_{S} f v d x \tag{3.2}
\end{equation*}
$$

Note that
(1) $D v=G^{\prime}(w) D w=H^{\prime}(w)^{2} D w$,
(2) $v$ and $D v$ are supported on $\{u \geq 0\}$, and on the set $\{u>0\}=\{v>0\}$, we have $D w=D u=D u^{+}$, and
(3) $H^{\prime}$ is increasing on $(k, \infty)$, hence $G^{\prime}$ is also increasing on $(k, \infty)$. Thus,

$$
G(w)=\int_{k}^{w} G^{\prime}(s) d s \leq w G^{\prime}(w) .
$$

Now we estimate the terms in (3.2) separately. Note that as $\varphi$ is convex and $\operatorname{det} D^{2} \varphi>0$ by (1.3), $D^{2} \varphi$ is positive definite. Moreover, the largest eigenvalue of $D^{2} \varphi$ is bounded by $\Delta \varphi$. Therefore, we have, in the sense of symmetric matrices,

$$
\Phi=\left(\operatorname{det} D^{2} \varphi\right)\left(D^{2} \varphi\right)^{-1} \geq \frac{\operatorname{det} D^{2} \varphi}{\Delta \varphi} I_{n}
$$

Hence for any $\eta \in \mathbb{R}^{n}$, we have, by (1.3),

$$
\begin{equation*}
\Phi \eta \cdot \eta \geq\left(\frac{\operatorname{det} D^{2} \varphi}{\Delta \varphi}\right)|\eta|^{2} \geq\left(\frac{\lambda}{\Delta \varphi}\right)|\eta|^{2} . \tag{3.3}
\end{equation*}
$$

Using the Cauchy-Schwarz inequality and (3.3), we get

$$
\begin{align*}
-\int_{S}(\mathbf{b} \cdot D u) v d x & \leq \int_{S} G(w)|\mathbf{b} \cdot D w| d x \leq \int_{S} w G^{\prime}(w)|\mathbf{b} \cdot D w| d x \\
& \leq \int_{S}\left(G^{\prime}(w) \Phi D w \cdot D w\right)^{1 / 2}\left(w^{2} G^{\prime}(w) \frac{\Delta \varphi}{\lambda}|\mathbf{b}|^{2}\right)^{1 / 2} d x  \tag{3.4}\\
& \leq \frac{1}{4} \int_{S} G^{\prime}(w) \Phi D w \cdot D w d x+\int_{S} w^{2} G^{\prime}(w) \frac{\Delta \varphi}{\lambda}|\mathbf{b}|^{2} d x
\end{align*}
$$

Similarly, recalling that $D v$ is supported on $\{u \geq 0\}$, we have

$$
\begin{align*}
-\int_{S} u \mathbf{B} \cdot D v d x & =-\int_{S} G^{\prime}(w) u \mathbf{B} \cdot D w d x \leq \int_{S} G^{\prime}(w) w|\mathbf{B} \| D w| d x \\
& \leq \int_{S}\left(G^{\prime}(w) \Phi D w \cdot D w\right)^{1 / 2}\left(w^{2} G^{\prime}(w) \frac{\Delta \varphi}{\lambda}|\mathbf{B}|^{2}\right)^{1 / 2} d x  \tag{3.5}\\
& \leq \frac{1}{4} \int_{S} G^{\prime}(w) \Phi D w \cdot D w d x+\int_{S} w^{2} G^{\prime}(w) \frac{\Delta \varphi}{\lambda}|\mathbf{B}|^{2} d x
\end{align*}
$$

By the same reason, we have

$$
\begin{align*}
\int_{S} \mathbf{F} \cdot D v d x & =\int_{S} G^{\prime}(w) \mathbf{F} \cdot D w d x \\
& \leq \int_{S}\left(G^{\prime}(w) \Phi D w \cdot D w\right)^{1 / 2}\left(G^{\prime}(w) \frac{\Delta \varphi}{\lambda}|\mathbf{F}|^{2}\right)^{1 / 2} d x  \tag{3.6}\\
& \leq \frac{1}{4} \int_{S} G^{\prime}(w) \Phi D w \cdot D w d x+\int_{S} G^{\prime}(w) \frac{\Delta \varphi}{\lambda}|\mathbf{F}|^{2} d x \\
& \leq \frac{1}{4} \int_{S} G^{\prime}(w) \Phi D w \cdot D w d x+\int_{S} w^{2} G^{\prime}(w) \frac{\Delta \varphi}{\lambda} d x
\end{align*}
$$

where we used $w \geq\|\mathbf{F}\|_{L^{\infty}(S)}$, and because $w \geq k$,

$$
\begin{align*}
\int_{S} f v d x & \leq \int_{S}|f| G(w) d x \leq \int_{S}|f| w G^{\prime}(w) d x  \tag{3.7}\\
& \leq \int_{S} \frac{|f|}{k} w^{2} G^{\prime}(w) d x
\end{align*}
$$

Note that

$$
\int_{S} \Phi D u \cdot D v d x=\int_{S} G^{\prime}(w) \Phi D w \cdot D w
$$

Adding (3.4)-(3.7) and invoking (3.2), we obtain

$$
\begin{aligned}
& \int_{S} G^{\prime}(w) \Phi D w \cdot D w d x \\
& \leq \frac{3}{4} \int_{S} G^{\prime}(w) \Phi D w \cdot D w d x+\int_{S} w^{2} G^{\prime}(w)\left[\frac{\Delta \varphi}{\lambda}\left(1+|\mathbf{b}|^{2}+|\mathbf{B}|^{2}\right)+\frac{|f|}{k}\right] d x
\end{aligned}
$$

Hence

$$
\begin{equation*}
\int_{S} G^{\prime}(w) \Phi D w \cdot D w d x \leq 4 \int_{S} w^{2} G^{\prime}(w) h d x \tag{3.8}
\end{equation*}
$$

where

$$
h=\frac{\Delta \varphi}{\lambda}\left(1+|\mathbf{b}|^{2}+|\mathbf{B}|^{2}\right)+\frac{|f|}{k} .
$$

Before moving to the next step, we estimate $h$. As $S$ is normalized, $\left|B_{1}\right| \leq|S| \leq\left|B_{n}\right|$. Therefore, for

$$
q:=\min \left\{1+\varepsilon^{*}, r\right\}>\frac{n}{2}
$$

we have, by the Hölder inequality,

$$
\begin{align*}
\|h\|_{L^{q}(S)} & \leq \frac{1+\|\mathbf{b}\|_{L^{\infty}(S)}^{2}+\|\mathbf{B}\|_{L^{\infty}(S)}^{2}\|\Delta \varphi\|_{L^{q}(S)}+\frac{\|f\|_{L^{q}(S)}}{k}}{\lambda} \\
& \leq \frac{1+\|\mathbf{b}\|_{L^{\infty}(S)}^{2}+\|\mathbf{B}\|_{L^{\infty}(S)}^{2}\|\Delta \varphi\|_{L^{1+\varepsilon^{*}(S)}}|S|^{\frac{1+\varepsilon^{*}-q}{q\left(1+\varepsilon^{*}\right)}}+\frac{\|f\|_{L^{r}(S)}}{k}|S|^{\frac{r-q}{q r}}}{\lambda}\|\mathbf{l}\|_{L^{\infty}(S)}^{2}+\|\mathbf{B}\|_{L^{\infty}(S)}^{2}\|\Delta \varphi\|_{L^{1+\varepsilon^{*}(S)}}\left|B_{n}\right|^{\frac{1+\varepsilon^{*}-q}{q\left(1+\varepsilon^{*}\right)}}+\left|B_{n}\right|^{\frac{r-q}{q r}} \tag{3.9}
\end{align*}
$$

Then, for

$$
\begin{equation*}
\widehat{q}:=\frac{2 q}{q-1}, \tag{3.10}
\end{equation*}
$$

we have, from the Hölder inequality

$$
\begin{align*}
\int_{S} w^{2} G^{\prime}(w) h d x & =\int_{S}\left(w H^{\prime}(w)\right)^{2} h d x \\
& \leq\|h\|_{L^{q}(S)}\left\|\left(w H^{\prime}(w)\right)^{2}\right\|_{L^{\frac{q}{q-1}}(S)}  \tag{3.11}\\
& =\|h\|_{L^{q}(S)}\left\|w H^{\prime}(w)\right\|_{L^{\tilde{q}}(S)}^{2} .
\end{align*}
$$

As $u \leq 0$ on $\partial S, H(w)=0$ on $\partial S$ and the Monge-Ampère Sobolev inequality, Theorem 2.4, implies

$$
\begin{align*}
\int_{S} G^{\prime}(w) \Phi D w \cdot D w d x & =\int_{S} H^{\prime}(w)^{2} \Phi D w \cdot D w d x \\
& =\int_{S} \Phi D H(w) \cdot D H(w) d x  \tag{3.12}\\
& \geq c_{1}(q, n, \lambda, \Lambda)\|H(w)\|_{L^{\hat{n}}(S)}^{2}
\end{align*}
$$

where

$$
\widehat{n}= \begin{cases}\frac{2 n}{n-2} & \text { if } n \geq 3  \tag{3.13}\\ 2 \widehat{q} & \text { if } n=2\end{cases}
$$

Note that as $q>n / 2$, we have $\widehat{n}>\widehat{q}$. From (3.8), (3.11), and (3.12), we have

$$
\begin{equation*}
\|H(w)\|_{L^{\hat{n}}(S)} \leq C_{2}(q, n, \lambda, \Lambda)\|h\|_{L^{q}(S)}^{1 / 2}\left\|w H^{\prime}(w)\right\|_{L^{\hat{q}}(S)} \tag{3.14}
\end{equation*}
$$

Letting $N \rightarrow \infty$, the terms in (3.14) converge to

$$
\begin{align*}
& \|H(w)\|_{L^{\widehat{n}}(S)} \rightarrow\left\|w^{\beta}-k^{\beta}\right\|_{L^{\widehat{n}}(S)},  \tag{3.15}\\
& \left\|w H^{\prime}(w)\right\|_{L^{\widehat{q}}(S)} \rightarrow\left\|\beta w^{\beta}\right\|_{L^{\widehat{q}}(S)}
\end{align*}
$$

We also have

$$
\begin{align*}
\left\|k^{\beta}\right\|_{L^{\hat{n}}(S)} & =k^{\beta}|S|^{1 / \widehat{n}}=|S|^{1 / \widehat{n}-1 / \widehat{q}}\left\|k^{\beta}\right\|_{L^{\widehat{q}}(S)} \\
& \leq\left|B_{1}\right|^{1 / \widehat{n}-1 / \widehat{q}}\left\|k^{\beta}\right\|_{L^{\widehat{q}}(S)}  \tag{3.16}\\
& \leq\left|B_{1}\right|^{1 / \widehat{n}-1 / \widehat{q}}\left\|w^{\beta}\right\|_{L^{\widehat{q}}(S)} .
\end{align*}
$$

Because $\beta \geq 1$, from (3.14)-(3.16) and (3.9), we conclude that

$$
\begin{equation*}
\left\|w^{\beta}\right\|_{L^{\widehat{n}}(S)} \leq \widetilde{C} \beta\left\|w^{\beta}\right\|_{L^{\widehat{q}}(S)}, \tag{3.17}
\end{equation*}
$$

where

$$
\begin{aligned}
\widetilde{C} & =C_{2}(n, \lambda, \Lambda, q)\|h\|_{L^{q}(S)}^{1 / 2}+\left|B_{1}\right|^{1 / \widehat{n}-1 / \widehat{q}} \\
& \leq \widetilde{C}\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)},\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}\right) .
\end{aligned}
$$

Note that $\widetilde{C}$ is independent of $\beta$.
We define

$$
\chi:=\frac{\widehat{n}}{\widehat{q}}>1
$$

and rewrite (3.17) as

$$
\begin{equation*}
\|w\|_{L^{\beta \chi \widehat{q}}(S)} \leq(\widetilde{C} \beta)^{1 / \beta}\|w\|_{L^{\beta \widehat{q}}(S)} . \tag{3.18}
\end{equation*}
$$

Setting $\beta=\chi^{m} \geq 1$ (for integer $m \geq 0$ ) in (3.18), we get

$$
\begin{equation*}
\|w\|_{L \chi^{m+1} \widetilde{\left.q^{( } S\right)}} \leq \widetilde{C}^{\chi^{-m}} \chi^{m \chi^{-m}}\|w\|_{L \chi^{m}(\widehat{q}(S)} . \tag{3.19}
\end{equation*}
$$

Iterating (3.19) yields

$$
\begin{equation*}
\|w\|_{L^{\infty}(S)} \leq \widetilde{C}^{\sum_{m \geq 0} \chi^{-m}} \chi^{\sum_{m \geq 0} m \chi^{-m}}\|w\|_{L^{\widehat{q}}(S)} . \tag{3.20}
\end{equation*}
$$

Because $w \geq u^{+} \geq 0$ and

$$
\|w\|_{L^{\widehat{q}}(S)} \leq\|w\|_{L^{\infty}(S)}^{1-2 / \widehat{q}}\|w\|_{L^{2}(S)}^{2 / \widehat{q}}
$$

(3.20) gives

$$
\begin{aligned}
\sup _{S} u^{+} \leq\|w\|_{L^{\infty}(S)} & \leq C\|w\|_{L^{2}(S)} \leq C\left(k+\left\|u^{+}\right\|_{L^{2}(S)}\right) \\
& =C\left(\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)}+\left\|u^{+}\right\|_{L^{2}(S)}\right)
\end{aligned}
$$

where

$$
C=C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)},\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}\right) .
$$

This completes the proof.
Note that the $L^{2}$ norm of $u^{+}$appears on the right-hand side of (3.1). We will use a trick in Gilbarg-Trudinger [GT01, Section 8.5] to eliminate this term. We first prove the following lemma.

Lemma 3.2. Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Suppose $\mathbf{F}, \mathbf{B}, \mathbf{b} \in$ $L_{\text {loc }}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\text {loc }}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\text {loc }}^{n}(\Omega), n / 2<r<\infty$, and div $\mathbf{B} \leq 0$. Suppose $S=S_{\varphi}(x, t)$ is a normalized section and $S_{\varphi}(x, 2 t) \Subset \Omega$. Suppose $u \in W^{1,2}(S) \cap C(\bar{S})$ is a subsolution to (1.1) in $S$ satisfying $u \leq 0$ on $\partial S$. Assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n}{2}$, where $\varepsilon^{*}$ is as in Theorem 2.7.

Then,

$$
\begin{equation*}
w=\log \frac{M+k}{M+k-u^{+}} \quad \text { where } M=\sup _{S} u^{+} \quad \text { and } k=\|f\|_{L^{r}(S)}+\|\mathbf{F}\|_{L^{\infty}(S)}, \tag{3.21}
\end{equation*}
$$

satisfies

$$
\begin{equation*}
\|w\|_{L^{2}(S)} \leq C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)},\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}\right) \tag{3.22}
\end{equation*}
$$

Proof. Set

$$
v:=\frac{u^{+}}{M+k-u^{+}} .
$$

Then $v \geq 0$, and $v \in W_{0}^{1,2}(S) \cap C(\bar{S})$. Because $u$ is a subsolution to (1.1), we get

$$
\int_{S} \Phi D u \cdot D v d x+\int_{S} u \mathbf{B} \cdot D v d x+\int_{S}(\mathbf{b} \cdot D u) v d x \leq \int_{S} \mathbf{F} \cdot D v d x+\int_{S} f v d x
$$

As $\operatorname{div} \mathbf{B} \leq 0$ and $u v \geq 0$,

$$
\int_{S} u \mathbf{B} \cdot D v d x=\int_{S} \mathbf{B} \cdot D(u v) d x-\int_{S} v \mathbf{B} \cdot D u d x \geq-\int_{S} v \mathbf{B} \cdot D u d x
$$

and therefore, we have

$$
\begin{equation*}
\int_{S} \Phi D u \cdot D v d x+\int_{S}((\mathbf{b}-\mathbf{B}) \cdot D u) v d x \leq \int_{S} \mathbf{F} \cdot D v d x+\int_{S} f v d x \tag{3.23}
\end{equation*}
$$

Because

$$
\begin{equation*}
D v=\frac{M+k}{\left(M+k-u^{+}\right)^{2}} D u^{+}, \tag{3.24}
\end{equation*}
$$

the left-hand side of (3.23) becomes

$$
\begin{align*}
& \int_{S} \Phi D u \cdot D v d x+\int_{S}((\mathbf{b}-\mathbf{B}) \cdot D u) v d x \\
& =\int_{S} \frac{M+k}{\left(M+k-u^{+}\right)^{2}} \Phi D u^{+} \cdot D u^{+} d x+\int_{S} \frac{u^{+}(\mathbf{b}-\mathbf{B}) \cdot D u^{+}}{M+k-u^{+}} d x . \tag{3.25}
\end{align*}
$$

We may also use (3.24) to substitute $D v$ in the right-hand side of (3.23) to obtain

$$
\begin{equation*}
\int_{S} \mathbf{F} \cdot D v d x+\int_{S} f v d x=\int_{S} \frac{(M+k) \mathbf{F} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} d x+\int_{S} \frac{f u^{+}}{M+k-u^{+}} d x . \tag{3.26}
\end{equation*}
$$

Putting (3.23), (3.25), and (3.26) together, and dividing both sides by $M+k$, we find

$$
\begin{equation*}
\int_{S} \frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} d x \leq \int_{S} \frac{\mathbf{F} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} d x+\int_{S} \frac{f u^{+}+u^{+}(\mathbf{B}-\mathbf{b}) \cdot D u^{+}}{(M+k)\left(M+k-u^{+}\right)} d x \tag{3.27}
\end{equation*}
$$

Now we estimate the terms in (3.27) separately. First, from the Cauchy-Schwarz inequality and (3.3), we have

$$
\begin{align*}
\int_{S} \frac{\mathbf{F} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} d x & \leq \int_{S} \frac{\left(\Phi D u^{+} \cdot D u^{+}\right)^{1 / 2}\left(\lambda^{-1} \Delta \varphi|\mathbf{F}|^{2}\right)^{1 / 2}}{\left(M+k-u^{+}\right)^{2}} d x \\
& \leq \frac{1}{4} \int_{S} \frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} d x+\int_{S} \frac{\lambda^{-1} \Delta \varphi|\mathbf{F}|^{2}}{\left(M+k-u^{+}\right)^{2}} d x  \tag{3.28}\\
& \leq \frac{1}{4} \int_{S} \frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} d x+\int_{S} \lambda^{-1} \Delta \varphi d x
\end{align*}
$$

as $M+k-u^{+} \geq k \geq\|\mathbf{F}\|_{L^{\infty}(S)}$. Next, using $k \geq\|f\|_{L^{r}(S)}$ and the Hölder inequality, we estimate

$$
\begin{align*}
\int_{S} \frac{f u^{+}}{\left(M+k-u^{+}\right)(M+k)} d x & \leq \int_{S} \frac{|f|}{k} \times 1 d x \leq\left\|\frac{f}{k}\right\|_{L^{r}(S)}\|1\|_{L^{r /(r-1)}(S)}  \tag{3.29}\\
& \leq|S|^{\frac{r-1}{r}} \leq\left|B_{n}\right|^{\frac{r-1}{r}}
\end{align*}
$$

Finally, from Cauchy-Schwarz inequality and (3.3), we estimate

$$
\begin{align*}
\int_{S} \frac{u^{+}(\mathbf{B}-\mathbf{b}) \cdot D u^{+}}{(M+k)\left(M+k-u^{+}\right)} d x & \leq \int_{S}|\mathbf{b}-\mathbf{B}|\left|\frac{D u^{+}}{M+k-u^{+}}\right| d x \\
& \leq \int_{S}\left\{\frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}}\right\}^{1 / 2}\left\{\frac{\Delta \varphi}{\lambda}|\mathbf{b}-\mathbf{B}|^{2}\right\}^{1 / 2} d x  \tag{3.30}\\
& \leq \frac{1}{4} \int_{S} \frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} d x+\int_{S} \frac{\Delta \varphi}{\lambda}|\mathbf{b}-\mathbf{B}|^{2} d x
\end{align*}
$$

Combining (3.27) with (3.28)-(3.30) yields

$$
\begin{align*}
\frac{1}{2} \int_{S} \frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} d x & \leq\left|B_{n}\right|^{\frac{r-1}{r}}+\frac{1+\left(\|\mathbf{b}\|_{L^{\infty}(S)}+\|\mathbf{B}\|_{L^{\infty}(S)}\right)^{2}}{\lambda} \int_{S} \Delta \varphi d x  \tag{3.31}\\
& \leq C_{0}\left(n, r, \varepsilon^{*}, \lambda, \Lambda,\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)},\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}\right)
\end{align*}
$$

As $u \leq 0$ on $\partial S, w=0$ on $\partial S$. Also, we have

$$
\begin{equation*}
D w=\frac{D u^{+}}{M+k-u^{+}} \tag{3.32}
\end{equation*}
$$

Therefore, the left-hand side of (3.31) can be estimated using the Hölder inequality and the Monge-Amp̀ere Sobolev inequality in Theorem [2.4.

$$
\begin{align*}
& \frac{1}{2} \int_{S} \frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} d x=\frac{1}{2} \int_{S} \Phi D w \cdot D w d x \\
& \geq \begin{cases}c_{1}\|w\|_{L^{\frac{2 n}{n-2}(S)}}^{2} \geq c_{1}|S|^{-2 / n}\|w\|_{L^{2}(S)}^{2} \geq c_{1}\left|B_{n}\right|^{-2 / n}\|w\|_{L^{2}(S)}^{2} & \text { if } n \geq 3 \\
c_{1}\|w\|_{L^{4}(S)}^{2} \geq c_{1}\left|B_{n}\right|^{-1 / 2}\|w\|_{L^{2}(S)}^{2} & \text { if } n=2\end{cases} \tag{3.33}
\end{align*}
$$

where $c_{1}=c_{1}(n, \lambda, \Lambda)$. The conclusion of the lemma follows from (3.31) and (3.33).
Now we obtain the following global $L^{\infty}$ estimate, independent of the $L^{2}$ norm of the solution $u$, by showing that $w$ in (3.21) is a subsolution to an equation of the same form as (1.1).

Lemma 3.3. Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Suppose $\mathbf{F}, \mathbf{B}, \mathbf{b} \in$ $L_{\text {loc }}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\mathrm{loc}}^{n}(\Omega), n / 2<r<\infty$, and $\operatorname{div} \mathbf{B} \leq 0$. Suppose $S=S_{\varphi}(x, t)$ is a normalized section and $S_{\varphi}(x, 2 t) \Subset \Omega$. Suppose $u \in W^{1,2}(S) \cap C(\bar{S})$ is a subsolution to (1.1) in $S$ satisfying $u \leq 0$ on $\partial S$. Assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n}{2}$, where $\varepsilon^{*}$ is from Theorem 2.7.

Then,

$$
\begin{equation*}
\sup _{S} u^{+} \leq C\left(\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)}\right) \tag{3.34}
\end{equation*}
$$

where

$$
C=C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)},\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}\right) .
$$

Proof. Let $w \in W_{0}^{1,2}(S)$ be as in (3.21). Then, using (3.32), we get

$$
\begin{align*}
-\mathbf{B} \cdot D w & =-\frac{\mathbf{B} \cdot D u^{+}}{M+k-u^{+}} \\
& =\frac{-\operatorname{div}\left(\mathbf{B} u^{+}\right)+u^{+} \operatorname{div} \mathbf{B}}{M+k-u^{+}} \leq \frac{-\operatorname{div}\left(\mathbf{B} u^{+}\right)}{M+k-u^{+}} \tag{3.35}
\end{align*}
$$

as $\operatorname{div} \mathbf{B} \leq 0$. We have in the weak sense,

$$
\begin{equation*}
-\operatorname{div}(\Phi D w)=-\frac{\operatorname{div}\left(\Phi D u^{+}\right)}{M+k-u^{+}}-\frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} . \tag{3.36}
\end{equation*}
$$

From (3.32), (3.35), and (3.36), we get

$$
-\operatorname{div}(\Phi D w)+(\mathbf{b}-\mathbf{B}) \cdot D w \leq \frac{-\operatorname{div}\left(\Phi D u^{+}+u^{+} \mathbf{B}\right)+\mathbf{b} \cdot D u^{+}}{M+k-u^{+}}-\frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} .
$$

Combining this with (1.1), we get

$$
\begin{aligned}
& -\operatorname{div}(\Phi D w)+(\mathbf{b}-\mathbf{B}) \cdot D w \\
& \leq \frac{f-\operatorname{div} \mathbf{F}}{M+k-u^{+}}-\frac{\Phi D u^{+} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}} \\
& =-\operatorname{div}\left(\frac{\mathbf{F}}{M+k-u^{+}}\right)+\frac{f}{M+k-u^{+}}+\left(\frac{-\Phi D u^{+} \cdot D u^{+}+\mathbf{F} \cdot D u^{+}}{\left(M+k-u^{+}\right)^{2}}\right) \quad \text { in }\{u \geq 0\} .
\end{aligned}
$$

From (3.3) and the Cauchy-Schwarz inequality, we have in $S$

$$
\begin{aligned}
-\Phi D u^{+} \cdot D u^{+}+\mathbf{F} \cdot D u^{+} & \leq-\frac{\lambda}{\Delta \varphi}\left|D u^{+}\right|^{2}+\mathbf{F} \cdot D u^{+} \\
& \leq \frac{\Delta \varphi|\mathbf{F}|^{2}}{4 \lambda} \\
& \leq \frac{\Delta \varphi\left(M+k-u^{+}\right)^{2}}{4 \lambda}
\end{aligned}
$$

which implies

$$
-\operatorname{div}(\Phi D w)+(\mathbf{b}-\mathbf{B}) \cdot D w \leq-\operatorname{div}\left(\frac{\mathbf{F}}{M+k-u^{+}}\right)+\frac{f}{M+k-u^{+}}+\frac{\Delta \varphi}{4 \lambda} \quad \text { in }\{u \geq 0\}
$$

As $w=0$ outside $\{u \geq 0\}, w$ is a subsolution to

$$
\begin{equation*}
-\operatorname{div}(\Phi D w)+\widetilde{\mathbf{b}} \cdot D w \leq-\operatorname{div} \widetilde{\mathbf{F}}+\widetilde{f} \quad \text { in } S \tag{3.37}
\end{equation*}
$$

where

$$
\begin{align*}
\widetilde{\mathbf{b}} & =\mathbf{b}-\mathbf{B}, \\
\widetilde{\mathbf{F}} & =\frac{\mathbf{F}}{M+k-u^{+}} \chi_{\{u \geq 0\}}, \quad \text { and }  \tag{3.38}\\
\widetilde{f} & =\left(\frac{f}{M+k-u^{+}}+\frac{\Delta \varphi}{4 \lambda}\right) \chi_{\{u \geq 0\}} .
\end{align*}
$$

Recalling that $k=\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)}$ and $M=\sup _{S} u^{+} \geq u^{+}$, we obtain

$$
\begin{equation*}
\|\widetilde{\mathbf{b}}\|_{L^{\infty}(S)} \leq\|\mathbf{b}\|_{L^{\infty}(S)}+\|\mathbf{B}\|_{L^{\infty}(S)}, \quad \text { and } \quad\|\widetilde{\mathbf{F}}\|_{L^{\infty}(S)} \leq 1 \tag{3.39}
\end{equation*}
$$

For $\widetilde{r}:=\min \left\{r, 1+\varepsilon^{*}\right\}>n / 2$, using the Hölder inequality and the volume estimate in Lemma [2.8, we have

$$
\begin{align*}
\|\widetilde{f}\|_{L^{\tilde{r}}(S)} & \leq \frac{\|f\|_{L^{\tilde{r}}(S)}}{k}+\frac{\|\Delta \varphi\|_{L^{\tilde{r}}(S)}}{4 \lambda} \\
& \leq C_{1}\left(n, r, \varepsilon^{*}\right)\left(\frac{\|f\|_{L^{r}(S)}}{k}+\frac{\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}(S)}}}{4 \lambda}\right)  \tag{3.40}\\
& \leq C_{1}\left(n, r, \varepsilon^{*}\right)\left(1+\frac{\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}}{4 \lambda}\right) \\
& \leq C_{2}\left(n, r, \varepsilon^{*}, \lambda,\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}\right)
\end{align*}
$$

Combining (3.37)-(3.40) and applying Lemmas 3.1 and 3.2, we get

$$
\begin{align*}
\sup _{S} w & \leq C_{3}\left(\|\widetilde{\mathbf{F}}\|_{L^{\infty}(S)}+\|f\|_{L^{\tilde{r}}(S)}+\|w\|_{L^{2}(S)}\right)  \tag{3.41}\\
& \leq C_{4}\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)},\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}\right) .
\end{align*}
$$

Recalling that

$$
w=\log \frac{M+k}{M+k-u^{+}}
$$

and $M=\sup _{S} u^{+}$, we have

$$
\begin{equation*}
\sup _{S} w=\log \frac{M+k}{k} . \tag{3.42}
\end{equation*}
$$

Therefore, as $k=\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)}$, the conclusion of the lemma follows from (3.41) and (3.42).

By applying Lemma 3.3 to $u$ and $-u$, we obtain the following estimate.
Lemma 3.4. Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Suppose $\mathbf{F}, \mathbf{B}, \mathbf{b} \in$ $L_{\text {loc }}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\mathrm{loc}}^{n}(\Omega), n / 2<r<\infty$, and $\operatorname{div} \mathbf{B} \leq 0$. Suppose $S=S_{\varphi}(x, t)$ is a normalized section and $S_{\varphi}(x, 2 t) \Subset \Omega$. Suppose $u \in W^{1,2}(S) \cap C(\bar{S})$ is a solution to (1.1) in $S$ satisfying $u=0$ on $\partial S$. Assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n}{2}$, where $\varepsilon^{*}$ is from Theorem 2.7.

Then,

$$
\begin{equation*}
\|u\|_{L^{\infty}(S)} \leq C\left(\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)}\right) \tag{3.43}
\end{equation*}
$$

where

$$
C=C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)},\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}}(S)}\right)
$$

Now, we rescale (1.1) and apply Lemma 3.4 to obtain the following global estimate.
Proposition 3.5 (Global $L^{\infty}$ estimate in normalized section). Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.31). Suppose $\mathbf{F}, \mathbf{B}, \mathbf{b} \in L_{\mathrm{loc}}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\mathrm{loc}}^{n}(\Omega), n / 2<$ $r<\infty$, and $\operatorname{div} \mathbf{B} \leq 0$. Suppose $S_{\varphi}\left(x_{0}, 2 h_{0}\right)$ is a normalized section contained in $\Omega$, and $h \leq h_{0}$. Assume that $u \in W^{1,2}(S) \cap C(\bar{S})$ is a solution to (1.1) in $S=S_{\varphi}\left(x_{0}, h\right)$ satisfying $u=0$ on $\partial S$. Further assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n}{2}$, where $\varepsilon^{*}$ is from Theorem 2.7.

Then,

$$
\begin{equation*}
\|u\|_{L^{\infty}(S)} \leq C\left(\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)}\right) h^{\gamma} \tag{3.44}
\end{equation*}
$$

where

$$
\begin{aligned}
& C=C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)}\right), \quad \text { and } \\
& \gamma=\gamma(n, \lambda, \Lambda, r)>0
\end{aligned}
$$

Proof. We use the rescaling in Le ([Le23, pp.20-22], LLe18a, Section 3.2]). By John's lemma, there is an affine transformation $T x=A_{h} x+b_{h}$ such that $B_{1} \subset T^{-1}\left(S_{\varphi}\left(x_{0}, h\right)\right) \subset B_{n}$. We define the rescaled functions

$$
\begin{align*}
\widetilde{\varphi}(x) & :=\left(\operatorname{det} A_{h}\right)^{-2 / n} \varphi(T x), \\
\widetilde{u}(x) & :=u(T x), \\
\widetilde{\mathbf{F}}(x) & :=\left(\operatorname{det} A_{h}\right)^{2 / n} A_{h}^{-1} \mathbf{F}(T x), \\
\widetilde{\mathbf{b}}(x) & :=\left(\operatorname{det} A_{h}\right)^{2 / n} A_{h}^{-1} \mathbf{b}(T x),  \tag{3.45}\\
\widetilde{\mathbf{B}}(x) & :=\left(\operatorname{det} A_{h}\right)^{2 / n} A_{h}^{-1} \mathbf{B}(T x), \quad \text { and } \\
\widetilde{f}(x) & :=\left(\operatorname{det} A_{h}\right)^{2 / n} f(T x)
\end{align*}
$$

on

$$
\begin{equation*}
\widetilde{S}:=T^{-1}\left(S_{\varphi}\left(x_{0}, h\right)\right)=S_{\widetilde{\varphi}}\left(y_{0},\left(\operatorname{det} A_{h}\right)^{-2 / n} h\right) \tag{3.46}
\end{equation*}
$$

where $y_{0}=T^{-1} x_{0}$. Then, the rescaled functions satisfy the equation

$$
\begin{equation*}
-\operatorname{div}(\widetilde{\Phi} D \widetilde{u}+\widetilde{u} \widetilde{\mathbf{B}})+\widetilde{\mathbf{b}} \cdot D \widetilde{u}=\widetilde{f}-\operatorname{div} \widetilde{\mathbf{F}} \quad \text { in } \widetilde{S} \tag{3.47}
\end{equation*}
$$

To apply Lemma 3.4 to $\widetilde{u}$, we estimate the rescaled functions. First, note that

$$
\operatorname{det} D^{2} \widetilde{\varphi}(x)=\left(\operatorname{det} D^{2} \varphi\right)(T x) \quad \text { in } \widetilde{S}
$$

so that

$$
\lambda \leq \operatorname{det} D^{2} \widetilde{\varphi} \leq \Lambda \quad \text { in } \widetilde{S}
$$

Furthermore, as $B_{1} \subset \widetilde{S} \subset B_{n}$, we have from Lemma 2.8,

$$
\begin{equation*}
c(n, \lambda, \Lambda) h^{n / 2} \leq \operatorname{det} A_{h} \leq C(n, \lambda, \Lambda) h^{n / 2} . \tag{3.48}
\end{equation*}
$$

From Corollary 2.6, we get

$$
\begin{equation*}
\left\|A_{h}^{-1}\right\| \leq \frac{n}{c h^{\frac{1}{1+\alpha}}} \leq C(n, \lambda, \Lambda) h^{-\frac{1}{1+\alpha}} . \tag{3.49}
\end{equation*}
$$

Now, from (3.45), (3.48), and (3.49), we get

$$
\begin{equation*}
\|\widetilde{\mathbf{b}}\|_{L^{\infty}(\widetilde{S})} \leq\left(C h^{n / 2}\right)^{2 / n} C h^{-\frac{1}{1+\alpha}}\|\mathbf{b}\|_{L^{\infty}(S)} \leq C(n, \lambda, \Lambda) h^{\frac{\alpha}{1+\alpha}}\|\mathbf{b}\|_{L^{\infty}(S)} . \tag{3.50}
\end{equation*}
$$

Similarly, we also obtain

$$
\begin{align*}
& \|\widetilde{\mathbf{B}}\|_{L^{\infty}(\widetilde{S})} \leq C(n, \lambda, \Lambda) h^{\frac{\alpha}{1+\alpha}}\|\mathbf{B}\|_{L^{\infty}(S)}, \quad \text { and }  \tag{3.51}\\
& \|\widetilde{\mathbf{F}}\|_{L^{\infty}(\widetilde{S})} \leq C(n, \lambda, \Lambda) h^{\frac{\alpha}{1+\alpha}}\|\mathbf{F}\|_{L^{\infty}(S)}
\end{align*}
$$

Finally, we get

$$
\begin{align*}
\|\widetilde{f}\|_{L^{r}(\widetilde{S})} & =\left(\int_{\widetilde{S}}\left(\operatorname{det} A_{h}\right)^{2 r / n} f^{r}(T x) d x\right)^{1 / r} \\
& =\left(\int_{S}\left(\operatorname{det} A_{h}\right)^{(2 r / n)-1} f^{r}(y) d y\right)^{1 / r}  \tag{3.52}\\
& \leq\left(\int_{S}\left(C h^{n / 2}\right)^{(2 r / n)-1} f^{r}(y) d y\right)^{1 / r} \\
& =C(n, \lambda, \Lambda)^{2 / n-1 / r} h^{1-n / 2 r}\|f\|_{L^{r}(S)} .
\end{align*}
$$

As $\partial \widetilde{S}=T^{-1}(\partial S), \widetilde{u}=0$ on $\partial \widetilde{S}$. Therefore, we may apply Lemma 3.4 to $\widetilde{u}$ and combine it with (3.51) and (3.52) to get

$$
\begin{align*}
\|u\|_{L^{\infty}(S)} & =\|\widetilde{u}\|_{L^{\infty}(\widetilde{S})} \\
& \leq \widetilde{C}\left(\|\widetilde{\mathbf{F}}\|_{L^{\infty}(\widetilde{S})}+\|\widetilde{f}\|_{L^{r}(\widetilde{S})}\right)  \tag{3.53}\\
& \leq \widetilde{C}\left(C(n, \lambda, \Lambda) h^{\frac{\alpha}{1+\alpha}}\|\mathbf{F}\|_{L^{\infty}(S)}+C(n, \lambda, \Lambda, r) h^{1-n / 2 r}\|f\|_{L^{r}(S)}\right)
\end{align*}
$$

where

$$
\begin{equation*}
\widetilde{C}=C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\widetilde{\mathbf{b}}\|_{L^{\infty}(\widetilde{S})},\|\widetilde{\mathbf{B}}\|_{L^{\infty}(\widetilde{S})},\left\|D^{2} \widetilde{\varphi}\right\|_{L^{1+\varepsilon^{*}}(\widetilde{S})}\right) \tag{3.54}
\end{equation*}
$$

As $S_{\varphi}\left(x_{0}, h\right)$ is contained in a normalized section, we have

$$
\begin{equation*}
h \leq C(n, \lambda, \Lambda) \tag{3.55}
\end{equation*}
$$

Therefore, we have

$$
\begin{equation*}
\widetilde{C} \leq C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)}\right) \tag{3.56}
\end{equation*}
$$

Furthermore, the $L^{\infty}$ norms of $\widetilde{\mathbf{b}}, \widetilde{\mathbf{B}}$ are under control by (3.50) and (3.51). Finally, by the $W^{2,1+\varepsilon}$ estimate in Theorem [2.7, we have

$$
\left\|D^{2} \widetilde{\varphi}\right\|_{L^{1+\varepsilon^{*}}(\widetilde{S})} \leq C(n, \lambda, \Lambda)
$$

Combining (3.53), (3.54), and (3.55), we have

$$
\begin{equation*}
\|u\|_{L^{\infty}(S)} \leq \widetilde{C} C(n, \lambda, \Lambda, r, \alpha)\left(\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)}\right) h^{\gamma(n, r, \alpha)} \tag{3.57}
\end{equation*}
$$

where

$$
\gamma=\min \left\{1-\frac{n}{2 r}, \frac{\alpha}{1+\alpha}\right\} .
$$

As $\alpha=\alpha(n, \lambda, \Lambda)$, the conclusion of the lemma follows from (3.56) and (3.57).

## 4. Harnack Inequality

In this section, we prove the Harnack inequality in Theorem 1.1. As in Section 3, we first prove the Harnack inequality in a domain contained in a normalized section; then, we rescale (1.1) to prove the inequality in general domains.

Proposition 4.1 (Harnack inequality in normalized section). Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Suppose that $\mathbf{F}, \mathbf{B}, \mathbf{b} \in L_{\mathrm{loc}}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right) \cap W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\text {loc }}^{n}(\Omega)$, $\operatorname{div} \mathbf{B} \leq 0$, and $n / 2<r<\infty$. Suppose $S_{\varphi}\left(x, h_{0}\right)$ is a normalized section contained in $\Omega$, and $h \leq h_{0} / 2$. Assume that $u \in W^{2, n}\left(S_{\varphi}(x, h)\right)$ is a nonnegative solution to (1.1) in $S_{\varphi}(x, h)$. Further assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n}{2}$, where $\varepsilon^{*}$ is from Theorem 2.7.

Then,

$$
\sup _{S_{\varphi}(x, h / 2)} u \leq C\left(\left(\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}(x, h)\right)}+\|f\|_{L^{r}\left(S_{\varphi}(x, h)\right)}\right) h^{\gamma}+\inf _{S_{\varphi}(x, h / 2)} u\right)
$$

where

$$
\begin{aligned}
\gamma & =\gamma(n, \lambda, \Lambda, r)>0, \quad \text { and } \\
C & =C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}(x, h)\right)},\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}(x, h)\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{\varphi}(x, h)\right)}\right)>0 .
\end{aligned}
$$

Proof. By [GT01, Theorem 9.15], we can find a solution $u_{0} \in W^{2, n}(S)$ to

$$
\begin{cases}-\operatorname{div}\left(\Phi D u_{0}+u_{0} \mathbf{B}\right)+\mathbf{b} \cdot D u_{0}=f-\operatorname{div} \mathbf{F} & \text { in } S:=S_{\varphi}(x, h) \\ u_{0}=0 & \text { on } \partial S\end{cases}
$$

Then $v=u-u_{0}$ satisfies $v \geq 0$ on $\partial S$, and is a solution to

$$
-\operatorname{div}(\Phi D v+v \mathbf{B})+\mathbf{b} \cdot D v=0 \quad \text { in } S
$$

Observing that the equation above can be written as

$$
-\Phi^{i j} D_{i j} v+(\mathbf{b}-\mathbf{B}) \cdot D v-(\operatorname{div} \mathbf{B}) v=0
$$

and $\operatorname{div} \mathbf{B} \leq 0$, we have $v \geq 0$ in $S$ by the maximum principle [GT01, Theorem 9.1]. As $S_{\varphi}(x, 2 h)$ is contained in a normalized section, $S_{\varphi}(x, 2 h) \subset B_{n}$ and $h \leq C(n, \lambda, \Lambda)$ by Lemma 2.8. Therefore, we can apply the Harnack inequality in Theorem 2.9 to get

$$
\begin{equation*}
\sup _{S_{\varphi}(x, h / 2)} v \leq C_{1} \inf _{S_{\varphi}(x, h / 2)} v, \tag{4.1}
\end{equation*}
$$

where

$$
C_{1}=C_{1}\left(n, \lambda, \Lambda,\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)},\|\operatorname{div} \mathbf{B}\|_{L^{n}(S)}\right)
$$

By applying the global estimate in Proposition 3.5 to $u_{0}$, we obtain

$$
\begin{equation*}
\sup _{S}\left|u_{0}\right| \leq C_{2}\left(\|\mathbf{F}\|_{L^{\infty}(S)}+\|f\|_{L^{r}(S)}\right) h^{\gamma}, \tag{4.2}
\end{equation*}
$$

where

$$
\begin{aligned}
C_{2} & =C_{2}\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}(S)},\|\mathbf{B}\|_{L^{\infty}(S)}\right), \quad \text { and } \\
\gamma & =\gamma(n, \lambda, \Lambda, r)>0 .
\end{aligned}
$$

As $v=u-u_{0}$, combining (4.1) and (4.2) completes the proof.
We are now ready to prove Theorem [1.1.
Proof of Theorem 1.1. We prove the theorem by using the rescaling scheme in the proof of Proposition 3.5, Using John's lemma, we find an affine transformation

$$
T x=A_{h} x+b_{h}
$$

such that

$$
\begin{equation*}
T B_{1} \subset S:=S_{\varphi}\left(x_{0}, h\right) \subset T B_{n} \tag{4.3}
\end{equation*}
$$

Using the transformation $T$, we define the rescaled functions as in (3.45), (3.46).
We start by estimating the matrix $A_{h}$. First, from (4.3) and Lemma 2.8, we obtain the following bounds on $\operatorname{det} A_{h}$ :

$$
\begin{align*}
& \left|\operatorname{det} A_{h}\right|=\frac{\left|T B_{1}\right|}{\left|B_{1}\right|} \leq \frac{\left|S_{\varphi}\left(x_{0}, h\right)\right|}{\left|B_{1}\right|} \leq C_{1}(n, \lambda, \Lambda) h^{n / 2}=: C_{3}(n, \lambda, \Lambda, h), \quad \text { and } \\
& \left|\operatorname{det} A_{h}\right|=\frac{\left|T B_{n}\right|}{\left|B_{n}\right|} \geq \frac{\left|S_{\varphi}\left(x_{0}, h\right)\right|}{\left|B_{n}\right|} \geq c_{1}(n, \lambda, \Lambda) h^{n / 2}=: c_{4}(n, \lambda, \Lambda, h) . \tag{4.4}
\end{align*}
$$

We also have (see [Le24, (5.6)])

$$
\begin{equation*}
\left\|A_{h}^{-1}\right\| \leq C_{2}=\widetilde{C}\left(n, \lambda, \Lambda, \operatorname{diam}\left(S_{\varphi}\left(x_{0}, 2 h\right)\right)\right) h^{-n / 2} \tag{4.5}
\end{equation*}
$$

Recall that from (3.46),

$$
\widetilde{S}:=T^{-1}\left(S_{\varphi}\left(x_{0}, h\right)\right)=S_{\widetilde{\varphi}}\left(y_{0},\left(\operatorname{det} A_{h}\right)^{-2 / n} h\right)
$$

We now estimate the rescaled functions. From (3.45), (4.5) and (4.4), we have

$$
\begin{aligned}
\|\widetilde{\mathbf{b}}\|_{L^{\infty}(\widetilde{S})} & \leq C_{3}^{2 / n} C_{2}\|\mathbf{b}\|_{L^{\infty}(S)}, \\
\|\widetilde{\mathbf{B}}\|_{L^{\infty}(\widetilde{S})} & \leq C_{3}^{2 / n} C_{2}\|\mathbf{B}\|_{L^{\infty}(S)}, \\
\|\widetilde{\mathbf{F}}\|_{L^{\infty}(\widetilde{S})} & \leq C_{3}^{2 / n} C_{2}\|\mathbf{F}\|_{L^{\infty}(S)}, \quad \text { and } \\
\|\widetilde{f}\|_{L^{r}(\widetilde{S})} & =\left(\int_{S}\left(\operatorname{det} A_{h}\right)^{(2 r / n)-1} f^{r}(y) d y\right)^{1 / r} \\
& \leq\left(\int_{S} C_{3}^{(2 r / n)-1} f^{r}(y) d y\right)^{1 / r} \\
& =C_{3}^{2 / n-1 / r}\|f\|_{L^{r}(S)} .
\end{aligned}
$$

Also, as

$$
\begin{equation*}
\operatorname{div} \widetilde{\mathbf{B}}(x)=\left(\operatorname{det} A_{h}\right)^{2 / n} \operatorname{div} \mathbf{B}(T x) \leq 0, \tag{4.7}
\end{equation*}
$$

we have

$$
\begin{align*}
\|\operatorname{div} \widetilde{\mathbf{B}}\|_{L^{n}(\widetilde{S})} & =\left(\int_{\widetilde{S}}\left(\operatorname{det} A_{h}\right)^{2}[(\operatorname{div} \mathbf{B})(T x)]^{n} d x\right)^{1 / n} \\
& =\left(\int_{S}\left(\operatorname{det} A_{h}\right)[(\operatorname{div} \mathbf{B})(y)]^{n} d y\right)^{1 / n}  \tag{4.8}\\
& \leq\left(\int_{S} C_{3}[(\operatorname{div} \mathbf{B})(y)]^{n} d y\right)^{1 / n} \\
& =C_{3}^{1 / n}\|\operatorname{div} \mathbf{B}\|_{L^{n}(S)}
\end{align*}
$$

For $t \leq h / 2$, setting

$$
\widetilde{t}=\left(\operatorname{det} A_{h}\right)^{-2 / n} t \leq\left(\operatorname{det} A_{h}\right)^{-2 / n} h / 2
$$

gives

$$
\begin{equation*}
S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{t}\right)=T^{-1} S_{\varphi}\left(x_{0}, t\right) \tag{4.9}
\end{equation*}
$$

Then, $\widetilde{u}$ is a solution to the rescaled equation (3.47) in $S_{\widetilde{\varphi}}\left(y_{0}, 2 \widetilde{t}\right)$. Applying Proposition 4.1 to $\widetilde{u}$, we get

$$
\begin{equation*}
\sup _{S_{\tilde{\varphi}}\left(y_{0}, \widetilde{t}\right)} \widetilde{u} \leq C_{5}\left\{\left(\|\widetilde{\mathbf{F}}\|_{L^{\infty}(\widetilde{S})}+\|\widetilde{f}\|_{L^{r}(\widetilde{S})}\right) \widetilde{t^{\gamma}}+\inf _{S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{t}\right)} \widetilde{u}\right\} . \tag{4.10}
\end{equation*}
$$

Here, the constants $C_{5}$ and $\gamma$ come from Proposition 4.1.

$$
\begin{aligned}
\gamma & =\gamma(n, \lambda, \Lambda, r)>0, \quad \text { and } \\
C_{5} & =C_{5}\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\widetilde{\mathbf{b}}\|_{L^{\infty}(\widetilde{S})},\|\operatorname{div} \widetilde{\mathbf{B}}\|_{L^{n}(\widetilde{S})},\|\widetilde{\mathbf{B}}\|_{L^{\infty}(\widetilde{S})}\right)>0 .
\end{aligned}
$$

Furthermore, the norms $\|\widetilde{\mathbf{b}}\|_{L^{\infty}(\widetilde{S})},\|\operatorname{div} \widetilde{\mathbf{B}}\|_{L^{n}(\widetilde{S})},\|\widetilde{\mathbf{B}}\|_{L^{\infty}(\widetilde{S})},\|\widetilde{\mathbf{F}}\|_{L^{\infty}(\widetilde{S})}$, and $\|\widetilde{f}\|_{L^{r}(\widetilde{S})}$ of the rescaled functions are under control by (4.6) and (4.8). Finally, $\tilde{t}$ is controlled by $t$ through

$$
\begin{equation*}
\tilde{t} \leq c_{4}^{-2 / n} t \tag{4.11}
\end{equation*}
$$

Therefore, putting (4.6), (4.8), (4.9) and (4.11) together, we obtain the conclusion of the theorem from (4.10).

## 5. Interior Estimates

In this section, we obtain interior estimates for solutions to (1.1) that will be used in the proof of Hölder estimates in Section 6. We start by proving an interior estimate in a normalized section; then, we rescale (1.1) to extend the result to general sections.
Lemma 5.1 (Interior estimate in normalized section). Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Suppose $\mathbf{F}, \mathbf{b}, \mathbf{B} \in W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right) \cap L_{\mathrm{loc}}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\mathrm{loc}}^{n}(\Omega)$, and $n / 2<$ $r<\infty$. Assume that $S_{\varphi}\left(x_{0}, 2 t\right) \Subset \Omega$, and $S_{\varphi}\left(x_{0}, t\right)$ is a normalized section. Assume that $u \in W^{1,2}\left(S_{\varphi}\left(x_{0}, t\right)\right)$ is a nonnegative solution to (1.1) in $S_{\varphi}\left(x_{0}, t\right)$. Further assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n(n-1)}{2}$ where $\varepsilon^{*}$ is from Theorem 2.7.

Then,

$$
\sup _{S_{\varphi}\left(x_{0}, t / 2\right)} u \leq C\left(\|u\|_{L^{q^{*}}\left(S_{\varphi}\left(x_{0}, t\right)\right)}+\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, t\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, t\right)\right)}\right),
$$

where

$$
C=C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, t\right)\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, t\right)\right)}\right), \quad \text { and } \quad q^{*}=q^{*}\left(\varepsilon^{*}, n, r\right)
$$

Proof. We argue as in Le Le24, pp.515-517]. Let $\bar{u}=u+k$, where

$$
k=\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, t\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, t\right)\right)}
$$

For $\eta \in C_{c}^{1}\left(S_{\varphi}\left(x_{0}, t\right)\right)$ to be determined later and $\beta \geq 0$, we use $v=\eta^{2} \bar{u}^{\beta+1} \in C_{c}^{1}\left(S_{\varphi}\left(x_{0}, t\right)\right)$ as a test function in (1.1) and extend it to be zero outside $S_{\varphi}\left(x_{0}, t\right)$ to obtain

$$
\begin{equation*}
\int_{\Omega} \Phi D u \cdot D v d x+\int_{\Omega} u \mathbf{B} \cdot D v d x+\int_{\Omega} v \mathbf{b} \cdot D u d x=\int_{\Omega} \mathbf{F} \cdot D v d x+\int_{\Omega} f v \tag{5.1}
\end{equation*}
$$

Because

$$
D v=(\beta+1) \eta^{2} \bar{u}^{\beta} D \bar{u}+2 \eta \bar{u}^{\beta+1} D \eta \quad \text { and } D \bar{u}=D u
$$

the terms in (5.1) become

$$
\begin{align*}
\int_{\Omega} \Phi D u \cdot D v d x & =(\beta+1) \int_{\Omega} \eta^{2} \bar{u}^{\beta} \Phi D \bar{u} \cdot D \bar{u} d x+2 \int_{\Omega} \eta \bar{u}^{\beta+1} \Phi D \bar{u} \cdot D \eta d x \\
\int_{\Omega} u \mathbf{B} \cdot D v d x & =(\beta+1) \int_{\Omega} \eta^{2} u \bar{u}^{\beta} \mathbf{B} \cdot D \bar{u} d x+2 \int_{\Omega} \eta u \bar{u}^{\beta+1} \mathbf{B} \cdot D \eta d x \\
\int_{\Omega} v \mathbf{b} \cdot D u d x & =\int_{\Omega} \eta^{2} \bar{u}^{\beta+1} \mathbf{b} \cdot D \bar{u} d x  \tag{5.2}\\
\int_{\Omega} \mathbf{F} \cdot D v d x & =(\beta+1) \int_{\Omega} \eta^{2} \bar{u}^{\beta} \mathbf{F} \cdot D \bar{u} d x+2 \int_{\Omega} \eta \bar{u}^{\beta+1} \mathbf{F} \cdot D \eta d x, \quad \text { and } \\
\int_{\Omega} f v d x & =\int_{\Omega} \eta^{2} \bar{u}^{\beta+1} f d x
\end{align*}
$$

We now estimate these terms. By the Cauchy-Schwarz inequality, we have

$$
\begin{equation*}
-2 \int_{\Omega} \eta \bar{u}^{\beta+1} \Phi D \bar{u} \cdot D \eta d x \leq \frac{1}{8} \int_{\Omega} \eta^{2} \bar{u}^{\beta} \Phi D \bar{u} \cdot D \bar{u} d x+8 \int_{\Omega} \bar{u}^{\beta+2} \Phi D \eta \cdot D \eta d x \tag{5.3}
\end{equation*}
$$

By the Cauchy-Schwarz inequality and (3.3), we get

$$
\begin{align*}
& -(\beta+1) \int_{\Omega} \eta^{2} u \bar{u}^{\beta} \mathbf{B} \cdot D \bar{u} d x \\
& \leq(\beta+1) \int_{\Omega} \eta^{2} \bar{u}^{\beta+1}|\mathbf{B}||D \bar{u}| d x  \tag{5.4}\\
& \leq \frac{\beta+1}{8} \int_{\Omega} \eta^{2} \bar{u}^{\beta} \Phi D \bar{u} \cdot D \bar{u} d x+2(\beta+1) \int_{\Omega} \eta^{2} \bar{u}^{\beta+2} \frac{\Delta \varphi}{\lambda}|\mathbf{B}|^{2} d x
\end{align*}
$$

Similarly,

$$
\begin{align*}
-2 \int_{\Omega} \eta u \bar{u}^{\beta+1} \mathbf{B} \cdot D \eta d x & \leq 2 \int_{\Omega} \eta \bar{u}^{\beta+2}|\mathbf{B}||D \eta| d x \\
& \leq \int_{\Omega} \bar{u}^{\beta+2} \Phi D \eta \cdot D \eta d x+\int_{\Omega} \eta^{2} \bar{u}^{\beta+2} \frac{\Delta \varphi}{\lambda}|\mathbf{B}|^{2} d x \tag{5.5}
\end{align*}
$$

and

$$
\begin{equation*}
-\int_{\Omega} \eta^{2} \bar{u}^{\beta+1} \mathbf{b} \cdot D \bar{u} d x \leq \frac{1}{8} \int_{\Omega} \eta^{2} \bar{u}^{\beta} \Phi D \bar{u} \cdot D \bar{u} d x+2 \int_{\Omega} \eta^{2} \bar{u}^{\beta+2} \frac{\Delta \varphi}{\lambda}|\mathbf{b}|^{2} d x . \tag{5.6}
\end{equation*}
$$

As in (5.3) and using $\bar{u} \geq|\mathbf{F}|$ in $S_{\varphi}\left(x_{0}, t\right)$, we have

$$
\begin{align*}
& (\beta+1) \int_{\Omega} \eta^{2} \bar{u}^{\beta} \mathbf{F} \cdot D \bar{u} d x \\
& \leq(\beta+1) \int_{\Omega}\left(\eta^{2} \bar{u}^{\beta} \Phi D \bar{u} \cdot D \bar{u}\right)^{1 / 2}\left(\eta^{2} \bar{u}^{\beta} \frac{\Delta \varphi}{\lambda}|\mathbf{F}|^{2}\right)^{1 / 2} d x  \tag{5.7}\\
& \leq \frac{\beta+1}{8} \int_{\Omega} \eta^{2} \bar{u}^{\beta} \Phi D \bar{u} \cdot D \bar{u} d x+2(\beta+1) \int_{\Omega} \eta^{2} \bar{u}^{\beta} \frac{\Delta \varphi}{\lambda}|\mathbf{F}|^{2} d x \\
& \leq \frac{\beta+1}{8} \int_{\Omega} \eta^{2} \bar{u}^{\beta} \Phi D \bar{u} \cdot D \bar{u} d x+2(\beta+1) \int_{\Omega} \eta^{2} \bar{u}^{\beta+2} \frac{\Delta \varphi}{\lambda} d x
\end{align*}
$$

and

$$
\begin{align*}
2 \int_{\Omega} \eta \bar{u}^{\beta+1} \mathbf{F} \cdot D \eta d x & \leq 2 \int_{\Omega}\left(\bar{u}^{\beta+2} \Phi D \eta \cdot D \eta\right)^{1 / 2}\left(\eta^{2} \bar{u}^{\beta} \frac{\Delta \varphi}{\lambda}|\mathbf{F}|^{2}\right)^{1 / 2} d x \\
& \leq \int_{\Omega} \bar{u}^{\beta+2} \Phi D \eta \cdot D \eta d x+\int_{\Omega} \eta^{2} \bar{u}^{\beta} \frac{\Delta \varphi}{\lambda}|\mathbf{F}|^{2} d x  \tag{5.8}\\
& \leq \int_{\Omega} \bar{u}^{\beta+2} \Phi D \eta \cdot D \eta d x+\int_{\Omega} \eta^{2} \bar{u}^{\beta+2} \frac{\Delta \varphi}{\lambda} d x .
\end{align*}
$$

Finally,

$$
\begin{equation*}
\int_{\Omega} \eta^{2} \bar{u}^{\beta+1} f d x \leq \int_{\Omega} \eta^{2} \bar{u}^{\beta+2} \frac{|f|}{k} d x . \tag{5.9}
\end{equation*}
$$

Now we put (5.1) - (5.9) together. We use (5.2) to substitute the integrals in (5.1); then, we apply the estimates in (5.3)-(5.9). As $\beta \geq 0$ and each integral appearing on the right-hand sides of (5.3)-(5.9) is nonnegative, we get

$$
\begin{align*}
& \frac{1}{2}\left(\frac{\beta}{2}+1\right) \int_{\Omega} \eta^{2} \bar{u}^{\beta} \Phi D \bar{u} \cdot D \bar{u} d x \\
& \leq 10\left(\int_{\Omega} \bar{u}^{\beta+2} \Phi D \eta \cdot D \eta d x+\frac{\beta+2}{2} \int_{\Omega} \eta^{2} \bar{u}^{\beta+2}\left\{\frac{\Delta \varphi}{\lambda}\left(1+|\mathbf{b}|^{2}+|\mathbf{B}|^{2}\right)+\frac{|f|}{k}\right\} d x\right) \tag{5.10}
\end{align*}
$$

Because

$$
D\left(\bar{u}^{\beta / 2+1} \eta\right)=\left(\frac{\beta}{2}+1\right) \bar{u}^{\beta / 2} \eta D \bar{u}+\bar{u}^{\beta / 2+1} D \eta
$$

we have

$$
\Phi D\left(\bar{u}^{\beta / 2+1} \eta\right) \cdot D\left(\bar{u}^{\beta / 2+1} \eta\right) \leq 2\left[\left(\frac{\beta}{2}+1\right)^{2} \bar{u}^{\beta} \eta^{2} \Phi D \bar{u} \cdot D \bar{u}+\bar{u}^{\beta+2} \Phi D \eta \cdot D \eta\right]
$$

Therefore, (5.10) implies that

$$
\begin{align*}
& \int_{\Omega} \Phi D\left(\bar{u}^{\beta / 2+1} \eta\right) \cdot D\left(\bar{u}^{\beta / 2+1} \eta\right) d x \leq 128\left(\frac{\beta}{2}+1\right)^{2}\left[\int_{\Omega} \bar{u}^{\beta+2} \Phi D \eta \cdot D \eta d x\right.  \tag{5.11}\\
& \left.\quad+\int_{\Omega} \eta^{2} \bar{u}^{\beta+2}\left\{\frac{\Delta \varphi}{\lambda}\left(1+|\mathbf{b}|^{2}+|\mathbf{B}|^{2}\right)+\frac{|f|}{k}\right\} d x\right]
\end{align*}
$$

Letting

$$
S_{a}:=S_{\varphi}\left(x_{0}, a\right),
$$

we have, from the Alexandrov Maximum Principle [Le24, Theorem 3.12] (also see [Le24, (15.16)]),

$$
\operatorname{dist}\left(S_{\bar{r}}, \partial S_{R}\right) \geq c(n, \lambda, \Lambda)(R-\bar{r})^{n} \quad \text { for } 0<\bar{r}<R \leq t
$$

Hence, we may choose $\eta$ supported on $S_{R}$ so that $0 \leq \eta \leq 1, \eta \equiv 1$ in $S_{\bar{r}}$, and

$$
\begin{equation*}
|D \eta| \leq C_{0}(n, \lambda, \Lambda)(R-\bar{r})^{-n} \tag{5.12}
\end{equation*}
$$

We set

$$
q=\min \left\{\frac{1+\varepsilon^{*}}{n-1}, r\right\}>\frac{n}{2}
$$

and define $\widehat{q}, \widehat{n}$ using (3.10) and (3.13). That is,

$$
\widehat{q}:=\frac{2 q}{q-1}, \quad \text { and } \widehat{n}:= \begin{cases}\frac{2 n}{n-2} & \text { if } n \geq 3 \\ 2 \widehat{q} & \text { if } n=2\end{cases}
$$

Then, by the Monge-Ampère Sobolev inequality, Theorem 2.4, we have

$$
\begin{align*}
\int_{\Omega} \Phi D\left(\bar{u}^{\beta / 2+1} \eta\right) \cdot D\left(\bar{u}^{\beta / 2+1} \eta\right) d x & =\int_{S_{R}} \Phi D\left(\bar{u}^{\beta / 2+1} \eta\right) \cdot D\left(\bar{u}^{\beta / 2+1} \eta\right) d x \\
& \geq c_{1}(n, \lambda, \Lambda, \widehat{q})\left\|\bar{u}^{\beta / 2+1} \eta\right\|_{L^{\hat{n}}\left(S_{R}\right)}^{2}  \tag{5.13}\\
& \geq c_{1}\left\|\bar{u}^{\beta / 2+1}\right\|_{L^{\hat{n}}\left(S_{\bar{r}}\right)}^{2} .
\end{align*}
$$

Because $D^{2} \varphi>0$, all of its eigenvalues are smaller than $\Delta \varphi$. Hence,

$$
\Phi=\left(\operatorname{det} D^{2} \varphi\right)\left(D^{2} \varphi\right)^{-1} \leq(\Delta \varphi)^{n-1} I_{n}
$$

Therefore, we have, from (5.12),

$$
\begin{align*}
\int_{\Omega} \bar{u}^{\beta+2} \Phi D \eta \cdot D \eta d x & \leq \int_{S_{R}} \bar{u}^{\beta+2}(\Delta \varphi)^{n-1}|D \eta|^{2} d x  \tag{5.14}\\
& \leq C_{0}^{2}(R-\bar{r})^{-2 n} \int_{S_{R}} \bar{u}^{\beta+2}(\Delta \varphi)^{n-1} d x
\end{align*}
$$

We also have

$$
\begin{align*}
& \int_{\Omega} \eta^{2} \bar{u}^{\beta+2}\left\{\frac{\Delta \varphi}{\lambda}\left(1+|\mathbf{b}|^{2}+|\mathbf{B}|^{2}\right)+\frac{|f|}{k}\right\} d x \\
& \leq \int_{S_{R}} \bar{u}^{\beta+2}\left\{\frac{\Delta \varphi}{\lambda}\left(1+|\mathbf{b}|^{2}+|\mathbf{B}|^{2}\right)+\frac{|f|}{k}\right\} d x  \tag{5.15}\\
& \leq C_{2}(n, \lambda, \Lambda)(R-\bar{r})^{-2 n} \int_{S_{R}} \bar{u}^{\beta+2}\left\{\frac{\Delta \varphi}{\lambda}\left(1+|\mathbf{b}|^{2}+|\mathbf{B}|^{2}\right)+\frac{|f|}{k}\right\} d x .
\end{align*}
$$

If we define

$$
h:=\frac{\Delta \varphi}{\lambda}\left(1+|\mathbf{b}|^{2}+|\mathbf{B}|^{2}\right)+\frac{|f|}{k}+(\Delta \varphi)^{n-1},
$$

then $h \in L^{q}\left(S_{t}\right)$. From (5.14), (5.15), and the Hölder inequality, the right-hand side of (5.11) is bounded by

$$
\begin{align*}
\text { RHS (5.11) } & \leq 128\left(C_{0}^{2}+C_{2}\right)\left(\frac{\beta}{2}+1\right)^{2}(R-\bar{r})^{-2 n} \int_{S_{R}} \bar{u}^{\beta+2} h d x  \tag{5.16}\\
& \leq C_{3}(n, \lambda, \Lambda)\left(\frac{\beta}{2}+1\right)^{2}(R-\bar{r})^{-2 n}\left\|\bar{u}^{\beta / 2+1}\right\|_{L^{\hat{q}}\left(S_{R}\right)}^{2}\|h\|_{L^{q}\left(S_{t}\right)} .
\end{align*}
$$

Combining (5.11), (5.13), and (5.16) yields

$$
\begin{equation*}
\left\|\bar{u}^{\beta / 2+1}\right\|_{L^{\hat{n}}\left(S_{\bar{r}}\right)}^{2} \leq C_{4}(n, \lambda, \Lambda, \widehat{q})\|h\|_{L^{q}\left(S_{t}\right)}(R-\bar{r})^{-2 n}\left(\frac{\beta}{2}+1\right)^{2}\left\|\bar{u}^{\beta / 2+1}\right\|_{L^{\widehat{\imath}}\left(S_{R}\right)}^{2} \tag{5.17}
\end{equation*}
$$

As $q>n / 2, \widehat{n}>\widehat{q}$ and we may set

$$
\chi:=\frac{\widehat{n}}{\widehat{q}}>1, \quad \text { and } \gamma:=\widehat{q}\left(\frac{\beta}{2}+1\right) .
$$

Then, (5.17) becomes

$$
\begin{equation*}
\|\bar{u}\|_{L^{\gamma \chi}\left(S_{\bar{r}}\right)} \leq\left(C_{5}(n, \lambda, \Lambda, \widehat{q})\|h\|_{L^{q}\left(S_{t}\right)}(R-\bar{r})^{-2 n} \gamma^{2}\right)^{\frac{q}{q-1} \frac{1}{\gamma}}\|\bar{u}\|_{L^{\gamma}\left(S_{R}\right)} \tag{5.18}
\end{equation*}
$$

Define for each integer $j \geq 0$

$$
r_{j}=\frac{t}{2}+\frac{t}{2^{j+1}}, \quad \text { and } \gamma_{j}=\chi^{j} \widehat{q}
$$

Setting $R=r_{j}, \bar{r}=r_{j+1}$, and $\gamma=\gamma_{j}$ in (5.18), we get

$$
\begin{equation*}
\|\bar{u}\|_{L^{\chi^{j+1} \widehat{q}\left(S_{r_{j+1}}\right)}} \leq\left(2 C_{5} \widehat{q}^{2}\|h\|_{L^{q}\left(S_{t}\right)} t^{-2 n} 2^{2 n(j+2)} \chi^{2 j}\right)^{\chi^{-j} / 2}\|\bar{u}\|_{L^{\chi}\left(S_{r_{j}}\right)} \tag{5.19}
\end{equation*}
$$

Iterating (5.19) yields

$$
\begin{equation*}
\|\bar{u}\|_{L^{\infty}\left(S_{t / 2}\right)} \leq\left(2 C_{5} \widehat{q}^{2}\|h\|_{L^{q}\left(S_{t}\right)} t^{-2 n}\right)^{\sum_{j \geq 0} \chi^{-j} / 2} 2^{\sum_{j \geq 0} n(j+2) \chi^{-j}} \chi^{\sum_{j \geq 0} j \chi^{-j}}\|\bar{u}\|_{L^{\widehat{q}}\left(S_{t}\right)} . \tag{5.20}
\end{equation*}
$$

As $S_{\varphi}\left(x_{0}, t\right)$ is normalized, we have from Lemma 2.8,

$$
\begin{equation*}
t^{-1} \leq C_{6}(n, \lambda, \Lambda) \tag{5.21}
\end{equation*}
$$

Finally, the $W^{2,1+\varepsilon}$ estimate in Theorem 2.7 implies

$$
\begin{align*}
\|h\|_{L^{q}\left(S_{t}\right)} \leq & C_{7}(n) \frac{1+\|\mathbf{b}\|_{L^{\infty}\left(S_{t}\right)}^{2}+\|\mathbf{B}\|_{L^{\infty}\left(S_{t}\right)}^{2}\left\|D^{2} \varphi\right\|_{L^{q}\left(S_{t}\right)}}{\lambda} \\
& +\frac{\|f\|_{L^{q}\left(S_{t}\right)}}{k}+C_{7}(n)\left\|D^{2} \varphi\right\|_{L^{q(n-1)}\left(S_{t}\right)}^{n-1}  \tag{5.22}\\
\leq & C_{8}\left(n, \varepsilon^{*}, r, \lambda, \Lambda,\|\mathbf{b}\|_{L^{\infty}\left(S_{t}\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{t}\right)},\left\|D^{2} \varphi\right\|_{L^{1+\varepsilon^{*}\left(S_{t}\right)}}\right) \\
\leq & C_{9}\left(n, \varepsilon^{*}, r, \lambda, \Lambda,\|\mathbf{b}\|_{L^{\infty}\left(S_{t}\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{t}\right)}\right) .
\end{align*}
$$

The conclusion of the lemma follows from (5.20)-(5.22).
Now, we rescale (1.1) as we did in the proof of Proposition 3.5, and apply the result in Lemma 5.1. Using the estimates from the proof of Theorem 1.1, we then argue as in Le [Le24, Theorem 15.4] to obtain the following interior estimates in general sections.

Lemma 5.2 (Interior estimate in general section). Let $\varphi \in C^{3}(\Omega)$ be a convex function satisfying (1.3). Suppose $\mathbf{F}, \mathbf{b}, \mathbf{B} \in W_{\mathrm{loc}}^{1, n}\left(\Omega ; \mathbb{R}^{n}\right) \cap L_{\mathrm{loc}}^{\infty}\left(\Omega ; \mathbb{R}^{n}\right), f \in L_{\mathrm{loc}}^{n}(\Omega)$, and $n / 2<r<\infty$. Assume that $S_{\varphi}\left(x_{0}, 2 h\right) \Subset \Omega$ and $u \in W^{1,2}\left(S_{\varphi}\left(x_{0}, h\right)\right)$ is a nonnegative solution to (1.1) in $S_{\varphi}\left(x_{0}, 2 h\right)$. Further assume that
(1) either $n=2$, or
(2) $n \geq 3$ and $\varepsilon^{*}(n, \lambda, \Lambda)+1>\frac{n(n-1)}{2}$ where $\varepsilon^{*}$ is from Theorem 2.7.

Then,

$$
\begin{equation*}
\sup _{S_{\varphi}\left(x_{0}, h / 2\right)} u \leq C\left(h^{-\frac{n}{4}}\|u\|_{L^{2}\left(S_{\varphi}\left(x_{0}, h\right)\right)}+h^{1-\frac{n}{2}}\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)}+h^{1-\frac{n}{2 r}}\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, h\right)\right)}\right) \tag{5.23}
\end{equation*}
$$

where

$$
C=C\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)}, h, \operatorname{diam}\left(S_{\varphi}(x, 2 h)\right)\right)>0 .
$$

Proof. We rescale $S=S_{\varphi}\left(x_{0}, h\right)$ as in the proof of Theorem 1.1, so that $B_{1} \subset T^{-1} S_{\varphi}\left(x_{0}, h\right) \subset$ $B_{n}$. We will use $\widetilde{C}$ and the numbered constants $C_{n}$ to denote the same constants from the proof of Theorem 1.1 throughout the proof of this lemma.

For $\widetilde{h}:=\left(\operatorname{det} A_{h}\right)^{-2 / n} h$, we have the rescaled equation (3.47) in $\widetilde{S}=S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h}\right)$. Applying Lemma 5.1 to $\widetilde{u}$, we get

$$
\begin{equation*}
\sup _{S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h} / 2\right)} \widetilde{u} \leq D_{1}\left(\|\widetilde{u}\|_{L^{q *}\left(S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h}\right)\right)}+\|\widetilde{\mathbf{F}}\|_{L^{\infty}\left(S_{\widetilde{\varphi}}\left(y_{0}, \tilde{h}\right)\right)}+\|\widetilde{f}\|_{L^{r}\left(S_{\widetilde{\varphi}}\left(y_{0}, \tilde{h}\right)\right)}\right) \tag{5.24}
\end{equation*}
$$

where $D_{1}>0$ depends on $n, \lambda, \Lambda, r, \varepsilon^{*},\|\widetilde{\mathbf{b}}\|_{L^{\infty}(\widetilde{S})}$, and $\|\widetilde{\mathbf{B}}\|_{L^{\infty}(\widetilde{S})}$.
Using the expression for $C_{2}$ in (4.5) and $C_{3}$ in (4.4), we use the estimates (4.6) to estimate the norms of the rescaled functions:

$$
\begin{align*}
\|\widetilde{\mathbf{b}}\|_{L^{\infty}\left(S_{\widetilde{\varphi}}\left(y_{0}, \tilde{h}\right)\right)} & \leq\left(C_{1} h^{n / 2}\right)^{2 / n}\left(\widetilde{C} h^{-n / 2}\right)\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)} \\
& =C_{1}^{2 / n} \widetilde{C} h^{1-n / 2}\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)}, \\
\|\widetilde{\mathbf{B}}\|_{L^{\infty}\left(S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h}\right)\right)} & \leq C_{1}^{2 / n} \widetilde{C} h^{1-n / 2}\|\mathbf{B}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)}, \\
\|\widetilde{\mathbf{F}}\|_{L^{\infty}\left(S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h}\right)\right)} & \leq C_{1}^{2 / n} \widetilde{C} h^{1-n / 2}\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)}, \quad \text { and }  \tag{5.25}\\
\|\widetilde{f}\|_{L^{r}\left(S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h}\right)\right)} & =\left(C_{1} h^{n / 2}\right)^{2 / n-1 / r}\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, h\right)\right)} \\
& =C_{1}^{2 / n-1 / r} h^{1-n / 2 r}\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, h\right)\right)} .
\end{align*}
$$

We also have (see [Le24, Lemma 15.2(iii)])

$$
\begin{equation*}
\|\widetilde{u}\|_{L^{q^{*}}\left(S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h}\right)\right)} \leq D_{2}\left(n, \lambda, \Lambda, q^{*}\right) h^{-n / 2 q^{*}}\|u\|_{L^{q^{*}}\left(S_{\varphi}\left(x_{0}, h\right)\right)} \tag{5.26}
\end{equation*}
$$

for $q^{*}=q^{*}\left(\varepsilon^{*}, n, r\right)$, and

$$
\begin{equation*}
\sup _{S_{\tilde{\varphi}}\left(y_{0}, \tilde{h} / 2\right)} \widetilde{u}=\sup _{S_{\varphi}\left(x_{0}, h / 2\right)} u . \tag{5.27}
\end{equation*}
$$

The $L^{\infty}$ norms of $\widetilde{\mathbf{b}}$ and $\widetilde{\mathbf{B}}$ are under control from (5.25). Hence, from (5.24)-(5.27) we have,

$$
\begin{equation*}
\sup _{S_{\varphi}\left(x_{0}, h / 2\right)} u \leq D_{3}\left(h^{-\frac{n}{2 q^{*}}}\|u\|_{L^{q^{*}}\left(S_{\varphi}\left(x_{0}, h\right)\right)}+h^{1-\frac{n}{2}}\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)}+h^{1-\frac{n}{2 r}}\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, h\right)\right)}\right), \tag{5.28}
\end{equation*}
$$

where $D_{3}$ depends on $n, \lambda, \Lambda, r, \varepsilon^{*},\|(\mathbf{b}, \mathbf{B})\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)}, h$, and $\operatorname{diam}\left(S_{\varphi}\left(x_{0}, 2 h\right)\right)$. We can now use (5.28) to argue as in Le [Le24, pp.519-521] (see also Han-Lin [HL11, pp.75-76]) to obtain (5.23). This gives the conclusion of the Lemma.

Remark 5.3. In fact, following the arguments cited above, we can obtain (5.23) with the $L^{2}$ norm of $u$ replaced by the $L^{p}$ norm of $u$, for any $p>0$.

## 6. Interior Hölder Estimates

In this section, we prove the interior Hölder estimates in Corollary 1.2 and Theorem 1.3, We start by combining the Harnack inequality in Theorem 1.1 and the global estimate in Proposition 3.5 to prove Corollary 1.2.

Proof of Corollary 1.2. Let $\operatorname{osc}(g, E):=\sup _{E} g-\inf _{E} g$. It is sufficient (see [Le24, pp.523524]) to prove the oscillation estimate

$$
\begin{equation*}
\operatorname{osc}\left(u, S_{\varphi}\left(x_{0}, h\right)\right) \leq C_{0}\left(\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)}+\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}\right) h^{\gamma_{0}} \tag{6.1}
\end{equation*}
$$

for all $h \leq h_{0}$, where the positive constants $C_{0}$ and $\gamma_{0}$ have the same dependency as $C$ and $\gamma$ stated in the Corollary.

As in Le [Le18a, pp.284-285], we break up the solution $u=v+w$ in $S_{\varphi}\left(x_{0}, h\right), h \leq h_{0}$, where $v, w \in W^{2, n}\left(S_{\varphi}\left(x_{0}, h\right)\right)$ are solutions to

$$
\begin{cases}-\operatorname{div}(\Phi D v+v \mathbf{B})+\mathbf{b} \cdot D v=f-\operatorname{div} \mathbf{F} & \text { in } S_{\varphi}\left(x_{0}, h\right) \\ v=0 & \text { on } \partial S_{\varphi}\left(x_{0}, h\right)\end{cases}
$$

and

$$
\begin{cases}-\operatorname{div}(\Phi D w+w \mathbf{B})+\mathbf{b} \cdot D w=0 & \text { in } S_{\varphi}\left(x_{0}, h\right) \\ w=u & \text { on } \partial S_{\varphi}\left(x_{0}, h\right)\end{cases}
$$

Such $u$ and $v$ exist as a consequence of [GT01, Theorem 9.15].
We now rescale $S_{\varphi}\left(x_{0}, 2 h_{0}\right)$ as in the proof of Theorem 1.1, so that $B_{1} \subset T^{-1} S_{\varphi}\left(x_{0}, 2 h_{0}\right) \subset$ $B_{n}$ for $T x=A_{2 h_{0}} x+b_{2 h_{0}}$. We define the rescaled functions using (3.45), and set $\widetilde{v}(x):=$ $v(T x)$. Applying the global estimate in Proposition 3.5 to $\widetilde{v}$, we get

$$
\begin{equation*}
\|\widetilde{v}\|_{L^{\infty}\left(S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h}\right)\right)} \leq \widetilde{C}_{1}\left(\|\widetilde{\mathbf{F}}\|_{L^{\infty}\left(S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h}\right)\right)}+\|\widetilde{f}\|_{L^{r}\left(S_{\widetilde{\varphi}}\left(y_{0}, \widetilde{h}\right)\right)}\right) \widetilde{h}^{\widetilde{\gamma}_{1}} \tag{6.2}
\end{equation*}
$$

where

$$
\begin{aligned}
\widetilde{h} & :=\left(\operatorname{det} A_{2 h_{0}}\right)^{-2 / n} h \\
\widetilde{C}_{1} & =\widetilde{C}_{1}\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\widetilde{\mathbf{B}}\|_{L^{\infty}\left(S_{\widetilde{\varphi}}\left(y_{0}, \tilde{h}\right)\right)},\|\widetilde{\mathbf{b}}\|_{L^{\infty}\left(S_{\widetilde{\varphi}}\left(y_{0}, \tilde{h}\right)\right)}\right), \quad \text { and } \\
\gamma_{1} & =\gamma_{1}(n, \lambda, \Lambda, r)>0
\end{aligned}
$$

The $L^{\infty}$ norms of $\widetilde{\mathbf{F}}, \widetilde{\mathbf{b}}, \widetilde{\mathbf{B}}$, and the $L^{r}$ norm of $\widetilde{f}$ are under control as in (5.25). Also, by (4.4),

$$
\widetilde{h} \leq C\left(n, \lambda, \Lambda, h_{0}\right) h
$$

Hence, from (6.2), we get

$$
\begin{equation*}
\operatorname{osc}\left(v, S_{\varphi}\left(x_{0}, h / 2\right)\right) \leq 2\|v\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)} \leq C_{1}\left(\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}\right) h^{\gamma_{1}} \tag{6.3}
\end{equation*}
$$

where

$$
C_{1}=C_{1}\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}, h_{0}, \operatorname{diam}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)\right)
$$

We now estimate the oscillation of $w$. Define

$$
M(t):=\sup _{S_{\varphi}\left(x_{0}, t\right)} w \quad \text { and } m(t):=\inf _{S_{\varphi}\left(x_{0}, t\right)} w
$$

and set

$$
w_{1}(x):=w(x)-m(h) \quad \text { and } w_{2}(x):=M(h)-w(x) .
$$

Then, $w_{1}$ and $w_{2}$ are nonnegative solutions to

$$
\begin{aligned}
& -\operatorname{div}\left(\Phi D w_{1}+w_{1} \mathbf{B}\right)+\mathbf{b} \cdot D w_{1}=m(h) \operatorname{div} \mathbf{B}, \quad \text { and } \\
& -\operatorname{div}\left(\Phi D w_{2}+w_{2} \mathbf{B}\right)+\mathbf{b} \cdot D w_{2}=-M(h) \operatorname{div} \mathbf{B}
\end{aligned}
$$

in $S_{\varphi}\left(x_{0}, h\right)$. Therefore, applying the Harnack inequality in Theorem 1.1 to $w_{1}, w_{2}$ gives

$$
\begin{align*}
& M(h / 2)-m(h) \leq C_{2}\left(m(h / 2)-m(h)+\|m(h) \operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)} h^{\gamma_{2}}\right), \quad \text { and } \\
& M(h)-m(h / 2) \leq C_{2}\left(M(h)-M(h / 2)+\|M(h) \operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)} h^{\gamma_{2}}\right), \tag{6.4}
\end{align*}
$$

where

$$
C_{2}=C_{2}\left(n, \lambda, \Lambda, \varepsilon^{*},\|(\mathbf{b}, \mathbf{B})\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)},\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}, h_{0}, \operatorname{diam}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)\right),
$$

and

$$
\gamma_{2}=\gamma_{2}(n, \lambda, \Lambda)>0
$$

Note that $w$ satisfies a nondivergence form equation in $S_{\varphi}\left(x_{0}, h\right)$. That is,

$$
-\Phi_{i j} D_{i j} w+(\mathbf{b}-\mathbf{B}) \cdot D w-(\operatorname{div} \mathbf{B}) w=0
$$

As $\operatorname{div} \mathbf{B} \leq 0$, we may apply the maximum principle [GT01, Theorem 9.1] using the nondivergence form equation to conclude that $w$ takes extreme values on $\partial S$. As $w=u$ on $\partial S$,

$$
|M(h)|,|m(h)| \leq\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h\right)\right)} .
$$

Therefore, as $h \leq h_{0}$, we have
$\|m(h) \operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)}+\|M(h) \operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)} \leq 2\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)}\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}$.
Hence, adding the two inequalities in (6.4), we get

$$
\begin{aligned}
& \left(1+C_{2}\right)(M(h / 2)-m(h / 2)) \leq \\
& \quad\left(C_{2}-1\right)(M(h)-m(h))+2 C_{2}\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)} h^{\gamma_{2}}
\end{aligned}
$$

Replacing $C_{2}$ by $C_{2}+2$, we may assume $C_{2}>1$. Setting $\beta:=\frac{C_{2}-1}{C_{2}+1} \in(0,1)$ and

$$
C_{3}:=\frac{2 C_{2}\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}}{1+C_{2}}
$$

we have

$$
\begin{equation*}
\operatorname{osc}\left(w, S_{\varphi}\left(x_{0}, h / 2\right)\right) \leq \beta \operatorname{osc}\left(w, S_{\varphi}\left(x_{0}, h\right)\right)+C_{3}\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)} h^{\gamma_{2}} \tag{6.5}
\end{equation*}
$$

From the maximum principle, we also have

$$
\begin{equation*}
\operatorname{osc}\left(w, S_{\varphi}\left(x_{0}, h\right)\right)=\operatorname{osc}\left(w, \partial S_{\varphi}\left(x_{0}, h\right)\right)=\operatorname{osc}\left(u, \partial S_{\varphi}\left(x_{0}, h\right)\right) \leq \operatorname{osc}\left(u, S_{\varphi}\left(x_{0}, h\right)\right) \tag{6.6}
\end{equation*}
$$

Recalling $u=v+w$, from (6.3), (6.5), and (6.6) we get

$$
\begin{aligned}
\operatorname{osc}\left(u, S_{\varphi}\left(x_{0}, h / 2\right)\right) \leq & \operatorname{osc}\left(w, S_{\varphi}\left(x_{0}, h / 2\right)\right)+\operatorname{osc}\left(v, S_{\varphi}\left(x_{0}, h / 2\right)\right) \\
\leq & \beta \operatorname{osc}\left(u, S_{\varphi}\left(x_{0}, h\right)\right)+C_{3}\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)} h^{\gamma_{2}} \\
& \quad+C_{1}\left(\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}\right) h^{\gamma_{1}} .
\end{aligned}
$$

Therefore, by a standard argument (see [GT01, Lemma 8.23]), for all $h \leq h_{0}$ we get

$$
\begin{aligned}
& \operatorname{osc}\left(u, S_{\varphi}\left(x_{0}, h\right)\right) \\
& \leq C_{4}\left(\frac{h}{h_{0}}\right)^{\gamma_{3}}\left(\operatorname{osc}\left(u, S_{\varphi}\left(x_{0}, h_{0}\right)\right)+C_{3}\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)} h_{0}^{\gamma_{2}}\right. \\
& \left.\quad+C_{1}\left(\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}\right) h_{0}^{\gamma_{1}}\right) \\
& \leq C_{4}\left(\frac{h}{h_{0}}\right)^{\gamma_{3}}\left(\left(2+C_{3} h_{0}^{\gamma_{2}}\right)\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)}+C_{1}\left(\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}\right) h_{0}^{\gamma_{1}}\right)
\end{aligned}
$$

where $C_{4}=C_{4}(\beta)>0$ and $\gamma_{3}=\gamma_{3}(\beta)>0$. This gives the desired oscillation estimate (6.1). The proof of the Theorem is complete.

Now, we combine the interior estimate in Lemma 5.2 with the Hölder estimate in Corollary 1.2 to prove Theorem 1.3 ,

Proof of Theorem 1.3. From Corollary 1.2, for all $x, y \in S_{\varphi}\left(x_{0}, h_{0}\right)$, we have

$$
\begin{equation*}
|u(x)-u(y)| \leq C_{1}\left(\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)}\right)|x-y|^{\gamma} \tag{6.7}
\end{equation*}
$$

where $C_{1}$ depends on $n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)},\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}$, $h_{0}$, and $\operatorname{diam}\left(S_{\varphi}\left(x_{0}, 4 h_{0}\right)\right)$, and $\gamma$ depends on $n, \lambda, \Lambda, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}$, $\|\operatorname{div} \mathbf{B}\|_{L^{n}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}, h_{0}$, and $\operatorname{diam}\left(S_{\varphi}\left(x_{0}, 4 h_{0}\right)\right)$.

As

$$
D u^{+}=D u \chi_{\{u>0\}} \quad \text { and } D u^{-}=-D u \chi_{\{u<0\}},
$$

$u^{+}$and $u^{-}$are solutions to

$$
\begin{aligned}
& -\operatorname{div}\left(\Phi D u^{+}+u^{+} \mathbf{B}\right)+\mathbf{b} \cdot D u^{+}=f \chi_{\{u>0\}}-\operatorname{div}\left(\mathbf{F} \chi_{\{u>0\}}\right) \\
& -\operatorname{div}\left(\Phi D u^{-}+u^{-} \mathbf{B}\right)+\mathbf{b} \cdot D u^{-}=-f \chi_{\{u<0\}}+\operatorname{div}\left(\mathbf{F} \chi_{\{u<0\}}\right) .
\end{aligned}
$$

Therefore, we may apply Lemma 5.2 to $u^{+}$and $u^{-}$to get
$\|u\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, h_{0}\right)\right)} \leq C_{2}\left(h_{0}^{-\frac{n}{4}}\|u\|_{L^{2}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+h_{0}^{1-\frac{n}{2}}\|\mathbf{F}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}+h_{0}^{1-\frac{n}{2 r}}\|f\|_{L^{r}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}\right)$,
where

$$
C_{2}=C_{2}\left(n, \lambda, \Lambda, r, \varepsilon^{*},\|\mathbf{b}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)},\|\mathbf{B}\|_{L^{\infty}\left(S_{\varphi}\left(x_{0}, 2 h_{0}\right)\right)}, h_{0}, \operatorname{diam}\left(S_{\varphi}\left(x_{0}, 4 h_{0}\right)\right)\right)>0 .
$$

Combining (6.7) and (6.8) completes the proof of the Theorem.
Acknowledgments. The author would like to thank his advisor, Professor Nam Q. Le, for suggesting the problem, and all the advice and guidance the author has received so far.

The research of the author was supported in part by NSF grant DMS-2054686.
