#### Abstract

Characteristic formulae give a complete logical description of the behaviour of processes modulo some chosen notion of behavioural semantics．They allow one to reduce equivalence or preorder checking to model checking，and are exactly the formulae in the modal logics characterizing classic behavioural equivalences and preorders for which model checking can be reduced to equivalence or preorder checking．

This paper studies the complexity of determining whether a formula is characteristic for some finite，loop－free process in each of the logics providing modal characterizations of the simulation－ based semantics in van Glabbeek＇s branching－time spectrum．Since characteristic formulae in each of those logics are exactly the consistent and prime ones，it presents complexity results for the satisfiability and primality problems，and investigates the boundary between modal logics for which those problems can be solved in polynomial time and those for which they become computationally hard．

Amongst other contributions，this article also studies the complexity of constructing characteristic formulae in the modal logics characterizing simulation－based semantics，both when such formulae are presented in explicit form and via systems of equations．

## 1 Introduction

Modal characterizations of behavioural equivalences and preorders are some of the most classic and pleasing results in concurrency theory－see，for instance，［24］for the seminal Hennessy－Milner theorem and［11，14，15，19］for similar results for other relations in van Glabbeek＇s linear－time／branching－time spectrum and other settings．By way of example，in their archetypal modal characterization of bisimilarity，Hennessy and Milner have shown in［24］that，under a mild finiteness condition，two processes are bisimilar if，and only if，they satisfy the same formulae in a multi－modal logic that is now often called Hennessy－Milner logic．Apart from its intrinsic theoretical interest，this seminal logical characterization of
bisimilarity means that, when two processes are not bisimilar, there is always a formula that distinguishes between them. Such a formula describes a reason why the two processes are not bisimilar, provides useful debugging information and can be algorithmically constructed over finite processes - see, for instance, [7, 12] and [35], where Martens and Groote show that, in general, computing minimal distinguishing Hennessy-Milner formulae is NP-hard. On the other hand, using the Hennessy-Milner theorem to show that two processes are bisimilar would involve verifying that they satisfy the same formulae, and there are infinitely many of those. However, as shown in works such as $[2,5,11,20,42]$, the logics that underlie classic modal characterization theorems for equivalences and preorders over processes allow one to express characteristic formulae. Intuitively, a characteristic formula $\chi(p)$ for a process $p$ gives a complete logical characterization of the behaviour of $p$ modulo the behavioural semantics of interest $\lesssim$, in the sense that any process is related to $p$ with respect to $\lesssim$ if, and only if, it satisfies $\chi(p)$. Since the formula $\chi(p)$ can be constructed from $p$, characteristic formulae reduce the problem of checking whether a process $q$ is related to $p$ by $\lesssim$ to a model checking problem, viz. whether $q$ satisfies $\chi(p)$. See, for instance, the classic reference [13] for applications of this approach.

Characteristic formulae, thus, allow one to reduce equivalence and preorder checking to model checking. Conversely, in the setting of modal refinement over modal transition systems, Boudol and Larsen studied in [10] the problem of characterizing the collection of modal formulae for which model checking can be reduced to equivalence checking. See [2, 3] for other contributions in that line of research. The aforementioned articles showed that characteristic formulae coincide with those that are consistent and prime. (A formula is prime if whenever it entails a disjunction $\varphi_{1} \vee \varphi_{2}$, then it must entail $\varphi_{1}$ or $\varphi_{2}$.) Moreover, characteristic formulae with respect to bisimilarity coincide with the formulae that are consistent and complete [6]. (A modal formula is complete if, for each formula $\varphi$, it entails either $\varphi$ or its negation.) The aforementioned results give semantic characterizations of the formulae that are characteristic within the logics that correspond to the behavioural semantics in van Glabbeek's spectrum. Those characterizations tell us for what logical specifications model checking can be reduced to equivalence or preorder checking. But, given a formula, can one decide whether that formula is characteristic and therefore can be model checked using algorithms for behavioural equivalences? And, if so, what is the complexity of checking whether a formula is characteristic? Perhaps surprisingly, those questions were not addressed in the literature until the recent papers [1,6], where it is shown that, in the setting of the modal logics that characterize bisimilarity over natural classes of Kripke structures and labelled transition systems, the problem of checking whether a formula is characteristic for some process modulo bisimilarity is computationally hard and, typically, has the same complexity as validity checking, which is PSPACE-complete for Hennessy-Milner logic and EXP-complete for its extension with fixed-point operators [25, 33] and the $\mu$-calculus [31].

The aforementioned hardness results for the logics characterizing bisimilarity tell us that deciding whether a formula is characteristic in bisimulation semantics is computationally hard. But what about the less expressive logics that characterize the coarser semantics in van Glabbeek's spectrum? And for what logics characterizing relations in the spectrum does hardness manifest itself? Finally, what is the complexity of computing a characteristic formula for a process?

The aim of this paper is to answer the aforementioned questions for some of the simulationbased semantics in the spectrum over finite, loop-free processes. In particular, we study the complexity of determining whether a formula is characteristic modulo the simulation [36], complete simulation and ready-simulation preorders [9, 34]. Since characteristic formulae
are exactly the consistent and prime ones for each behavioural relation in van Glabbeek's spectrum [2], the above-mentioned tasks naturally break down into studying the complexity of satisfiability and primality checking for formulae in the fragments of Hennessy-Milner logic that characterize those preorders. We discover that both those problems are decidable in polynomial time for the simulation and the complete simulation preorders, as well as for the ready-simulation preorder when the set of actions has constant size. On the other hand, when the set of actions is unbounded (that is, it is an input of the algorithmic problem at hand), the problems of checking satisfiability and primality for formulae in the logic characterizing the ready-simulation preorder are NP-complete and coNP-complete respectively. We also show that deciding characteristic formulae in that setting is US-hard [8] (that is, it is at least as hard as the problem of deciding whether a given Boolean formula has exactly one satisfying truth assignment) and belongs to DP, which is the class of languages that are the intersection of one language in NP and of one in coNP [40]. These negative results are in stark contrast with the positive results for the simulation and the complete simulation preorder, and indicate that augmenting the logic characterizing the simulation preorder with formulae that state that a process cannot perform a given action suffices to make satisfiability and primality checking computationally hard. In passing, we also prove that, in the presence of at least two actions, (1) satisfiability and primality checking for the logic characterizing the trace-simulation preorder are NP-hard and coNP-hard respectively, (2) deciding characteristic formulae in that logic is US-hard and fixed-parameter tractable [16], with the modal depth of the input formula as the parameter, when the size of the action set is a constant, and (3) deciding characteristic formulae in the modal logic for the 3-nested simulation preorder [21] is PSPACE-hard.

We also study the complexity of computing characteristic formulae for finite, loop-free processes modulo the above-mentioned simulation semantics. To do so, we consider two different representations for formulae, namely an explicit form, where formulae are given by strings of symbols generated by their respective grammars, and a declarative form, where formulae are described by systems of equations. We prove that, in all the semantics we consider, computing the characteristic formula in explicit form for a finite, loop-free process cannot be done in polynomial time, unless $P=N P$. On the other hand, the characteristic formula for a process modulo those preorders (as well as for the 2-nested simulation preorder [21]) can be computed in polynomial time if the output is given in declarative form. In sharp contrast to that result, we prove that, modulo the trace simulation preorder, even if characteristic formulae are always of polynomial declaration size and polynomial equational length, they cannot be efficiently computed unless $\mathrm{P}=\mathrm{NP}$.

We summarize our results in Table 2. Their full proofs may be found in the technical appendices.

## 2 Preliminaries

In this paper, we model processes as finite, loop-free labelled transition systems (LTS). A finite LTS is a triple $\mathcal{S}=(P, A, \longrightarrow)$, where $P$ is a finite set of states (or processes), $A$ is a finite, non-empty set of actions and $\longrightarrow \subseteq P \times A \times P$ is a transition relation. As usual, we use $p \xrightarrow{a} q$ instead of $(p, a, q) \in \longrightarrow$. For each $t \in A^{*}$, we write $p \xrightarrow{t} q$ to mean that there is a sequence of transitions labelled with $t$ starting from $p$ and ending at $q$. An LTS is loop-free iff $p \xrightarrow{t} p$ holds only when $t$ is the empty trace $\varepsilon$. A process $q$ is reachable from $p$ if $p \xrightarrow{t} q$, for some $t \in A^{*}$. We define the size of an $\operatorname{LTS} \mathcal{S}=(P, A, \longrightarrow)$, denoted by $|\mathcal{S}|$, to be $|P|+|\longrightarrow|$. The size of a process $p \in P$, denoted by $|p|$, is the cardinality of
reach $(p)=\{q \mid q$ is reachable from $p\}$ plus the cardinality of the set $\longrightarrow$ restricted to reach $(p)$. We define the set of initials of $p$, denoted $I(p)$, as the set $\left\{a \in A \mid p \xrightarrow{a} p^{\prime}\right.$ for some $\left.p^{\prime} \in P\right\}$. We write $p \xrightarrow{a}$ if $a \in I(p), p \stackrel{a}{\nrightarrow}$ if $a \notin I(p)$, and $p \nrightarrow$ if $I(p)=\emptyset$. A sequence of actions $t \in A^{*}$ is a trace of $p$ if there is a $q$ such that $p \xrightarrow{t} q$. We denote the set of traces of $p$ by $\operatorname{traces}(p)$. The depth of a finite, loop-free process $p$, denoted by $\operatorname{depth}(p)$, is the length of a longest trace $t$ of $p$.

In what follows, we shall often describe finite, loop-free processes using the fragment of Milner's CCS [37] given by the following grammar:

$$
p::=0 \mid \text { a.p } \mid p+p,
$$

where $a \in A$. For each action $a$ and terms $p, p^{\prime}$, we write $p \xrightarrow{a} p^{\prime}$ iff
(i) $p=a \cdot p^{\prime}$ or
(ii) $p=p_{1}+p_{2}$, for some $p_{1}, p_{2}$, and $p_{1} \xrightarrow{a} p^{\prime}$ or $p_{2} \xrightarrow{a} p^{\prime}$ holds.

In this paper, we consider the following relations in van Glabbeek's spectrum: simulation, complete simulation, ready simulation, trace simulation, 2-nested simulation, 3-nested simulation, and bisimilarity. Their definitions are given below.

- Definition 1 ([37, 19, 2]). We define each of the following preorders as the largest binary relation over $P$ that satisfies the corresponding condition.
(a) Simulation preorder (S): $p \lesssim_{S} q \Leftrightarrow$ for all $p \xrightarrow{a} p^{\prime}$ there exists some $q \xrightarrow{a} q^{\prime}$ such that $p^{\prime} \lesssim S q^{\prime}$.
(b) Complete simulation (CS): $p \lesssim C S q \Leftrightarrow$
(i) for all $p \xrightarrow{a} p^{\prime}$ there exists some $q \xrightarrow{a} q^{\prime}$ such that $p^{\prime} \lesssim_{C S} q^{\prime}$, and
(ii) $I(p)=\emptyset$ iff $I(q)=\emptyset$.
(c) Ready simulation (RS): $p \lesssim_{R S} q \Leftrightarrow$
(i) for all $p \xrightarrow{a} p^{\prime}$ there exists some $q \xrightarrow{a} q^{\prime}$ such that $p^{\prime} \lesssim_{R S} q^{\prime}$, and
(ii) $I(p)=I(q)$.
(d) Trace simulation (TS): $p \lesssim_{T S} q \Leftrightarrow$
(i) for all $p \xrightarrow{a} p^{\prime}$ there exists some $q \xrightarrow{a} q^{\prime}$ such that $p^{\prime} \lesssim_{T S} q^{\prime}$, and
(ii) $\operatorname{traces}(p)=\operatorname{traces}(q)$.
(e) $n$-Nested simulation ( $n \mathrm{~S}$ ), where $n \geq 1$, is defined inductively as follows: The 1-nested simulation preorder $\lesssim_{1 S}$ is $\lesssim_{S}$, and the n-nested simulation preorder $\lesssim_{n S}$ for $n>1$ is the largest relation such that $p \lesssim_{n S} q \Leftrightarrow$
(i) for all $p \xrightarrow{a} p^{\prime}$ there exists some $q \xrightarrow{a} q^{\prime}$ such that $p^{\prime} \lesssim_{n S} q^{\prime}$, and
(ii) $q \lesssim{ }_{(n-1) S} p$.
(f) Bisimilarity (BS): $\lesssim_{B S}$ is the largest symmetric relation satisfying the condition defining the simulation preorder.

It is well-known that bisimilarity is an equivalence relation and all the other relations are preorders [19, 37]. We sometimes write $p \sim q$ instead of $p \lesssim_{B S}$. Moreover, we have that $\sim \subsetneq \lesssim_{3 S} \subsetneq \lesssim_{2 S} \subsetneq \lesssim_{T S} \subsetneq \lesssim_{R S} \subsetneq \lesssim_{C S} \subsetneq \lesssim_{S}$-see [19].

- Definition 2 (Kernels of the preorders). For each $X \in\{S, C S, R S, T S, 2 S, 3 S\}$, the kernel $\equiv_{X}$ of $\lesssim_{X}$ is the equivalence relation defined thus: for every $p, q \in P, p \equiv_{X} q$ iff $p \lesssim_{X} q$ and $q \lesssim X p$.

Each relation $\lesssim X$, where $X \in\{S, C S, R S, T S, 2 S, 3 S, B S\}$, is characterized by a fragment $\mathcal{L}_{X}$ of Hennessy-Milner logic, HML, defined as follows [19, 2].

- Definition 3. For $X \in\{S, C S, R S, T S, 2 S, 3 S, B S\}, \mathcal{L}_{X}$ is defined by the corresponding grammar given below ( $a \in A$ ):
(a) $\mathcal{L}_{S}: \varphi_{S}::=\mathrm{tt}|\mathrm{ff}| \varphi_{S} \wedge \varphi_{S}\left|\varphi_{S} \vee \varphi_{S}\right|\langle a\rangle \varphi_{S}$.
(b) $\mathcal{L}_{C S}: \varphi_{C S}::=\mathbf{t t}|\mathbf{f f}| \varphi_{C S} \wedge \varphi_{C S}\left|\varphi_{C S} \vee \varphi_{C S}\right|\langle a\rangle \varphi_{C S} \mid \mathbf{0}$, where $\mathbf{0}=\bigwedge_{a \in A}[a] \mathbf{f f}$.
(c) $\mathcal{L}_{R S}: \varphi_{R S}::=$ tt $\mid$ ff $\left|\varphi_{R S} \wedge \varphi_{R S}\right| \varphi_{R S} \vee \varphi_{R S}\left|\langle a\rangle \varphi_{R S}\right|[a] \mathrm{ff}$.
(d) $\mathcal{L}_{T S}: \varphi_{T S}::=\mathbf{t t}|\mathbf{f f}| \varphi_{T S} \wedge \varphi_{T S}\left|\varphi_{T S} \vee \varphi_{T S}\right| \quad\langle a\rangle \varphi_{T S} \mid \quad \psi_{T S}$, where $\psi_{T S}::=\mathrm{ff} \mid[a] \psi_{T S}$.
(e) $\mathcal{L}_{2 S}: \varphi_{2 S}::=$ tt $|\mathrm{ff}| \varphi_{2 S} \wedge \varphi_{2 S}\left|\varphi_{2 S} \vee \varphi_{2 S}\right|\langle a\rangle \varphi_{2 S} \mid \neg \varphi_{S}$.
(f) $\mathcal{L}_{3 S}: \varphi_{3 S}::=\mathrm{tt}|\mathrm{ff}| \varphi_{3 S} \wedge \varphi_{3 S}\left|\varphi_{3 S} \vee \varphi_{3 S}\right|\langle a\rangle \varphi_{3 S} \mid \neg \varphi_{2 S}$.
(g) HML $\left(\mathcal{L}_{B S}\right): \varphi_{B S}::=$ tt $\mid$ ff $\left|\varphi_{B S} \wedge \varphi_{B S}\right| \varphi_{B S} \vee \varphi_{B S}\left|\langle a\rangle \varphi_{B S}\right|[a] \varphi_{B S} \mid \neg \varphi_{B S}$.

Note that the explicit use of negation in the grammar for $\mathcal{L}_{B S}$ is unnecessary. However, we included the negation operator explicitly so that $\mathcal{L}_{B S}$ extends syntactically each of the other modal logics presented in Definition 3.

Given a formula $\varphi \in \mathcal{L}_{B S}$, the modal depth of $\varphi$, denoted $\operatorname{by} \operatorname{md}(\varphi)$, is the maximum nesting of modal operators in $\varphi$. (See Definition 36 in Appendix A for the formal definition.)

Truth in an $\operatorname{LTS} \mathcal{S}=(P, A, \longrightarrow)$ is defined via the satisfaction relation $\models$ as follows:

$$
\begin{aligned}
& p \models \mathbf{t t} \text { and } p \not \models \mathbf{f f} ; \\
& p \models \neg \varphi \text { iff } p \not \models \varphi ; \\
& p \models \varphi \wedge \psi \text { iff both } p \models \varphi \text { and } p \models \psi ; \\
& p \models \varphi \vee \psi \text { iff } p \models \varphi \text { or } p \models \psi ; \\
& p \models\langle a\rangle \varphi \text { iff there is } p \xrightarrow{a} q \text { such that } q \models \varphi ; \\
& p \models[a] \varphi \text { iff for all } p \xrightarrow{a} q \text { it holds that } q \models \varphi .
\end{aligned}
$$

If $p \models \varphi$, we say that $\varphi$ is true, or satisfied, in $p$. If $\varphi$ is satisfied in every process in every LTS, we say that $\varphi$ is valid. Formula $\varphi_{1}$ entails $\varphi_{2}$, denoted by $\varphi_{1} \models \varphi_{2}$, if every process that satisfies $\varphi_{1}$ also satisfies $\varphi_{2}$. Moreover, $\varphi_{1}$ and $\varphi_{2}$ are logically equivalent, denoted by $\varphi_{1} \equiv \varphi_{2}$, if $\varphi_{1} \models \varphi_{2}$ and $\varphi_{2} \models \varphi_{1}$. A formula $\varphi$ is consistent, or satisfiable, if there is a process that satisfies $\varphi$. Finally, $\operatorname{Sub}(\varphi)$ denotes the set of subformulae of formula $\varphi$.

For $\mathcal{L} \subseteq \mathcal{L}_{B S}$, we define the dual fragment of $\mathcal{L}$ to be $\overline{\mathcal{L}}=\{\varphi \mid \neg \varphi \in \mathcal{L}\}$, where $\neg \mathbf{t t}=\mathbf{f f}$, $\neg \mathrm{ff}=\mathbf{t t}, \neg(\varphi \wedge \psi)=\neg \varphi \vee \neg \psi, \neg(\varphi \vee \psi)=\neg \varphi \wedge \neg \psi, \neg[a] \varphi=\langle a\rangle \neg \varphi, \neg\langle a\rangle \varphi=[a] \neg \varphi$, and $\neg \neg \varphi=\varphi$. It is not hard to see that $p \models \neg \varphi$ iff $p \not \vDash \varphi$, for every process $p$.

- Definition 4 ([10, 3]). Let $\mathcal{L} \subseteq \mathcal{L}_{B S}$. A formula $\varphi \in \mathcal{L}_{B S}$ is prime in $\mathcal{L}$ if for all $\varphi_{1}, \varphi_{2} \in \mathcal{L}$, $\varphi \models \varphi_{1} \vee \varphi_{2}$ implies $\varphi \models \varphi_{1}$ or $\varphi \models \varphi_{2}$.

When the logic $\mathcal{L}$ is clear from the context, we say that $\varphi$ is prime. Note that every inconsistent formula is trivially prime in $\mathcal{L}$, for every $\mathcal{L}$.

For process $p$ and logic $\mathcal{L} \subseteq \mathbf{H M L}$, we define $\mathcal{L}(p)=\{\varphi \in \mathcal{L} \mid p \models \varphi\}$. A simplification of the Hennessy-Milner theorem gives a modal characterization of bisimilarity over finite processes. An analogous result is true for every preorder examined in this paper.

- Theorem 5 (Hennessy-Milner theorem [24]). For all processes $p, q$ in a finite LTS, $p \sim q$ iff $\mathcal{L}_{B S}(p)=\mathcal{L}_{B S}(q)$.
- Proposition $6([19,2])$. Let $X \in\{S, C S, R S, T S, 2 S, 3 S\}$. Then $p \lesssim x$ qiff $\mathcal{L}_{X}(p) \subseteq \mathcal{L}_{X}(q)$, for all $p, q \in P$.

The definition of a characteristic formula within logic $\mathcal{L}$ is given next.

- Definition 7 ([4, 20, 42]). Let $\mathcal{L} \subseteq \mathcal{L}_{B S}$. A formula $\varphi \in \mathcal{L}$ is characteristic for $p \in P$ within $\mathcal{L}$ iff, for all $q \in P$, it holds that $q \models \varphi \Leftrightarrow \mathcal{L}(p) \subseteq \mathcal{L}(q)$. We denote by $\chi(p)$ the unique characteristic formula for $p$ with respect to logical equivalence.
- Remark 8. Let $X \in\{S, C S, R S, T S, 2 S, 3 S, B S\}$. In light of Theorem 5 and Proposition 6, a formula $\varphi \in \mathcal{L}_{X}$ is characteristic for $p$ within $\mathcal{L}_{X}$ iff, for all $q \in P$, it holds that $q \models \varphi \Leftrightarrow$ $p \lesssim x q$. This property is often used as an alternative definition of characteristic formula for process $p$ modulo $\lesssim x$. In what follows, we shall employ the two definitions interchangeably.

In [2, Table 1 and Theorem 5], Aceto, Della Monica, Fabregas, and Ingólfsdóttir presented characteristic formulae for each of the semantics we consider in this paper, and showed that characteristic formulae are exactly the consistent and prime ones.

- Proposition 9 ([2]). For every $X \in\{S, C S, R S, T S, 2 S\}, \varphi \in \mathcal{L}_{X}$ is characteristic for some process within $\mathcal{L}_{X}$ iff $\varphi$ is consistent and prime in $\mathcal{L}_{X}$.

We note, in passing, that the article [2] does not deal explicitly with $3 S$. However, its results apply to all the $m$-nested simulation preorders.

We can also consider characteristic formulae modulo equivalence relations as follows.

- Definition 10. Let $X \in\{S, C S, R S, T S, 2 S, 3 S, B S\}$. A formula $\varphi \in \mathcal{L}_{X}$ is characteristic for $p \in P$ modulo $\equiv_{X}$ iff for all $q \in P$, it holds that $q \models \varphi \Leftrightarrow \mathcal{L}_{X}(p)=\mathcal{L}_{X}(q)^{1}$.

When studying the complexity of finding a characteristic formula for some process $p$ with respect to the behavioural relations we have introduced above, we will need some way of measuring the size of the resulting formula as a function of $|p|$. A formula in $\mathcal{L}_{X}$, where $X \in\{S, C S, R S, T S, 2 S, 3 S, B S\}$, can be given in explicit form as in Definition 3 or by means of recursive equations. In the latter case, we say that the formula is given in declarative form. For example, formula $\phi=\langle a\rangle(\langle a\rangle \mathbf{t t} \wedge\langle b\rangle \mathbf{t t}) \wedge\langle b\rangle(\langle a\rangle \mathbf{t t} \wedge\langle b\rangle \mathbf{t t})$ can be represented by the equations $\phi=\langle a\rangle \phi_{1} \wedge\langle b\rangle \phi_{1}$ and $\phi_{1}=\langle a\rangle \mathbf{t t} \wedge\langle b\rangle \mathbf{t t}$. We define:

- the size of formula $\varphi$, denoted by $|\varphi|$, to be the number of symbols that appear in the explicit form of $\varphi$,
- the declaration size of formula $\varphi$, denoted $\operatorname{by} \operatorname{decl}(\varphi)$, to be the number of equations that are used in the declarative form of $\varphi$, and
- the equational length of formula $\varphi$, denoted by eqlen $(\varphi)$, to be the maximum number of symbols that appear in an equation in the declarative form of $\varphi$.
For example, for the aforementioned formula $\phi$, we have that $|\phi|=13, \operatorname{decl}(\phi)=2$, and eqlen $(\phi)=5$.

## 3 The complexity of deciding characteristic formulae modulo preorders

In this section, we address the complexity of deciding whether formulae in $\mathcal{L}_{S}, \mathcal{L}_{C S}, \mathcal{L}_{R S}$, and $\mathcal{L}_{T S}$ are characteristic. Moreover, we also present related results for $\mathcal{L}_{2 S}$ and $\mathcal{L}_{3 S}$. Since characteristic formulae in those logics are exactly the consistent and prime ones [2, Theorem 5], we study the complexity of checking satisfiability and primality separately in Subsections 3.1 and 3.2.

[^0]
### 3.1 The complexity of satisfiability

To address the complexity of the satisfiability problem in $\mathcal{L}_{S}, \mathcal{L}_{C S}$, or $\mathcal{L}_{R S}$, we associate a set $I(\varphi) \subseteq 2^{A}$ to every formula $\varphi \in \mathcal{L}_{R S}$. Intuitively, $I(\varphi)$ describes all possible sets of initial actions that a process $p$ can have, when $p \models \varphi$.

- Definition 11. Let $\varphi \in \mathcal{L}_{R S}$. We define $I(\varphi)$ inductively as follows:
(a) $I(\mathbf{t} \mathbf{t})=2^{A}$,
(b) $I(\mathrm{ff})=\emptyset$,
(c) $I([a]$ ff $)=\{X \mid X \subseteq A$ and $a \notin X\}$,
(d) $I(\langle a\rangle \varphi)= \begin{cases}\emptyset, & \text { if } I(\varphi)=\emptyset, \\ \{X \mid X \subseteq A \text { and } a \in X\}, & \text { otherwise }\end{cases}$
(e) $I\left(\varphi_{1} \vee \varphi_{2}\right)=I\left(\varphi_{1}\right) \cup I\left(\varphi_{2}\right)$,
(f) $I\left(\varphi_{1} \wedge \varphi_{2}\right)=I\left(\varphi_{1}\right) \cap I\left(\varphi_{2}\right)$.

Note that $I(\mathbf{0})=\{\emptyset\}$.

- Lemma 12. For every $\varphi \in \mathcal{L}_{R S}$, the following statements hold:
(a) for every $S \subseteq A, S \in I(\varphi)$ iff there is a process $p$ such that $I(p)=S$ and $p \models \varphi$.
(b) $\varphi$ is inconsistent iff $I(\varphi)=\emptyset$.

When the number of actions is constant, $I(\varphi)$ can be computed in linear time for every $\varphi \in \mathcal{L}_{R S}$. For $\mathcal{L}_{C S}$, we need even less information; indeed, it is sufficient to define $I(\varphi)$ so that it encodes whether $\varphi$ is inconsistent, or is satisfied only in deadlocked states (that is, states with an empty set of initial actions), or is satisfied only in processes that are not deadlocked, or is satisfied both in some deadlocked and non-deadlocked states. This information can be computed in linear time for every $\varphi \in \mathcal{L}_{C S}$, regardless of the size of the action set.

## - Proposition 13.

(a) Satisfiability of formulae in $\mathcal{L}_{C S}$ and $\mathcal{L}_{S}$ is decidable in linear time.
(b) Let $|A|=k$, where $k \geq 1$ is a constant. Satisfiability of formulae in $\mathcal{L}_{R S}$ is decidable in linear time.

On the other hand, if we can use an unbounded number of actions, the duality of $\langle a\rangle$ and $[a]$ can be employed to define a polynomial-time reduction from SAT, the satisfiability problem for propositional logic, to satisfiability in $\mathcal{L}_{R S}$. Moreover, if we are allowed to nest $[a]$ modalities $(a \in A)$ and have at least two actions, we can encode $n$ propositional literals using formulae of $\log n$ size and reduce $S A T$ to satisfiability in $\mathcal{L}_{T S}$ in polynomial time. Finally, satisfiability in $\mathcal{L}_{2 S}$ is in NP, which can be shown by an appropriate tableau construction.

- Proposition 14. Let either $X=R S$ and $|A|$ be unbounded or $X \in\{T S, 2 S\}$ and $|A|>1$. Satisfiability of formulae in $\mathcal{L}_{X}$ is NP-complete.

Deciding satisfiability of formulae in $\overline{\mathcal{L}}_{2 S}$ when $|A|>1$, turns out to be PSPACE-complete. (A proof is provided in Appendix B.6.) This means that satisfiability of $\mathcal{L}_{3 S}$ is also PSPACEcomplete, since $\overline{\mathcal{L}}_{2 S} \subseteq \mathcal{L}_{3 S}$.

- Proposition 15. Let $|A|>1$. Satisfiability of formulae in $\mathcal{L}_{3 S}$ is PSPACE-complete.

\frac{\langle a\rangle \varphi_{1},\langle a\rangle \varphi_{2} \Rightarrow\langle a\rangle \psi}{\varphi_{1}, \varphi_{2} \Rightarrow \psi}(\diamond) & \frac{\varphi_{1}, \varphi_{2} \Rightarrow \mathrm{tt}}{\mathrm{TRUE}}(\mathrm{tt})
\end{array}
$$

Table 1 Rules for the simulation preorder. If $\mid \forall$ is displayed in the conclusion of a rule, then the rule is called universal. Otherwise, it is called existential.

### 3.2 The complexity of primality

We now study the complexity of checking whether a formula is prime in the logics that characterize some of the relations in Definition 1.

Primality in $\mathcal{L}_{S}$. Inconsistent formulae are trivially prime. Note also that in the case that $|A|=1$, all consistent formulae in $\mathcal{L}_{S}$ are prime. To address the problem for any action set, for every consistent formula $\varphi \in \mathcal{L}_{S}$ we can efficiently compute a logically equivalent formula $\varphi^{\prime}$ given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$. We examine the complexity of deciding primality of such formulae.

- Proposition 16. Let $\varphi \in \mathcal{L}_{S}$ such that $\mathrm{ff} \notin \operatorname{Sub}(\varphi)$. Deciding whether $\varphi$ is prime is in P .

Proof. We describe algorithm Prime $_{S}$ that, on input $\varphi$, decides primality of $\varphi$. Prime ${ }_{S}$ constructs a rooted directed acyclic graph, denoted by $G_{\varphi}$, from the formula $\varphi$ as follows. Every vertex of the graph is either of the form $\varphi_{1}, \varphi_{2} \Rightarrow \psi-$ where $\varphi_{1}, \varphi_{2}$ and $\psi$ are subformulae of $\varphi$, or TRUE. The algorithm starts from vertex $x=(\varphi, \varphi \Rightarrow \varphi)$ and applies some rule in Table 1 to $x$ in top-down fashion to generate one or two new vertices that are given at the bottom of the rule. These vertices are the children of $x$ and the vertex $x$ is labelled with either $\exists$ or $\forall$, depending on which one is displayed at the bottom of the applied rule. If $x$ has only one child, Prime $_{S}$ labels it with $\exists$. The algorithm recursively continues this procedure on the children of $x$. If no rule can be applied on a vertex, then this vertex has no outgoing edges. For the sake of clarity and consistency, we assume that right rules, i.e. $(\mathrm{R} \vee)$ and $(\mathrm{R} \wedge)$, are applied before the left ones, i.e. $\left(\mathrm{L} \vee_{i}\right)$ and $\left(\mathrm{L} \wedge_{i}\right), i=1$, 2 , by the algorithm. The graph generated in this way is an alternating graph, as defined by Immerman in $\left[28\right.$, Definition 3.24]. In $G_{\varphi}$, the source vertex $s$ is $\varphi, \varphi \Rightarrow \varphi$, and the target vertex $t$
 Reachability on alternating graphs and is defined in [28, pp. 53-54]. It accepts $\varphi$ iff $\mathrm{REACH}_{a}$ accepts $G_{\varphi}$. The full technical details are included in Appendix C.1. Note that graph $G_{\varphi}$ is of polynomial size and there is a linear-time algorithm solving REACH ${ }_{a}$ [28].

Primality in $\mathcal{L}_{C S}$. Note that, in the case of $\mathcal{L}_{C S}$, the rules in Table 1 do not work any more because, unlike $\mathcal{L}_{S}$, the logic $\mathcal{L}_{C S}$ can express some 'negative information' about the behaviour of processes. For example, let $A=\{a\}$ and $\varphi=\langle a\rangle \mathbf{t t}$. Then, Primes accepts $\varphi$, even though $\varphi$ is not prime in $\mathcal{L}_{C S}$. Indeed, $\varphi \models\langle a\rangle\langle a\rangle \mathbf{t t} \vee\langle a\rangle \mathbf{0}$, but $\varphi \not \models\langle a\rangle\langle a\rangle \mathbf{t t}$ and $\varphi \not \vDash\langle a\rangle \mathbf{0}$. However, we can overcome this problem as described in the proof sketch of Proposition 17 below.

Proposition 17. Let $\varphi \in \mathcal{L}_{C S}$ be a formula such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent. Deciding whether $\varphi$ is prime is in P .

Proof. Consider the algorithm that first computes the formula $\varphi^{\diamond}$ by applying rule $\langle a\rangle \mathbf{t t} \rightarrow_{\diamond}$ $\mathbf{t t}$, and rules $\mathbf{t t} \vee \psi \rightarrow_{\mathrm{tt}} \mathbf{t t}$ and $\mathbf{t t} \vee \psi \rightarrow_{\mathrm{tt}}$ tt modulo commutativity on $\varphi$. It holds that $\varphi$ is prime iff $\varphi^{\diamond}$ is prime and $\varphi^{\diamond} \models \varphi$. Next, the algorithm decides primality of $\varphi^{\diamond}$ by solving reachability on a graph constructed as in the case of simulation using the rules in Table 1, where rule ( tt ) is replaced by rule ( 0 ), whose premise is $\mathbf{0 , 0} \Rightarrow \mathbf{0}$ and whose conclusion is True. To verify $\varphi^{\diamond} \models \varphi$, the algorithm computes a process $p$ for which $\varphi^{\diamond}$ is characteristic within $\mathcal{L}_{C S}$ and checks whether $p \models \varphi$. In fact, the algorithm has also a preprocessing phase during which it applies a set of rules on $\varphi$ and obtains an equivalent formula with several desirable properties. See Appendix C. 2 for full details, where Remark 122 comments on the type and ordering of the rules applied.

Primality in $\mathcal{L}_{R S}$. The presence of formulae of the form [a]ff in $\mathcal{L}_{R S}$ means that a prime formula $\varphi \in \mathcal{L}_{R S}$ has at least to describe which actions are necessary or forbidden for any process that satisfies $\varphi$. For example, let $A=\{a, b\}$. Then, $\langle a\rangle \mathbf{0}$ is not prime, since $\langle a\rangle \mathbf{0} \models(\langle a\rangle \mathbf{0} \wedge[b] \mathbf{f f}) \vee(\langle a\rangle \mathbf{0} \wedge\langle b\rangle \mathbf{t t})$, and $\langle a\rangle \mathbf{0}$ entails neither $\langle a\rangle \mathbf{0} \wedge[b]$ ff nor $\langle a\rangle \mathbf{0} \wedge\langle b\rangle \mathbf{t t}$. Intuitively, we call a formula $\varphi$ saturated if $\varphi$ describes exactly which actions label the outgoing edges of any process $p$ such that $p \models \varphi$. Formally, $\varphi$ is saturated iff $I(\varphi)$ is a singleton.

If the action set is bounded by a constant, given $\varphi$, we can efficiently construct a formula $\varphi^{s}$ such that (1) $\varphi^{s}$ and every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}\left(\varphi^{s}\right)$ are saturated, (2) $\varphi$ is prime iff $\varphi^{s}$ is prime and $\varphi^{s} \models \varphi$, and (3) primality of $\varphi^{s}$ can be efficiently reduced to $\mathrm{REACH}_{a}$.

- Proposition 18. Let $|A|=k$, where $k \geq 1$ is a constant, and $\varphi \in \mathcal{L}_{R S}$ be such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and $\psi$ occurs in the scope of some $[a]$. Deciding whether $\varphi$ is prime is in P .

As the following result indicates, primality checking for formulae in $\mathcal{L}_{R S}$ becomes computationally hard when $|A|$ is not a constant.

Proposition 19. Let $|A|$ be unbounded. Deciding primality of formulae in $\mathcal{L}_{R S}$ is coNPcomplete.

Proof. We give a polynomial-time reduction from Sat to deciding whether a formula in $\mathcal{L}_{R S}$ is not prime. Let $\varphi$ be a propositional formula over $x_{0}, \ldots, x_{n-1}$. We set $\varphi^{\prime}=$ $\left(\varphi \wedge \neg x_{n}\right) \vee\left(x_{n} \wedge \bigwedge_{i=1}^{n-1} \neg x_{i}\right)$ and $\varphi^{\prime \prime}$ to be $\varphi^{\prime}$ where $x_{i}$ is substituted with $\left\langle a_{i}\right\rangle \mathbf{0}$ and $\neg x_{i}$ with $\left[a_{i}\right] \mathrm{ff}$, where $A=\left\{a_{0}, \ldots, a_{n}\right\}$. As $\varphi^{\prime \prime}$ is satisfied in $a_{n} .0$, it is a consistent formula, and so $\varphi^{\prime \prime}$ is prime in $\mathcal{L}_{R S}$ iff $\varphi^{\prime \prime}$ is characteristic within $\mathcal{L}_{R S}$. We show that $\varphi$ is satisfiable iff $\varphi^{\prime \prime}$ is not characteristic within $\mathcal{L}_{R S}$. Let $\varphi$ be satisfiable and let $s$ denote a satisfying assignment of $\varphi$. Consider $p_{1}, p_{2} \in P$ such that:

- $p_{1} \xrightarrow{a_{i}} 0$ iff $s\left(x_{i}\right)=$ true, for $0 \leq i \leq n-1$, and $p_{1} \stackrel{a_{n}}{\rightarrow}$, and
- $p_{2} \xrightarrow{a_{n}} 0$ and $p_{2} \stackrel{a}{\rightarrow}$ for every $a \in A \backslash\left\{a_{n}\right\}$.

It holds that $p_{i} \models \varphi^{\prime \prime}, i=1,2, p_{1} \not \mathcal{L}_{R S} p_{2}$, and $p_{2} \not \mathcal{L}_{R S} p_{1}$. Suppose that there is a process $q$, such that $\varphi^{\prime \prime}$ is characteristic for $q$ within $\mathcal{L}_{R S}$. If $q \xrightarrow{a_{n}}$, then $q \not \mathcal{L}_{R S} p_{1}$. On the other hand, if $q \stackrel{a_{n}}{\rightarrow}$, then $q \not \leq_{R S} p_{2}$. So, both cases lead to a contradiction, which means that $\varphi^{\prime \prime}$ is not characteristic within $\mathcal{L}_{R S}$. For the converse implication, assume that $\varphi$ is unsatisfiable. This implies that there is no process satisfying the first disjunct of $\varphi^{\prime \prime}$. Thus, up to $\equiv_{R S}$, the only process satisfying $\varphi^{\prime \prime}$ is the unique process satisfying $\left\langle a_{n}\right\rangle \mathbf{0} \wedge \bigwedge_{a \in A \backslash\left\{a_{n}\right\}}[a] \mathbf{f f}$, which is process $p_{2}$ described above. Consequently, $\varphi^{\prime \prime}$ is characteristic for $p_{2}$ within $\mathcal{L}_{R S}$.

Proving the matching upper bound is non-trivial. There is a coNP algorithm that uses properties of prime formulae and rules of Table 1, carefully adjusted to the case of ready simulation. We describe the algorithm and prove its correctness in Appendix C.3.2.

Primality in $\mathcal{L}_{T S}$. If we have more than one action, a propositional literal can be encoded by using the restricted nesting of modal operators that is allowed by the grammar for $\mathcal{L}_{T S}$. This observation is the crux of the proof of the following result.

- Proposition 20. Let $|A|>1$. Deciding prime formulae within $\mathcal{L}_{T S}$ is coNP-hard.

Proof. Let $A=\{0,1\}$. The proof follows the steps of the proof of Proposition 19. The only difference is that $x_{i}$ is substituted with $\left[\overline{b_{i 1}}\right] \mathrm{ff} \wedge\left\langle b_{i 1}\right\rangle\left(\left[\overline{b_{i 2}}\right] \mathrm{ff} \wedge\left\langle b_{i 2}\right\rangle\left(\ldots\left(\left[\overline{b_{i k}}\right] \mathrm{ff} \wedge\left\langle b_{i k}\right\rangle \mathbf{0}\right) \ldots\right)\right)$ and $\neg x_{i}$ with $\left[b_{i 1}\right]\left[b_{i 2}\right] \ldots\left[b_{i k}\right] \mathrm{ff}$, where $b_{i 1} \ldots b_{i k}$ is the binary representation of $i$ and $\bar{b}=0$, if $b=1$, and $\bar{b}=1$, if $b=0$.

In contrast to the case for $\mathcal{L}_{R S}$, bounding the size of the action set is not sufficient for deciding primality of formulae in $\mathcal{L}_{T S}$ in polynomial time. However, we show that both satisfiability and primality become efficiently solvable if we bound both $|A|$ and the modal depth of the input formula.

- Proposition 21. Let $|A|=k$ and $\varphi \in \mathcal{L}_{T S}$ with $\operatorname{md}(\varphi)=d$, where $k, d \geq 1$ are constants. Then, there is an algorithm that decides whether $\varphi$ is consistent and prime in linear time.

Proof. It is necessary and sufficient to check that there is a process $p$ with $\operatorname{depth}(p) \leq d$ such that (1) $p \models \varphi$ and (2) for every $q$ with $\operatorname{depth}(q) \leq d+1$, if $q \models \varphi$ then $p \lesssim_{T S} q$. Since $k$ and $d$ are considered to be constants, there is an algorithm that does so and requires linear time in $|\varphi|$. In particular, the algorithm runs in $\mathcal{O}\left(2^{2 k^{d+1}} \cdot k^{d+1} \cdot|\varphi|\right)$.

To classify the problem of deciding characteristic formulae in $\mathcal{L}_{T S}$ when $|A|$ is bounded, let us briefly introduce fixed-parameter tractable problems - see, for instance, $[17,18]$ for textbook accounts of this topic. Let $L \subseteq \Sigma^{*} \times \Sigma^{*}$ be a parameterized problem. We denote by $L_{y}$ the associated fixed-parameter problem $L_{y}=\{x \mid(x, y) \in L\}$, where $y$ is the parameter. Then, $L \in$ FPT (or $L$ is fixed-parameter tractable) if there are a constant $\alpha$ and an algorithm to determine if $(x, y)$ is in $L$ in time $f(|y|) \cdot|x|^{\alpha}$, where $f$ is a computable function [16].

- Corollary 22. Let $|A|=k$, where $k \geq 1$ is a constant. The problems of deciding satisfiable, prime, and characteristic formulae in $\mathcal{L}_{T S}$ are in FPT , with the modal depth of the input formula as the parameter.

Primality in $\mathcal{L}_{3 S}$. Let $|A|>1$. PSPACE-hardness of $\mathcal{L}_{3 S}$-satisfiability implies PSPACEhardness of $\overline{\mathcal{L}}_{3 S}$-validity. Along the lines of the proof of [1, Theorem 26], we prove the following result.

- Proposition 23. Let $|A|>1$. Deciding prime formulae within $\mathcal{L}_{3 S}$ is PSPACE-hard.

Remark 24. Note that primality within $\mathcal{L}_{B S}$ coincides with primality modulo $\sim$. In [1], primality modulo $\sim$ is called completeness and it is shown to be decidable in PSPACE. However, the algorithm used in [1] does not immediately imply that primality within $\mathcal{L}_{3 S}$ is in PSPACE.

Interestingly, PSPACE-hardness of $\mathcal{L}_{2 S}$-validity implies the following theorem.

- Theorem 25. Let $X \in\{C S, R S, T S, 2 S, 3 S\}$ and $|A|>1$. The problem of deciding whether a formula in $\overline{\mathcal{L}}_{2 S}$ is prime in $\mathcal{L}_{X}$ is PSPACE-hard.

Proof. We reduce $\mathcal{L}_{2 S}$-validity to this problem. Let $\varphi \in \mathcal{L}_{2 S}$. The reduction will return a formula $\varphi^{\prime}$, such that $\varphi$ is $\mathcal{L}_{2 S}$-valid if and only if $\varphi^{\prime}$ is prime in $\mathcal{L}_{X}$. If $0 \not \vDash \varphi$, then let $\varphi^{\prime}=\mathbf{t t}$; in this case, $\varphi$ is not valid and $\mathbf{t t}$ is not prime in $\mathcal{L}_{X}$. Otherwise, let $\varphi^{\prime}=\mathbf{0} \vee \neg \varphi$. If $\varphi$ is valid, then $\varphi^{\prime} \equiv \mathbf{0}$ and therefore $\varphi^{\prime}$ is prime in $\mathcal{L}_{X}$. On the other hand, if $\varphi$ is not valid, then there is some process $p \models \neg \varphi$. From $0 \models \varphi$, it holds that $p \xrightarrow{a}$. Then, $\varphi^{\prime} \models \mathbf{0} \vee \bigvee_{a \in A}\langle a\rangle \mathbf{t t}$, but $\varphi^{\prime} \not \models \mathbf{0}$ and $\varphi^{\prime} \not \models \bigvee_{a \in A}\langle a\rangle$ tt. Since $\mathbf{0} \vee \bigvee_{a \in A}\langle a\rangle \mathbf{t t} \in \mathcal{L}_{C S}, \varphi^{\prime}$ is not prime in $\mathcal{L}_{X}$, where $X \in\{C S, R S, T S, 2 S, 3 S\}$.

Theorem 25 shows that when deciding primality in $\mathcal{L}_{X}$, if we allow the input to be in a $\operatorname{logic} \mathcal{L}$ that is more expressive than $\mathcal{L}_{X}$, the computational complexity of the problem can increase. It is then reasonable to constrain the input of the problem to be in $\mathcal{L}_{X}$ in order to obtain tractable problems as in the case of $\mathcal{L}_{S}$ and $\mathcal{L}_{C S}$.

Before we give our main result summarizing the complexity of deciding characteristic formulae, we introduce two classes that play an important role in pinpointing the complexity of deciding characteristic formulae within $\mathcal{L}_{R S}$ and $\mathcal{L}_{T S}$. The first class is DP $=\left\{L_{1} \cap L_{2} \mid\right.$ $L_{1} \in \mathrm{NP}$ and $\left.L_{2} \in \operatorname{coNP}\right\}[40]$ and the second one is US [8], which is defined thus: A language $L \in \mathrm{US}$ iff there is a non-deterministic Turing machine $T$ such that, for every instance $x$ of $L, x \in L$ iff $T$ has exactly one accepting path. The problem UniqueSat, viz. the problem of deciding whether a given Boolean formula has exactly one satisfying truth assignment, is US-complete and US $\subseteq$ DP [8].

## - Theorem 26.

(a) Deciding characteristic formulae within $\mathcal{L}_{S}, \mathcal{L}_{C S}$, or $\mathcal{L}_{R S}$ with a bounded action set is in P .
(b) Deciding characteristic formulae within $\mathcal{L}_{R S}$ with an unbounded action set is US-hard and belongs to DP.
(c) Deciding characteristic formulae within $\mathcal{L}_{T S}$ is US-hard.
(d) Deciding characteristic formulae within $\mathcal{L}_{3 S}$ is PSPACE-hard.

## 4 Finding characteristic formulae: The gap between trace simulation and the other preorders

Let $X \in\{S, C S\}$ or $X=R S$ and $|A|$ is bounded by a constant. The complexity of finding characteristic formulae within $\mathcal{L}_{X}$ depends on the representation of the output. If the characteristic formula has to be given in explicit form, then the following result holds.

- Proposition 27. Let $X \in\{S, C S\}$ or $X=R S$ and $|A|$ is bounded by a constant. If finding the characteristic formula within $\mathcal{L}_{X}$ for a given finite loop-free process can be done in polynomial time when the output is given in explicit form, then $\mathrm{P}=\mathrm{NP}$.

|  | $\mathcal{L}_{S}$ | $\mathcal{L}_{C S}$ | $\mathcal{L}_{\overline{=}}^{\overline{=}}{ }_{S}$ | $\mathcal{L}_{R S}^{>k}$ | $\mathcal{L}_{T S}^{>1}$ | $\mathcal{L}_{2 S}$ | $\mathcal{L}_{3 S}^{>1}$ | $\mathcal{L}_{B S}$ |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| Satisfiability | P | P | P | NP- comp. | $\begin{aligned} & \text { NP- } \\ & \text { comp. } \end{aligned}$ | $\begin{aligned} & \text { NP- } \\ & \text { comp. } \end{aligned}$ | PSPACEcomp. | PSPACE- <br> comp. |

| Finding ${ }_{\text {decl }}$ | FP | FP | FP | FP | NP- <br> hard | FP | FP | FP |
| Finding $_{\text {expl }}$ | NP-hard |  |  |  |  |  |  |  |

Table 2 The complexity of solving satisfiability, primality and finding characteristic formulae for different logics. Finding ${ }_{\text {decl }}$ (resp. Finding ${ }_{\text {expl }}$ ) denotes the problem of finding the characteristic formula for a given finite loop-free process, when the output is given in declarative (resp. explicit form). Superscripts $=k,>k$, and $>1$ mean that the action set is bounded by a constant, unbounded, and has more than one action, respectively. All the results shown in white cells have been proven in this paper, whereas results in light gray are from [1]. The cell in dark gray corresponds to a problem that we leave open in this article.

Proof. If the assumption of the proposition is true, the results of this paper allow us to decide trace equivalence of two finite loop-free processes in polynomial time. (For details, the reader can see Appendix E.1.) Since trace equivalence for such processes is coNP-complete [27, Theorem 2.7(1)], this implies that $\mathrm{P}=\mathrm{NP}$.

However, if output formulae are given in declarative form, then finding characteristic formulae within $\mathcal{L}_{X}$, where $X \in\{n S, C S, R S, B S\}, n \geq 1$, can be done in polynomial time.

- Proposition 28. For every $X \in\{n S, C S, R S, B S\}$, where $n \geq 1$, there is a polynomial-time algorithm that, given a finite loop-free process $p$, outputs a formula in declarative form that is characteristic for $p$ within $\mathcal{L}_{X}$.

Proof. The proof relies on inductive definitions of characteristic formulae within $\mathcal{L}_{X}$, where $X \in\{S, C S, R S, 2 S, B S\}$, given in $[29,5]$, and within $\mathcal{L}_{n S}, n \geq 3$, given in Appendix E.1. These definitions guarantee that there are polynomial-time recursive procedures which construct characteristic formulae within $\mathcal{L}_{X}$.

We now present the complexity gap between finding characteristic formulae for preorders CS, RS, BS, and nS, $n \geq 1$, and the same search problem for preorder TS. In the former case, there are characteristic formulae that have both declaration size and equational length that are polynomial in the size of the processes they characterize, and they can be efficiently computed. On the contrary, for TS, even if characteristic formulae are always of polynomial declaration size and polynomial equational length, they cannot be efficiently computed, unless $\mathrm{P}=\mathrm{NP}$.

- Proposition 29. Assume that for every finite loop-free process $p$, there is a characteristic formula within $\mathcal{L}_{T S}$ for $p$, denoted by $\chi(p)$, such that both $\operatorname{decl}(\chi(p))$ and eqlen $(\chi(p))$ are in $\mathcal{O}\left(|p|^{k}\right)$ for some $k \in \mathbb{N}$. Given a finite loop-free process $p$, if $\chi(p)$ can be computed in polynomial time, then $\mathrm{P}=\mathrm{NP}$.

Next, we prove that we do not expect that a finite loop-free process $p$ has always a short characteristic formula within $\mathcal{L}_{T S}$ when this is combined with a second condition. To show that statement, we need the following lemma.

- Lemma 30. For every finite $p$ and $q, \operatorname{traces}(p)=\operatorname{traces}(q)$ iff $p \lesssim_{T S} p+q$ and $q \lesssim_{T S} p+q$.

Proof. If $\operatorname{traces}(p)=\operatorname{traces}(q)$, then $p \lesssim_{T S} p+q$. Indeed, for every $p \xrightarrow{a} p^{\prime}$, it holds that $p+q \xrightarrow{a} p^{\prime}$ and, trivially, $p^{\prime} \lesssim_{T S} p^{\prime}$. Moreover, $\operatorname{traces}(p+q)=\operatorname{traces}(p) \cup \operatorname{traces}(q)=$ $\operatorname{traces}(p)$. Symmetrically, $q \lesssim_{T S} p+q$. Conversely, if $p \lesssim_{T S} p+q$ and $q \lesssim_{T S} p+q$, then $\operatorname{traces}(p+q)=\operatorname{traces}(p)=\operatorname{traces}(q)$, and we are done.

- Proposition 31. Assume that the following two conditions hold:

1. For every finite loop-free process $p$, there is a characteristic formula within $\mathcal{L}_{T S}$ for $p$, denoted by $\chi(p)$, such that both $\operatorname{decl}(\chi(p))$ and eqlen $(\chi(p))$ are in $\mathcal{O}\left(|p|^{k}\right)$ for some $k \in \mathbb{N}$.
2. Given a finite loop-free process $p$ and a formula $\varphi$ in declarative form, deciding whether $\varphi$ is characteristic for $p$ within $\mathcal{L}_{T S}$ is in NP.
Then NP = coNP.
Proof. We describe an NP algorithm $\mathcal{A}$ that decides non-membership in SAT and makes use of conditions 1 and 2 of the proposition. Let $\phi$ be an input CNF formula to SAT. Algorithm $\mathcal{A}$ computes the DNF formula $\neg \phi$ for which it needs to decide DNF-Tautology. Then, $\mathcal{A}$ reduces DNF-TAUTOLOGY to deciding trace equivalence of processes $p_{0}$ and $q$ constructed as described in the proof of [27, Theorem 2.7(1)] (or Proposition 178 in Appendix D). $\mathcal{A}$ can decide if $\operatorname{traces}\left(p_{0}\right)=\operatorname{traces}(q)$ by checking $p_{0} \lesssim_{T S} p_{0}+q$ and $q \lesssim_{T S} p_{0}+q$ because of Lemma 30. Finally, $\mathcal{A}$ reduces $p_{0} \lesssim_{T S} p_{0}+q$ (resp. $q \lesssim_{T S} p_{0}+q$ ) to model checking: it needs to check whether $p_{0}+q \models \chi\left(p_{0}\right)$ (resp. $p_{0}+q \models \chi(q)$ ) (by Proposition 41(a)). To this end, $\mathcal{A}$ guesses two formulae $\varphi_{p_{0}}$ and $\varphi_{q}$ in declarative form of polynomial declaration size and equational length, and two witnesses that verify that $\varphi_{p_{0}}$ and $\varphi_{q}$ are characteristic within $\mathcal{L}_{T S}$ for $p_{0}$ and $q$, respectively. This can be done due to conditions 1 and 2 . $\mathcal{A}$ rejects the input iff both $p_{0}+q \models \chi\left(p_{0}\right)$ and $p_{0}+q \models \chi(q)$ are true.

## 5 A note on deciding characteristic formulae modulo equivalence relations

So far, we have studied the complexity of algorithmic problems related to characteristic formulae in the modal logics that characterize the simulation-based preorders in van Glabbeek's spectrum. As shown in [2], those logics are powerful enough to describe characteristic formulae for each finite, loop-free process up to the preorder they characterize. It is therefore natural to wonder whether they can also express characteristic formulae modulo the kernels of those preorders. The following result indicates that the logics $\mathcal{L}_{X}$, where $X \in\{S, C S, R S\}$, have very weak expressive power when it comes to defining characteristic formulae modulo $\equiv_{X}$.

Proposition 32. No formula in $\mathcal{L}_{S}$ is characteristic for some process $p$ with respect to $\equiv_{S}$. For $X \in\{C S, R S\}$, a formula $\varphi$ is characteristic for some process $p$ with respect to $\equiv_{X}$ iff it is logically equivalent to $\bigwedge_{a \in A}[a] \mathrm{ff}$.

Proof. Assume, towards contradiction, that there is a formula $\varphi_{c}^{S}$ in $\mathcal{L}_{S}$ that is characteristic for some process $p$ with respect to $\equiv_{S}$. Let $\ell$ be the depth of $p$ and $a \in A$. Define process $q=p+a^{\ell+1} 0$ - that is, $q$ is a copy of $p$ with an additional path that has exactly $\ell+1$ $a$-transitions. It is easy to see that $p \lesssim_{S} q$, but $q \mathcal{L}_{S} p$. Since $p \models \varphi_{c}^{S}$, it holds that $q \models \varphi_{c}^{S}$. However, $q \not 三_{S} p$, which contradicts our assumption that $\varphi_{c}^{S}$ is characteristic for $p$ with respect to $\equiv_{S}$. For $X \in\{C S, R S\}$, note that a formula $\varphi$ is logically equivalent to $\bigwedge_{a \in A}[a] \mathrm{ff}$ iff it is satisfied only by processes without outgoing transitions, and so it is characteristic for
any such process modulo $\equiv_{X}$. To prove that no formula is characteristic for some process $p$ with positive depth modulo $\equiv_{C S}$ or $\equiv_{R S}$, a similar argument to the one for $\equiv_{S}$ can be used. For $\equiv_{R S}$, the action $a$ should be chosen such that $p \xrightarrow{a} p^{\prime}$ for some $p^{\prime}$.

For $T S$ and $2 S$, there are characteristic formulae modulo $\equiv_{T S}$ and $\equiv_{2 S}$, respectively. For example, if $A=\{a, b\}$, the formula $\varphi_{a}=\langle a\rangle([a] \mathbf{f f} \wedge[b] \mathbf{f f}) \wedge[b] \mathbf{f f} \wedge[a][a] \mathbf{f f} \wedge[a][b] \mathrm{ff}$ is satisfied only by processes that are equivalent, modulo those equivalences, to process $p_{a}=a .0$ that has a single transition labelled with $a$. Thus, $\varphi_{a}$ is characteristic for $p_{a}$ modulo both $\equiv_{T S}$ and $\equiv_{2 S}$. We can use the following theorem as a tool to prove hardness of deciding characteristic formulae modulo some equivalence relation. Theorem 33 below is an extension of [1, Theorem 26], so that it holds for every $X$ such that a characteristic formula modulo $\equiv_{X}$ exists, namely $X \in\{C S, R S, T S, 2 S, 3 S, B S\}$.

- Theorem 33. Let $X \in\{C S, R S, T S, 2 S, 3 S, B S\}$. Validity in $\overline{\mathcal{L}}_{X}$ reduces in polynomial time to deciding characteristic formulae with respect to $\equiv_{X}$.

Note that from the results of Subsection 3.1, validity in $\overline{\mathcal{L}}_{R S}$ with an unbounded action set, $\overline{\mathcal{L}}_{T S}$ with $|A|>1$, or $\overline{\mathcal{L}}_{2 S}$ with $|A|>1$ is coNP-complete, whereas in $\overline{\mathcal{L}}_{3 S}$ with $|A|>1$ is PSPACE-complete. Consequently, from Theorem 33, deciding characteristic formulae modulo $\equiv_{R S}$ with an unbounded action set, $\equiv_{T S}$ with $|A|>1$, or $\equiv_{2 S}$ with $|A|>1$ is coNP-hard and modulo $\equiv_{3 S}$ with $|A|>1$ is PSPACE-hard.

## 6 Conclusions

In this paper, we studied the complexity of determining whether a formula is characteristic for some finite, loop-free process in each of the logics providing modal characterizations of the simulation-based semantics in van Glabbeek's branching-time spectrum [19]. Since, as shown in [2], characteristic formulae in each of those logics are exactly the consistent and prime ones, we gave complexity results for the satisfiability and primality problems, and investigated the boundary between logics for which those problems can be solved in polynomial time and those for which they become computationally hard. Our results show that computational hardness already manifests itself in ready simulation semantics [9, 34] when the size of the action set is not a constant. Indeed, in that setting, the mere addition of formulae of the form $[a]$ ff to the logic that characterizes the simulation preorder yields a logic whose satisfiability and primality problems are NP-hard and coNP-hard respectively. Moreover, we show that deciding primality in the logic characterizing 3-nested simulation is PSPACE-hard in the presence of at least two actions.

Amongst others, we also studied the complexity of constructing characteristic formulae in each of the logics we consider, both when such formulae are presented in explicit form and in declarative form. In particular, one of our results identifies a sharp difference between trace simulation and the other semantics when it comes to constructing characteristic formulae. For all the semantics apart from trace simulation, there are characteristic formulae that have declaration size and equational length that are polynomial in the size of the processes they characterize and they can be efficiently computed. On the contrary, for trace simulation, even if characteristic formulae are always of polynomial declaration size and polynomial equational length, they cannot be efficiently computed, unless $P=N P$.

Our results are summarized in Table 2 and open several avenues for future research that we are currently pursuing. First of all, as highlighted in that table, the precise complexity of primality checking is still open for the logics characterizing the $n$-nested simulation
semantics. We conjecture that checking primality in $\mathcal{L}_{2 S}$ is coNP-complete and that PSPACEcompleteness holds for $n$-nested simulation when $n \geq 3$. Next, we plan to study the complexity of deciding whether formulae are characteristic in the extensions of the modal logics we have considered in this article with greatest fixed points. Indeed, in those extended languages, one can define characteristic formulae for finite processes. It is known that deciding whether a formula is characteristic is PSPACE-complete for HML, but becomes EXP-complete for its extension with fixed-point operators-see reference [1]. It would be interesting to see whether similar results hold for the other logics. Finally, building on the work presented in [2], we plan to study the complexity of the algorithmic questions considered in this article for (some of) the linear-time semantics in van Glabbeek's spectrum.

## A Further preliminaries

We include here the material we need to use when proving in detail the results of this paper.
$\rightarrow$ Remark 34. We use $\mathbf{0}$ and $\bigwedge_{a \in A}[a] \mathbf{f f}$ interchangeably, especially when it comes to $\mathcal{L}_{C S}$ or $\mathcal{L}_{R S}$ formulae. Note that in the case of $|A|=1$, ready simulation coincides with complete simulation and $\mathcal{L}_{C S}=\mathcal{L}_{R S}$.
$\rightarrow$ Remark 35. As is well-known [19], the preorders defined in Definition 1 are preserved by action prefixing, i.e. if $p \lesssim_{X} q$, then $a . p \lesssim_{X} a . q$, and by the operator + , i.e. if $p_{1} \lesssim_{X} q_{1}$ and $p_{2} \lesssim_{X} q_{2}$, then $p_{1}+p_{2} \lesssim_{X} q_{1}+q_{2}$.

Formally, the modal depth of a formula is defined as follows.

- Definition 36. Given a formula $\varphi \in \mathcal{L}_{B S}$, the modal depth of $\varphi$, denoted by $\operatorname{md}(\varphi)$, is defined inductively as follows:
- $\operatorname{md}(\mathbf{t t})=\operatorname{md}(\mathbf{f f})=0$,
- $\operatorname{md}(\langle a\rangle \varphi)=\operatorname{md}([a] \varphi)=\operatorname{md}(\varphi)+1$,
$-\operatorname{md}\left(\varphi_{1} \wedge \varphi_{2}\right)=\operatorname{md}\left(\varphi_{1} \vee \varphi_{2}\right)=\max \left\{\operatorname{md}\left(\varphi_{1}\right), \operatorname{md}\left(\varphi_{2}\right)\right\}$,
- $\operatorname{md}(\neg \varphi)=\operatorname{md}(\varphi)$.

The following is a corollary of Proposition 6 and Definition 7.

- Corollary 37. For every $X \in\{S, C S, R S, T S, 2 S, 3 S, B S\}$, a formula $\varphi$ is characteristic within $\mathcal{L}_{X}$ for $p \in P$ if, for all $q \in P$, it holds that $q \vDash \varphi$ iff $\mathcal{L}_{X}(p) \subseteq \mathcal{L}_{X}(q)$ iff $p \lesssim_{X} q$.
- Remark 38. We sometimes say that $\varphi$ is characteristic with respect to $\lesssim_{X}$ for $p$ when $\varphi$ is characteristic within $\mathcal{L}_{X}$ for $p$. Similarly to Corollary $37, \varphi$ is characteristic modulo $\equiv_{X}$ for $p$ if, for all $q \in P$, it holds that $q \models \varphi \Leftrightarrow \mathcal{L}_{X}(p)=\mathcal{L}_{X}(q) \Leftrightarrow p \equiv_{X} q$.

We derive the following corollary from Corollary 37.

- Corollary 39. Let $\varphi \in \mathcal{L}_{X}, X \in\{S, C S, R S, T S, 2 S, 3 S, B S\}$. If $\varphi$ is characteristic for both $p$ and $q$, then $p \equiv_{X} q$.
- Corollary 40. Let $\varphi, \psi \in \mathcal{L}_{X}$ be characteristic within $\mathcal{L}_{X}$ for $p, q$, respectively, where $X \in\{S, C S, R S, T S, 2 S, 3 S, B S\}$. Then, $\varphi \models \psi$ iff $q \lesssim x p$.

The following proposition states that for characteristic formulae, preorder-checking and model-checking are interreducible.

- Proposition 41. (a) Given processes $p$ and $q$, deciding $p \lesssim x q$, where $X \in\{S, C S, R S, T S$, $2 S, 3 S, B S\}$, reduces to finding $\chi(p)$ within $\mathcal{L}_{X}$ and checking whether $q \models \chi(p)$.
(b) Given a formula $\varphi \in \mathcal{L}_{X}$, where $X \in\{S, C S, R S, T S, 2 S, 3 S, B S\}$, and a process $q$, if $\varphi$ is characteristic within $\mathcal{L}_{X}$, deciding $q \models \varphi$ reduces to finding a process $p$ for which $\varphi$ is characteristic within $\mathcal{L}_{X}$ and checking whether $p \lesssim x q$.

Proof. (a) If $q \models \chi(p)$, then $\mathcal{L}_{X}(p) \subseteq \mathcal{L}_{X}(q)$ by Definition 7 , which implies that $p \lesssim_{X} q$ by Proposition 6.
(b) If $p \lesssim_{X} q$, then $\mathcal{L}_{X}(p) \subseteq \mathcal{L}_{X}(q)$ by Proposition 6 . Since $\varphi$ is characteristic for $p$, by Definition $7, \varphi \in \mathcal{L}_{S}(p)$, and so $\varphi \in \mathcal{L}_{S}(q)$.

We extensively use the disjunctive normal form (DNF) of formulae. A formula in $\mathcal{L}_{B S}$ is in DNF if it is in the form $\bigvee_{i=1}^{k} \varphi_{i}, k \geq 1$, where every $\varphi_{i}, 1 \leq i \leq k$, contains no disjunctions. To transform a formula $\varphi \in \mathcal{L}_{B S}$ into DNF, we can call Algorithm 1. The next lemma is true for formulae in $\mathcal{L}_{X}$, where $X \neq\{2 S, 3 S, B S\}$.

Algorithm 1 Computing the DNF of a formula in $\mathcal{L}_{B S}$

```
procedure \(\operatorname{DNF}(\varphi)\)
    if \(\varphi=\varphi_{1} \vee \varphi_{2}\) then \(\varphi \leftarrow \operatorname{DNF}\left(\varphi_{1}\right) \vee \operatorname{DNF}\left(\varphi_{2}\right)\)
    if \(\varphi=\varphi_{1} \wedge\left(\varphi_{2} \vee \varphi_{3}\right)\) then \(\varphi \leftarrow\left(\operatorname{DNF}\left(\varphi_{1} \wedge \varphi_{2}\right)\right) \vee\left(\operatorname{DNF}\left(\varphi_{1} \wedge \varphi_{3}\right)\right)\)
    if \(\varphi=\langle a\rangle \varphi^{\prime}\) and \(\varphi^{\prime} \neq \varphi_{1} \vee \varphi_{2}\) then
        \(\varphi^{\prime} \leftarrow \operatorname{DNF}\left(\varphi^{\prime}\right)\)
        \(\varphi \leftarrow \operatorname{DNF}\left(\langle a\rangle \varphi^{\prime}\right)\)
    if \(\varphi=\langle a\rangle\left(\varphi_{1} \vee \varphi_{2}\right)\) then \(\varphi \leftarrow \operatorname{DNF}\left(\langle a\rangle \varphi_{1}\right) \vee \operatorname{DNF}\left(\langle a\rangle \varphi_{2}\right)\)
    if \(\varphi=[a] \varphi^{\prime}\) and \(\varphi^{\prime} \neq \varphi_{1} \vee \varphi_{2}\) then
        \(\varphi^{\prime} \leftarrow \operatorname{DNF}\left(\varphi^{\prime}\right)\)
        \(\varphi \leftarrow \operatorname{DNF}\left([a] \varphi^{\prime}\right)\)
        if \(\varphi=[a]\left(\varphi_{1} \vee \varphi_{2}\right)\) then \(\varphi \leftarrow \operatorname{DNF}\left([a] \varphi_{1}\right) \vee \operatorname{DNF}\left([a] \varphi_{2}\right)\)
        return \(\varphi\)
    end procedure
```

- Lemma 42. Let $\varphi \in \mathcal{L}_{X}$, where $X \in\{S, C S, R S, T S\}$. Then, the DNF of $\varphi$ is logically equivalent to $\varphi$.

Proof. To transform a formula in $\mathcal{L}_{X}$, where $X \in\{S, C S, R S, T S\}$, into its DNF, we do not need to distribute $[a]$ over disjunctions. The proof of the lemma is immediate from the following facts: $\langle a\rangle\left(\varphi_{1} \vee \varphi_{2}\right) \equiv\langle a\rangle \varphi_{1} \vee\langle a\rangle \varphi_{2}, \varphi_{1} \wedge\left(\varphi_{2} \vee \varphi_{3}\right) \equiv\left(\varphi_{1} \wedge \varphi_{2}\right) \vee\left(\varphi_{1} \wedge \varphi_{3}\right)$, and for every $\varphi, \psi, \chi \in \mathcal{L}_{X}, X \in\{S, C S, R S, T S\}$, if $\psi \equiv \chi$, then $\varphi[\psi / \chi] \equiv \varphi$.

- Remark 43. Note that Lemma 42 does not hold when $X \in\{2 S, 3 S, B S\}$, since, for example, $[a](\langle a\rangle \mathbf{t t} \vee\langle b\rangle \mathbf{t t}) \not \vDash[a]\langle a\rangle \mathbf{t t} \vee[a]\langle b\rangle \mathbf{t t}$.

The following two basic lemmas that are true for formulae in $\mathcal{L}_{B S}$.

- Lemma 44. For every $\varphi_{1}, \varphi_{2}, \psi \in \mathcal{L}_{B S}, \varphi_{1} \vee \varphi_{2} \models \psi$ iff $\varphi_{1} \models \psi$ and $\varphi_{2} \models \psi$.

Proof. $(\Rightarrow)$ Let $p_{1} \models \varphi_{1}$. Then, $p_{1} \models \varphi_{1} \vee \varphi_{2}$, and so $p_{1} \models \psi$. The same argument is true for any $p_{2}$ that satisfies $\varphi_{2}$. Thus, $\varphi_{1} \models \psi$ and $\varphi_{2} \models \psi$.
$(\Leftarrow)$ Let $p \models \varphi_{1} \vee \varphi_{2}$. Then, $p \models \varphi_{1}$ or $p \models \varphi_{2}$. In either case, $p \models \psi$. So, $\varphi_{1} \vee \varphi_{2} \models \psi$.

- Lemma 45. For every $\varphi, \psi \in \mathcal{L}_{B S},\langle a\rangle \varphi \models\langle a\rangle \psi$ iff $\varphi \models \psi$.

Proof. $(\Rightarrow)$ Suppose that $\varphi \not \models \psi$ and let $p$ be a process such that $p \models \varphi$ and $p \not \vDash \psi$. Consider process $q$ such that $q \xrightarrow{a} p$ and there is no other $p^{\prime}$ such that $q \xrightarrow{b} p^{\prime}, b \in A$. Then $q \models\langle a\rangle \varphi$ and $q \not \vDash\langle a\rangle \psi$, contradiction.
$(\Leftarrow)$ Let $p \models\langle a\rangle \varphi$. Then, there is $p \xrightarrow{a} p^{\prime}$ such that $p^{\prime} \models \varphi$ and so $p^{\prime} \models \psi$. Hence, $p \models\langle a\rangle \psi$.

Finally, $\operatorname{Sub}(\varphi)$ denotes the set of subformulae of formula $\varphi$ and $\varphi\left[\psi / \psi^{\prime}\right]$ is formula $\varphi$ where every occurrence of $\psi$ is replaced by $\psi^{\prime}$. Then, the following lemma is true.

- Lemma 46. Let $\varphi, \psi, \chi \in \mathcal{L}_{B S}$. If $\varphi \models \psi$, then $\chi \models \chi[\varphi / \psi]$.

Proof. We prove the lemma by induction on the structure of $\chi$.

- If $\varphi \notin \operatorname{Sub}(\chi)$ or $\chi=\varphi$, then the lemma is trivially true.
- If $\chi=\phi \vee \phi^{\prime}$, by inductive hypothesis, $\phi \models \phi[\varphi / \psi]$ and $\phi^{\prime} \models \phi^{\prime}[\varphi / \psi]$. So, $\phi \models$ $\phi[\varphi / \psi] \vee \phi^{\prime}[\varphi / \psi]$ and $\phi^{\prime} \models \phi[\varphi / \psi] \vee \phi^{\prime}[\varphi / \psi]$. From Lemma 44, $\phi \vee \phi^{\prime} \models \phi[\varphi / \psi] \vee \phi^{\prime}[\varphi / \psi]$.
- If $\chi=\phi \wedge \phi^{\prime}$, by inductive hypothesis $\phi \models \phi[\varphi / \psi]$ and $\phi^{\prime} \models \phi^{\prime}[\varphi / \psi]$. Then, $\phi \wedge \phi^{\prime} \models \phi[\varphi / \psi]$ and $\phi \wedge \phi^{\prime} \models \phi^{\prime}[\varphi / \psi]$. It holds that for every $p$ such that $p \models \phi \wedge \phi^{\prime}, p \models \phi[\varphi / \psi]$ and $p \models \phi^{\prime}[\varphi / \psi]$. So, $p \models \phi[\varphi / \psi] \wedge \phi^{\prime}[\varphi / \psi]$. As a result, $\phi \wedge \phi^{\prime} \models \phi[\varphi / \psi] \wedge \phi^{\prime}[\varphi / \psi]$.
- If $\chi=\langle a\rangle \phi$, by inductive hypothesis, $\phi \models \phi[\varphi / \psi]$. Then, $\langle a\rangle \phi \models\langle a\rangle \phi[\varphi / \psi]$ from Lemma 44.
- If $\chi=[a] \phi$, by inductive hypothesis, $\phi \models \phi[\varphi / \psi]$. It suffices to show that for every $\varphi, \psi \in \mathcal{L}_{B S}, \varphi \models \psi$ implies $[a] \varphi \models[a] \psi$. Assume $\varphi \models \psi$ is true and let $p \models[a] \varphi$. This means that for every $p \xrightarrow{a} p^{\prime}, p^{\prime} \models \varphi$. By hypothesis, $p^{\prime} \models \psi$, and so $p \models[a] \psi$.

We use two kinds of reductions: Karp reductions and polytime Turing reductions. We provide their definitions below, which can be found, for instance, in [39].

- Definition 47. We say that a problem $\Pi_{1}$ reduces to $\Pi_{2}$ (under Karp reductions), denoted by $\Pi_{1} \leq_{m}^{p} \Pi_{2}$, if there is an algorithm $A$ that has the following properties:
- given an instance $x$ of $\Pi_{1}$, A produces an instance $y$ of $\Pi_{2}$,
- A runs in time polynomial in $|x|$, which implies that $|y|$ is polynomial in $|x|$,
- $x$ is a yes instance of $\Pi_{1}$ iff $y$ is a yes instance of $\Pi_{2}$.
- Definition 48. We say that problem $\Pi_{1}$ reduces to $\Pi_{2}$ under polytime Turing reductions, denoted by $\Pi_{1} \leq_{T}^{p} \Pi_{2}$, if there is an algorithm $A$ for $\Pi_{1}$ that has the following properties:
- on any given instance $x$ of $\Pi_{1}, A$ uses polynomial steps in $|x|$,
- a step is either a standard computation step or an oracle call to $\Pi_{2}$.

A polytime Turing reduction from $\Pi_{1}$ to $\Pi_{2}$ means that $\Pi_{1}$ can be efficiently solved, assuming that $\Pi_{2}$ is easy to solve. Hence, the following proposition is true.

- Proposition 49. If a problem that is coNP-hard under polytime Turing reductions can be solved in polynomial time, then $\mathrm{P}=\mathrm{NP}$.

Proof. If a coNP-hard problem can be decided in $P$, then $P=$ coNP, which in turn implies that $\operatorname{coNP}=N P=P$.

For formulae in $\mathcal{L}_{B S}$, model checking is tractable.

- Proposition 50 ([23]). Given a formula $\varphi \in \mathcal{L}_{B S}$ and a process $p$, there is an algorithm for checking if $p$ satisfies $\varphi$ that runs in time $\mathcal{O}(|p| \cdot|\varphi|)$.
- Proposition 51 ([13]). Given a process $p$ and a formula $\varphi \in \mathcal{L}_{B S}$ in declarative form, there is an algorithm for checking if $p$ satisfies $\varphi$ that runs in time $\mathcal{O}(|p| \cdot \operatorname{decl}(\varphi))$.

Let $\varphi \in \mathcal{L}_{B S}$. The DNF $\bigvee_{i=1}^{k} \varphi_{i}$ of $\varphi$ can have exponential size with respect to $|\varphi|$. However, we can non-determinically choose $\varphi_{i}$ for some $1 \leq i \leq k$ in polynomial time.

- Lemma 52. Let $\varphi \in \mathcal{L}_{B S}$ and $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. We can compute $\varphi_{i}$ for some $1 \leq i \leq k$ in non-deterministic polynomial time.

Proof. We prove the lemma by induction on the structure of $\varphi$.

- If $\varphi$ does not contain disjunctions, then it is in DNF and $k=1$. So, we return $\varphi$.
- Assume $\varphi=\varphi_{1} \vee \varphi_{2}$ and let $\bigvee_{i=1}^{k_{1}} \varphi_{1 i}, \bigvee_{i=1}^{k_{2}} \varphi_{2 i}$ be the DNFs of $\varphi_{1}$ and $\varphi_{2}$, respectively. Then, we non-deterministically choose between $j=1$ and $j=2$. By inductive hypothesis, we can compute $\varphi_{j_{i}}$ for some $1 \leq i \leq k_{j}$, and return this formula.
- Assume $\varphi=\varphi_{1} \wedge \varphi_{2}$ and let $\bigvee_{i=1}^{k_{1}} \varphi_{1 i}, \bigvee_{i=1}^{k_{2}} \varphi_{2 i}$ be the DNFs of $\varphi_{1}$ and $\varphi_{2}$, respectively. By inductive hypothesis, we can compute $\varphi_{1_{i_{1}}}, \varphi_{i_{i_{2}}}$ for some $1 \leq i_{1} \leq k_{1}, 1 \leq i_{2} \leq k_{2}$. We do this computation and we return $\varphi_{1_{i_{1}}} \wedge \varphi_{1_{i_{1}}}$.
- Assume $\varphi=\langle a\rangle \varphi^{\prime}$ and let $\bigvee_{i=1}^{k} \varphi_{i}^{\prime}$ be the DNF of $\varphi^{\prime}$. By inductive hypothesis, we can compute $\varphi_{i}^{\prime}$, for some $1 \leq i \leq k$. We return $\langle a\rangle \varphi_{i}^{\prime}$.
- The case of $\varphi=[a] \varphi^{\prime}$ is similar to the previous one.

Alternating graphs and the problem of reachability on alternating graphs are provided below.

- Definition 53 ([28]). An alternating graph $G=(V, E, A, s, t)$ is a directed graph whose vertices are either existential or universal, i.e. they are labelled with $\exists$ or $\forall$, respectively. $V$ and $E$ are the sets of vertices and edges, respectively, $A$ is the set of universal vertices, and $s$ and $t$ are two vertices that are called source and target, respectively.
- Definition 54 ([28]). Let $G=(V, E, A, s, t)$ be an alternating graph. Let $P^{G}$ be the smallest relation on $V \times V$ that satisfies the following clauses:

1. $P^{G}(x, x)$.
2. If $x$ is existential and for some $(x, z) \in E$ it holds that $P^{G}(z, y)$, then $P^{G}(x, y)$.
3. If $x$ is universal, there is at least one edge leaving $x$, and $P^{G}(z, y)$ holds for all edges $(x, z)$, then $P^{G}(x, y)$.
If $P^{G}(x, y)$, we say that there is an alternating path from $x$ to $y$.
We define REACH $_{a}=\left\{G \mid G\right.$ is an alternating graph and $\left.P^{G}(s, t)\right\}$.

## B The complexity of satisfiability

Proofs of Subsection 3.1 are given in detail in part B of the appendix.

- Lemma 12. For every $\varphi \in \mathcal{L}_{R S}$, the following statements hold:
(a) for every $S \subseteq A, S \in I(\varphi)$ iff there is a process $p$ such that $I(p)=S$ and $p \models \varphi$.
(b) $\varphi$ is inconsistent iff $I(\varphi)=\emptyset$.

Proof. (a) We prove the lemma by induction on the structure of $\varphi$.

- Assume $\varphi=\mathrm{ff}$. The lemma trivially holds.
- Assume $\varphi=\mathbf{t t}$. For every set $S \subseteq A$, there is a process $p$ with $I(p)=S$ and $p \models \mathbf{t t}$ and $S \in I(\mathbf{t t})$.
- Assume $\varphi=[a]$ ff. For every $S \subseteq A, S \in I(\varphi)$ iff $a \notin S$ iff there is a process $p$ such $I(p)=S$ and $p \models[a]$ ff.
- Assume $\varphi=\langle a\rangle \varphi^{\prime}$. Let $S \subseteq A$. If $S \in I(\varphi)$, then from Definition $11(\mathrm{~d}), a \in I(\varphi)$ and $I\left(\varphi^{\prime}\right) \neq \emptyset$. So, there is some $T \subseteq A$ and $T \in I\left(\varphi^{\prime}\right)$ and from inductive hypothesis there is a process $q$ with $I(q)=T$ such that $q \models \varphi^{\prime}$. Consider the process $p$ such that $p \xrightarrow{a} q$, and $p \xrightarrow{b} 0$ for every $b \in S, b \neq a$. Then, $I(p)=S$ and $p \models\langle a\rangle \varphi^{\prime}$. Conversely, if there is a process $p$ such that $p \models\langle a\rangle \varphi^{\prime}$ and $I(p)=S$, then $p \xrightarrow{a} p^{\prime}$ for some $p^{\prime}$ such that $p^{\prime} \models \varphi^{\prime}$. From inductive hypothesis, $I\left(p^{\prime}\right) \in I\left(\varphi^{\prime}\right)$, so $I\left(\varphi^{\prime}\right) \neq \emptyset$, and from Definition 11(d), $I(\varphi)=\{X \mid X \subseteq A$ and $a \in X\}$. Consequently, $I(p) \in I(\varphi)$, since $a \in I(p)$.
- Assume $\varphi=\varphi_{1} \vee \varphi_{2} . S \in I(\varphi)=I\left(\varphi_{1}\right) \cup I\left(\varphi_{2}\right)$ iff $S \in I\left(\varphi_{1}\right)$ or $S \in I\left(\varphi_{2}\right)$ iff there is $p$ with $I(p)=S$ such that $p \models \varphi_{1}$ or there is $p$ with $I(p)=S$ such that $p \models \varphi_{2}$ iff there is $p$ with $I(p)=S$ such that $p \models \varphi_{1} \vee \varphi_{2}$, where to prove the equivalences we used the inductive hypothesis, Definition 11(e), and the definition of truth in a process.
- Assume $\varphi=\varphi_{1} \wedge \varphi_{2} . S \in I(\varphi)=I\left(\varphi_{1}\right) \cap I\left(\varphi_{2}\right)$ iff $S \in I\left(\varphi_{1}\right)$ and $S \in I\left(\varphi_{2}\right)$ iff there is $p_{1}$ with $I\left(p_{1}\right)=S$ such that $p \models \varphi_{1}$ and there is $p_{2}$ with $I\left(p_{2}\right)=S$ such that $p_{2} \models \varphi_{2}$. We prove that the last statement is equivalent to the existence of some $q$ for which $I(q)=S$ and $q \models \varphi$. Let the last statetment in the above equivalences be true and consider the process $p_{1}+p_{2}$. It holds $I\left(p_{1}\right)=I\left(p_{2}\right)=I\left(p_{1}+p_{2}\right)=S$, so $p_{1} \lesssim_{R S} p_{1}+p_{2}$ and $p_{2} \lesssim_{R S} p_{1}+p_{2}$. From Proposition 6, $p_{1}+p_{2} \models \varphi_{1} \wedge \varphi_{2}$. Conversely, if there is $q$ with $q=S$ such that $q \models \varphi_{1} \wedge \varphi_{2}$, the last statement above follows from the fact that $q \models \varphi_{1}$ and $q \models \varphi_{2}$.
(b) This is an immediate corollary of (a).

## B. 1 Satisfiability in $\mathcal{L}_{R S}$

In the case of $\mathcal{L}_{R S}$, we distinguish between the case of $|A|=k$, where $k \geq 1$ is a constant, and the case of $A$ being unbounded. In the former case, the satisfiability problem is linear-time solvable, whereas in the latter case, the number of actions appearing in $\varphi$ can be linear in $|\varphi|$, and satisfiability becomes NP-complete.

## B.1.1 The case of $|A|=k, k \geq 1$

- Proposition 55. Let $|A|=k$, where $k \geq 1$ is a constant. Satisfiability of formulae in $\mathcal{L}_{R S}$ is linear-time decidable.

Proof. Let $\varphi \in \mathcal{L}_{R S}$. Consider algorithm $\operatorname{Cons}_{\text {RS }}$ that recursively computes $I(\varphi)$. Note that since $k$ is a constant, for every $\psi \in \mathcal{L}_{R S}, I(\varphi)$ is of constant size. We can prove by induction on the structure of $\varphi$, that Consers requires linear time in $|\varphi|$. Cons ${ }_{\text {RS }}$ accepts $\varphi$ iff $I(\varphi) \neq \emptyset$. The correctness of the algorithm is immediate from Lemma 12.

- Proposition 56. Let $|A|=k$, where $k \geq 1$ is a constant. There is a polynomial-time algorithm that on input a consistent $\varphi \in \mathcal{L}_{R S}$, it returns $\varphi^{\prime}$ such that (a) $\varphi \equiv \varphi^{\prime}$, and (b) if $\psi \in \operatorname{Sub}\left(\varphi^{\prime}\right)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in $\varphi^{\prime}$ in the scope of some $[a]$.

Proof. Let $\varphi \in \mathcal{L}_{R S}$ be a consistent formula. Consider algorithm ConSub ${ }_{\text {RS }}$ that computes $I(\psi)$ for every $\psi \in \operatorname{Sub}(\varphi)$ and stores $I(\psi)$ in memory. For every $\psi \in \operatorname{Sub}(\varphi)$ such that $I(\psi)=\emptyset$, ConSub ${ }_{\mathrm{RS}}$ substitutes $\psi$ with ff in $\varphi$. We denote by $\varphi^{\mathrm{ff}}$ the obtained formula. Then, ConSub $_{\text {RS }}$ repeatedly applies the rules $\langle a\rangle \mathbf{f f} \rightarrow_{\mathrm{ff}} \mathrm{ff}, \mathrm{ff} \vee \psi \rightarrow_{\mathrm{ff}} \psi, \psi \vee \mathrm{ff} \rightarrow_{\mathrm{ff}} \psi$, $\mathrm{ff} \wedge \psi \rightarrow_{\mathrm{ff}} \mathrm{ff}$, and $\psi \wedge \mathrm{ff} \rightarrow_{\mathrm{ff}} \mathrm{ff}$ on $\varphi^{\mathrm{ff}}$ until no rule can be applied, and returns the resulting formula, which we denote by $\varphi^{\prime}$. Since every substitution has replaced a formula $\psi$ with some $\psi^{\prime} \equiv \psi$, from Lemma $46, \varphi \equiv \varphi^{\prime}$. From the type of the substitutions made on $\varphi$, every inconsistent formula has been substituted with ff , and all occurrences of ff have been eliminated except for the ones that are in the scope of some [a]. Moreover, it is not hard to see that the algorithm requires polynomial time.

## B.1.2 The case of $|A|$ being unbounded

Let $\varphi \in \mathcal{L}_{R S}$. Assume now that the number of actions appearing in $\varphi$ can be linear in $|\varphi|$. Then, satisfiability in $\mathcal{L}_{R S}$ becomes NP-hard.

- Proposition 57. Let $|A|$ be unbounded and $\varphi \in \mathcal{L}_{R S}$ with $\operatorname{md}(\varphi)=1$. Deciding whether $\varphi$ is satisfiable is NP-complete.

Proof. Let $\varphi \in \mathcal{L}_{R S}$ with $\operatorname{md}(\varphi)=1$ and let $|\varphi|=n$. If $\varphi$ is satisfiable, there is a process $p$ of depth at most 1 that satisfies $\varphi$. Let $A_{\varphi}$ denote the set of different actions that appear in $\varphi$. It holds that $\left|A_{\varphi}\right|=\mathcal{O}(n)$, and there are $\mathcal{O}\left(2^{n}\right)$ different processes of depth 1 over $A_{\varphi}$. So, the problem can be solved in non-deterministic polynomial time by guessing a process of depth 1 and checking whether it satisfies $\varphi$. To prove that the problem is NP-hard, consider a propositional formula $\psi$ in CNF with variables $x_{1}, \ldots, x_{n}$. Construct formula $\psi^{\prime}$ by substituting every literal $x_{i}$ with $\left\langle a_{i}\right\rangle \mathbf{t t}$ and every literal $\neg x_{i}$ with $\left[a_{i}\right] \mathbf{f f}$. Then, it is not hard to see that $\psi$ is satisfiable iff there is a process that satisfies $\psi^{\prime}$.

We show that satisfiability of formulae in the more general case of $\mathcal{L}_{R S}$ still belongs to NP, and so it is NP-complete. We first prove the following lemma.

- Lemma 58. Let $|A|$ be unbounded and $\varphi$ be a formula in $\mathcal{L}_{R S}$ that does not contain disjunctions. Then, the satisfiability of $\varphi$ can be decided in polynomial time.

Proof. Consider the algorithm that first repeatedly applies the rules $\langle a\rangle \mathbf{f f} \rightarrow_{\mathrm{ff}} \mathrm{ff}, \mathrm{ff} \wedge \psi \rightarrow_{\mathrm{ff}} \mathrm{ff}$, and $\psi \wedge \mathbf{f f} \rightarrow_{\mathrm{ff}} \mathrm{ff}$ on $\varphi$ until no rule can be applied. If the resulting formula $\varphi^{\prime}$ is $\mathbf{f f}$, it rejects. Otherwise, it checks that for every $\varphi_{1} \wedge \varphi_{2} \in \operatorname{Sub}\left(\varphi^{\prime}\right)$, it is not the case that $\varphi_{1}=\langle a\rangle \varphi_{1}^{\prime}$ and $\varphi_{2}=[a]$ ff, for some $a \in A$. This is a necessary and sufficient condition for acceptance.

- Corollary 59. Let $|A|$ be unbounded. Satisfiability of formulae in $\mathcal{L}_{R S}$ is NP-complete.

Proof. Let $\varphi \in \mathcal{L}_{R S}$ and $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. Consider the algorithm that decides satisfiability of $\varphi$ by guessing $\varphi_{i}$ for some $1 \leq i \leq k$, and checking whether $\varphi_{i}$ is satisfiable.

The correctness of the algorithm relies on the fact that $\varphi_{1} \vee \varphi_{2}$ is satisfiable iff at least one of $\varphi_{1}, \varphi_{2}$ is satisfiable, and Lemma 42. The polynomial-time complexity of the algorithm is because of Lemmas 52 and 58. Moreover, NP-hardness of the problem is a corollary of Proposition 57.

## B. 2 Satisfiability in $\mathcal{L}_{C S}$

To decide satisfiability in the case of complete simulation, we show that we need much less information than $I(\varphi)$ gives for a formula $\varphi \in \mathcal{L}_{C S}$. Alternatively, we associate $\varphi$ to a set $J(\varphi)$, which is one of $\emptyset,\{\emptyset\},\{\alpha\},\{\emptyset, \alpha\}$. Note that the main difference here is that we let $\alpha$ symbolize every possible set of actions.

- Definition 60. Let $\varphi \in \mathcal{L}_{C S}$. We define $J(\varphi)$ inductively as follows:
(a) $J(\mathbf{t t})=\{\emptyset, \alpha\}$,
(b) $J(\mathrm{ff})=\emptyset$,
(c) $J(\mathbf{0})=\{\emptyset\}$,
(d) $J(\langle a\rangle \varphi)= \begin{cases}\emptyset, & \text { if } J(\varphi)=\emptyset, \\ \{\alpha\}, & \text { otherwise }\end{cases}$
(e) $J\left(\varphi_{1} \vee \varphi_{2}\right)=J\left(\varphi_{1}\right) \cup J\left(\varphi_{2}\right)$,
(f) $J\left(\varphi_{1} \wedge \varphi_{2}\right)=J\left(\varphi_{1}\right) \cap J\left(\varphi_{2}\right)$.
- Lemma 61. For every $\varphi \in \mathcal{L}_{C S}, \varphi$ is inconsistent iff $J(\varphi)=\emptyset$.

Proof. We prove the lemma by proving the following claims simultaneously by induction on the structure of $\varphi$.
Claim 1. $\varphi \equiv 0$ iff $J(\varphi)=\{\emptyset\}$.
Claim 2. $\varphi \equiv$ ff iff $J(\varphi)=\emptyset$.
Claim 3. $\varphi$ is consistent and $\mathbf{0} \not \models \varphi$ iff $J(\varphi)=\{\alpha\}$.
Claim 4. $\mathbf{0} \models \varphi$ and $\varphi \not \models \mathbf{0}$ iff $J(\varphi)=\{\emptyset, \alpha\}$.
Proof of Claim 1. Note that $\varphi \equiv \mathbf{0}$ iff $\varphi$ is satisfied exactly by 0 .
$(\Rightarrow)$ Let $\varphi$ be satisfied exactly by 0 . Then $\varphi$ can have one of the following forms.
$\varphi=0$. Then $J(\varphi)=\{\emptyset\}$.
$\varphi=\varphi_{1} \vee \varphi_{2}$. Then either both $\varphi_{i}, i=1,2$, are satisfied exactly by 0 , in which case, from inductive hypothesis, $J\left(\varphi_{1}\right)=J\left(\varphi_{2}\right)=\{\emptyset\}$, and so $J(\varphi)=J\left(\varphi_{1}\right) \cup J\left(\varphi_{2}\right)=\{\emptyset\}$, or one of them, w.l.o.g. assume that this is $\varphi_{1}$, is satisfied exactly by 0 and $\varphi_{2}$ is inconsistent, in which case $J\left(\varphi_{2}\right)=\emptyset$ from inductive hypothesis of Claim 2, and $J(\varphi)=J\left(\varphi_{1}\right) \cup J\left(\varphi_{2}\right)=$ $\{\emptyset\} \cup \emptyset=\{\emptyset\}$.
$\varphi=\varphi_{1} \wedge \varphi_{2}$. Then, one of three cases is true.
$=$ Both $\varphi_{i}, i=1,2$, are satisfied exactly by 0 . Then, $J(\varphi)=J\left(\varphi_{1}\right) \cap J\left(\varphi_{2}\right)=\{\emptyset\} \cap\{\emptyset\}=$ $\{\emptyset\}$.
= W.l.o.g. $\varphi_{1}$ is satisfied exactly by 0 and $\varphi_{2} \equiv \mathbf{t t}$. Then, $J(\varphi)=J\left(\varphi_{1}\right) \cap J\left(\varphi_{2}\right)=$ $\{\emptyset\} \cap\{\emptyset, \alpha\}=\{\emptyset\}$.
= W.l.o.g. $\varphi_{1}$ is satisfied exactly by 0 and $\varphi_{2}$ is satisfied in 0 and some other processes. From inductive hypothesis of Claim 4, $J\left(\varphi_{2}\right)=\{\emptyset, \alpha\}$. Then, $J(\varphi)=J\left(\varphi_{1}\right) \cap J\left(\varphi_{2}\right)=$ $\{\emptyset\} \cap\{\emptyset, \alpha\}=\{\emptyset\}$.
$(\Leftarrow)$ Let $J(\varphi)=\{\emptyset\}$. Then, one of the following holds.
$\varphi=0$. Trivial.
$\varphi_{1} \vee \varphi_{2}$. Then, since $J(\varphi)=J\left(\varphi_{1}\right) \cup J\left(\varphi_{2}\right)$, it must be the case that w.l.o.g. $J\left(\varphi_{1}\right)=\{\emptyset\}$ and either $J\left(\varphi_{2}\right)=\{\emptyset\}$ or $J\left(\varphi_{2}\right\}=\emptyset$. Hence, either both $\varphi_{i}, i=1,2$, are satisfied exactly by 0 , or $\varphi_{1}$ is satisfied exactly by 0 and $\varphi_{2}$ is inconsistent. In both cases, $\varphi$ is satisfied exactly by 0 .
$\varphi_{1} \wedge \varphi_{2}$. Since $J(\varphi)=J\left(\varphi_{1}\right) \cap J\left(\varphi_{2}\right)$, it must be the case that either $J\left(\varphi_{1}\right)=J\left(\varphi_{2}\right)=\{\emptyset\}$, or w.l.o.g. $J\left(\varphi_{1}\right)=\{\emptyset\}$ and $J\left(\varphi_{2}\right)=\{\emptyset, \alpha\}$. In the former case, $\varphi_{1} \equiv \varphi_{2} \equiv \mathbf{0}$, and so $\varphi_{1} \wedge \varphi_{2} \equiv \mathbf{0}$. In the latter case, $\varphi_{1} \equiv \mathbf{0}, \mathbf{0} \models \varphi_{2}$ and $\varphi_{2} \not \vDash \mathbf{0}$, and so $\varphi_{1} \wedge \varphi_{2}$ is satisfied exactly by 0 .
Proof of Claim 2. Note that $\varphi \equiv \mathrm{ff}$ iff $\varphi$ is inconsistent.
$(\Rightarrow)$ Let $\varphi$ be inconsistent. Then, $\varphi$ can have one of the following forms.
$\varphi=$ ff. Trivial.
$\varphi=\langle a\rangle \varphi^{\prime}$. Then, $\varphi^{\prime}$ is inconsistent, so from inductive hypothesis $J\left(\varphi^{\prime}\right)=\emptyset$ and $J(\varphi)=\emptyset$.
$\varphi=\varphi_{1} \vee \varphi_{2}$. Then, both $\varphi_{1}$ and $\varphi_{2}$ are inconsistent, and $J(\varphi)=J\left(\varphi_{1}\right) \cup J\left(\varphi_{2}\right)=\emptyset \cup \emptyset=\emptyset$.
$\varphi=\varphi_{1} \wedge \varphi_{2}$. Then, one of the following cases holds.
= W.l.o.g. $\varphi_{1}$ is inconsistent. Then, $J(\varphi)=J\left(\varphi_{1}\right) \cap J\left(\varphi_{2}\right)=\emptyset \cap J\left(\varphi_{2}\right)=\emptyset$.
$=$ W.l.o.g. $\varphi_{1}$ is satisfied exactly by 0 and $\varphi_{2}$ is satisfied only by processes that are not 0 . From inductive hypothesis of Claims 1 and $3, J\left(\varphi_{1}\right)=\{\emptyset\}$, and $J\left(\varphi_{2}\right)=\{\alpha\}$, respectively. Thus, $J(\varphi)=J\left(\varphi_{1}\right) \cap J\left(\varphi_{2}\right)=\emptyset$.
$(\Leftarrow)$ Assume that $J(\varphi)=\emptyset$. Then, one of the following holds.
$\varphi=\mathrm{ff}$. Trivial.
$\varphi=\langle a\rangle \varphi^{\prime}$. Then, $J\left(\varphi^{\prime}\right)=\emptyset$, which implies that $\varphi^{\prime}$ is inconsistent, and so $\varphi$ is inconsistent.
$\varphi=\varphi_{1} \vee \varphi_{2}$. Then for both $i=1,2, J\left(\varphi_{i}\right)=\emptyset$, and from inductive hypothesis, both $\varphi_{i}$
are inconsistent, which implies that $\varphi$ is inconsistent as well.
$\varphi=\varphi_{1} \wedge \varphi_{2}$. We distinguish between the following cases.
= W.l.o.g. $J\left(\varphi_{1}\right)=\emptyset$. From inductive hypothesis, $\varphi_{1}$ is inconsistent, and so $\varphi$ is also inconsistent.
$=$ W.l.o.g. $J\left(\varphi_{1}\right)=\{\emptyset\}$ and $J\left(\varphi_{2}\right)=\{\alpha\}$. Then, from inductive hypothesis of Claims 1 and $3, \varphi_{1}$ is satisfied exactly by 0 and $\varphi_{2}$ is not satisfied in 0 , respectively, which implies that $\varphi$ is inconsistent.
Proof of Claim 3. ( $\Rightarrow$ ) Let $\varphi$ be consistent and $\mathbf{0} \not \vDash \varphi$. Then, $\varphi$ can have one of the following forms.
$\varphi=\langle a\rangle \varphi^{\prime}$. Then, $\varphi^{\prime}$ is consistent, and so $J(\varphi)=\{\alpha\}$.
$\varphi_{1} \wedge \varphi_{2}$. One of the following is true.

- For both $i=1,2, \varphi_{i}$ is consistent and $\mathbf{0} \not \vDash \varphi_{i}$. From inductive hypothesis, for both $i=1,2, J\left(\varphi_{i}\right)=\{\alpha\}$, and $J(\varphi)=J\left(\varphi_{1}\right) \cap J\left(\varphi_{2}\right)=\{\alpha\}$ as well.
- For both $i=1,2, \varphi_{i}$ is consistent and w.l.o.g. $\mathbf{0} \models \varphi_{1}$ and $\mathbf{0} \not \vDash \varphi_{2}$. Suppose that $\varphi_{1} \equiv \mathbf{0}$. Then, $\varphi_{1} \wedge \varphi_{2}$ is not consistent, contradiction. So, $\mathbf{0} \models \varphi_{1}$ and $\varphi_{1} \not \vDash \mathbf{0}$. From inductive hypothesis of Claims 3 and $4, J\left(\varphi_{2}\right)=\{\alpha\}$ and $J\left(\varphi_{1}\right)=\{\emptyset, \alpha\}$, respectively. Thus, $J(\varphi)=\{\alpha\}$.
$\varphi_{1} \vee \varphi_{2}$. Then, for both $i=1,2, \varphi_{i}$ is consistent and $\mathbf{0} \not \models \varphi_{i}$, or w.l.o.g. $\varphi_{1}$ is consistent, $\mathbf{0} \not \models \varphi_{1}$ and $\varphi_{2}$ is inconsistent. In both cases, $J(\varphi)=\{\alpha\}$.
$(\Leftarrow)$ Let $J(\varphi)=\{\alpha\}$. Then,
$\varphi=\langle a\rangle \varphi^{\prime}$. Since $J\left(\langle a\rangle \varphi^{\prime}\right) \neq \emptyset, J\left(\varphi^{\prime}\right) \neq \emptyset$, which implies that $\varphi^{\prime}$ is consistent. So, $\langle a\rangle \varphi^{\prime}$ is consistent and $\mathbf{0} \not \models\langle a\rangle \varphi^{\prime}$.
$\varphi_{1} \wedge \varphi_{2}$. One of the following is true.
- $J\left(\varphi_{1}\right)=J\left(\varphi_{2}\right)=\{\alpha\}$, and so $\varphi_{i}$ is consistent and $\mathbf{0} \not \vDash \varphi_{i}$ for both $i=1,2$. In this case, there are processes $p_{1}, p_{2} \neq 0$ such that $p_{1} \models \varphi_{1}$ and $p_{2} \models \varphi_{2}$. Since $p_{1}, p_{2} \neq 0$, it holds that $p_{i} \lesssim_{C S} p_{1}+p_{2}$ for both $i=1,2$. From Proposition 6, $p_{1}+p_{2} \models \varphi_{1} \wedge \varphi_{2}$, and so $\varphi$ is consistent. It is immediate from $\mathbf{0} \not \vDash \varphi_{i}$ that $\mathbf{0} \not \vDash \varphi_{1} \wedge \varphi_{2}$.
- W.l.o.g. $J\left(\varphi_{1}\right)=\{\emptyset, \alpha\}$ and $J\left(\varphi_{2}\right)=\{\alpha\}$. Then, $\varphi_{2}$ is consistent, $\mathbf{0} \not \models \varphi_{2}, \mathbf{0} \models \varphi_{1}$, and $\varphi_{1} \not \models \mathbf{0}$. So, there are processes $p_{1}, p_{2} \neq 0$ such that $p_{1} \models \varphi_{1}$ and $p_{2} \models \varphi_{2}$. As in the previous case, $p_{1}+p_{2} \models \varphi_{1} \wedge \varphi_{2}$, which implies that $\varphi$ is consistent, and $\mathbf{0} \not \vDash \varphi_{1} \wedge \varphi_{2}$ because of $\mathbf{0} \not \vDash \varphi_{2}$.
$\varphi_{1} \vee \varphi_{2}$. We distinguish between two cases. $J\left(\varphi_{i}\right)=\{\alpha\}$ for both $i=1,2$. Then, from inductive hypothesis, for both $i=1,2, \varphi_{i}$ is consistent and $\mathbf{0} \not \models \varphi_{i}$, which also holds for $\varphi_{1} \vee \varphi_{2}$. Otherwise, w.l.o.g. $J\left(\varphi_{1}\right)=\{\alpha\}$ and $J\left(\varphi_{2}\right)=\emptyset$, which implies that $\varphi_{1}$ is consistent, $\mathbf{0} \not \vDash \varphi_{1}$, and $\varphi_{2}$ is inconsistent. $\operatorname{So}, \varphi_{1} \vee \varphi_{2}$ is consistent and $\mathbf{0} \not \vDash \varphi_{1} \vee \varphi_{2}$.

Proof of Claim 4. $(\Rightarrow)$ Let $\mathbf{0} \models \varphi$ and $\varphi \not \models \mathbf{0}$ be both true.
$\varphi=\mathrm{tt}$. Trivial.
$\varphi=\varphi_{1} \wedge \varphi_{2}$. Then, $\mathbf{0} \models \varphi$ implies that for both $i=1,2, \mathbf{0} \models \varphi_{i}$, and $\varphi \not \vDash \mathbf{0}$ means
that there is $p \neq 0$ such that $p \models \varphi_{1} \wedge \varphi_{2}$, or equivalently, $p \models \varphi_{1}$ and $p \models \varphi_{2}$. Thus,
$J(\varphi)=J\left(\varphi_{1}\right) \cap J\left(\varphi_{2}\right)=\{\emptyset, \alpha\} \cap\{\emptyset, \alpha\}=\{\emptyset, \alpha\}$.
$\varphi=\varphi_{1} \vee \varphi_{2} . \mathbf{0} \models \varphi_{1} \vee \varphi_{2}$ and $\varphi_{1} \vee \varphi_{2} \not \vDash \mathbf{0}$ implies one of the following cases.

- $\mathbf{0} \models \varphi_{i}$ and $\varphi_{i} \not \vDash \mathbf{0}$ for some $i=1,2$. From inductive hypothesis and the fact that $J(\varphi)=J\left(\varphi_{1}\right) \cup J\left(\varphi_{2}\right)$, we have that $J(\varphi)=\{\emptyset, \alpha\}$.
- $\varphi_{i} \equiv \mathbf{0}$ for some $i=1,2$, assume w.l.o.g that $\varphi_{1} \equiv \mathbf{0}, \mathbf{0} \not \vDash \varphi_{2}$, and $\varphi_{2} \not \vDash \mathbf{0}$. From $\varphi_{2} \not \models \mathbf{0}$, we have that $\varphi_{2}$ is consistent. From inductive hypothesis of Claims 2 and 3, $J\left(\varphi_{1}\right)=\{\emptyset\}$, and $J\left(\varphi_{2}\right)=\{\alpha\}$, respectively. Thus, $J\left(\varphi_{1} \vee \varphi_{2}\right)=\{\emptyset, \alpha\}$.
$(\Leftarrow)$ Let $J(\varphi)=\{\emptyset, \alpha\}$.
$\varphi=\mathrm{tt}$. Trivial.
$\varphi=\varphi_{1} \wedge \varphi_{2}$. For both $i=1,2, J\left(\varphi_{i}\right)=\{\emptyset, \alpha\}$. So, for both $i=1,2, \mathbf{0} \models \varphi_{i}$ and $\varphi_{i} \not \equiv \mathbf{0}$,
which implies that $\mathbf{0} \models \varphi_{1} \wedge \varphi_{2}$ and for both $i=1,2$, there is $p_{i} \neq 0$ such that $p_{i} \models \varphi_{i}$.
As shown above, $p_{1}+p_{2} \models \varphi_{1} \wedge \varphi_{2}$, and so $\varphi \not \models \mathbf{0}$.
$\varphi=\varphi_{1} \vee \varphi_{2}$. One of the following cases is true.
$=$ W.l.o.g. $J\left(\varphi_{1}\right)=\emptyset$ and $J\left(\varphi_{2}\right)=\{\emptyset, \alpha\}$. Then, $\varphi_{1}$ is inconsistent, $\mathbf{0} \models \varphi_{2}$, and $\varphi_{2} \not \models \mathbf{0}$. Then, $\mathbf{0} \models \varphi$ and $\varphi \not \models \mathbf{0}$.
- W.l.o.g. $J\left(\varphi_{1}\right)=\{\emptyset\}$ and $J\left(\varphi_{2}\right)=\{\alpha\}$. Then $\varphi_{1} \equiv \mathbf{0}, \varphi_{2}$ is consistent, and $\mathbf{0} \not \vDash \varphi_{2}$. As a result, $\mathbf{0} \models \varphi_{1} \vee \varphi_{2}$. Suppose that $\varphi_{1} \vee \varphi_{2} \models \mathbf{0}$. Then, from Lemma 44, $\varphi_{1} \models \mathbf{0}$ and $\varphi_{2} \models \mathbf{0}$. Since $\varphi_{2}$ is consistent, $\varphi_{2} \models \mathbf{0}$ implies that $\varphi_{2} \equiv \mathbf{0}$, which contradicts with $\mathbf{0} \not \vDash \varphi_{2}$. So, $\varphi_{1} \vee \varphi_{2} \not \vDash \mathbf{0}$.
$=$ W.l.o.g. $J\left(\varphi_{1}\right)=\{\emptyset\}$ and $J\left(\varphi_{2}\right)=\{\emptyset, \alpha\}$. This can be proven similarly to the previous case.
= W.l.o.g. $J\left(\varphi_{1}\right)=\{\alpha\}$ and $J\left(\varphi_{2}\right)=\{\emptyset, \alpha\}$. This can be proven similarly to the previous two cases.
- For both $i=1,2, J\left(\varphi_{i}\right)=\{\emptyset, \alpha\}$. Then, $\mathbf{0} \models \varphi_{i}$ and $\varphi_{i} \not \vDash \mathbf{0}$ for both $i=1,2$. Consequently, $\mathbf{0} \models \varphi_{1} \vee \varphi_{2}$ and from Lemma $44, \varphi_{1} \vee \varphi_{2} \not \models \mathbf{0}$.
- Corollary 62. Satisfiability of formulae in $\mathcal{L}_{C S}$ is linear-time decidable.

Proof. Let $\varphi \in \mathcal{L}_{C S}$. Consider algorithm Cons $_{\mathrm{CS}}$ that recursively computes $J(\varphi)$. We can easily prove by induction on the structure of $\varphi$, that $\mathrm{Cons}_{\mathrm{CS}}$ requires linear time in $|\varphi|$. Cons ${ }_{\mathrm{CS}}$ accepts $\varphi$ iff $J(\varphi) \neq \emptyset$. The correctness of the algorithm is immediate from Lemma 61.

- Proposition 63. There is a polynomial-time algorithm that on input a consistent $\varphi \in \mathcal{L}_{C S}$, it returns $\varphi^{\prime}$ such that (a) $\varphi \equiv \varphi^{\prime}$, and (b) every $\psi \in \operatorname{Sub}\left(\varphi^{\prime}\right)$ is consistent.

Proof. The proof is completely analogous to the proof of Proposition 56. Let $\varphi \in \mathcal{L}_{C S}$ be a consistent formula. Consider algorithm ConSub $_{\mathrm{CS}}$ that computes $J(\psi)$ for every $\psi \in \operatorname{Sub}(\varphi)$ and stores $J(\psi)$ in memory. For every $\psi \in \operatorname{Sub}(\varphi)$ such that $J(\psi)=\emptyset$, ConSub ${ }_{\mathrm{CS}}$ substitutes $\psi$ with ff in $\varphi$. We denote by $\varphi^{\mathrm{ff}}$ the obtained formula. Then, $\mathrm{ConSub}_{\mathrm{CS}}$ repeatedly applies the rules $\langle a\rangle \mathbf{f f} \rightarrow_{\mathrm{ff}} \mathrm{ff}, \mathbf{f f} \vee \psi \rightarrow_{\mathrm{ff}} \psi, \psi \vee \mathrm{ff} \rightarrow_{\mathrm{ff}} \psi, \mathrm{ff} \wedge \psi \rightarrow_{\mathrm{ff}} \mathrm{ff}$, and $\psi \wedge \mathbf{f f} \rightarrow_{\mathrm{ff}} \mathrm{ff}$ on $\varphi^{\mathrm{ff}}$ until no rule can be applied, and returns the resulting formula, which we denote by $\varphi^{\prime}$. Since every substitution has replaced a formula $\psi$ with some $\psi^{\prime} \equiv \psi$, from Lemma $46, \varphi \equiv \varphi^{\prime}$. Suppose that there is some $\psi \in \operatorname{Sub}\left(\varphi^{\prime}\right)$ such that $\psi$ is inconsistent. Suppose that $\mathrm{ff} \notin \operatorname{Sub}(\psi)$. Then, either $\psi \in \operatorname{Sub}(\varphi)$ or $\psi$ is the result of some substitution. In the latter case, since $\mathrm{ff} \notin \operatorname{Sub}(\psi), \psi$ can only be the result of rules of the form $\mathrm{ff} \vee \psi \rightarrow_{\mathrm{ff}} \psi$ (and $\psi \vee \mathrm{ff} \rightarrow_{\mathrm{ff}} \psi$ ), and so again $\psi \in \operatorname{Sub}(\varphi)$. However, if $\psi \in \operatorname{Sub}(\varphi)$, then since $J(\psi)=\emptyset$, $\operatorname{ConSub}_{\mathrm{CS}}$ would have substituted $\psi$ with ff in $\varphi$ and $\psi \notin \operatorname{Sub}\left(\varphi^{\prime}\right)$, contradiction. So, $\mathrm{ff} \in \operatorname{Sub}(\psi)$, which implies that some rule can be applied on $\varphi^{\prime}$, contradiction. So, $\psi$ cannot be inconsistent.

## B. 3 Satisfiability in $\mathcal{L}_{S}$

To decide satisfiability in $\mathcal{L}_{S}$, we need even less information than in the case of complete simulation. We can define and use a variant of $J(\varphi)$, namely $K(\varphi)$, as follows.

- Definition 64. Let $\varphi \in \mathcal{L}_{S}$. We define $K(\varphi)$ inductively as follows:
(a) $K(\mathbf{t} \mathbf{t})=\{\alpha\}$,
(b) $K(\mathbf{f f})=\emptyset$,
(c) $K(\langle a\rangle \varphi)= \begin{cases}\emptyset, & \text { if } K(\varphi)=\emptyset, \\ \{\alpha\}, & \text { otherwise }\end{cases}$
(d) $K\left(\varphi_{1} \vee \varphi_{2}\right)=K\left(\varphi_{1}\right) \cup K\left(\varphi_{2}\right)$,
(e) $K\left(\varphi_{1} \wedge \varphi_{2}\right)=K\left(\varphi_{1}\right) \cap K\left(\varphi_{2}\right)$.

The following statements can be proven similarly to the case of complete simulation.

- Proposition 65. Satisfiability of formulae in $\mathcal{L}_{S}$ is linear-time decidable.
- Proposition 66. There is a polynomial-time algorithm that on input a consistent $\varphi \in \mathcal{L}_{S}$, it returns $\varphi^{\prime}$ such that (a) $\varphi \equiv \varphi^{\prime}$, and (b) every $\psi \in \operatorname{Sub}\left(\varphi^{\prime}\right)$ is consistent.

Alternatively, in this case, we can characterize inconsistent formulae as follows.

- Lemma 67. Every inconsistent formula $\varphi \in \mathcal{L}_{S}$ is given by the following grammar:

$$
\operatorname{unsat}_{S}::=\mathrm{ff} \mid\langle a\rangle \text { unsat }_{S} \mid \text { unsat }_{S} \wedge \varphi_{S} \mid \varphi_{S} \wedge \text { unsat }_{S} \mid \text { unsat }_{S} \vee \text { unsat }_{S}
$$

where $\varphi_{S} \in \mathcal{L}_{S}$.
As a result, given $\varphi \in \mathcal{L}_{S}$, it suffices to apply the rules $\langle a\rangle \mathbf{f f} \rightarrow_{\mathrm{ff}} \mathrm{ff}, \mathrm{ff} \wedge \varphi \rightarrow_{\mathrm{ff}} \mathrm{ff}$, $\varphi \wedge \mathrm{ff} \rightarrow_{\mathrm{ff}} \mathrm{ff}, \mathrm{ff} \vee \varphi \rightarrow_{\mathrm{ff}} \varphi, \varphi \vee \mathrm{ff} \rightarrow_{\mathrm{ff}} \varphi$, on $\varphi$. Then, the resulting formula $\varphi^{\prime}$ is ff iff $\varphi$ is inconsistent, contains no inconsistent subformulae if $\varphi$ is consistent, and is logically equivalent to $\varphi$.

## B. 4 Satisfiability in $\mathcal{L}_{T S}$

## B.4.1 The case of $|A|>1$

- Proposition 68. Let $|A|>1$. Satisfiability of formulae in $\mathcal{L}_{T S}$ is NP-hard.

Proof. Assume that $A=\{0,1\}$. Consider a propositional formula $\psi$ in CNF with variables $x_{1}, \ldots, x_{n}$. We use $\mathcal{L}_{T S}$ formulae of logarithmic size to encode literals of $\varphi$. We associate a positive literal $x_{i}, i=1, \ldots, n$, with the binary representation of $i$, i.e. $b_{i 1} \ldots b_{i k}$, where every $b_{i j} \in\{0,1\}$ and $k=\lceil\log n\rceil$. The binary string $b_{i 1} \ldots b_{i k}$ can now be mapped to formula $\operatorname{enc}\left(x_{i}\right)=\left\langle b_{i 1}\right\rangle\left\langle b_{i 2}\right\rangle \ldots\left\langle b_{i k}\right\rangle$ tt. We map a negative literal $\neg x_{i}$ to enc $\left(\neg x_{i}\right)=$ $\left[b_{i 1}\right]\left[b_{i 2}\right] \ldots\left[b_{i k}\right]$ ff. We construct formula $\varphi \in \mathcal{L}_{T S}$ by starting with $\psi$ and substituting every literal $l$ with enc $(l)$ in $\psi$. It is not hard to see that $\varphi$ is satisfiable iff $\psi$ is satisfiable.

To prove that the problem is in NP, we first prove that it is efficient when the input is a formula that does not contain disjunctions. We associate two sets to a formula $\varphi$, namely the set of traces required by $\varphi$, denoted $\operatorname{by} \operatorname{traces}(\varphi)$, and the set of traces forbidden by $\varphi$, denoted by forbidden $(\varphi)$. The sets are defined as follows.

- Definition 69. Let $\varphi \in \mathcal{L}_{T S}$ be a formula that does not contain disjunctions. Sets $\operatorname{traces}(\varphi)$ and forbidden $(\varphi)$ are defined inductively as follows:
- $\operatorname{traces}(\mathbf{t t})=\{\varepsilon\}$ and forbidden $(\mathbf{t t})=\emptyset$,
- $\operatorname{traces}(\mathbf{f f})=\emptyset$ and forbidden $(\mathbf{f f})=\{\varepsilon\}$,
- $\operatorname{traces}\left([a] \varphi^{\prime}\right)=\{\varepsilon\}$ and forbidden $\left([a] \varphi^{\prime}\right)=\left\{a t \mid t \in\right.$ forbidden $\left.\left(\varphi^{\prime}\right)\right\}$,
- $\operatorname{traces}\left(\varphi_{1} \wedge \varphi_{2}\right)=\operatorname{traces}\left(\varphi_{1}\right) \cup \operatorname{traces}\left(\varphi_{2}\right)$ and forbidden $\left(\varphi_{1} \wedge \varphi_{2}\right)=$ forbidden $\left(\varphi_{1}\right) \cup$ forbidden $\left(\varphi_{2}\right)$,
- $\operatorname{traces}\left(\langle a\rangle \varphi^{\prime}\right)=\left\{a t \mid t \in \operatorname{traces}\left(\varphi^{\prime}\right)\right\} \cup\{\varepsilon\}$ and forbidden $\left(\langle a\rangle \varphi^{\prime}\right)=\emptyset$.
- Lemma 70. Let $\varphi \in \mathcal{L}_{T S}$ be a formula that does not contain disjunctions such that if $\mathrm{ff} \in \operatorname{Sub}(\varphi)$, then ff occurs in $\varphi$ only in the scope of some $[a]$. Then, $\varphi$ is consistent iff for every $\varphi_{1} \wedge \varphi_{2} \in \operatorname{Sub}(\varphi), \operatorname{traces}\left(\varphi_{1} \wedge \varphi_{2}\right) \cap$ forbidden $\left(\varphi_{1} \wedge \varphi_{2}\right)=\emptyset$.

Lemma 71. Let $|A|>1$ and $\varphi$ be a formula in $\mathcal{L}_{T S}$ that does not contain disjunctions. Then, the satisfiability of $\varphi$ can be decided in polynomial time.

Proof. Consider the algorithm that first repeatedly applies the rules $\langle a\rangle \mathbf{f f} \rightarrow_{\mathrm{ff}} \mathbf{f f}, \mathbf{f f} \wedge \psi \rightarrow_{\mathrm{ff}}$ ff , and $\psi \wedge \mathrm{ff} \rightarrow_{\mathrm{ff}} \mathrm{ff}$ on $\varphi$ until no rule can be applied. If the resulting formula $\varphi^{\prime}$ is $\mathbf{f f}$, it rejects. Otherwise, for every $\varphi_{1} \wedge \varphi_{2} \in \operatorname{Sub}(\varphi)$, the algorithm checks whether $\operatorname{traces}\left(\varphi_{1} \wedge \varphi_{2}\right) \cap$ forbidden $\left(\varphi_{1} \wedge \varphi_{2}\right)=\emptyset$. From Lemma 70 , this is a necessary and sufficient condition for acceptance. Since the sets $\operatorname{traces}\left(\varphi^{\prime}\right)$ and forbidden $\left(\varphi^{\prime}\right)$ can be efficiently computed for every $\varphi^{\prime} \in \operatorname{Sub}(\varphi)$, the algorithm requires polynomial time.

- Corollary 72. Let $|A|>1$. Satisfiability of formulae in $\mathcal{L}_{T S}$ is NP-complete.

Proof. The proof is analogous to the proof of Corollary 59, where Lemma 58 is used for the membership in NP and Proposition 68 shows the NP-hardness of the problem.

## B. 5 Satisfiability in $\mathcal{L}_{2 S}$

## B.5.1 The case of $|A|>1$

- Proposition 73. Let $|A|>1$. Satisfiability of formulae in $\mathcal{L}_{2 S}$ is NP-complete.

Proof. NP-hardness is a corollary of Proposition 68. We can decide whether $\varphi \in \mathcal{L}_{2 S}$ is satisfiable in a standard way by constructing a tableau for $\varphi$ and checking whether its root is satisfiable as described in [23]. To avoid giving here the details of this construction, we refer the reader to [23, Section 6.3]. Consider the non-deterministic polynomial-time Turning machine $M$ such that each path of $M$ constructs a branch of a tableau for $\varphi$ as follows. It starts from the node $r$ of the tableau that corresponds to $\varphi$ labelled with $L(r)=\{\varphi\}$. Let $s$ be a node of the tableau that has been already created by $M$ labelled with $L(s)$. If one successor $s^{\prime}$ of a node $s$ must be created because of a formula $\psi \wedge \psi^{\prime} \in L(s)$, then $M$ creates $s^{\prime}$. If for every $\left\langle a_{i}\right\rangle \varphi^{\prime} \in L(s)$, an $i$-successor of $s$ must be created, then $M$ creates all these successors. If two different successors $s^{\prime}$ and $s^{\prime \prime}$ of $s$ that are not $i$ successors of $s$ must be created, then $M$ non-deterministically chooses to create one of them. In this last case, $s^{\prime}$ and $s^{\prime \prime}$ correspond either to some $\psi \vee \psi^{\prime} \in L(s)$ or some $\psi \in \operatorname{Sub}\left(\varphi^{\prime}\right)$, where $\varphi^{\prime} \in L(s)$, such that $\psi \notin L(s)$ and $\neg \psi \in L(s)$. To decide if the root $r$ is marked satisfiable, we need to know whether at least one of $s, s^{\prime \prime}$ is marked satisfiable and this will be done by $M$ using non-determinism. After constructing this branch of the tableau, $M$ propagates information from the leaves to the root and decides whether the root must be marked "satisfiable". It accepts iff $r$ is marked "satisfiable". It holds that $\varphi$ is satisfiable iff there is some branch that makes $r$ satisfiable iff $M$ has an accepting path. Since $\varphi \in \mathcal{L}_{2 S}$, the formula has no diamond operators $\left\langle a_{i}\right\rangle$ in the scope of box operators $\left[a_{i}\right]$. So, the longest path of a branch is polynomial in the number of nested diamond operators occurring in $\varphi$ and a branch can be computed in polynomial time.

## B. 6 Satisfiability in $\mathcal{L}_{3 S}$

## B.6.1 The case of $|A|>1$

Let $|A|>1$. We show that $\mathcal{L}_{2 S}$-validity is PSPACE-complete. In fact, this is done by proving that $\overline{\mathcal{L}}_{2 S \text {-satisfiability }}$ is PSPACE-complete.

In what follows $\mathcal{L}_{\square \diamond}$ denotes the dual fragment of $\mathcal{L}_{2 S}$, which consists of all HML formulae that have no box subformulae in the scope of a diamond operator.

- Theorem 74. Let $|A|>1$. Validity of formulae in $\mathcal{L}_{2 S}$ is PSPACE-complete.

Proof. That $\mathcal{L}_{2 S}$-validity is in PSPACE is a direct result of the fact that validity for Modal Logic $\mathbf{K}$ and $\mathbf{H M L}$ is in PSPACE [32, 23]. To prove the PSPACE-hardness of $\mathcal{L}_{2 S}$-validity, we consider $\mathcal{L}_{\square \diamond x}$ to be the extension of $\mathcal{L}_{\square \diamond}$ with literals, i.e. with propositional variables and their negation. We can interpret variables and their negation in the usual way by introducing a labelling of each process in an LTS with a set of propositional variables (see [23] for instance). As $\mathcal{L}_{\square \diamond}$ is the dual fragment of $\mathcal{L}_{2 S}$, it suffices to prove that $\mathcal{L}_{\square \diamond^{-}}$ satisfiability is PSPACE-hard. We observe that Ladner's reduction in the proof for the PSPACE-hardness of K-satisfiability from [32] constructs a one-action formula in $\mathcal{L}_{\square \diamond x}$, and therefore $\mathcal{L}_{\square \diamond x}$-satisfiability is PSPACE-hard, even with only one action.

We now give a reduction from $\mathcal{L}_{\square \diamond x}$-satisfiability to $\mathcal{L}_{\square \diamond}$-satisfiability by encoding literals with formulae that have no box modalities. Let $\mathcal{L}_{[a]\langle a\rangle^{d} x}^{k}$ be the fragment of $\mathcal{L}_{\square \diamond x}$ that includes the formulae of modal depth up to $d$ that use only action $a$ and $k$ propositional variables, $x_{1}, x_{2}, \ldots, x_{k}$. We write the negation of variable $x$ as $\bar{x}$; let $b \neq a$ be an action. We now describe how to encode each $x_{i}$ and $\bar{x}_{i}$. For each $0 \leq i \leq k$ and $0 \leq j<\lceil\log k\rceil$, let $\alpha(i, j)=a$, if position $j$ in the binary representation of $i$ (using $\lceil\log k\rceil$ bits) has bit 1 , and $\alpha(i, j)=b$ otherwise. Let $e\left(x_{i}\right)=\langle b\rangle\langle\alpha(i, 0)\rangle\langle\alpha(i, 1)\rangle \cdots\langle\alpha(i,\lceil\log k\rceil)\rangle\langle a\rangle$ tt, and $e\left(\bar{x}_{i}\right)=$ $\langle b\rangle\langle\alpha(i, 0)\rangle\langle\alpha(i, 1)\rangle \cdots\langle\alpha(i,\lceil\log k\rceil)\rangle\langle b\rangle \mathbf{t t}$. The negations of these are defined as $\neg e\left(x_{i}\right)=$
$[b][\alpha(i, 0)][\alpha(i, 1)] \cdots[\alpha(i,\lceil\log k\rceil)][a] \mathbf{f f}$, and $\neg e\left(\overline{x_{i}}\right)=[b][\alpha(i, 0)][\alpha(i, 1)] \cdots[\alpha(i,\lceil\log k\rceil)][b] \mathbf{f f}$. The formula $e\left(x_{i}\right)$ asserts that a process has a trace of the form $b t_{i} a$, where $t_{i}$ encodes $i$ in binary, where $a$ stands for 1 and $b$ for 0 ; and $e\left(\bar{x}_{i}\right)$ asserts that a process has a trace of the form $b t_{i} b$. Notice that for $i \neq j, t_{i} \neq t_{j}$, and therefore every conjunction than can be formed from the $e\left(x_{i}\right)$ 's and $e\left(\bar{x}_{i}\right)$ 's is satisfiable. For each $d, k \geq 0$, let $\varphi_{d}^{k}=\bigwedge_{j=0}^{d}[a]^{j} \bigwedge_{i=1}^{k}\left(\left(e\left(x_{i}\right) \wedge \neg e\left(\bar{x}_{i}\right)\right) \vee\left(\neg e\left(x_{i}\right) \wedge e\left(\bar{x}_{i}\right)\right)\right)$. The formula $\varphi_{d}^{k}$ asserts that for every process that can be reached with up to $k a$-transitions, for each $1 \leq i \leq k$, exactly one of $e\left(x_{i}\right)$ and $e\left(\bar{x}_{i}\right)$ must be true.

For each formula $\varphi \in \mathcal{L}_{[a]\langle a\rangle x}$ of modal depth $d$ and on variables $\left\{x_{1}, x_{2}, \ldots, x_{k}\right\}$, let $\varphi_{-x}=\varphi^{\prime} \wedge \varphi_{d}^{k}$, where $\varphi^{\prime}$ is the result of replacing each positive occurrence of $x_{i}$ in $\varphi$ with $e\left(x_{i}\right)$ and each occurrence of $\bar{x}_{i}$ in $\varphi$ with $e\left(\bar{x}_{i}\right)$. For each $1 \leq i \leq k$, let $p_{i}$ be the process that only has $t_{i} a$ and its prefixes as traces; and let $\neg p_{i}$ be the process that only has $t_{i} b$ and its prefixes as traces. For each labelled LTS $\mathcal{S}$ with only $a$-transitions, we can define the LTS $\mathcal{S}_{e}$ that additionally includes the processes $p_{i}$ and $\neg p_{i}$ and for every $p$ in $\mathcal{S}$ and $1 \leq i \leq k$, it includes an $a$-transition to $p_{i}$, if $x_{i}$ is in the labelling of $p$, and an $a$-transition to $\neg p_{i}$, otherwise. It is easy to see that for every $p$ in $\mathcal{S}, p$ satisfies $\varphi_{d}^{k}$; also by straightforward induction on $\varphi, p$ satisfies $\varphi$ in $\mathcal{S}$ if and only if $p$ satisfies $\varphi^{\prime}$ in $\mathcal{S}_{e}$. Therefore, if $\varphi$ is $\mathcal{L}_{\square \diamond x}$-satisfiable, then $\varphi_{-x}$ is $\mathcal{L}_{\square \diamond}$-satisfiable.

Let $\mathcal{S}$ be an LTS; we define $\mathcal{S}_{x}$ to be the labelled LTS that results from labelling each $p$ in $\mathcal{S}$ with $\left\{x_{i} \mid b t_{i} a \in \operatorname{traces}(p)\right\}$. It is then not hard to use induction on $\varphi$ to prove that for every process $p$ in $\mathcal{L}$, if $p$ satisfies $\varphi_{-x}$ in $\mathcal{L}$, then $p$ satisfies $\varphi$ in $\mathcal{L}_{x}$. Therefore, if $\varphi_{-x}$ is $\mathcal{L}_{\square \diamond \text {-satisfiable, then }} \varphi$ is $\mathcal{L}_{\square \diamond x}$-satisfiable.

- Proposition 15. Let $|A|>1$. Satisfiability of formulae in $\mathcal{L}_{3 S}$ is PSPACE-complete.

Proof. It holds that $\mathcal{L}_{\square \diamond} \subseteq \mathcal{L}_{3 S}$, and so from Theorem $74, \mathcal{L}_{3 S}$-satisfiability is PSPACE-hard. Again, PSPACE-membership is an immediate implication of the fact that satisfiability for Modal Logic K and HML is in PSPACE [32, 23].

## C The complexity of primality

Proofs of statements in Subection 3.2 are given in detail below. Let $\mathcal{L}$ be $\mathcal{L}_{S}, \mathcal{L}_{C S}$, or $\mathcal{L}_{R S}$ with a bounded action set. From Subsection 3.1 and Appendix B inconsistency in $\mathcal{L}$ is linear-time decidable. Moreover, in case that the input formula is consistent, we can efficiently compute a logically equivalent formula that contains no inconsistent formulae. Therefore, we examine formulae of this form when we examine the complexity of primality.

## C. 1 Primality in $\mathcal{L}_{S}$

We first provide some simple lemmas.

- Lemma 75. For every $\varphi_{1}, \varphi_{2}, \psi \in \mathcal{L}_{S}, \varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi$ iff $\varphi_{1} \models\langle a\rangle \psi$ or $\varphi_{2} \models\langle a\rangle \psi$.

Proof. $(\Leftarrow)$ If $\varphi_{1} \models\langle a\rangle \psi$ or $\varphi_{2} \models\langle a\rangle \psi$, then $\varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi$ immediately holds.
$(\Rightarrow)$ Assume that $\varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi$ and w.l.o.g. $\varphi_{1} \not \models\langle a\rangle \psi$. We show that $\varphi_{2} \models\langle a\rangle \psi$. Since $\varphi_{1} \not \models\langle a\rangle \psi$, there is some $p_{1}$ such that $p_{1} \models \varphi_{1}$ and $p_{1} \not \models\langle a\rangle \psi$. If $\varphi_{2}$ is not satisfiable, then $\varphi_{2} \models\langle a\rangle \psi$ trivially holds. Assume now that $\varphi_{2}$ is satisfiable and let $p_{2} \models \varphi_{2}$. Observe that $p_{1} \lesssim_{S} p_{1}+p_{2}$ and $p_{2} \lesssim_{S} p_{1}+p_{2}$. Then, $p_{1}+p_{2} \models \varphi_{1} \wedge \varphi_{2}$ by Proposition 6, and therefore $p_{1}+p_{2} \models\langle a\rangle \psi$. This means that either $p_{1} \xrightarrow{a} p^{\prime}$ or $p_{2} \xrightarrow{a} p^{\prime}$ for some $p^{\prime}$ such that $p^{\prime} \models \psi$. Since $p_{1} \not \vDash\langle a\rangle \psi$, we have that $p_{2} \xrightarrow{a} p^{\prime}$, and so $p_{2} \models\langle a\rangle \psi$, which was to be shown.

Lemma 77 states that all formulae in $\mathcal{L}_{S}$ that do not contain ff and disjunctions are prime. Similarly to the previous subsection, we associate a process $p_{\varphi}$ to a formula $\varphi$ of this form and prove that $\varphi$ is characteristic within $\mathcal{L}_{S}$ for $p_{\varphi}$.

- Definition 76. Let $\varphi \in \mathcal{L}_{S}$ given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi$. We define process $p_{\varphi}$ inductively as follows.
- If $\varphi=\mathbf{t t}$, then $p_{\varphi}=0$.
- If $\varphi=\langle a\rangle \varphi^{\prime}$, then $p_{\varphi}=a . p_{\varphi^{\prime}}$.
- If $\varphi=\varphi_{1} \wedge \varphi_{2}$, then $p_{\varphi}=p_{\varphi_{1}}+p_{\varphi_{2}}$.
- Lemma 77. Let $\varphi$ be a formula given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi$. Then, $\varphi$ is prime. In particular, $\varphi$ is characteristic within $\mathcal{L}_{S}$ for $p_{\varphi}$.

Proof. We prove that $\varphi$ is characteristic within $\mathcal{L}_{S}$ for $p_{\varphi}$. Then, from Proposition $9, \varphi$ is also prime. Let $p \models \varphi$. From Corollary 37, it suffices to show that $p_{\varphi} \lesssim_{S} p$. We show that by induction on the structure of $\varphi$.
Case $\varphi=\mathrm{tt}$. It holds $p_{\varphi}=0 \lesssim_{S} p$, since $0 \lesssim_{S} p$ holds for every process $p$.
Case $\varphi=\langle a\rangle \varphi^{\prime}$. As $p \models\langle a\rangle \varphi^{\prime}$, there is $p \xrightarrow{a} p^{\prime}$ such that $p^{\prime} \models \varphi^{\prime}$. By inductive hypothesis, $p_{\varphi^{\prime}} \lesssim_{S} p^{\prime}$. Thus, a. $p_{\varphi^{\prime}} \lesssim_{S} p$, or $p_{\varphi} \lesssim_{S} p$.
Case $\varphi=\varphi_{1} \wedge \varphi_{2}$. As $p \models \varphi_{1} \wedge \varphi_{2}$, then $p \models \varphi_{1}$ and $p \models \varphi_{2}$. By inductive hypothesis, $p_{\varphi_{1}} \lesssim_{S} p$ and $p_{\varphi_{2}} \lesssim_{S} p$. As noted in Remark $35, \lesssim_{S}$ is preserved under + , and so $p_{\varphi_{1}}+p_{\varphi_{2}} \lesssim_{S} p+p \sim p$. Hence, $p_{\varphi} \lesssim_{S} p$.
The inverse implication, namely $p_{\varphi} \lesssim C S p \Longrightarrow p \models \varphi$, can be easily proven by induction on the structure of $\varphi$.

The next more general statement follows immediately from Lemma 77 and the fact that inconsistent formulae are prime.

- Corollary 78. Let $\varphi \in \mathcal{L}_{S}$ be a formula given by the grammar $\varphi::=\mathbf{t t}|\mathbf{f f}|\langle a\rangle \varphi \mid \varphi \wedge \varphi$. Then, $\varphi$ is prime.

Proposition 79 provides a necessary and sufficient condition for primality in $\mathcal{L}_{S}$.

- Proposition 79. Let $\varphi \in \mathcal{L}_{S}$ and $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. Then, $\varphi$ is prime iff $\varphi \models \varphi_{j}$ for some $1 \leq j \leq k$.

Proof. $(\Rightarrow)$ Assume that $\varphi$ is prime. From Lemma 42, $\varphi \equiv \bigvee_{i=1}^{k} \varphi_{i}$. By the definition of primality, $\varphi \models \varphi_{j}$, for some $1 \leq j \leq k$.
$(\Leftarrow)$ From Lemma 42, it suffices to show the claim for $\bigvee_{i=1}^{k} \varphi_{i}$. Assume that $\bigvee_{i=1}^{k} \varphi_{i} \models \varphi_{j}$, for some $1 \leq j \leq k$. Let $\bigvee_{i=1}^{k} \varphi_{i} \models \bigvee_{l=1}^{m} \phi_{l}$. From Lemma 44, $\varphi_{i} \models \bigvee_{l=1}^{m} \phi_{l}$, for every $1 \leq i \leq k$, and in particular $\varphi_{j} \models \bigvee_{l=1}^{m} \phi_{l}$. But $\varphi_{j}$ does not contain disjunctions and Corollary 78 guarantees that it is prime. Thus, $\varphi_{j} \models \phi_{s}$, for some $1 \leq s \leq m$, and since $\bigvee_{i=1}^{k} \varphi_{i} \models \varphi_{j}$, it holds that $\bigvee_{i=1}^{k} \varphi_{i} \models \phi_{s}$.

To give necessary and sufficient conditions for the primality of formulae in $\mathcal{L}_{S}$ without $\mathbf{f f}$, we examine and state results regarding the DNF of such formulae.

- Lemma 80. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. Then, for every $1 \leq i \leq k, \varphi_{i}$ is characteristic for $p_{\varphi_{i}}$.

Proof. Every $\varphi_{i}$ does not contain disjunctions and so it is characteristic for $p_{\varphi_{i}}$ from Lemma 77.

- Lemma 81. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in $D N F$. If for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}, 1 \leq i, j \leq k$, there is some process $q$ such that $q \lesssim_{S} p_{\varphi_{i}}, q \lesssim_{S} p_{\varphi_{j}}$, and $q \models \varphi$, then there is some process $q$ such that $q \lesssim_{S} p_{\varphi_{i}}$ for every $1 \leq i \leq k$, and $q \models \varphi$.

Proof. We prove that for every $2 \leq m \leq k$ processes $p_{\varphi_{i_{1}}}, \ldots, p_{\varphi_{i_{m}}}$ there is some process $q$ such that $q \lesssim_{S} p_{\varphi_{i_{1}}}, \ldots, q \lesssim_{S} p_{\varphi_{i_{m}}}$ and $q \models \varphi$. The proof is by strong induction on $m$.
Base case. Let $m=2$. This is true from the hypothesis of the lemma.
Inductive step. Let the argument be true for every $m \leq n-1$. We show that it is true for $m=n$. Let $p_{\varphi_{i_{1}}}, \ldots, p_{\varphi_{i_{n}}}$ be processes associated to $\varphi_{i_{1}}, \ldots, \varphi_{i_{n}}$, respectively. Consider the pairs $\left(p_{\varphi_{i_{1}}}, p_{\varphi_{i_{2}}}\right),\left(p_{\varphi_{i_{3}}}, p_{\varphi_{i_{4}}}\right), \ldots,\left(p_{\varphi_{i_{n-1}}}, p_{\varphi_{i_{n}}}\right)$. By inductive hypothesis, there are $q_{1}, \ldots, q_{n / 2}$ such that $q_{1} \lesssim_{S} p_{\varphi_{i_{1}}}, p_{\varphi_{i_{2}}}, q_{2} \lesssim_{S} p_{\varphi_{i_{3}}}, p_{\varphi_{i_{4}}}, \ldots, q_{n / 2} \lesssim S p_{\varphi_{i_{n-1}}}, p_{\varphi_{i_{n}}}$, and $q_{i} \models \varphi$ for every $1 \leq i \leq n / 2$. Thus, there are $\varphi_{j_{i}}, 1 \leq j_{i} \leq k, 1 \leq i \leq n / 2$, such that $q_{i} \models \varphi_{j_{i}}$. From Lemma 80, every $\varphi_{j_{i}}$ is characteristic for $p_{\varphi_{j_{i}}}$ and from Corollary 37, $p_{\varphi_{j_{i}}} \lesssim S q_{i}$ for every $1 \leq j_{i} \leq k$ and $1 \leq i \leq n / 2$. By inductive hypothesis, there is $q$ such that $q \lesssim S p_{\varphi_{j_{1}}}, \ldots, p_{\varphi_{j_{n / 2}}}$ and $q \models \varphi$. By transitivity of $\lesssim_{S}, q \lesssim_{S} p_{\varphi_{i_{1}}}, \ldots, p_{\varphi_{i_{n}}}$.

- Remark 82. Note that if we consider $k$ processes $p_{1}, \ldots, p_{k}$ and for every pair $p_{i}, p_{j}$, there is $q \neq 0$ such that $q \lesssim_{S} p_{i}$ and $q \lesssim_{S} p_{j}$, then it may be the case that there is no $q \neq 0$ such that $q \lesssim S p_{i}$ for every $1 \leq i \leq k$. For example, this is true for processes $p_{1}, p_{2}$, and $p_{3}$, where $p_{1} \xrightarrow{a} 0, p_{1} \xrightarrow{b} 0, p_{1} \xrightarrow{c} 0, p_{2} \xrightarrow{c} 0, p_{2} \xrightarrow{d} 0, p_{2} \xrightarrow{e} 0, p_{3} \xrightarrow{e} 0, p_{3} \xrightarrow{f} 0$, and $p_{3} \xrightarrow{a} 0$.
- Corollary 83. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. If for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}, 1 \leq i, j \leq k$, there is some process $q$ such that $q \lesssim_{S} p_{\varphi_{i}}, q \lesssim_{S} p_{\varphi_{j}}$, and $q \models \varphi$, then there is some $1 \leq m \leq k$, such that $p_{\varphi_{m}} \lesssim_{S} p_{\varphi_{i}}$ for every $1 \leq i \leq k$.

Proof. From Lemma 81, there is $q$ such that $q \lesssim_{S} p_{\varphi_{i}}$ for every $1 \leq i \leq k$, and $q \models \varphi$. Consequently, $q \models \varphi_{m}$ for some $1 \leq m \leq k$, so $p_{\varphi_{m}} \lesssim_{S} q$. By transitivity of $\lesssim_{S}, p_{\varphi_{m}} \lesssim_{S} p_{\varphi_{i}}$ for every $1 \leq i \leq k$. Since, $p_{\varphi_{m}} \models \varphi_{m}$, we have that $p_{\varphi_{m}} \models \varphi$ as well.

Proposition 84 provides a necessary and sufficient condition for primality in $\mathcal{L}_{S}$ given that the formulae do not contain ff.

- Proposition 84. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. Then, $\varphi$ is prime iff for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}, 1 \leq i, j \leq k$, there is some process $q$ such that $q \lesssim S p_{\varphi_{i}}, q \lesssim S p_{\varphi_{j}}$, and $q \models \varphi$.

Proof. $(\Leftarrow)$ From Corollary 83, there is some $1 \leq m \leq k$, such that $p_{\varphi_{m}} \lesssim_{S} p_{\varphi_{i}}$ for every $1 \leq i \leq k$. From the fact that $\varphi_{i}$ is characteristic for $p_{\varphi_{i}}$ and Corollary 40, $\varphi_{i} \models \varphi_{m}$ for every $1 \leq i \leq m$. From Proposition 79, $\varphi$ is prime. $(\Rightarrow)$ Let $\varphi$ be prime. From Lemma 77 , there is some $1 \leq m \leq k$ such that $\varphi \models \varphi_{m}$. From Lemmas 42 and $44, \varphi_{i} \models \varphi_{m}$ for all $1 \leq i \leq k$. From Corollary 40, $p_{\varphi_{m}} \lesssim S p_{\varphi_{i}}$ for every $1 \leq i \leq k$. As a result, for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}$, it holds that $p_{\varphi_{m}} \lesssim S p_{\varphi_{i}}, p_{\varphi_{m}} \lesssim S p_{\varphi_{j}}$, and $p_{\varphi_{m}} \models \varphi_{m}$, which implies that $p_{\varphi_{m}} \models \varphi$.

- Corollary 85. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. Then, $\varphi$ is prime iff for every pair $\varphi_{i}, \varphi_{j}$ there is some $1 \leq m \leq k$ such that $\varphi_{i} \models \varphi_{m}$ and $\varphi_{j} \models \varphi_{m}$.

Proof. $(\Rightarrow)$ From Proposition 79, if $\varphi$ is prime, then there is some $1 \leq m \leq k$ such that $\varphi_{i} \models \varphi_{m}$ for every $1 \leq i \leq k$. $(\Leftarrow)$ If for every $\varphi_{i}, \varphi_{j}$ there is some $1 \leq m \leq k$ such that $\varphi_{i} \models \varphi_{m}$ and $\varphi_{j} \models \varphi_{m}$, then from the fact that $\varphi_{i}, \varphi_{j}$ are characteristic for $p_{\varphi_{i}}$ and
$p_{\varphi_{j}}$, and Corollary 40, $p_{\varphi_{m}} \lesssim S p_{\varphi_{i}}$ and $p_{\varphi_{m}} \lesssim S p_{\varphi_{j}}$. It also holds that $p_{\varphi_{m}} \models \varphi$, so from Proposition $84, \varphi$ is prime.

To prove correctness of algorithm Prime $_{S}$, we need the following lemmas.

- Lemma 86. Let $\varphi \in \mathcal{L}_{S}$ such that $\mathrm{ff} \notin \operatorname{Sub}(\varphi)$. For every formula $\psi$ that appears in vertices of $G_{\varphi}$, it holds that $\mathrm{ff} \notin \operatorname{Sub}(\psi)$.
- Lemma 87. Let $\varphi \in \mathcal{L}_{S}$ such that $\mathrm{ff} \notin \operatorname{Sub}(\varphi)$. If there is an alternating path in $G_{\varphi}$ from $(\varphi, \varphi \Rightarrow \varphi)$ to True, then $\varphi$ is prime.

Proof. Let $\varphi_{1}, \varphi_{2} \Rightarrow \psi$ be a vertex in an alternating path from $(\varphi, \varphi \Rightarrow \varphi)$ to TruE and $\bigvee_{i=1}^{k_{1}} \varphi_{1}^{i}, \bigvee_{i=1}^{k_{2}} \varphi_{2}^{i}$, and $\bigvee_{i=1}^{k_{3}} \psi^{i}$ be $\varphi_{1}, \varphi_{2}$, and $\psi$ in DNF, respectively. We show that $\varphi_{1}, \varphi_{2}$ and $\psi$ satisfy the following property $P_{1}$ :
"For every $\varphi_{1}^{i}, \varphi_{2}^{j}$ there is $\psi^{k}$ such that $\varphi_{1}^{i} \models \psi^{k}$ and $\varphi_{2}^{j} \models \psi^{k}$."
Edges of $G_{\varphi}$ correspond to the application of some rule of Table 1. In an alternating path from $(\varphi, \varphi \Rightarrow \varphi)$ to True, the edges connect the top vertex of a rule to one or two vertices that correspond to the bottom of the same rule: if a rule is universal, the top vertex connects to two children. Otherwise, it connects to one child. We show that $P_{1}$ is true for every vertex in the alternating path from $s$ to $t$ by induction on the type of rules, read from their conclusions to their premise.
Case (tt). $P_{1}$ is trivial for $\varphi_{1}, \varphi_{2}$, and $\mathbf{t t}$, since for every $\varphi_{1}^{i}, \varphi_{2}^{j}$, it holds that $\varphi_{1}^{i} \models \mathbf{t t}$ and $\varphi_{2}^{j} \models \mathrm{tt}$.
Case $\left(\mathrm{L} \vee_{1}\right)$. Since rule $\left(\mathrm{L}_{1}\right)$ is universal, assume that $P_{1}$ is true for both $\varphi_{1}, \varphi, \psi$ and $\varphi_{2}, \varphi, \psi$. Let $\bigvee_{i=1}^{k_{12}} \varphi_{12}^{i}$ be $\varphi_{1} \vee \varphi_{2}$ in DNF. Then, $\bigvee_{i=1}^{k_{12}} \varphi_{12}^{i}=\bigvee_{i=1}^{k_{1}} \varphi_{1}^{i} \vee \bigvee_{i=1}^{k_{2}} \varphi_{2}^{i}$. So, $P_{1}$ holds for $\varphi_{1} \vee \varphi_{2}, \varphi, \psi$ as well. Case $\left(\mathrm{L}_{2}\right)$ is completely analogous.
Case $\left(\mathrm{L} \wedge_{1}\right)$. Since rule $\left(\mathrm{L} \wedge_{1}\right)$ is existential, assume that $P_{1}$ is true for either $\varphi_{1}, \varphi,\langle a\rangle \psi$ or $\varphi_{2}, \varphi,\langle a\rangle \psi$. Let $\bigvee_{i=1}^{k_{12}} \varphi_{12}^{i}$ and $\bigvee_{i=1}^{k} \varphi^{i}$ be $\varphi_{1} \wedge \varphi_{2}$ and $\varphi$ in DNF, respectively. Then, every $\varphi_{12}^{i}$ is $\varphi_{1}^{j} \wedge \varphi_{2}^{k}$ for some $1 \leq j \leq k_{1}$ and $1 \leq k \leq k_{2}$. Property $P_{1}$ for $\varphi_{1} \wedge \varphi_{2}, \varphi,\langle a\rangle \psi$ is as follows: for every $\varphi_{1}^{j} \wedge \varphi_{2}^{k}, \varphi^{i}$ there is $\langle a\rangle \psi^{m}$ such that $\varphi_{1}^{j} \wedge \varphi_{2}^{k} \models\langle a\rangle \psi^{m}$ and $\varphi^{i} \models\langle a\rangle \psi^{m}$. This is true since $\varphi_{1}^{j} \wedge \varphi_{2}^{k} \models\langle a\rangle \psi^{m}$ is equivalent to $\varphi_{1}^{j} \models\langle a\rangle \psi^{m}$ or $\varphi_{2}^{k} \models\langle a\rangle \psi^{m}$ from Lemma 75. Case $\left(\mathrm{L} \wedge_{2}\right)$ is completely analogous.
Case ( $\mathrm{R} \wedge$ ). Let $\bigvee_{i=1}^{m_{1}} \psi_{1}^{i}$ and $\bigvee_{i=1}^{m_{2}} \psi_{2}^{i}$, and $\bigvee_{i=1}^{m} \psi_{12}^{i}$ be $\psi_{1}, \psi_{2}$, and $\psi_{1} \wedge \psi_{2}$ in DNF, respectively. Assume $P_{1}$ is true for $\varphi_{1}, \varphi_{2}, \psi_{1}$ and $\varphi_{1}, \varphi_{2}, \psi_{2}$, which means that for every $\varphi_{1}^{i}, \varphi_{2}^{j}$ there are $\psi_{1}^{k_{1}}, \psi_{2}^{k_{2}}$ such that $\varphi_{1}^{i} \models \psi_{1}^{k_{1}}, \psi_{2}^{k_{2}}$ and $\varphi_{2}^{j} \models \psi_{1}^{k_{1}}, \psi_{2}^{k_{2}}$. So, $\varphi_{1}^{i} \models \psi_{1}^{k_{1}} \wedge \psi_{2}^{k_{2}}$ and $\varphi_{2}^{j} \models \psi_{1}^{k_{1}} \wedge \psi_{2}^{k_{2}}$. Since every $\psi_{12}^{i}$ in the DNF of $\psi_{1} \wedge \psi_{2}$ is $\psi_{1}^{j} \wedge \psi_{2}^{k}$ for some $1 \leq j \leq m_{1}$ and $1 \leq k \leq m_{2}, P_{1}$ is also true for $\varphi_{1}, \varphi_{2}, \psi_{1} \wedge \psi_{2}$.
Case $(\mathbf{R} \vee)$. Let $\bigvee_{i=1}^{m_{1}} \psi_{1}^{i}$ and $\bigvee_{i=1}^{m_{2}} \psi_{2}^{i}$, and $\bigvee_{i=1}^{m} \psi_{12}^{i}$ be $\psi_{1}, \psi_{2}$, and $\psi_{1} \vee \psi_{2}$ in DNF, respectively. Assume $P_{1}$ is true for $\varphi_{1}, \varphi_{2}, \psi_{1}$ or $\varphi_{1}, \varphi_{2}, \psi_{2}$, which means that for every $\varphi_{1}^{i}, \varphi_{2}^{j}$ there is $\psi_{n}^{k}$ such that $\varphi_{1}^{i} \models \psi_{n}^{k}$ and $\varphi_{2}^{j} \models \psi_{n}^{k}$, where $n=1$ or $n=2$. Since every $\psi_{12}^{i}$ in the DNF of $\psi_{1} \vee \psi_{2}$ is either some $\psi_{1}^{j}, 1 \leq j \leq m_{1}$, or $\psi_{2}^{k}, 1 \leq k \leq m_{2}, P_{1}$ is also true for $\varphi_{1}, \varphi_{2}, \psi_{1} \vee \psi_{2}$.
Case $(\diamond)$. Assume that $P_{1}$ is true for $\varphi_{1}, \varphi_{2}, \psi$, so for every $\varphi_{1}^{i}, \varphi_{2}^{j}$, there is some $\psi^{k}$ such that $\varphi_{1}^{i} \models \psi^{k}$ and $\varphi_{2}^{j} \models \psi^{k}$. The DNFs of $\langle a\rangle \varphi_{1},\langle a\rangle \varphi_{2}$, and $\langle a\rangle \psi$ are $\bigvee_{i=1}^{k_{1}}\langle a\rangle \varphi_{1}^{i}, \bigvee_{i=1}^{k_{2}}\langle a\rangle \varphi_{2}^{i}$, and $\bigvee_{i=1}^{k_{3}}\langle a\rangle \psi^{i}$, respectively. From Lemma $45,\langle a\rangle \varphi_{1}^{i} \models\langle a\rangle \psi^{k}$ and $\langle a\rangle \varphi_{2}^{j} \models\langle a\rangle \psi^{k}$ hold and $P_{1}$ is also true for $\langle a\rangle \varphi_{1},\langle a\rangle \varphi_{2},\langle a\rangle \psi$.
Consequently, if $\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ is a vertex in $G_{\varphi}, P_{1}$ is true for $\varphi_{1}, \varphi_{2}, \psi$. In particular, $(\varphi, \varphi \Rightarrow \varphi)$ is a vertex in $G_{\varphi}$. Thus, for every $\varphi^{i}, \varphi^{j}$ there is $\varphi^{k}$ such that $\varphi^{i} \models \varphi^{k}$ and $\varphi^{j} \models \varphi^{k}$. From Corollary 85, $\varphi$ is prime.

- Lemma 88. Let $\varphi \in \mathcal{L}_{S}$ such that $\mathrm{ff} \notin \operatorname{Sub}(\varphi)$. If $\varphi$ is prime, then there is an alternating path in $G_{\varphi}$ from $(\varphi, \varphi \Rightarrow \varphi)$ to True.

Proof. Assume that $\varphi$ is prime. Let $\varphi_{1}, \varphi_{2}, \psi \in \mathcal{L}_{S}$, such that they do not contain ff , and $\bigvee_{i=1}^{k_{1}} \varphi_{1}^{i}, \bigvee_{i=1}^{k_{2}} \varphi_{2}^{i}$, and $\bigvee_{i=1}^{k_{3}} \psi^{i}$ be their DNFs, respectively. We say that $\varphi_{1}, \varphi_{2}, \psi$ satisfy property $P_{2}$ if there is $\psi^{k}$ such that $\varphi_{1} \models \psi^{k}$ and $\varphi_{2} \models \psi^{k}$. We prove Claims 1 and 2 .
Claim 1. For every vertex $x=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ in $G_{\varphi}$ such that $\psi \neq \mathbf{t t}$ and $\varphi_{1}, \varphi_{2}, \psi$ satisfy $P_{2}$, the following are true:
(a) One of the rules from Table 1 can be applied on $x$.
(b) If an existential rule is applied on $x$, then there is some $z=\left(\varphi_{1}^{\prime}, \varphi_{2}^{\prime} \Rightarrow \psi^{\prime}\right)$ such that $(x, z) \in E$ and $\varphi_{1}^{\prime}, \varphi_{2}^{\prime}, \psi^{\prime}$ satisfy $P_{2}$.
(c) If a universal rule is applied on $x$, then for all $z=\left(\varphi_{1}^{\prime}, \varphi_{2}^{\prime} \Rightarrow \psi^{\prime}\right)$ such that $(x, z) \in E$, $\varphi_{1}^{\prime}, \varphi_{2}^{\prime}, \psi^{\prime}$ satisfy $P_{2}$.
Claim 2. If $x$ is a vertex $\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ in $G_{\varphi}$ such that $\varphi_{1}, \varphi_{2}, \psi$ satisfy $P_{2}$, then there is an alternating path from $x$ to True.

Proof of Claim 1. We first prove statement (a). To this end, suppose that $\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ is a vertex such that no rule from Table 1 can be applied and $\varphi_{1}, \varphi_{2}, \psi$ satisfy $P_{2}$. Then, it must be the case that $\varphi_{1}=\langle a\rangle \varphi_{1}^{\prime}, \varphi_{2}=\langle b\rangle \varphi_{2}^{\prime}$, and $\psi=\langle c\rangle \psi^{\prime}$, where $a=b=c$ is not true. Assume that $a=c \neq b$. Hence, there is $\psi^{k}$ such that $\langle a\rangle \varphi_{1}^{\prime} \models \psi^{k}$ and $\langle b\rangle \varphi_{2}^{\prime} \models \psi^{k}$. However, $\psi^{k}=\langle a\rangle \psi^{\prime}$ for some $\psi^{\prime}$, and $\langle b\rangle \varphi_{2}^{\prime} \not \models\langle a\rangle \psi^{\prime}$, contradiction. The other cases that make $a=b=c$ false can be proven analogously.

We prove parts (b) and (c) of the claim by induction on the type of the rules.
Case $\left(\mathbf{L} \vee_{1}\right)$. Assume there is $\psi^{k}$ such that $\varphi_{1} \vee \varphi_{2} \models \psi^{k}$ and $\varphi \models \psi^{k}$. From Lemma 44, it holds that $\varphi_{1} \models \psi^{k}$ and $\varphi_{2} \models \psi^{k}$, and so $P_{2}$ is true for both $\varphi_{1}, \varphi, \psi$ and $\varphi_{2}, \varphi, \psi$. Case $\left(\mathrm{L} \vee_{2}\right)$ is similar.
Case $\left(\mathrm{L} \wedge_{1}\right)$. Assume there is $\langle a\rangle \psi^{k}$ such that $\varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi^{k}$ and $\varphi \models\langle a\rangle \psi^{k}$. From Lemma 75, it holds that $\varphi_{1} \models\langle a\rangle \psi^{k}$ or $\varphi_{2} \models\langle a\rangle \psi^{k}$, and so $P_{2}$ is true for either $\varphi_{1}, \varphi,\langle a\rangle \psi$ or $\varphi_{2}, \varphi,\langle a\rangle \psi$. Case $\left(\mathrm{L} \wedge_{2}\right)$ is similar.
Case $(\mathbf{R} \wedge)$. Let $\bigvee_{i=1}^{m} \psi_{12}^{i}$ be the DNF of $\psi_{1} \wedge \psi_{2}$. Assume there is $\psi_{12}^{k}$ such that $\varphi_{1} \models \psi_{12}^{k}$ and $\varphi_{2} \models \psi_{12}^{k}$. Since every $\psi_{12}^{k}$ is $\psi_{1}^{i} \wedge \psi_{2}^{j}$ for some $1 \leq i \leq k_{1}$ and $1 \leq j \leq k_{2}$, it holds that $P_{2}$ is true for both $\varphi_{1}, \varphi_{2}, \psi_{1}$ and $\varphi_{1}, \varphi_{2}, \psi_{2}$.
Case ( $\mathbf{R} \vee$ ). Let $\bigvee_{i=1}^{m} \psi_{12}^{i}$ denote the DNF of $\psi_{1} \vee \psi_{2}$. Then, $\bigvee_{i=1}^{m} \psi_{12}^{i}=\bigvee_{i=1}^{k_{1}} \varphi_{1}^{i} \vee \bigvee_{i=1}^{k_{2}} \varphi_{2}^{i}$. This immediately implies that if $P_{2}$ is true for $\varphi_{1}, \varphi_{2}, \psi_{1} \vee \psi_{2}$, then $P_{2}$ is true for $\varphi_{1}, \varphi_{2}, \psi_{1}$ or $\varphi_{1}, \varphi_{2}, \psi_{2}$.
Case ( $\diamond$ ). If there is $\langle a\rangle \psi^{k}$ such that $\langle a\rangle \varphi_{1} \models\langle a\rangle \psi^{k}$ and $\langle a\rangle \varphi_{2} \models\langle a\rangle \psi^{k}$, then from Lemma 45, $\varphi_{1} \models \psi^{k}$ and $\varphi_{2} \models \psi^{k}$. From the fact that the DNFs of $\langle a\rangle \varphi_{1},\langle a\rangle \varphi_{2}$, and $\langle a\rangle \psi$ are $\bigvee_{i=1}^{k_{1}}\langle a\rangle \varphi_{1}^{i}, \bigvee_{i=1}^{k_{2}}\langle a\rangle \varphi_{2}^{i}$, and $\bigvee_{i=1}^{k_{3}}\langle a\rangle \psi^{i}$, respectively, we have that $P_{2}$ is true for $\varphi_{1}, \varphi_{2}, \psi$.
Proof of Claim 2. Let $x=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ be a vertex in $G_{\varphi}$ such that $\varphi_{1}, \varphi_{2}, \psi$ satisfy $P_{2}$. We prove the claim by induction on the form of $x$.
Case $x=\left(\varphi_{1}, \varphi_{2} \Rightarrow \mathrm{tt}\right)$. In this case, $\varphi_{1}, \varphi_{2}, \psi$ satisfy $P_{2}$ and $P^{G}(x$, TRUE $)$ trivially holds.
Case $x=\left(\varphi_{1} \vee \varphi_{2} \Rightarrow \psi\right)$. In this case, $x$ is universal and from Claim 1(c), all $z$ such that $(x, z) \in E$, i.e. $z_{1}=\left(\varphi_{1}, \varphi \Rightarrow \psi\right)$ and $z_{2}=\left(\varphi_{2}, \varphi \Rightarrow \psi\right)$, are vertices such that $\varphi_{1}, \varphi, \psi$ and $\varphi_{2}, \varphi, \psi$ satisfy $P_{2}$, respectively. By inductive hypothesis, $P^{G}\left(z_{1}\right.$, TRUE $)$ and $P^{G}\left(z_{2}\right.$, True $)$. As a result, $P^{G}(x$, True $)$.
Similarly to the case $x=\left(\varphi_{1} \vee \varphi_{2} \Rightarrow \psi\right)$ and using Claims 1(b) and (c), Claim 2 can be proven for all the other cases that correspond to the top of the rules in Table 1. From Claim 1(a), we know that these are the only forms that vertex $x$ can have. Finally, primality of $\varphi$ and Proposition 101 imply that $P_{2}$ is true for $\varphi, \varphi, \varphi$, and so there is an alternating path from $(\varphi, \varphi \Rightarrow \varphi)$ to True.

Polynomial-time complexity of algorithm Prime $_{S}$ derives from the polynomial size of $G_{\varphi}$ and linear-time complexity of $\mathrm{REACH}_{a}$.

- Lemma 89. Given a formula $\varphi \in \mathcal{L}_{S}$ such that $\mathrm{ff} \notin \operatorname{Sub}(\varphi)$, the size of $G_{\varphi}$ is polynomial in $|\varphi|$.

Proof. Let $|\varphi|=n$. To construct $G_{\varphi}$, we start from $(\varphi, \varphi \Rightarrow \varphi)$ and apply repeatedly rules from Table 1 until no rule can be applied. Let $x=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ be a vertex in $G_{\varphi}$. Apart from (tt), every rule generates new vertices by replacing at least one of $\varphi_{1}, \varphi_{2}, \psi$ with one of its subformulae. Thus, every vertex of the form $\left(\varphi_{1}^{\prime}, \varphi_{2}^{\prime} \Rightarrow \psi^{\prime}\right)$ is such that all $\varphi_{1}^{\prime}, \varphi_{2}^{\prime}, \psi^{\prime} \in \operatorname{Sub}(\varphi)$. Since $|\operatorname{Sub}(\varphi)|=\mathcal{O}(n)$, the number of different vertices is at most $\mathcal{O}\left(n^{3}\right)$.

- Corollary 90. Given a formula $\varphi \in \mathcal{L}_{S}$ such that $\mathrm{ff} \notin \operatorname{Sub}(\varphi)$, algorithm Prime ${ }_{S}$ decides whether $\varphi$ is prime in polynomial time.

Proof. In [28], a linear-time algorithm that solves $\mathrm{REACH}_{a}$ is described. On input $\varphi$, let Primes $_{S}$ construct $G_{\varphi}$ and call the algorithm from [28] to solve $\mathrm{REACH}_{a}$ on $G_{\varphi}$. Since the size of $G_{\varphi}$ is $\mathcal{O}\left(|\varphi|^{3}\right)$, Primes runs in $\mathcal{O}\left(|\varphi|^{3}\right)$ as well. Correctness of Primes is immediate from Lemmas 87 and 88 .

- Corollary 91. Let $\varphi \in \mathcal{L}_{S}$ such that $\mathrm{ff} \notin \operatorname{Sub}(\varphi)$. If $\varphi$ is prime, there is a polynomial-time algorithm that constructs a process for which $\varphi$ is characteristic within $\mathcal{L}_{S}$.

Proof. Let $\varphi$ be consistent and prime and $p_{\varphi}$ be a process for which $\varphi$ is characteristic within $\mathcal{L}_{S}$. From Proposition 79 , there is $1 \leq j \leq k$, such that $\varphi \models \varphi_{j}$. If $p_{j}$ denotes a process for which $\varphi_{j}$ is characteristic within $\mathcal{L}_{S}$, then from Corollary $40, p_{j} \lesssim_{S} p_{\varphi}$ and so $p_{j} \equiv \equiv_{S} p_{\varphi}$. Consider now algorithm Prime ${ }_{S}$ described in the proof of Corollary 90. When Primes checks whether there is an alternating path in $G_{\varphi}$ from $s$ to $t$, it can also find an alternating path, denoted here by $\mathcal{P}_{a}$. As we move from the starting vertex $s=(\varphi, \varphi \Rightarrow \varphi)$ to the descendants of $s$ along $\mathcal{P}_{a}$, formula $\varphi$ on the right-hand side of $\Rightarrow$ gets deconstructed to give some $\varphi_{j}$ such that $\varphi \models \varphi_{j}$. We construct a process $p_{j}$ for which $\varphi_{j}$ is characteristic within $\mathcal{L}_{S}$, by following $\mathcal{P}_{a}$ bottom-up, i.e. from $t$ to $s$, and associating a process $p$ to every vertex $x$ in $\mathcal{P}_{a}$. Process $p$ depends only on the right-hand side of $\Rightarrow$ that appears in vertex $x$. At the end, the process corresponding to $s$ is $p_{j}$.

- If $x=\left(\varphi_{1}, \varphi_{2} \Rightarrow \mathbf{t t}\right)$ belongs to $\mathcal{P}_{a}$, then $p=0$ corresponds to $x$.
- If $p$ corresponds to $x=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ and $y=\left(\langle a\rangle \varphi_{1},\langle a\rangle \varphi_{2} \Rightarrow\langle a\rangle \psi\right)$ is the parent of $x$ in $\mathcal{P}_{a}$, then $q=a . p$ corresponds to $y$.
- If $p_{1}$ corresponds to $x_{1}=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi_{1}\right), p_{2}$ corresponds to $x_{2}=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi_{2}\right)$, and $y=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi_{1} \wedge \psi_{2}\right)$ is the parent of $x_{1}$ and $x_{2}$ in $\mathcal{P}_{a}$, then $p_{1}+p_{2}$ corresponds to $y$.
- If $p \in P$ corresponds to $x=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi_{1}\right)$ and $y=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi_{1} \vee \psi_{2}\right)$ is the parent of $x$ in $\mathcal{P}_{a}$, then $p$ corresponds to $y$.
- If $p \in P$ corresponds to $x=\left(\varphi_{1}, \varphi \Rightarrow\langle a\rangle \psi\right)$ and $y=\left(\varphi_{1} \wedge \varphi_{2}, \varphi \Rightarrow\langle a\rangle \psi\right)$ (or $y=$ $\left.\left(\varphi, \varphi_{1} \wedge \varphi_{2} \Rightarrow\langle a\rangle \psi\right)\right)$ is the parent of $x$ in $\mathcal{P}_{a}$, then $p$ corresponds to $y$.
- If $p_{1} \in P$ corresponds to $x_{1}=\left(\varphi_{1}, \varphi \Rightarrow \psi\right), p_{2} \in P$ corresponds to $x_{2}=\left(\varphi_{2}, \varphi \Rightarrow \psi\right)$ and $y=\left(\varphi_{1} \vee \varphi_{2}, \varphi \Rightarrow \psi\right)\left(\right.$ or $\left.y=\left(\varphi, \varphi_{1} \vee \varphi_{2} \Rightarrow \psi\right)\right)$ is the parent of $x_{1}$ and $x_{2}$ in $\mathcal{P}_{a}$, then w.l.o.g. $p_{1}$ corresponds to $y$.
- Corollary 92. Deciding characteristic formulae in $\mathcal{L}_{S}$ is polynomial-time solvable.

Proof. Immediate from Propositions 9, 65, and 66, and Corollary 90. In particular, deciding characteristic formulae in $\mathcal{L}_{S}$ requires $\mathcal{O}\left(n^{3}\right)$.

## C.1.1 The case of $|A|=1$

In the case that $A$ is a singleton, i.e. $A=\{a\}$, we prove that every formula given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$ is characteristic within $\mathcal{L}_{S}$ for some process. In other words, primality of formulae that do not contain inconsistent subformulae can be decided in constant time.

Note that in this case, if $p \lesssim_{S} q$, then $\operatorname{traces}(p) \subseteq \operatorname{traces}(q)$, and vice versa.

- Definition 93. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$. The trace depth of $\varphi$ is inductively defined as follows.
- $\operatorname{td}(\mathbf{t} \mathbf{t})=0$,
$-\operatorname{td}(\langle a\rangle \varphi)=1+\operatorname{td}(\varphi)$,
$-\operatorname{td}\left(\varphi_{1} \wedge \varphi_{2}\right)=\max \left\{\operatorname{td}\left(\varphi_{1}\right), \operatorname{td}\left(\varphi_{2}\right)\right\}$,
- $\operatorname{td}\left(\varphi_{1} \vee \varphi_{2}\right)=\min \left\{\operatorname{td}\left(\varphi_{1}\right), \operatorname{td}\left(\varphi_{2}\right)\right\}$.
- Lemma 94. Let $|A|=1$ and $\varphi$ be given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$. For every process $p, p \models \varphi$ iff there are $i$ and $p^{\prime}$ such that $p \xrightarrow{a^{i}} p^{\prime}$ and $i \geq \operatorname{td}(\varphi)$.

Proof. We prove both implications separately by induction on the structure of $\varphi$.
$(\Rightarrow)$ We proceed by a case analysis on the form of $\varphi$.
Case $\varphi=\mathbf{t t}$. Trivial since $p \xrightarrow{\varepsilon} p$ holds for every $p$ and $|\varepsilon| \geq 0=\operatorname{td}(\mathbf{t t})$.
Case $\varphi=\langle a\rangle \varphi^{\prime}$. Assume $p \models \varphi$. Then, there is some $p^{\prime}$ such that $p \xrightarrow{a} p^{\prime}$ and $p^{\prime} \models \varphi^{\prime}$. By inductive hypothesis, $p^{\prime} \xrightarrow{a^{i}} p^{\prime \prime}$ for some $i \geq \operatorname{td}\left(\varphi^{\prime}\right)$. So $p \xrightarrow{a^{i+1}} p^{\prime \prime}$ and $i+1 \geq \operatorname{td}(\varphi)$.
Case $\varphi=\varphi_{1} \wedge \varphi_{2}$. Assume $p \models \varphi$. Then $p \models \varphi_{1}$ and $p \models \varphi_{2}$. By inductive hypothesis, $p \xrightarrow{a^{i}} p_{1}$ and $p \xrightarrow{a^{j}} p_{2}$ for some $i, j, p_{1}$, and $p_{2}$ such that $i \geq \operatorname{td}\left(\varphi_{1}\right)$ and $j \geq \operatorname{td}\left(\varphi_{2}\right)$. Let $m=\max \{i, j\}$. Then, $p \xrightarrow{a^{m}} p_{3}$ for some $p_{3}$, and $m \geq \operatorname{td}(\varphi)=\max \left\{\operatorname{td}\left(\varphi_{1}\right), \operatorname{td}\left(\varphi_{2}\right)\right\}$.
Case $\varphi=\varphi_{1} \vee \varphi_{2}$. Assume, without loss of generality, that $p \models \varphi$ because $p \models \varphi_{1}$. By inductive hypothesis, $p \xrightarrow{a^{i}} p^{\prime}$ for some $p^{\prime}$ and $i \geq \operatorname{td}\left(\varphi_{1}\right)$. If $\operatorname{td}(\varphi)=\operatorname{td}\left(\varphi_{1}\right)$, then we are done. Otherwise, $\operatorname{td}(\varphi)=\operatorname{td}\left(\varphi_{2}\right)<\operatorname{td}\left(\varphi_{1}\right) \leq i$ and we are done too.
$(\Leftarrow)$ The proof proceeds along similar lines, by a case analysis on the form of $\varphi$.
Case $\varphi=\mathbf{t t}$. Trivial since $p \models \mathbf{t t}$ always holds.
Case $\varphi=\langle a\rangle \varphi^{\prime}$. Assume that $p \xrightarrow{a^{i}} p^{\prime}$ and $i \geq \operatorname{td}(\varphi)$. Since $\operatorname{td}(\varphi)=1+\operatorname{td}\left(\varphi^{\prime}\right)$, we have that $p \xrightarrow{a} p^{\prime \prime} \xrightarrow{i^{i-1}} p^{\prime}$ for some $p^{\prime \prime}$ and $i-1 \geq \operatorname{td}\left(\varphi^{\prime}\right)$. By inductive hypothesis, $p^{\prime \prime} \models \varphi^{\prime}$, and thus $p \models \varphi$.
Case $\varphi=\varphi_{1} \wedge \varphi_{2}$. Assume $p \xrightarrow{a^{i}} p^{\prime}$ and $i \geq \operatorname{td}(\varphi)$. Since $\operatorname{td}(\varphi)=\max \left\{\operatorname{td}\left(\varphi_{1}\right), \operatorname{td}\left(\varphi_{2}\right)\right\}$, by inductive hypothesis, we have that $p \models \varphi_{1}$ and $p \models \varphi_{2}$, which implies that $p \models \varphi_{1} \wedge \varphi_{2}$.
Case $\varphi=\varphi_{1} \vee \varphi_{2}$. Assume $p \xrightarrow{a^{i}} p^{\prime}$ and $i \geq \operatorname{td}(\varphi)=\min \left\{\operatorname{td}\left(\varphi_{1}\right), \operatorname{td}\left(\varphi_{2}\right)\right\}$. By inductive hypothesis, $p \models \varphi_{1}$ or $p \models \varphi_{2}$, which implies that $p \models \varphi_{1} \vee \varphi_{2}$.

Our next step is to associate a process $p_{\varphi}$ to each formula $\varphi$ given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$. Our intention is to prove that $p_{\varphi}$ is a process for which $\varphi$ is characteristic.

- Definition 95. Let $|A|=1$ and $\varphi$ be given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$. We define process $p_{\varphi}$ to be $p_{\varphi}=a^{\operatorname{td}(\varphi)}$, where $a^{0}=0$ and $a^{n+1}=a . a^{n}$.
- Proposition 96. Let $|A|=1$. Every $\varphi$ given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$ is characteristic within $\mathcal{L}_{S}$ for $p_{\varphi}$.

Proof. It suffices to show that for every $q, q \models \varphi$ iff $p_{\varphi} \lesssim S q$. This is true since $q \models \varphi \Leftrightarrow$ $q \xrightarrow{a^{i}} q^{\prime}$ for some $i, q^{\prime}$ such that $i \geq \operatorname{td}(\varphi) \Leftrightarrow p_{\varphi}=a^{\operatorname{td}(\varphi)} \lesssim_{S} q$.

- Corollary 97. Let $|A|=1$. Every formula given by the grammar $\varphi::=\mathbf{t t}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$ is characteristic within $\mathcal{L}_{S}$ for some $p$. Moreover, such a $p$ can be constructed in time linear in $|\varphi|$.

## C. 2 Primality in $\mathcal{L}_{C S}$

In this subsection we consider formulae in $\mathcal{L}_{C S}$ that contain only consistent subformulae and examine the complexity of deciding whether such a formula is prime. We describe a preprocessing phase during which appropriate rules are applied on $\varphi$, so that the primality of the resulting formula $\varphi^{\prime}$ can give information on the primality of $\varphi$. Moreover, primality of $\varphi^{\prime}$ can be efficiently decided by an appropriate variant of algorithm Primes.

First, we make some observations about formulae in $\mathcal{L}_{C S}$ that will be used throughout this section. Let $\varphi \in \mathcal{L}_{C S}$ be a consistent formula that does not contain disjunctions and $\mathbf{t t}$. We associate a process $p_{\varphi}$ to $\varphi$ and prove that $\varphi$ is characteristic within $\mathcal{L}_{C S}$ for $p_{\varphi}$.

- Definition 98. Let $\varphi \in \mathcal{L}_{C S}$ be a formula given by the grammar $\varphi::=\mathbf{0}|\langle a\rangle \varphi| \varphi \wedge \varphi$. We define process $p_{\varphi}$ inductively as follows.
- If $\varphi=\mathbf{0}$, then $p_{\varphi}=0$.
- If $\varphi=\langle a\rangle \varphi^{\prime}$, then $p_{\varphi}=a . p_{\varphi^{\prime}}$.
- If $\varphi=\varphi_{1} \wedge \varphi_{2}$, then $p_{\varphi}=p_{\varphi_{1}}+p_{\varphi_{2}}$.
- Lemma 99. Let $\varphi \in \mathcal{L}_{C S}$ be a consistent formula given by the grammar $\varphi::=\mathbf{0}|\langle a\rangle \varphi| \varphi \wedge \varphi$. Then, $\varphi$ is prime. In particular, $\varphi$ is characteristic within $\mathcal{L}_{C S}$ for $p_{\varphi}$.

Proof. The proof is analogous to the proof of Lemma 77, where we also use the fact that $\varphi$ is consistent.

As a corollary, in the case of complete simulation, all formulae that do not contain disjunctions and $\mathbf{t t}$ are prime.

- Corollary 100. Let $\varphi \in \mathcal{L}_{C S}$ be given by the grammar $\varphi::=\mathbf{f f}|\mathbf{0}| \varphi \wedge \varphi \mid\langle a\rangle \varphi$. Then, $\varphi$ is prime.

Let $\varphi$ be given by the grammar $\varphi::=\mathbf{0}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$ and $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. Propositions 101 and 104, Lemma 102 and Corollaries 103 and 105 are variants of Propositions 79 and 84, Lemma 81 and Corollaries 83 and 85, respectively, that hold in the case of complete simulation. Their proofs are completely analogous to those for their respective statements in Subsection C.1, where we also need that every $\varphi_{i}$ is prime from Corollary 100, and every consistent $\varphi_{i}$ is characteristic within $\mathcal{L}_{C S}$ for $p_{\varphi_{i}}$ from Lemma 99.

- Proposition 101. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{0}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. Then, $\varphi$ is prime iff $\varphi \models \varphi_{j}$ for some $1 \leq j \leq k$.
- Lemma 102. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{0}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$ such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. If for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}$, $1 \leq i, j \leq k$, there is some process $q$ such that $q \lesssim_{C S} p_{\varphi_{i}}, q \lesssim_{C S} p_{\varphi_{j}}$, and $q \models \varphi$, then there is some process $q$ such that $q \lesssim C S p_{\varphi_{i}}$ for every $1 \leq i \leq k$, and $q \models \varphi$.

Corollary 103. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{0}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$ such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. If for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}$, $1 \leq i, j \leq k$, there is some process $q$ such that $q \lesssim_{C S} p_{\varphi_{i}}, q \lesssim_{C S} p_{\varphi_{j}}$, and $q \models \varphi$, then there is some $1 \leq m \leq k$, such that $p_{\varphi_{m}} \lesssim_{C S} p_{\varphi_{i}}$ for every $1 \leq i \leq k$.

- Proposition 104. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{0}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$ such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. Then, $\varphi$ is prime iff for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}, 1 \leq i, j \leq k$, there is some process $q$ such that $q \lesssim_{C S} p_{\varphi_{i}}, q \lesssim_{C S} p_{\varphi_{j}}$, and $q \models \varphi$.
- Corollary 105. Let $\varphi$ be given by the grammar $\varphi::=\mathbf{0}|\langle a\rangle \varphi| \varphi \wedge \varphi \mid \varphi \vee \varphi$ such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in DNF. Then, $\varphi$ is prime iff for every pair $\varphi_{i}, \varphi_{j}$ there is some $1 \leq m \leq k$ such that $\varphi_{i} \models \varphi_{m}$ and $\varphi_{j} \models \varphi_{m}$.

Let $\varphi \in \mathcal{L}_{C S}$ be a formula such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent. We transform $\varphi$ into a formula that we denote by $\varphi^{\diamond}$, such that in case $\varphi$ is prime, $\varphi^{\diamond} \equiv \varphi, \varphi^{\diamond}$ is prime, and primality of $\varphi^{\diamond}$ can be efficiently checked. To this end, we apply a set of rules on $\varphi$. First, we consider the following rewriting rules: $\mathbf{t t} \wedge \psi \rightarrow_{\mathrm{tt}} \psi$ and $\mathbf{t t} \vee \psi \rightarrow_{\mathrm{tt}}$ tt modulo commutativity -i.e. we also consider the rules $\psi \wedge \mathbf{t t} \rightarrow_{\mathrm{tt}} \psi$ and $\psi \vee \mathbf{t t} \rightarrow_{\mathrm{tt}} \mathbf{t t}$. We write $\varphi \rightarrow_{\mathrm{tt}}^{s u b} \varphi^{\prime}$ if $\varphi^{\prime}=\varphi\left[\psi / \psi^{\prime}\right]$, where $\psi \rightarrow_{\mathrm{tt}} \psi^{\prime}$ for some $\psi \in \operatorname{Sub}(\varphi)$, and $\varphi \rightarrow_{\mathrm{tt}}^{s u b^{*}} \varphi^{\prime}$ to denote that there is a sequence $\varphi \rightarrow_{\mathrm{tt}}^{s u b} \varphi_{1} \cdots \rightarrow_{\mathrm{tt}}^{s u b} \varphi^{\prime}$ and there is no $\varphi^{\prime \prime}$ such that $\varphi^{\prime} \rightarrow_{\mathrm{tt}}^{s u b} \varphi^{\prime \prime}$.

- Lemma 106. Let $\varphi \in \mathcal{L}_{C S}$ and $\varphi \rightarrow_{{ }_{\mathrm{tt}}^{s u b}} \varphi^{t t}$. Then, $\varphi^{t t}$ is unique, can be computed in polynomial time, and $\varphi^{t t} \equiv \varphi$.
- Lemma 107. Let $\varphi \in \mathcal{L}_{C S}$ and $\varphi \rightarrow_{\mathrm{tt}}^{s u b^{*}} \varphi^{t t}$. If $\varphi$ is not a tautology and $\mathbf{t t} \in \operatorname{Sub}\left(\varphi^{t t}\right)$, then every occurrence of $\mathbf{t t}$ is in the scope of some $\langle a\rangle$.

Assume that we have a formula $\varphi \in \mathcal{L}_{C S}$, such that for every $\psi \in \operatorname{Sub}(\varphi), \psi$ is consistent and if $\psi=\mathbf{t t}$, then $\psi$ occurs only in the scope of some $\langle a\rangle$. We consider the following rewriting rules modulo commutativity and associativity:

1. $\mathbf{0} \vee \mathbf{0} \rightarrow_{0} \mathbf{0}$,
2. $\mathbf{0} \wedge \varphi \rightarrow_{0} \mathbf{0}$,
3. $\left(\mathbf{0} \vee \varphi_{1}\right) \wedge \varphi_{2} \rightarrow_{0} \varphi_{1} \wedge \varphi_{2}$, where $\varphi_{2} \neq \mathbf{0}$ and $\varphi_{2} \neq \mathbf{0} \vee \varphi_{2}^{\prime}$,
4. $\left(\mathbf{0} \vee \varphi_{1}\right) \wedge\left(\mathbf{0} \vee \varphi_{2}\right) \rightarrow_{0} \mathbf{0} \vee\left(\varphi_{1} \wedge \varphi_{2}\right)$.

Note that the following rules can be derived:
5. $\mathbf{0} \vee(\mathbf{0} \vee \varphi) \rightarrow_{0} \mathbf{0} \vee \varphi$ from rule 1 and associativity,
6. $\left(\mathbf{0} \vee \varphi_{1}\right) \vee \varphi_{2} \rightarrow_{0} \mathbf{0} \vee\left(\varphi_{1} \vee \varphi_{2}\right)$ from associativity, and
7. $\left(\mathbf{0} \vee \varphi_{1}\right) \vee\left(\mathbf{0} \vee \varphi_{2}\right) \rightarrow_{0} \mathbf{0} \vee\left(\varphi_{1} \vee \varphi_{2}\right)$ from rule 1, commutativity, and associativity.

We apply these rules on a formula $\varphi$ from the innermost to the outermost subformulae. Formally, we write $\varphi \rightarrow_{0}^{\text {sub }} \varphi^{\prime}$ if $\varphi^{\prime}=\varphi\left[\psi / \psi^{\prime}\right]$, where $\psi \rightarrow_{0} \psi^{\prime}$ for some $\psi \in \operatorname{Sub}(\varphi)$ and there is no $\psi^{\prime \prime} \in \operatorname{Sub}(\psi)$ on which a rule can be applied. For every $\varphi \in \mathcal{L}_{C S}$, if there is no $\varphi^{\prime}$ such that $\varphi \rightarrow_{0}^{\text {sub }} \varphi^{\prime}$, we say that $\varphi$ is in zero normal form. We write $\varphi \rightarrow_{0}^{\text {sub }}{ }^{*} \varphi^{\prime}$ if there is a (possibly empty) sequence $\varphi \rightarrow_{0}^{s u b} \varphi_{1} \cdots \rightarrow_{0}^{s u b} \varphi^{\prime}$, and $\varphi^{\prime}$ is in zero normal form.

- Lemma 108. Let $\varphi \in \mathcal{L}_{C S}$ and $\varphi \rightarrow_{0}^{\text {sub }}{ }^{*} \varphi^{0}$. Then, $\varphi^{0}$ is unique and can be computed in polynomial time.
- Lemma 109. Let $\varphi \in \mathcal{L}_{C S}$ such that for every $\psi \in \operatorname{Sub}(\varphi), \psi$ is consistent and if $\psi=\mathbf{t t}$, then $\psi$ occurs in the scope of some $\langle a\rangle$; let also $\varphi \rightarrow_{0}^{s u b^{*}} \varphi^{0}$. Then, (a) $\varphi \equiv \varphi^{0}$ and (b) $\mathbf{0} \models \varphi$ iff either $\varphi^{0}=\mathbf{0}$ or $\varphi^{0}=\mathbf{0} \vee \varphi^{\prime}$, where $\mathbf{0} \not \vDash \varphi^{\prime}$.

Proof. Let $\varphi \rightarrow_{0}^{\text {sub }} \varphi^{\prime}$, where $\varphi^{\prime}=\varphi\left[\psi / \psi^{\prime}\right]$ and every $\psi^{\prime \prime} \in \operatorname{Sub}(\psi)$ is in zero normal form. It suffices to show that $\psi \equiv \psi^{\prime}$. Then, from Lemma $46, \varphi \equiv \varphi^{\prime}$. We prove by mutual induction that (i) $\psi \equiv \psi^{\prime}$ and (ii) for every $\phi \in \varphi$ such that $\mathbf{0} \models \phi$, either $\phi \rightarrow_{0}^{s u b^{*}} \mathbf{0}$ or $\phi \rightarrow_{0}^{s u b^{*}} \mathbf{0} \vee \phi^{\prime}$, where $\mathbf{0} \not \models \phi^{\prime}$. For part (i), the only interesting cases are the following two.
$\psi=0 \wedge \psi^{\prime \prime}$. In this case $\psi \rightarrow_{0} \mathbf{0}$. Note that since $\mathbf{0} \wedge \psi^{\prime \prime}$ is consistent, there is $p$ such that $p \models \mathbf{0} \wedge \psi^{\prime \prime}$, which is equivalent to $p \models \mathbf{0}$ and $p \models \psi^{\prime \prime}$. Since 0 is the only process satisfying $\mathbf{0}, 0$ is also the only process satisfying both $\mathbf{0}$ and $\psi^{\prime \prime}$, which means that $\psi \equiv \mathbf{0}$ and (i) holds.
$\psi=\left(0 \vee \psi_{1}\right) \wedge \psi_{2}$, where $\psi_{2} \neq \mathbf{0}$ and $\psi_{2} \neq \mathbf{0} \vee \psi_{2}^{\prime}$. In this case, $\psi \rightarrow_{0} \psi_{1} \wedge \psi_{2}$. Since $\psi_{2}$ is in zero normal form, from inductive hypothesis of (ii), $\mathbf{0} \not \vDash \psi_{2}$. Let $p$ be a process such that $p \models \psi$. It holds that $p \models\left(\mathbf{0} \vee \psi_{1}\right) \wedge \psi_{2}$ iff $\left(p \models \mathbf{0}\right.$ or $\left.p \models \psi_{1}\right)$ and $p \models \psi_{2}$ iff $(p \models \mathbf{0}$ and $p \models \psi_{2}$ ) or ( $p \models \psi_{1}$ and $p \models \psi_{2}$ ). Since $\mathbf{0} \not \models \psi_{2},\left(p \models \mathbf{0}\right.$ and $\left.p \models \psi_{2}\right)$ is not true. Thus, we have that $\left(p \models \psi_{1}\right.$ and $\left.p \models \psi_{2}\right)$, and $\psi \models \psi_{1} \wedge \psi_{2}$. Since $\psi_{1} \wedge \psi_{2} \models\left(\mathbf{0} \vee \psi_{1}\right) \wedge \psi_{2}$ is also true, $\psi \equiv \psi_{1} \wedge \psi_{2}$ holds.
To prove part (ii), let $\phi \in \operatorname{Sub}(\varphi)$ such that $\mathbf{0} \models \phi$. Note that $\phi$ cannot be tt. Therefore, $\phi$ can have one of the following forms.
$\phi=0$. Trivial.
$\phi=\phi_{1} \vee \phi_{2}$, where $\mathbf{0} \models \phi_{i}$ for some $i=1,2$. Assume that w.l.o.g. $\mathbf{0} \models \phi_{1}$ and $\mathbf{0} \not \models \phi_{2}$. Let $\phi_{2} \rightarrow_{0}^{s u b^{*}} \phi_{2}^{\prime}$. From inductive hypothesis of (i) and Lemma $46, \phi_{2} \equiv \phi_{2}^{\prime}$ and so $\mathbf{0} \not \models \phi_{2}^{\prime}$. From inductive hypothesis, either $\phi_{1} \rightarrow_{0}^{\text {sub }} \mathbf{0}$ or $\phi_{1} \rightarrow_{0}^{s u b^{*}} \mathbf{0} \vee \phi_{1}^{\prime}$, where $\mathbf{0} \not \models \phi_{1}^{\prime}$. Thus, there is either a sequence $\phi_{1} \vee \phi_{2} \rightarrow_{0}^{s u b} \ldots \rightarrow_{0}^{s u b} \mathbf{0} \vee \phi_{2}^{\prime}$, where $\mathbf{0} \not \vDash \phi_{2}^{\prime}$, or $\phi_{1} \vee \phi_{2} \rightarrow_{0}^{s u b} \ldots \rightarrow_{0}^{s u b}\left(\mathbf{0} \vee \phi_{1}^{\prime}\right) \vee \phi_{2}^{\prime} \rightarrow_{0} \mathbf{0} \vee\left(\phi_{1}^{\prime} \vee \phi_{2}^{\prime}\right)$, where $\mathbf{0} \not \vDash \phi_{1}^{\prime} \vee \phi_{2}^{\prime}$, respectively. If $\mathbf{0} \models \phi_{1}$ and $\mathbf{0} \models \phi_{2}$, the proof is analogous.
$\phi=\phi_{1} \wedge \phi_{2}$, where $\mathbf{0} \models \phi_{i}$ for both $i=1,2$. From inductive hypothesis, for both $i=1,2$, either $\phi_{i} \rightarrow_{0}^{s u b^{*}} \mathbf{0}$ or $\phi_{i} \rightarrow_{0}^{s u b^{*}} \mathbf{0} \vee \phi_{i}^{\prime}$, where $\mathbf{0} \not \vDash \phi_{i}^{\prime}$. Assume that for both $i=1,2$, $\phi_{i} \rightarrow_{0}^{s u b^{*}} \mathbf{0} \vee \phi_{i}^{\prime}$, where $\mathbf{0} \not \models \phi_{i}^{\prime}$. Then, there is a sequence $\phi_{1} \wedge \phi_{2} \rightarrow_{0}^{s u b} \ldots \rightarrow_{0}^{s u b}$ $\left(\mathbf{0} \vee \phi_{1}^{\prime}\right) \wedge\left(\mathbf{0} \vee \phi_{2}^{\prime}\right) \rightarrow_{0} \mathbf{0} \vee\left(\phi_{1}^{\prime} \wedge \phi_{2}^{\prime}\right)$, where $\mathbf{0} \not \models \phi_{1}^{\prime} \wedge \phi_{2}^{\prime}$. The other cases can be similarly proven.
Let $\varphi=\varphi_{1} \rightarrow_{0}^{\text {sub }} \ldots \rightarrow_{0}^{\text {sub }} \varphi_{n}=\varphi^{0}$. From (i), for every $1 \leq i \leq n-1, \varphi_{i} \equiv \varphi_{i+1}$, and so it holds that $\varphi \equiv \varphi^{0}$. Part (ii) proven above implies that if $\mathbf{0} \models \varphi$, then either $\varphi^{0}=\mathbf{0}$ or $\varphi^{0}=\mathbf{0} \vee \varphi^{\prime}$, where $\mathbf{0} \not \models \varphi^{\prime}$. Conversely, if $\varphi^{0}=\mathbf{0}$ or $\varphi^{0}=\mathbf{0} \vee \varphi^{\prime}$, then $\mathbf{0} \models \varphi^{0}$ is immediate. From (a), $\mathbf{0} \models \varphi$ holds as well. Consequently, $\mathbf{0} \models \varphi$ iff $\varphi^{0}=\mathbf{0}$ or $\varphi^{0}=\mathbf{0} \vee \varphi^{\prime}$, where $\mathbf{0} \not \models \varphi^{\prime}$.

Remark 110. Note that since we follow an innermost reduction strategy, when we apply a rule on $\left(\mathbf{0} \vee \varphi_{1}\right) \wedge \varphi_{2}, \varphi_{2}$ is already in zero normal form. If $\mathbf{0} \models \varphi_{2}$, Lemma 109 guarantees that either $\varphi_{2}=\mathbf{0}$ or $\varphi_{2}=\mathbf{0} \vee \varphi_{2}^{\prime}$, where $\mathbf{0} \not \vDash \varphi_{2}^{\prime}$, and so either rule 2 or rule 4 is applied, respectively. Otherwise, if $\mathbf{0} \not \vDash \varphi_{2}$, rule 3 is applied. An alternative way to check whether rule 3 is to be applied on $\left(\mathbf{0} \vee \varphi_{1}\right) \wedge \varphi_{2}$ is to compute $J\left(\varphi_{2}\right)$ and check that $\emptyset \notin J\left(\varphi_{2}\right)$, which from Claims 1 and 4 in the proof of Lemma 61 , is equivalent to $\mathbf{0} \not \models \varphi_{2}$.

Lemma 75 takes the following form in the case of complete simulation.

- Lemma 111. Let $\varphi_{1} \wedge \varphi_{2} \in \mathcal{L}_{C S}$ such that for every $\psi \in \operatorname{Sub}\left(\varphi_{1} \wedge \varphi_{2}\right), \psi$ is consistent, if $\psi=\mathbf{t t}$, then $\mathbf{t t}$ occurs in the scope of some $\langle a\rangle$, and $\psi$ is in zero normal form. Then, $\varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi$ iff $\varphi_{1} \models\langle a\rangle \psi$ or $\varphi_{2} \models\langle a\rangle \psi$.

Proof. $(\Leftarrow)$ If $\varphi_{1} \models\langle a\rangle \psi$ or $\varphi_{2} \models\langle a\rangle \psi$, then $\varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi$ immediately holds. $(\Rightarrow)$ Let $\varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi$. We distinguish between the following cases.
$0 \not \models \varphi_{1}$ and $0 \not \vDash \varphi_{2}$. Assume that $\varphi_{1} \not \models\langle a\rangle \psi$. Then, there is $p_{1} \neq 0$ such that $p_{1} \models \varphi_{1}$ and $p_{1} \not \models\langle a\rangle \psi$. Let $p_{2} \models \varphi_{2}$. Since $\varphi_{2}$ is consistent there is such a process $p_{2}$ and $p_{2} \neq 0$ because of $\mathbf{0} \not \models \varphi_{2}$. The fact that $p_{1}, p_{2} \neq 0$ implies that $p_{1} \lesssim_{C S} p_{1}+p_{2}$ and $p_{2} \lesssim C S p_{1}+p_{2}$. From Proposition $6, p_{1}+p_{2} \models \varphi_{1} \wedge \varphi_{2}$, and so $p_{1}+p_{2} \xrightarrow{a} p^{\prime}$ such that $p^{\prime} \models \psi$. Thus, either $p_{1} \xrightarrow{a} p^{\prime}$ or $p_{2} \xrightarrow{a} p^{\prime}$. Since $p_{1} \not \models\langle a\rangle \psi$, it holds that $p_{2} \xrightarrow{a} p^{\prime}$. As a result, $\varphi_{2} \models\langle a\rangle \psi$.
$\mathbf{0} \models \varphi_{1}$ and $\mathbf{0} \models \varphi_{2}$. Then, $\mathbf{0} \models \varphi_{1} \wedge \varphi_{2}$ and $\mathbf{0} \not \models\langle a\rangle \psi$, which contradicts our assumption that $\varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi$. This case is therefore not possible.
W.I.o.g. $0 \models \varphi_{1}$ and $0 \not \models \varphi_{2}$. Since $\varphi_{1}$ is in zero normal form, from Lemma 109, $\varphi_{1}=\mathbf{0}$ or $\varphi_{1}=\mathbf{0} \vee \varphi_{1}^{\prime}$, where $\mathbf{0} \not \models \varphi_{1}^{\prime}$. Then, either $\varphi_{1} \wedge \varphi_{2}=\mathbf{0} \wedge \varphi_{2}$ or $\varphi_{1} \wedge \varphi_{2}=\left(\mathbf{0} \vee \varphi_{1}^{\prime}\right) \wedge \varphi_{2}$, respectively, which implies that either $\varphi_{1} \wedge \varphi_{2}$ is inconsistent, since $\mathbf{0} \not \vDash \varphi_{2}$, or $\varphi_{1} \wedge \varphi_{2} \rightarrow_{0}$ $\varphi_{1}^{\prime} \wedge \varphi_{2}$, since $\varphi_{2} \neq \mathbf{0}$ and $\varphi_{2} \neq \mathbf{0} \vee \varphi_{2}^{\prime}$. The former case contradicts the consistency of $\varphi_{1} \wedge \varphi_{2}$ and the latter case contradicts the fact that $\varphi_{1} \wedge \varphi_{2}$ is in zero normal form. So this case is not possible either.

- Lemma 112. Let $\varphi \in \mathcal{L}_{C S}$ be in zero normal form and for every $\psi \in \operatorname{Sub}(\varphi), \psi$ is consistent, and if $\psi=\mathbf{t t}$, then $\mathbf{t t}$ occurs in the scope of some $\langle a\rangle$; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be $\varphi$ in $D N F$. Then, $\varphi_{i}$ is consistent for every $1 \leq i \leq k$.
Proof. Consider Algorithm 1 that takes $\varphi$ and returns $\varphi$ in DNF. We prove the lemma by induction on the structure of $\varphi$.
$\varphi$ does not contain disjunctions. Trivial.
$\varphi=\varphi_{1} \vee \varphi_{2}$. The DNF of $\varphi$ is $\varphi_{1}^{\prime} \vee \varphi_{2}^{\prime}$, where $\varphi_{i}^{\prime}$ is the DNF of $\varphi_{i}$ for both $i=1,2$. By the inductive hyppothesis, the claim is true for $\varphi_{i}, i=1,2$, and so the lemma immediately holds for $\varphi$.
$\varphi=\langle a\rangle \varphi^{\prime}$. The DNF of $\varphi$ is $\bigvee_{i=1}^{k}\langle a\rangle \varphi_{i}^{\prime}$, where $\bigvee_{i=1}^{k} \varphi_{i}^{\prime}$ is the DNF of $\varphi^{\prime}$. Formula $\varphi^{\prime}$ satisfies the hypothesis of the lemma, and so from inductive hypothesis, every $\varphi_{i}^{\prime}$ is consistent, which implies that every $\langle a\rangle \varphi_{i}^{\prime}$ is also consistent.
$\varphi=\varphi_{1} \wedge\left(\varphi_{2} \vee \varphi_{3}\right)$. The DNF of $\varphi$ is $\bigvee_{i=1}^{k_{1}} \varphi_{12}^{i} \vee \bigvee_{i=1}^{k_{2}} \varphi_{13}^{i}$, where $\bigvee_{i=1}^{k_{1}} \varphi_{12}^{i}, \bigvee_{i=1}^{k_{2}} \varphi_{13}^{i}$ are the DNFs of $\varphi_{1} \wedge \varphi_{2}$ and $\varphi_{1} \wedge \varphi_{3}$, respectively. We show that, for both $j=2,3$, the formula $\varphi_{1} \wedge \varphi_{j}$ satisfies the hypothesis of the lemma. Suppose w.l.o.g. that $\varphi_{1} \wedge \varphi_{2}$ is not consistent. Since $\varphi_{1}, \varphi_{2}$ are consistent, we have that w.l.o.g. $0 \models \varphi_{1}$ and $0 \not \vDash \varphi_{2}$. Then, $0 \models \varphi_{3}$ holds, since otherwise, $\varphi$ is inconsistent. Then, either $\varphi_{1}=\mathbf{0}$ or $\varphi_{1}=\mathbf{0} \vee \varphi_{1}^{\prime}$, where $\mathbf{0} \not \vDash \varphi_{1}^{\prime}, \varphi_{2} \neq \mathbf{0}$ and $\varphi_{2} \neq \mathbf{0} \vee \varphi_{j}^{\prime}$, and either $\varphi_{3}=\mathbf{0}$ or $\varphi_{3}=\mathbf{0} \vee \varphi_{3}^{\prime}$, where $\mathbf{0} \not \vDash \varphi_{3}^{\prime}$, because of Lemma 109 and the fact that $\varphi_{1}, \varphi_{2}$, and $\varphi_{3}$ are in zero normal form. Any combination of these forms leads to contradiction. For example, assume that $\varphi_{1}=\mathbf{0} \vee \varphi_{1}^{\prime}$ and $\varphi_{3}=\mathbf{0} \vee \varphi_{3}^{\prime}$. Then, $\varphi=\left(\mathbf{0} \vee \varphi_{1}^{\prime}\right) \wedge\left(\varphi_{2} \vee\left(\mathbf{0} \vee \varphi_{3}^{\prime}\right)\right) \rightarrow_{0}^{s u b^{*}} \mathbf{0} \vee\left(\varphi^{\prime} \wedge \varphi_{2} \wedge \varphi_{3}^{\prime}\right)$, which contradicts the fact that $\varphi$ is in zero normal form. Every other case can be addressed in a similar way and proven to lead to contradiction. Consequently, every $\psi \in \operatorname{Sub}\left(\varphi_{1} \wedge \varphi_{j}\right)$ is either a subformula of some $\varphi_{i}, i \in\{1,2,3\}$, or $\varphi_{1} \wedge \varphi_{j}$, and so $\psi$ is consistent. The other parts of the hypothesis of the lemma immediately hold for both $\varphi_{1} \wedge \varphi_{j}$, where $j=2,3$. From inductive hypothesis, for every $1 \leq n \leq k_{1}$ and $1 \leq m \leq k_{2}, \varphi_{12}^{m}$ and $\varphi_{13}^{n}$ are consistent. This implies that every $\varphi_{i}, 1 \leq i \leq k$, is consistent.

Finally, we consider the rule $\langle a\rangle \mathbf{t t} \rightarrow_{\diamond} \mathbf{t t}$ and rules $\mathbf{t t} \vee \psi \rightarrow_{\mathrm{tt}} \mathbf{t t}$, $\mathbf{t t} \wedge \psi \rightarrow_{\mathrm{tt}} \psi$ modulo commutativity. As before, we write $\varphi \rightarrow_{\diamond}^{s u b} \varphi^{\prime}$ if $\varphi^{\prime}=\varphi\left[\psi / \psi^{\prime}\right]$, where $\psi \rightarrow_{\diamond} \psi^{\prime}$ or $\psi \rightarrow_{\mathrm{tt}} \psi^{\prime}$ for some $\psi \in \operatorname{Sub}(\varphi)$, and $\varphi \rightarrow_{\diamond}^{s u b^{*}} \varphi^{\prime}$ to denote that there is a sequence $\varphi \rightarrow_{\diamond}^{s u b} \varphi_{1} \cdots \rightarrow_{\diamond}^{s u b} \varphi^{\prime}$ and there is no $\varphi^{\prime \prime}$ such that $\varphi^{\prime} \rightarrow{ }_{\diamond}^{\text {sub }} \varphi^{\prime \prime}$.

- Lemma 113. Let $\varphi \in \mathcal{L}_{C S}$ be consistent and $\varphi \rightarrow_{\diamond}^{\text {sub }}{ }^{*} \varphi^{\diamond}$. Then, $\varphi^{\triangleright}$ is unique and can be computed in polynomial time.
- Lemma 114. Let $\varphi \in \mathcal{L}_{C S}$ be consistent and $\varphi \rightarrow_{\diamond}^{s u b^{*}} \varphi^{\diamond}$. Then, either $\mathbf{t t} \notin \operatorname{Sub}\left(\varphi^{\diamond}\right)$ or $\varphi^{\diamond}=\mathrm{tt}$.

Proof. Immediate from the definition of $\varphi \rightarrow_{\diamond}^{s u b^{*}} \varphi^{\diamond}$.
We prove Lemma 117, which is one of the main results of this subsection. We first provide some definitions and statements needed in its proof.

- Definition 115. Let $\varphi \in \mathcal{L}_{C S}$ be a formula given by the grammar $\varphi::=\mathbf{0}|\mathbf{t t}| \varphi \wedge \varphi \mid\langle a\rangle \varphi$. We define process $p_{\varphi}$ inductively as follows.
- If either $\varphi=\mathbf{0}$ or $\varphi=\mathbf{t t}$, then $p_{\varphi}=0$.
- If $\varphi=\langle a\rangle \varphi^{\prime}$, then $p_{\varphi}=a . p_{\varphi^{\prime}}$.
- If $\varphi=\varphi_{1} \wedge \varphi_{2}$, then $p_{\varphi}=p_{\varphi_{1}}+p_{\varphi_{2}}$.
- Lemma 116. Let $\varphi \in \mathcal{L}_{C S}$ be a consistent formula given by the grammar $\varphi::=\mathbf{0}|\mathbf{t t}| \varphi \wedge$ $\varphi \mid\langle a\rangle \varphi$. Then, $p_{\varphi} \models \varphi$.

Proof. We prove the lemma by structural induction on $\varphi$ and limit ourselves to presenting the case when $\varphi=\varphi_{1} \wedge \varphi_{2}$. In the remainder of our argument, we will use the following claim, which can be easily shown by induction on the structure of formulae:

Let $\varphi \in \mathcal{L}_{C S}$ be a consistent formula given by the grammar $\varphi::=\mathbf{0}|\mathbf{t t}| \varphi \wedge \varphi \mid\langle a\rangle \varphi$. Then, $0 \models \varphi$ iff $\varphi \equiv \mathbf{0}$ or $\varphi \equiv \mathbf{t t}$.

Our goal is to show that $p_{\varphi}=p_{\varphi_{1}}+p_{\varphi_{2}} \models \varphi_{1} \wedge \varphi_{2}=\varphi$.
By the inductive hypothesis, we have that $p_{\varphi_{1}} \models \varphi_{1}$ and $p_{\varphi_{2}} \models \varphi_{2}$. We now proceed by considering the following cases:

1. Neither $p_{\varphi_{1}}$ nor $p_{\varphi_{2}}$ is equivalent to 0 ,
2. Both $p_{\varphi_{1}}$ and $p_{\varphi_{2}}$ are equivalent to 0 , and
3. W.l.o.g. $p_{\varphi_{1}}$ is equivalent to 0 and $p_{\varphi_{2}}$ is not.

In the first case, $p_{\varphi_{i}} \lesssim C S p_{\varphi_{1}}+p_{\varphi_{2}}$, for $i=1,2$. Therefore, by Proposition 6, $p_{\varphi_{1}}+p_{\varphi_{2}} \models$ $\varphi_{1} \wedge \varphi_{2}$ and we are done.

In the second case, observe, first of all, that $p_{\varphi_{1}}+p_{\varphi_{2}}$ is equivalent to 0 . By the aforementioned claim, we infer that $\varphi_{i} \equiv \mathbf{0}$ or $\varphi_{i} \equiv \mathbf{t t}$, for $i=1,2$. Thus, $\varphi_{1} \wedge \varphi_{2} \equiv \mathbf{0}$ or $\varphi_{1} \wedge \varphi_{2} \equiv \mathbf{t t}$. In both cases, $p_{\varphi_{1}}+p_{\varphi_{2}} \models \varphi_{1} \wedge \varphi_{2}$ and we are done.

In the third case, we use the aforementioned claim to infer that $\varphi_{1} \equiv \mathbf{0}$ or $\varphi_{1} \equiv \mathbf{t t}$. Moreover, $p_{\varphi_{1}}+p_{\varphi_{2}}$ is equivalent to $p_{\varphi_{2}}$. Since $p_{\varphi_{2}}$ is not equivalent to 0 , the formula $\varphi_{1} \wedge \varphi_{2}$ is consistent and $p_{\varphi_{2}} \vDash \varphi_{2}$, it follows that $\varphi_{1} \equiv \mathbf{t t}$. Thus, $\varphi_{1} \wedge \varphi_{2} \equiv \varphi_{2}$. Since $p_{\varphi_{2}} \lesssim C S p_{\varphi_{1}}+p_{\varphi_{2}}$, by Proposition 6, $p_{\varphi_{1}}+p_{\varphi_{2}} \models \varphi_{2} \equiv \varphi_{1} \wedge \varphi_{2}$ and we are done.

- Lemma 117. Let $\varphi \in \mathcal{L}_{C S}$ be in zero normal form and for every $\psi \in \operatorname{Sub}(\varphi), \psi$ is consistent, and if $\psi=\mathbf{t t}$, then $\mathbf{t t}$ occurs in the scope of some $\langle a\rangle$; let also $\varphi \rightarrow_{\diamond}^{s u b^{*}} \varphi^{\diamond}$. Then, $\varphi$ is prime iff $\varphi^{\diamond} \models \varphi$ and $\varphi^{\diamond}$ is prime.

Proof. $(\Leftarrow)$ Let $\varphi^{\diamond} \models \varphi$ and $\varphi^{\diamond}$ be prime. It holds that $\langle a\rangle \mathbf{t t} \models \mathbf{t t}$, $\mathbf{t t} \wedge \psi \models \psi$, and $\mathbf{t t} \vee \psi \models \mathbf{t t}$, for every $\psi \in \mathcal{L}_{C S}$. Thus, from Lemma 46 and the definition of $\varphi^{\diamond}, \varphi \models \varphi^{\diamond}$. As a result $\varphi \equiv \varphi^{\diamond}$ and so $\varphi$ is prime.
$(\Rightarrow)$ Assume that $\varphi$ is prime. As we just showed, $\varphi \models \varphi^{\triangleright}$. Thus, it suffices to show that $\varphi^{\diamond} \models \varphi$. Then, we have that $\varphi \equiv \varphi^{\diamond}$ and $\varphi^{\diamond}$ is prime. The proof of $\varphi^{\diamond} \models \varphi$ is by induction on the type of the rules $\psi \rightarrow_{\diamond}^{s u b} \psi^{\prime}$.

- Let $\varphi^{\diamond}$ be the result of substituting only one occurrence of $\langle a\rangle \mathbf{t t}$ with $\mathbf{t t}$ in $\varphi$, and $p \models \varphi^{\diamond}$; let also $\bigvee_{i=1}^{k} \varphi_{i}^{\diamond}$ and $\bigvee_{i=1}^{k^{\prime}} \varphi_{i}$ be the DNFs of $\varphi^{\diamond}$ and $\varphi$, respectively. It holds that $p \models \varphi_{i}^{\diamond}$ for some $1 \leq i \leq k$. Formula $\varphi$ is consistent and prime, so from Proposition 9 there is a process $p_{\min }$ for which $\varphi$ is characteristic. We prove that $p_{\min } \lesssim_{C S} p$, which combined with Corollary 37 implies that $p \models \varphi$. If $\varphi_{i}^{\diamond}=\varphi_{j}$ for some $1 \leq j \leq k^{\prime}$, then $p \models \varphi$. Otherwise, $\varphi_{i}^{\diamond}$ coincides with $\varphi_{j}$ for some $1 \leq j \leq k^{\prime}$, where an occurrence of $\langle a\rangle$ tt has been substituted with $\mathbf{t t}$. Consider the process $p_{\varphi_{i}^{\diamond}}$ constructed from $\varphi_{i}^{\diamond}$ according to Definition 115, so that $p_{\varphi_{i}^{\diamond}} \models \varphi_{i}^{\diamond}$ as stated in Lemma 116. The construction of $p_{\varphi_{i}^{\diamond}}$ implies that there is some $p_{t t}$ such that $p_{\varphi_{i}^{\diamond}} \xrightarrow{t} p_{t t}, p_{t t}=0$ and $t \in A^{*}$, and $p_{t t}$ corresponds to subformula $\mathbf{t t}$ that substituted $\langle a\rangle \mathbf{t t}$ in $\varphi$. Define process $p_{\varphi_{i}^{\diamond}}^{1}$ to be a copy of $p_{\varphi_{i}^{\diamond}}$ extended with $p_{t t}^{1} \xrightarrow{a} p_{1}=0$, and $p_{\varphi_{i}^{\circ}}^{2}$ to be a copy of $p_{\varphi_{i}^{\diamond}}$ extended with $p_{t t}^{2} \xrightarrow{a} p_{2} \xrightarrow{a} p_{3}=0$. From Lemma 112, $\varphi_{j}$ is consistent and note that $p_{\varphi_{i}^{\diamond}}^{1}$ is $p_{\varphi_{j}}$, which implies that $p_{\varphi_{i}^{\circ}}^{1} \models \varphi_{j}$ because of Lemma 116. Moreover, it immediately holds that $p_{\varphi_{i}^{\circ}}^{2} \models \varphi_{j}$ as well. Therefore, both $p_{\varphi_{i}^{\circ}}^{1}$ and $p_{\varphi_{i}^{\circ}}^{2}$ satisfy $\varphi$. This means that $p_{\min } \lesssim_{C S} p_{\varphi_{i}^{\circ}}^{i_{i}^{\circ}}$ for both $j=1,2$. Let $p_{\text {min }} \xrightarrow{t} q$ for some $t \in A^{*}$. Then, there are some $q_{j}, j=1,2$, such that $p_{\varphi_{i}^{\diamond}}^{j} \xrightarrow{t} q_{j}$ and $q \lesssim_{C S} q_{j}$.
- Assume that there is some $q$ such that $p_{\text {min }} \xrightarrow{t} q$ and $q \lesssim_{C S} p_{1}$. Thus, $q=p_{1}=0$. On the other hand, $q \lesssim_{C S} p_{2}$ does not hold, since $p_{2} \neq 0$. So there is $p^{\prime}$ such that $p_{\varphi_{i}^{\diamond}}^{2} \xrightarrow{t} p^{\prime}, p^{\prime} \neq p_{2}$ and $q \lesssim C S p^{\prime}$. Moreover, $p^{\prime} \neq p_{3}$, since $p_{\varphi_{i}^{\diamond}}^{2} \stackrel{t}{\rightarrow} p_{3}$. But then, $p^{\prime}$ is a copy of a process $p^{\prime \prime}$ such that $p_{\varphi_{i}} \xrightarrow{t} p^{\prime \prime}$ and $q \lesssim_{C S} p^{\prime \prime}$.
- Assume that there is some $q$ such that $p_{\text {min }} \xrightarrow{t} q$ and $q \lesssim_{C S} p^{\prime}$, where $p^{\prime} \neq p_{1}$. Similar arguments can show that there is some $p^{\prime \prime}$ such that $p_{\varphi_{i}} \xrightarrow{t} p^{\prime \prime}$ and $q \lesssim C S p^{\prime \prime}$.
As a result, $p_{\text {min }} \lesssim_{C S} p_{\varphi_{i}^{\diamond}}$. In a similar way, we can prove that $p_{\text {min }}$ is complete-simulated by any process that satisfies $\varphi_{i}^{\diamond}$, and so $p_{\text {min }} \lesssim_{C S} p$.
- Let $\varphi^{\diamond}=\varphi[\mathbf{t t} \wedge \psi / \psi]$. From Lemma 46 and the fact that $\varphi^{\diamond} \vDash \varphi$, as $\mathbf{t t} \wedge \psi \equiv \psi$.
- Let $\varphi^{\diamond}=\varphi[\mathbf{t t} \vee \psi / \mathbf{t t}]$. Similarly to the previous case, from Lemma 46 and the fact that $\varphi^{\diamond} \models \varphi$, since $\mathbf{t t} \vee \psi \equiv \mathbf{t t}$.
- Corollary 118. Let $\varphi \in \mathcal{L}_{C S}$ be a formula such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent; let also $\varphi \rightarrow_{\mathrm{tt}}^{s u b^{*}} \varphi^{t t} \rightarrow_{0}^{\text {sub* }} \varphi^{0} \rightarrow_{\diamond}^{s u b^{*}} \varphi^{\diamond}$. Then, every $\psi \in \operatorname{Sub}\left(\varphi^{\diamond}\right)$ is consistent and $\varphi$ is prime iff $\varphi^{\diamond} \models \varphi$ and $\varphi^{\diamond}$ is prime.

Proof. Let $\psi \in \operatorname{Sub}\left(\varphi^{t t}\right)$. Then, there is some $\psi^{\prime} \in \operatorname{Sub}(\varphi)$, such that $\psi^{\prime} \rightarrow_{\mathrm{tt}}^{s u b^{*}} \psi$, and so $\psi^{\prime} \models \psi$. This implies that $\psi$ is consistent. Analogously, we can show that every $\psi \in \operatorname{Sub}\left(\varphi^{\diamond}\right)$ is consistent. It holds that $\varphi \equiv \varphi^{t t} \equiv \varphi^{0}$ from Lemmas 106 and 109(a). Formula $\varphi^{0}$ satisfies the hypothesis of Lemma 117 and so $\varphi^{0}$ is prime iff $\varphi^{\diamond} \models \varphi^{0}$ and $\varphi^{\diamond}$ is prime. Combining the aforementioned facts, we have that $\varphi$ is prime iff $\varphi^{\diamond} \models \varphi$ and $\varphi^{\diamond}$ is prime.

- Corollary 119. Let $\varphi \in \mathcal{L}_{C S}$ be a formula such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent; let also $\varphi \rightarrow_{\mathrm{tt}}^{\text {sub }} \varphi^{t t} \rightarrow_{0}^{\text {sub }}{ }^{*} \varphi^{0} \rightarrow_{\diamond}^{\text {sub }}{ }^{*} \varphi^{\diamond}$ and $\bigvee_{i=1}^{k} \varphi_{i}^{\diamond}$ be $\varphi^{\diamond}$ in DNF. Then, $\varphi^{\diamond}$ is prime iff $\varphi^{\diamond} \models \varphi_{j}^{\diamond}$ for some $1 \leq j \leq k$, such that $\varphi_{j}^{\diamond} \neq \mathbf{t t}$.

Proof. Let $\varphi^{\diamond}$ be prime. By the definition of primality and the fact that $\varphi^{\diamond} \models \bigvee_{i=1}^{k} \varphi_{i}^{\diamond}$, we have that $\varphi^{\diamond} \models \varphi_{j}^{\diamond}$ for some $1 \leq j \leq k$. Suppose that $\varphi_{j}^{\diamond}=\mathbf{t t}$. Since $\mathbf{t t} \vee \psi, \psi \in \mathcal{L}_{C S}$, is not prime, $\bigvee_{i=1}^{k} \varphi_{i}^{\diamond}$ is also not prime. From Lemma $42, \varphi^{\diamond}$ is not prime, which contradicts our assumption. So $\varphi_{j}^{\diamond} \neq \mathbf{t t}$. Conversely, let $\varphi^{\diamond} \models \varphi_{j}^{\diamond}$ for some $1 \leq j \leq k$, such that $\varphi_{j}^{\diamond} \neq \mathbf{t t}$. From Lemma 114, $\varphi^{\diamond}$ and $\varphi_{j}^{\diamond}$ do not contain tt. To prove that $\varphi^{\diamond}$ is prime, let $\varphi^{\diamond} \models \bigvee_{l=1}^{m} \phi_{l}$.

From Lemmas 42 and $44, \varphi_{i}^{\diamond} \models \bigvee_{l=1}^{m} \phi_{l}$, for every $1 \leq i \leq k$. In particular, $\varphi_{j}^{\diamond} \models \bigvee_{l=1}^{m} \phi_{l}$. Since $\varphi_{j}^{\diamond}$ does not contain disjunctions and $\mathbf{t t}$, from Corollary $100, \varphi_{j}^{\diamond}$ is prime. Consequently, $\varphi_{j}^{\diamond} \models \phi_{s}$ for some $1 \leq s \leq m$. Finally, since $\varphi^{\diamond} \models \varphi_{j}^{\diamond}$, it holds that $\varphi^{\diamond} \models \phi_{s}$.

- Example 120. Formula $\varphi=\langle a\rangle\langle a\rangle \mathbf{t t} \wedge\langle a\rangle \mathbf{0}$ is not prime and $\varphi^{\diamond}=\langle a\rangle \mathbf{0} \nLeftarrow \varphi$, whereas the prime formula $\psi=(\langle a\rangle \mathbf{t t} \wedge\langle a\rangle \mathbf{0}) \vee\langle a\rangle \mathbf{t t}$ has $\psi^{\diamond}=\langle a\rangle \mathbf{0}$, which logically implies $\psi$.

We can prove now the following main proposition.

- Proposition 121. Let $\varphi \in \mathcal{L}_{C S}$ be a formula such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent; let also $\varphi \rightarrow_{\mathrm{tt}}^{\operatorname{sub} b^{*}} \varphi^{t t} \rightarrow_{0}^{\operatorname{sub} b^{*}} \varphi^{0} \rightarrow_{\diamond}^{s u b^{*}} \varphi^{\diamond}$. There is a polynomial-time algorithm that decides whether $\varphi^{\diamond}$ is prime.

Proof. We describe algorithm Prime ${ }^{\diamond}$ which takes $\varphi^{\diamond}$ and decides whether $\varphi^{\diamond}$ is prime. If $\varphi^{\diamond}=\mathbf{t t}$, Prime $^{\diamond}$ rejects. Otherwise, from Lemma 114, $\mathbf{t t} \notin \varphi^{\diamond}$. Then, Prime ${ }^{\diamond}$ constructs the alternating graph $G_{\varphi^{\diamond}}=(V, E, A, s, t)$ by starting with vertex $\left(\varphi^{\diamond}, \varphi^{\diamond} \Rightarrow \varphi^{\diamond}\right)$ and repeatedly applying the rules for complete simulation, i.e. the rules from Table 1, where rule ( tt ) is replaced by the following one:

$$
\frac{\mathbf{0 , 0} \Rightarrow \mathbf{0}}{\text { TRUE }}
$$

Then, the algorithm solves $\mathrm{REACH}_{a}$ on $G_{\varphi^{\diamond}}$, where $s$ is $\left(\varphi^{\diamond}, \varphi^{\diamond} \Rightarrow \varphi^{\diamond}\right)$ and $t=$ TruE, and accepts $\varphi^{\diamond}$ iff there is an alternating path from $s$ to $t$. From Corollary 118, every $\psi \in \operatorname{Sub}\left(\varphi^{\diamond}\right)$ is consistent. Correctness of Prime ${ }^{\diamond}$ is immediate from the following claim.
Claim A. $\varphi^{\diamond}$ is prime iff there is an alternating path in $G_{\varphi^{\diamond}}$ from $s$ to $t$.
Proof of Claim A. $(\Leftarrow)$ The proof of this implication is similar to the proof of Lemma 87. If $\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ is a vertex in the alternating path from $s$ to $t$, then property $P_{1}$ is true for $\varphi_{1}, \varphi_{2}, \psi$ and this can be proven by induction on the type of the rules. We only include two cases that are different here.
Case (0). $P_{1}$ trivially holds for $\mathbf{0}, \mathbf{0}, \mathbf{0}$.
Case $\left(\mathrm{L} \wedge_{1}\right)$. Let $\bigvee_{i=1}^{k_{12}} \varphi_{12}^{i}$ be $\varphi_{1} \wedge \varphi_{2}$ in DNF. The argument is the same as in the proof of Lemma 87. In particular, if $P_{1}$ is true either for $\varphi_{1}, \varphi,\langle a\rangle \psi$ or for $\varphi_{2}, \varphi,\langle a\rangle \psi$, then either $\varphi_{1}^{i_{1}}, \varphi^{j} \models\langle a\rangle \psi^{k}$ for some $i_{1}, j, k$, or $\varphi_{2}^{i_{2}}, \varphi^{j} \models\langle a\rangle \psi^{k}$ for some $i_{2}, j, k$. From the easy direction of Lemma 111, $\varphi_{1}^{i_{1}} \wedge \varphi_{2}^{i_{2}}, \varphi^{j} \models\langle a\rangle \psi^{k}$, where $\varphi_{1}^{i_{1}} \wedge \varphi_{2}^{i_{2}}=\varphi_{12}^{i}$ for some $1 \leq i \leq k_{12}$.
As a result, $P_{1}$ is true for $\varphi^{\diamond}, \varphi^{\diamond}, \varphi^{\diamond}$, and from Corollary 105, $\varphi^{\diamond}$ is prime.
$(\Rightarrow)$ This implication can be proven similarly to Lemma 88 . We prove the parts that exhibit some differences from those in Lemma 88.
Claim 1(a). For every vertex $x=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ in $G_{\varphi} \circ$ such that $\varphi_{1}, \varphi_{2}, \psi \neq \mathbf{0}$ and $\varphi_{1}, \varphi_{2}, \psi$ satisfy $P_{2}$, one of the rules for complete simulation can be applied on $x$.
Proof of Claim 1(a). If a rule cannot be applied on $x$, then it must be the case that:

- either $\varphi_{1}=\langle a\rangle \varphi_{1}^{\prime}, \varphi_{2}=\langle b\rangle \varphi_{2}^{\prime}$, and $\psi=\langle c\rangle \psi^{\prime}$, where $a=b=c$ is not true, which leads to contradiction as we have already proven in the proof of Lemma 88,
- or all of $\varphi_{1}, \varphi_{2}, \psi$ are $\langle a\rangle \varphi$ or $\mathbf{0}$, and there is at least one of each kind. For example, if $\varphi_{1}=\langle a\rangle \varphi_{1}^{\prime}, \varphi_{2}=\langle a\rangle \varphi_{2}^{\prime}$, and $\psi=\mathbf{0}$, then $P_{2}$ does not hold for $\varphi_{1}, \varphi_{2}, \psi$, contradiction. All other cases can be proven similarly.
Claim 1(b). If an existential rule is applied on $x=\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right) \in V$, where $\varphi_{1}, \varphi_{2}, \psi \neq \mathbf{0}$ and $\varphi_{1}, \varphi_{2}, \psi$ satisfy $P_{2}$, then there is some $z=\left(\varphi_{1}^{\prime}, \varphi_{2}^{\prime} \Rightarrow \psi^{\prime}\right) \in V$ such that $(x, z) \in E$ and $\varphi_{1}^{\prime}, \varphi_{2}^{\prime}, \psi^{\prime}$ satisfy $P_{2}$.
Proof of Claim 1(b). All cases of the induction proof can be proven in the same manner as in Lemma 88. In particular, consider $\left(\mathrm{L} \wedge_{i}\right)$. The hypothesis of Lemma 111 holds for $\varphi_{1} \wedge \varphi_{2}$.

So, Lemma 111 can be used in place of Lemma 75 .
Claim 2. If $x$ is a vertex $\left(\varphi_{1}, \varphi_{2} \Rightarrow \psi\right)$ in $G_{\varphi^{\circ}}$ such that $\varphi_{1}, \varphi_{2}, \psi$ satisfy $P_{2}$, then there is an alternating path from $x$ to True.
Proof of Claim 2. All cases of the induction proof are the same except for the case $x=(\mathbf{0}, \mathbf{0} \Rightarrow \mathbf{0})$. Then, $P^{G}(x$, True $)$ trivially holds.
Claim 1(c) needs no adjustment. As $\phi^{\diamond}$ is prime, from Corollary 119, $\phi^{\diamond}, \phi^{\diamond}, \phi^{\diamond}$ satisfy $P_{2}$ and there is an alternating path from $s$ to $t$. This completes the proof of Claim A.

The polynomial-time complexity of Prime ${ }^{\diamond}$ relies on the polynomial size of $G_{\varphi^{\diamond}}$ and linear-time solvability of $\mathrm{REACH}_{a}$.

- Remark 122. At this point, we comment on the type of the rules and the ordering in which they are applied on a given formula $\varphi$ in this subsection. Note that formulae which are satisfied by $\mathbf{0}$ have a simple zero normal form, i.e. their zero normal form is either $\mathbf{0}$ or $\mathbf{0} \vee \varphi^{\prime}$, where $\mathbf{0} \not \vDash \varphi^{\prime}$. This is possible since we initially applied rules $\mathbf{t t} \vee \psi \rightarrow_{\mathrm{tt}} \mathbf{t t}$ and $\mathbf{t t} \wedge \psi \rightarrow_{\mathrm{tt}} \psi$ and we obtained $\varphi^{t t}$, such that the zero normal form of every tautology in $\varphi^{t t}$ is also $\mathbf{0} \vee \varphi^{\prime}$, where $\mathbf{0} \not \models \varphi^{\prime}$. Next, we apply rules that result in the equivalent formula $\varphi^{0}$, which is in zero normal form. Formula $\varphi^{0}$ has a DNF $\bigvee_{i=1}^{k} \varphi_{i}^{0}$, where every $\varphi_{i}^{0}$ is consistent as shown in Lemma 112, which is a crucial property in the proof of Lemma 117. A formula that is not in zero normal form can have a DNF where some disjuncts are inconsistent. For example, the DNF of $\psi=(\langle a\rangle \mathbf{t t} \vee\langle b\rangle \mathbf{t t}) \wedge(\mathbf{0} \vee\langle a\rangle \mathbf{0})$ is $(\langle a\rangle \mathbf{t t} \wedge \mathbf{0}) \vee(\langle a\rangle \mathbf{t t} \wedge\langle a\rangle \mathbf{0}) \vee(\langle b\rangle \mathbf{t t} \wedge \mathbf{0}) \vee(\langle b\rangle \mathbf{t t} \wedge\langle a\rangle \mathbf{0})$, where $\langle a\rangle \mathbf{t t} \wedge \mathbf{0}$ and $\langle b\rangle \mathbf{t t} \wedge \mathbf{0}$ are inconsistent. However, the zero normal form of $\psi$ is $\psi^{0}=\mathbf{0} \vee(\langle a\rangle \mathbf{0} \wedge\langle a\rangle \mathbf{t} \mathbf{t} \wedge\langle b\rangle \mathbf{t t})$ which is in DNF and every disjunct is consistent. Moreover, Lemma 111, which is necessary for proving our main result, does not hold for formulae that are not in zero normal form. For instance, $(\mathbf{0} \vee\langle a\rangle \mathbf{0}) \wedge(\langle a\rangle \mathbf{t t} \vee\langle b\rangle \mathbf{t t}) \models\langle a\rangle \mathbf{0}$, but $\mathbf{0} \vee\langle a\rangle \mathbf{0} \not \models\langle a\rangle \mathbf{0}$ and $\langle a\rangle \mathbf{t t} \vee\langle b\rangle$ tt $\not \models\langle a\rangle \mathbf{0}$. Finally, we apply rules to obtain $\varphi^{\diamond}$, which, in the case that is not $\mathbf{t t}$, does not contain $\mathbf{t t}$, so it has a DNF the disjuncts of which are consistent and prime. As a result, $\varphi^{\circ}$ satisfies various desired properties that allow us to use a variant of Primes that checks primality of $\varphi^{\diamond}$.
- Proposition 123. Let $\varphi \in \mathcal{L}_{C S}$ be a formula such that every $\psi \in \operatorname{Sub}(\varphi)$ is consistent; let also $\varphi \rightarrow_{\mathrm{tt}}^{s u b^{*}} \varphi^{\mathrm{tt}} \rightarrow_{0}^{s u b^{*}} \varphi^{0} \rightarrow_{\diamond}^{\text {sub }}{ }^{*} \varphi^{\diamond}$. If $\varphi^{\diamond}$ is prime, there is a polynomial-time algorithm that constructs a process for which $\varphi^{\diamond}$ is characteristic within $\mathcal{L}_{C S}$.

Proof. As in the case of simulation and the proof of Corollary 91, there is an algorithm that finds an alternating path $\mathcal{P}_{a}$ in $G_{\varphi^{\circ}}$ from $s$ to $t$ and associates a process to every vertex of $\mathcal{P}_{a}$ so that the process associated to $s$ is a process for which $\varphi$ is characteristic within $\mathcal{L}_{C S}$.

- Corollary 124. Deciding characteristic formulae within $\mathcal{L}_{C S}$ is polynomial-time solvable.

Proof. Let $\varphi \in \mathcal{L}_{C S}$. Consider Prime ${ }_{\mathrm{CS}}$ that on input $\varphi$ proceeds as follows: Prime ${ }_{\mathrm{CS}}$ checks whether $\varphi$ is consistent by calling $\operatorname{Cons}_{\mathrm{CS}}(\varphi)$. If $\varphi$ is inconsistent, Prime ${ }_{\mathrm{CS}}$ rejects. Otherwise, it calls ConSub ${ }_{\mathrm{CS}}(\varphi)$. Let $\varphi^{\prime}$ denote the output of $\operatorname{ConSub}_{\mathrm{CS}}(\varphi)$. Then, Prime $_{\mathrm{CS}}$ computes $\varphi^{t t}, \varphi^{0}$, and $\varphi^{\diamond}$ such that $\varphi^{\prime} \rightarrow_{\mathrm{tt}}^{s u b^{*}} \varphi^{t t} \rightarrow_{\mathrm{tt}}^{s u b^{*}} \varphi^{0} \rightarrow_{\diamond}^{s u b^{*}} \varphi^{\diamond}$. Prime CS checks whether $\varphi^{\diamond}$ is prime by calling Prime ${ }^{\diamond}\left(\varphi^{\diamond}\right)$. If $\varphi^{\diamond}$ is not prime, Prime ${ }_{\mathrm{CS}}$ rejects. Otherwise, Prime ${ }_{\mathrm{CS}}$ computes $p$ for which $\varphi^{\diamond}$ is characteristic within $\mathcal{L}_{C S}$. Finally, it checks whether $p \models \varphi$. Prime ${ }^{\diamond}$ accepts iff $p \models \varphi$.

If $p \models \varphi$, from Lemma 7, for every $q$ such that $q \models \varphi^{\diamond}$, it holds that $q \models \varphi$. Thus, $\varphi^{\diamond} \models \varphi$. Correctness of Prime ${ }_{\mathrm{CS}}$ is now a corollary of Proposition 9, Corollary 62, Proposition 63, Corollary 118, and Propositions 121 and 123. The polynomial-time complexity follows from Corollary 62 that shows the polynomial-time complexity of the satisfiability problem, Proposition 63 and Lemmas 106, 108, and 113, which state that $\varphi^{\prime}, \varphi^{t t}, \varphi^{0}$, and $\varphi^{\diamond}$,
respectively, can be computed in polynomial time, Proposition 121 that shows polynomialtime complexity of Prime ${ }^{\diamond}$, and Propositions 123 and 50 , which demonstrate that $p$ can be efficiently computed and $p \models \varphi$ can be also solved in polynomial time.

- Corollary 125. Let $\varphi \in \mathcal{L}_{C S}$. If $\varphi$ is consistent and prime, then there is a polynomial-time algorithm that constructs a process for which $\varphi$ is characteristic within $\mathcal{L}_{C S}$.

## C. 3 Primality in $\mathcal{L}_{R S}$

To examine the complexity of deciding prime formulae in $\mathcal{L}_{R S}$, we distinguish between bounded and unbounded action sets as in the case of satisfiability. We present a polynomialtime algorithm that decides primality when $|A|$ is bounded, and show that the problem is coNP-complete when $|A|$ is unbounded.

## C.3.1 The case of $|A|=k, k \geq 1$

In the case that $|A|=1$, ready simulation coincides with complete simulation. So, we assume that $|A|=k, k \geq 2$. We first introduce the notion of saturated formulae, which intuitively captures the following property: if a saturated formula $\varphi$ is satisfied in $p$, then $\varphi$ describes exactly which actions label the outgoing edges of $p$.

- Definition 126. Let $\varphi \in \mathcal{L}_{R S}$ such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some $[a]$. We say that $\varphi$ is saturated if $I(\varphi)$ is a singleton.
- Remark 127. From now on, when we say that $\varphi$ is saturated, we imply that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some $[a]$.
- Lemma 128. Let $\varphi \in \mathcal{L}_{R S}$ such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathbf{f f}$ and occurs in the scope of some $[a]$. If $\varphi$ is not saturated, there are two processes $p_{1}$ and $p_{2}$, such that $p_{i} \models \varphi$ for both $i=1,2$ and $I\left(p_{1}\right) \neq I\left(p_{2}\right)$.

Proof. From the assumptions of the lemma, Definition 126, and Lemma 12, $|I(\varphi)|>1$. Let $S_{1}, S_{2} \in I(\varphi)$, such that $S_{1} \neq S_{2}$. From Lemma 12 , there are $p_{1}, p_{2}$, such that $I\left(p_{i}\right)=S_{i}$ and $p_{i} \models \varphi$, where $i \in\{1,2\}$.

- Corollary 129. Let $\varphi \in \mathcal{L}_{R S}$ such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some [a]. If $\varphi$ is prime, then $\varphi$ is saturated.

Proof. Suppose that $\varphi$ is consistent, prime, and not saturated. Let $p$ be a process for which $\varphi$ is characteristic within $\mathcal{L}_{R S}$. Consider two processes $p_{1}, p_{2}$ that satisfy $\varphi$ and $I\left(p_{1}\right) \neq I\left(p_{2}\right)$, the existence of which is guaranteed by Lemma 128. Then, $p \lesssim_{R S} p_{1}$ and $p \lesssim_{R S} p_{2}$, contradiction.

Note that a saturated formula $\varphi$ might not describe exactly the labels of the outgoing edges of processes reachable from $p$, where $p \models \varphi$. To focus on this first level of edges that start from $p$, we construct a propositional formula corresponding to $\varphi$, where any formula of the form $\langle a\rangle \varphi^{\prime}$ that requires an edge labelled with $a$ leaving from $p$, corresponds to a propositional variable $x_{a}$.

- Definition 130. Let $\varphi \in \mathcal{L}_{R S}$ such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some $[a]$. The mapping $\operatorname{Prop}(\varphi): \mathcal{L}_{R S} \rightarrow \mathcal{L}_{\text {prop }}$, where $\mathcal{L}_{\text {prop }}$ is the set of propositional formulae, is inductively defined as follows:
- $\operatorname{PROP}(\mathbf{t t})=$ TRUE,
- $\operatorname{Prop}([a] f f)=\neg x_{a}$,
- $\operatorname{Prop}\left(\langle a\rangle \varphi^{\prime}\right)=x_{a}$,
- $\operatorname{Prop}\left(\varphi_{1} \wedge \varphi_{2}\right)=\operatorname{Prop}\left(\varphi_{1}\right) \wedge \operatorname{Prop}\left(\varphi_{2}\right)$,
- $\operatorname{Prop}\left(\varphi_{1} \vee \varphi_{2}\right)=\operatorname{Prop}\left(\varphi_{1}\right) \vee \operatorname{Prop}\left(\varphi_{2}\right)$,
where TRUE denotes a propositional tautology.
- Remark 131. When we construct $\operatorname{Prop}(\varphi)$, if $\varphi=\langle a\rangle \varphi^{\prime}$, we can attach $\varphi^{\prime}$ as a label to $x_{a}$ by setting $\operatorname{Prop}\left(\langle a\rangle \varphi^{\prime}\right)=x_{a}^{\varphi^{\prime}}$, where $\varphi^{\prime}$ acts as a label for this occerrence of $x_{a}$. Then, given a propositional formula $\psi$ over the set of variables $\operatorname{VAR}_{k}=\left\{x_{a_{1}}, \ldots, x_{a_{k}}\right\}$, together with labels for each positive occurrence of the variables, we can construct the formula in $\mathcal{L}_{R S}$ that corresponds to $\psi$.

We prove below that in the case of a saturated formula $\varphi, \operatorname{PrOP}(\varphi)$ has a unique satisfying assignment $s$ and $I(\varphi)$ determines $s$.

- Lemma 132. Let $\varphi \in \mathcal{L}_{R S}$ such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some [a]. If $p$ is a process such that $p \models \varphi$, the truth assignment $s: \mathrm{VAR}_{k} \rightarrow$ \{true, false \} such that $s\left(x_{a}\right)=$ true iff $p \xrightarrow{a} p^{\prime}$ for some $p^{\prime}$ is satisfying for $\operatorname{Prop}(\varphi)$. Inversely, if $t$ is a satisfying truth assignment for $\operatorname{Prop}(\varphi)$, there is a process $p$ such that $p \models \varphi$ and $p \xrightarrow{a} p^{\prime}$ iff $t\left(x_{a}\right)=$ true.

Proof. The proof is by induction on the structure of $\varphi$.

- If either $\varphi=\mathbf{t t}$ or $\varphi=[a] \mathbf{f f}$, then the lemma can be easily proven.
- If $\varphi=\langle a\rangle \varphi^{\prime}$, then let $p \models \varphi$. It holds that $p \xrightarrow{a} p^{\prime}$, where $p^{\prime} \models \varphi^{\prime}$, and perhaps there is $b \neq a$ such that $p \xrightarrow{b} p^{\prime \prime}$. We have that $\operatorname{Prop}(\varphi)=x_{a}$ and assignment $s$ defined in the lemma is satisfiable for $\operatorname{Prop}(\varphi)$. Inversely, if there is a satisfying truth assignment $t$ for $\operatorname{Prop}(\varphi)$, then $\operatorname{Prop}(\varphi)=x_{a}$, and so $t\left(x_{a}\right)=$ true. Since $\varphi^{\prime}$ is satisfiable, there is a process $p^{\prime}$ such that $p^{\prime} \models \varphi^{\prime}$. Consider process and $p$ such that $p \xrightarrow{a} p^{\prime}$ and $p \xrightarrow{b} 0$ for every $x_{b} \neq x_{a}$ such that $t\left(x_{b}\right)=$ true. Then, $p \models \varphi$.
- Assume that $\varphi=\varphi_{1} \wedge \varphi_{2}$ and let $p \models \varphi$. Since $p \models \varphi_{1}$ and $p \models \varphi_{2}$, assignment $s$ defined in the lemma is satisfying for $\operatorname{both} \operatorname{Prop}\left(\varphi_{1}\right)$ and $\operatorname{Prop}\left(\varphi_{2}\right)$ from inductive hypothesis. So, $s$ is also satisfying for $\operatorname{Prop}\left(\varphi_{1}\right) \wedge \operatorname{Prop}\left(\varphi_{2}\right)=\operatorname{Prop}\left(\varphi_{1} \wedge \varphi_{2}\right)$. Inversely, assume that we have a satisfying assignment $t$ for $\operatorname{Prop}\left(\varphi_{1} \wedge \varphi_{2}\right)=\operatorname{Prop}\left(\varphi_{1}\right) \wedge \operatorname{Prop}\left(\varphi_{2}\right)$. So, $t$ is satisfying for both $\operatorname{Prop}\left(\varphi_{1}\right)$ and $\operatorname{Prop}\left(\varphi_{2}\right)$. By inductive hypothesis, there are $p_{1}$ and $p_{2}$ such that $p_{1} \models \varphi_{1}$ and $p_{2} \models \varphi_{2}$, respectively, and $p_{1} \xrightarrow{a} p_{1}^{\prime}$ iff $p_{2} \xrightarrow{a} p_{2}^{\prime}$ iff $t\left(x_{a}\right)=$ true, which implies that $I\left(p_{1}\right)=I\left(p_{2}\right)$. Consider process $p_{1}+p_{2}$. It holds that $p_{i} \lesssim_{R S} p_{1}+p_{2}$ for both $i=1,2$, and so we have that $p_{1}+p_{2} \models \varphi_{1} \wedge \varphi_{2}$.
- Assume that $\varphi=\varphi_{1} \vee \varphi_{2}$ and let $p \models \varphi$. Since $p \models \varphi_{1}$ or $p \models \varphi_{2}$, assignment $s$ defined in the lemma is satisfying for $\operatorname{Prop}\left(\varphi_{1}\right)$ or $\operatorname{Prop}\left(\varphi_{2}\right)$ from inductive hypothesis. So, $s$ is also satisfying for $\operatorname{Prop}\left(\varphi_{1}\right) \vee \operatorname{Prop}\left(\varphi_{2}\right)=\operatorname{Prop}\left(\varphi_{1} \vee \varphi_{2}\right)$. Inversely, let $t$ be a satisfying assignment for $\operatorname{Prop}\left(\varphi_{1} \vee \varphi_{2}\right)=\operatorname{Prop}\left(\varphi_{1}\right) \vee \operatorname{Prop}\left(\varphi_{2}\right)$. Assume w.l.o.g. that $t$ is satisfying for $\operatorname{Prop}\left(\varphi_{1}\right)$. By inductive hypothesis, there is $p_{1} \models \varphi_{1}$ and $p_{1} \xrightarrow{a} p^{\prime}$ iff $t\left(x_{a}\right)=$ true. It also holds that $p_{1} \models \varphi$.
- Corollary 133. Let $\varphi \in \mathcal{L}_{R S}$ be saturated and $I(\varphi)=\{S\}$. Then, $s: \mathrm{VAR}_{k} \rightarrow\{$ true, false $\}$ is a satisfying truth assignment for $\operatorname{PROP}(\varphi)$ iff $s\left(x_{a}\right)=$ true $\Longleftrightarrow a \in S$.

Proof. $(\Rightarrow)$ Let $s$ be a satisfying assignment for $\operatorname{Prop}(\varphi)$. Then, from Lemma 132, there is $p$ such that $p \models \varphi$ and $a \in I(p) \Longleftrightarrow s\left(x_{a}\right)=$ true. From Lemma $12, I(p)=S$ and so $a \in S \Longleftrightarrow s\left(x_{a}\right)=$ true .
$(\Leftarrow)$ Let $s$ be a truth assignment such that $s\left(x_{a}\right)=$ true $\Longleftrightarrow a \in S$. Then, there is $p$ such
that $p \models \varphi$, which means that $I(p)=S$ from Lemma 12. Thus, $s\left(x_{a}\right)=$ true $\Longleftrightarrow a \in I(p)$. From Lemma $132, s$ is satisfying for $\operatorname{Prop}(\varphi)$.

Next, if $\varphi$ is saturated, we can simplify $\operatorname{Prop}(\varphi)$-and consequently, $\varphi$ as well-so that the resulting propositional formula has a DNF with only consistent disjuncts.

- Definition 134. Let $\varphi \in \mathcal{L}_{R S}$ be saturated and $\psi=\operatorname{Prop}(\varphi)$. We denote by $\operatorname{simpl}(\psi)$ the formula we obtain by making the following substitutions in $\psi$ :
- for every $a \in S$, substitute $\neg x_{a}$ with FALSE in $\psi$,
- for every $a \notin S$, substitute $x_{a}$ with FALSE in $\psi$, and
- apply rules FALSE $\vee \psi \rightarrow \psi$ and FALSE $\wedge \psi \rightarrow$ FALSE modulo commutativity, where FALSE denotes a propositional contradiction.
- Lemma 135. Let $\varphi \in \mathcal{L}_{R S}$ be saturated, $I(\varphi)=\{S\}$, and $\psi=\operatorname{PrOP}(\varphi)$. Then, $\operatorname{simpl}(\psi)$ is logically equivalent to $\psi$. Moreover, FASLE does not occur in $\operatorname{simpl}(\psi)$, if $a \in S$, then $\neg x_{a}$ does not occur in $\operatorname{simpl}(\psi)$, and if $a \notin S$, then $x_{a}$ does not occur in $\operatorname{simpl}(\psi)$.

Proof. Let $I(\varphi)=\{S\}$. From Corollary 133, $\psi$ has a unique assignment $s$ and it holds that $s\left(x_{a}\right)=$ true $\Longleftrightarrow a \in S$. So, if any of the substitutions presented in Definition 134, is made on $\psi$, we obtain a formula that is only satisfied by truth assignment $s$. It is easy to see that the second part of the lemma is also true.

- Lemma 136. Let $\varphi \in \mathcal{L}_{R S}$ be saturated, $I(\varphi)=\{S\}$, and $\psi=\operatorname{Prop}(\varphi)$. If $\bigvee_{i=1}^{k} \psi_{i}$ denotes the DNF of $\operatorname{simpl}(\psi)$, then $\psi_{i}$ is satisfiable for every $1 \leq i \leq k$.

Proof. Let $s: \mathrm{VAR}_{k} \rightarrow\{$ true, false $\}$ be such that $s\left(x_{a}\right)=$ true iff $a \in S$. From Corollary 133 and Lemma $135, s$ is the only satisfying assignment for $\operatorname{simpl}(\psi)$. The lemma is immediate from the following two claims, which we prove below.
Claim 1. Let $\psi^{\prime} \in \operatorname{Sub}(\psi)$. Then, $s$ is satisfying for $\psi^{\prime}$.
Claim 2. Let $\phi$ be a propositional formula and $\bigvee_{i=1}^{n} \phi_{i}$ denote the DNF of $\phi$. If there is a truth assignment $t$ such that is satisfying for every subformula of $\phi$, then $t$ is satisfying for $\phi_{i}$, for every $1 \leq i \leq n$.
Proof of Claim 1. If $s\left(x_{a}\right)=$ false, then $a \notin S$, and from Lemma 135, $x_{a}$ does not appear in $\psi^{\prime}$. Analogously, if $s\left(x_{a}\right)=$ true, $\neg x_{a}$ does not appear in $\psi^{\prime}$. Hence, $s$ assigns the false value only to literals that do not appear in $\psi^{\prime}$, and so $s$ is satisfying for $\psi^{\prime}$.
Proof of Claim 2. We prove the claim by structural induction on $\phi$.

- If $\phi$ does not contain disjunctions, then $\phi$ is already in DNF, and $t$ is satisfying for $\phi$.
- If $\phi=\phi_{1} \vee \phi_{2}$, then $t$ is satisfying for every subformula of $\phi_{i}$, where $i=1,2$. Let $\bigvee_{i=1}^{k_{1}} \phi_{1}^{i}$ and $\bigvee_{i=1}^{k_{2}} \phi_{2}^{i}$ denote the DNFs of $\phi_{1}$ and $\phi_{2}$, respectively. From inductive hypothesis, $t$ is satisfying for $\phi_{j}^{i}$, for every $j=1,2$ and $1 \leq i \leq k_{j}$. This is sufficient since $\bigvee_{i=1}^{n} \phi_{i}=\bigvee_{i=1}^{k_{1}} \phi_{1}^{i} \vee \bigvee_{i=1}^{k_{2}} \phi_{2}^{i}$.
- If $\phi=\phi_{1} \wedge \phi_{2}$, then $t$ is satisfying for every subformula of $\phi_{i}$, where $i=1,2$. Let $\bigvee_{i=1}^{k_{1}} \phi_{1}^{i}$ and $\bigvee_{i=1}^{k_{2}} \phi_{2}^{i}$ denote the DNFs of $\phi_{1}$ and $\phi_{2}$, respectively. It holds that for every $1 \leq i \leq k$, $\phi_{i}=\phi_{1}^{i_{1}} \wedge \phi_{2}^{i_{2}}$ for some $1 \leq i_{1} \leq k_{1}$ and $1 \leq i_{2} \leq k_{2}$. Since from inductive hypothesis, $t$ is satisfying for $\phi_{j}^{i}$, for every $j=1,2$ and $1 \leq i \leq k_{j}, t$ is satisfying for $\phi_{i}$, for every $1 \leq i \leq k$.

Properties of the simplified version of $\operatorname{Prop}(\varphi)$ can be transferred to $\varphi$.

- Definition 137. Let $\varphi \in \mathcal{L}_{R S}$ be saturated and $\psi=\operatorname{Prop}(\varphi)$. We denote by $\operatorname{simpl}(\varphi)$ the formula in $\mathcal{L}_{R S}$ that corresponds to $\operatorname{simpl}(\psi)$ as described in Remark 131. We say that $\varphi$ is simplified if $\varphi=\operatorname{simpl}(\varphi)$.

Corollary 138. Let $\varphi \in \mathcal{L}_{R S}$ be saturated and $I(\varphi)=S$. Then, $\operatorname{simpl}(\varphi) \equiv \varphi$; if $a \in S$, then any $[a] \mathrm{ff}$ occurs in $\operatorname{simpl}(\varphi)$ only in the scope of some $\langle b\rangle, b \in A$; and if $a \notin S$, then any $\langle a\rangle \varphi^{\prime}$, where $\varphi^{\prime} \in \mathcal{L}_{R S}$, occurs in $\operatorname{simpl}(\varphi)$ only in the scope of some $\langle b\rangle, b \in A$.

- Corollary 139. Let $\varphi \in \mathcal{L}_{R S}$ be saturated, $I(\varphi)=\{S\}$, and $\psi=\operatorname{Prop}(\varphi)$; let also $\bigvee_{i=1}^{k} \psi_{i}$ denote the DNF of $\operatorname{simpl}(\psi)$ and $\bigvee_{i=1}^{k} \varphi_{i}$ denote the formula in $\mathcal{L}_{R S}$ that corresponds to $\bigvee_{i=1}^{k} \psi_{i}$ as described in Remark 131. Then, every $\varphi_{i}$ is consistent and disjunctions occur in $\varphi_{i}$ only in the scope of some $\langle a\rangle$, where $a \in A$.

Given a formula $\varphi \in \mathcal{L}_{R S}$ such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some [a], we process the formula by running Algorithm 2 on input $\varphi$. We show that the resulting formula, denoted by $\varphi^{s}$, has properties that allow us to use a variant of Primes to check its primality. In the case that $\varphi^{s}$ is prime and logically implies $\varphi$, then $\varphi$ is also prime. As the reader may have already notice, the strategy is similar to the case of complete simulation.

Algorithm 2 Saturation of a formula in $\mathcal{L}_{R S}$

```
procedure \(\operatorname{SATUR}(\varphi)\)
        repeat
            \(\varphi^{\prime} \leftarrow \varphi\)

Lemma 140. Let $\varphi \in \mathcal{L}_{R S}$ be such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some $[a]$. Then, $\operatorname{Satur}(\varphi)$ returns either $\mathbf{t t}$ or a saturated and simplified formula $\varphi^{s}$ such that $\mathbf{t t} \notin \operatorname{Sub}\left(\varphi^{s}\right)$ and for every $\langle a\rangle \psi \in \operatorname{Sub}\left(\varphi^{s}\right), \psi$ is saturated and simplified.

Proof. Immediate from the substitutions made by Algorithm 2.

- Lemma 141. Let $\varphi \in \mathcal{L}_{R S}$ be prime, saturated, and simplified; let also $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi)$ such that there is an occurrence of $\langle a\rangle \varphi^{\prime}$ in $\varphi$, which is not in the scope of any $\langle b\rangle, b \in A$, and $\varphi^{\prime}$ is not saturated. If $\varphi^{s}$ denotes $\varphi$ where this occurrence of $\langle a\rangle \varphi^{\prime}$ has been substituted with $\mathbf{t t}$, then $\varphi^{s} \models \varphi$.

Proof. Consider the propositional formulae $\psi=\operatorname{Prop}(\varphi)$ and $\psi^{s}=\operatorname{Prop}\left(\varphi^{s}\right)$. Let $\bigvee_{i=1}^{k} \psi_{i}$ and $\bigvee_{i=1}^{k^{\prime}} \psi_{i}^{s}$ denote the DNFs of $\psi$ and $\psi^{s}$, respectively. Formula $\psi$ satisfies the assumptions
of Lemma 136 and so every $\psi_{i}$ is consistent. Let $\bigvee_{i=1}^{k} \varphi_{i}$ and $\bigvee_{i=1}^{k^{\prime}} \varphi_{i}^{s}$ denote the formulae in $\mathcal{L}_{R S}$ that correspond to $\bigvee_{i=1}^{k} \psi_{i}$ and $\bigvee_{i=1}^{k^{\prime}} \psi_{i}^{s}$, respectively, as described in Remark 131. From Corollary 139, every $\varphi_{i}, 1 \leq i \leq k$, is consistent and disjunctions occur in $\varphi_{i}$ and $\varphi_{j}^{s}$, $1 \leq j \leq k^{\prime}$, only in the scope of some $\langle b\rangle, b \in A$. Moreover, $\bigvee_{i=1}^{k} \varphi_{i} \equiv \varphi$ and $\bigvee_{i=1}^{k^{\prime}} \varphi_{i}^{s} \equiv \varphi^{s}$.

Let $p \models \varphi^{s}$ and $p_{\text {min }}$ be a process for which $\varphi$ is characteristic within $\mathcal{L}_{R S}$. Such a $p_{\text {min }}$ exists since $\varphi$ is consistent and prime. We show that $p_{\text {min }} \lesssim_{R S} p$, which combined with Corollary 37 implies that $p \models \varphi$. Note that $p \models \varphi_{i}^{s}$ for some $1 \leq i \leq k^{\prime}$. If $\varphi_{i}^{s}=\varphi_{j}$ for some $1 \leq j \leq k$, then $p \models \varphi$. Otherwise, $\varphi_{i}^{s}$ coincides with some $\varphi_{j}$, where an occurrence of $\langle a\rangle \varphi^{\prime}$ has been substituted with $\mathbf{t t}$. We describe now how to construct a process $p_{\varphi_{i}^{s}}$ that satisfies $\varphi_{i}^{s}$. We define $p_{\varphi_{i}^{s}}$ to be such that for every $\left\langle a_{i}\right\rangle \varphi_{a_{i}} \in \operatorname{Sub}\left(\varphi_{i}^{s}\right)$, such that $\left\langle a_{i}\right\rangle \varphi_{a_{i}}$ is not in the scope of some $\langle b\rangle, b \in A$, it holds that $p \xrightarrow{a} p_{\varphi_{a_{i}}}$, where $p_{\varphi_{a_{i}}}$ is some process that satisfies $\varphi_{a_{i}}$, and $p_{\varphi_{i}^{s}}$ has no other outgoing edges. We also consider two copies of $p_{\varphi_{i}^{s}}$, namely $p_{\varphi_{i}^{s}}^{1}$ and $p_{\varphi_{i}^{s}}^{2}$, that are as follows: $p_{\varphi_{i}^{s}}^{1}=p_{\varphi_{i}^{s}}+a . p_{1}$ is and $p_{\varphi_{i}^{s}}^{2}=p_{\varphi_{i}^{s}}+a . p_{2}$, where $p_{1} \models \varphi^{\prime}$ and $p_{2} \models \varphi^{\prime}$ and $I\left(p_{1}\right) \neq I\left(p_{2}\right)$. Such processes exist because $\varphi^{\prime}$ is not saturated and Lemma 128 holds. Note that $p_{\varphi_{i}^{s}}^{j} \models \varphi_{j}$ for both $j=1$, 2 , which means that $p_{\varphi_{i}^{s}}^{j} \models \varphi$ for both $j=1,2$, and $p_{\text {min }} \lesssim_{R S} p_{\varphi_{i}^{s}}^{j}$ for both $j=1,2$. Let $p_{\text {min }} \xrightarrow{a} q$. Then, there are some $q_{j}$, $j=1,2$, such that $p_{\varphi_{i}^{s}}^{j} \xrightarrow{a} q_{j}$ and $q \lesssim_{R S} q_{j}$.

- Assume that there is some $q$ such that $p_{\text {min }} \xrightarrow{a} q$ and $q \lesssim_{R S} p_{1}$. Thus, $I(q)=I\left(p_{1}\right)$. On the other hand, $q \lesssim_{R S} p_{2}$ does not hold, since $I\left(p_{2}\right) \neq I\left(p_{1}\right)=I(q)$. So there is $p^{\prime}$ such that $p_{\varphi_{i}^{\diamond}}^{2} \xrightarrow{a} p^{\prime}, p^{\prime} \neq p_{2}$, and $q \lesssim_{R S} p^{\prime}$. This means that $p^{\prime}$ is a copy of a process $p^{\prime \prime}$ such that $p_{\varphi_{i}^{s}} \xrightarrow{a} p^{\prime \prime}$ and $q \lesssim R S p^{\prime \prime}$.
- Assume that there is some $q$ such that $p_{\text {min }} \xrightarrow{t} q$ and $q \lesssim_{R S} p^{\prime}$, where $p^{\prime} \neq p_{1}$. Simpler arguments can show that there is some $p^{\prime \prime}$ such that $p_{\varphi_{i}^{s}} \xrightarrow{t} p^{\prime \prime}$ and $q \lesssim_{R S} p^{\prime \prime}$.
As a result, $p_{\text {min }} \lesssim_{R S} p_{\varphi_{i}^{s}}$. Any process that satisfies $\varphi_{i}^{s}$ has the form of $p_{\varphi_{i}^{s}}$, so this completes the proof of the lemma.
- Lemma 142. Let $\varphi \in \mathcal{L}_{R S}$ be prime, saturated, and simplified; let also $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi)$ such that there is an occurrence of $\langle a\rangle \varphi^{\prime}$ in $\varphi$ in the scope of some $\langle b\rangle, b \in A$, and $\varphi^{\prime}$ is not saturated. If $\varphi^{s}$ denotes $\varphi$ where this occurrence of $\langle a\rangle \varphi^{\prime}$ has been substituted with $\mathbf{t t}$, then $\varphi^{s} \models \varphi$.

Proof. We provide a proof sketch. Formally, the proof is by induction on the number of $\langle b\rangle$ in the scope of which $\langle a\rangle \varphi^{\prime}$ occurs in $\varphi$. Let $\langle b\rangle \psi \in \operatorname{Sub}(\varphi)$ be such that $\langle a\rangle \varphi^{\prime}$ occurs in $\psi$ not in the scope of any $\langle c\rangle, c \in A$. From Corollary 139, every saturated formula $\varphi$ corresponds to an equivalent $\bigvee_{i=1}^{k} \varphi_{i}$ with the properties outlined in the corollary. By combining all these formulae corresponding to the saturated formulae examined before this occurrence of $\langle a\rangle \varphi^{\prime}$ by procedure Satur, we can prove that there is $\bigvee_{i=1}^{m} \varphi_{i} \equiv \varphi$, every $\varphi_{i}$ is consistent, $\langle a\rangle \varphi^{\prime}$ occurs in some $\varphi_{i}$ 's and the structure of $\varphi_{i}$ 's is such that a similar argument to the one in the proof of Lemma 141 works.

Next, we show one of the main results of this subsection.

- Proposition 143. Let $\varphi \in \mathcal{L}_{R S}$ be a formula such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some $[a]$; let also $\varphi^{s}$ denote the output of $\operatorname{SATUR}(\varphi)$. Then, $\varphi$ is prime iff $\varphi^{s} \models \varphi$ and $\varphi^{s}$ is prime.

Proof. $(\Leftarrow)$ Let $\varphi^{s} \models \varphi$ and $\varphi^{s}$ be prime. It holds that $\langle a\rangle \psi \models$ tt, $\mathbf{t t} \wedge \psi \models \psi$, and $\mathbf{t t} \vee \psi \models \mathbf{t t}$, for every $\psi \in \mathcal{L}_{R S}$. Thus, from Lemma 46 and the type of substitutions made to compute $\varphi^{s}, \varphi \models \varphi^{s}$. As a result $\varphi \equiv \varphi^{s}$ and so $\varphi$ is prime.
$(\Rightarrow)$ Assume that $\varphi$ is prime. As we just showed, $\varphi \models \varphi^{s}$. Thus, it suffices to show that $\varphi^{s} \models \varphi$. Then, we have that $\varphi \equiv \varphi^{s}$ and $\varphi^{s}$ is prime. The proof of $\varphi^{s} \models \varphi$ is by induction on the type of substitutions made to derive $\varphi^{s}$ from $\varphi$. If either $\varphi^{s}=\varphi[\mathbf{t t} \vee \psi / \mathbf{t t}]$ or $\varphi^{s}=\varphi[\mathbf{t t} \wedge \psi / \psi]$, then $\varphi^{s} \equiv \varphi$ as already shown in the proof of Lemma 117. If Satur is called on input a prime formula $\varphi$, then $\varphi$ is saturated from Corollary 129 and substitution in line 4 is not made. Moreover, every recursive call is on saturated formulae and again this type of substitution is not made. The only interesting case is when $\langle a\rangle \psi$ occurs in a saturated subformula of $\varphi$ not in the scope of some $\langle b\rangle$ and $\psi$ is not saturated. Then, this occurrence of $\langle a\rangle \psi$ is substituted with $\mathbf{t t}$ in $\varphi$. Then, Lemmas 141 and 142 show that $\varphi^{s} \models \varphi$.

If a formula $\varphi^{s} \neq \mathbf{t t}$ is the output of $\operatorname{SATUR}(\varphi)$, where the only inconsistent subformulae that $\varphi \in \mathcal{L}_{R S}$ contains are occurrences of ff in the scope of some $[a]$, then $\varphi^{s}$ has properties shown in the following statements. To start with, a variant of Lemma 111 holds for saturated formulae.

- Lemma 144. Let $\varphi \in \mathcal{L}_{R S}$ such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathbf{f f}$ and occurs in the scope of some $[a]$; let also $\varphi^{s}$ be the output of $\operatorname{SATUR}(\varphi)$. For every $\varphi_{1} \wedge \varphi_{2},\langle a\rangle \psi \in$ $\operatorname{Sub}\left(\varphi^{s}\right)$, the following are true:
(a) $\varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi$ iff $\varphi_{1} \models\langle a\rangle \psi$ or $\varphi_{2} \models\langle a\rangle \psi$, and
(b) $\varphi_{1} \wedge \varphi_{2} \models[a]$ ff iff $\varphi_{1} \models[a]$ ff or $\varphi_{2} \models[a]$ ff.

Proof. Note that in the case of $\varphi^{s}=\mathbf{t t}$, the lemma is trivial. Assume that $\mathbf{t t} \notin \operatorname{Sub}\left(\varphi^{s}\right)$. The direction from left to right is easy for both cases. We prove the inverse direction for (a) and (b). Let $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi)$ such that $\varphi_{1} \wedge \varphi_{2}$ occurs in $\varphi^{\prime}$ not in the scope of some $\langle b\rangle$, where $b \in A$. Since $\varphi^{\prime}$ is saturated, it holds that $I\left(\varphi^{\prime}\right)=\{S\}$ for some $S \subseteq A$.
(a) ( $\Rightarrow$ ) Since tt $\notin \operatorname{Sub}\left(\varphi^{s}\right)$, then $\psi$ is not a tautology. Let $\varphi_{1} \wedge \varphi_{2} \models\langle a\rangle \psi$. Assume that $\varphi_{1} \not \models\langle a\rangle \psi$, and let $p_{1}$ such that $p_{1} \models \varphi_{1}$ and $p_{1} \not \models\langle a\rangle \psi$ and $p_{2}$ be such that $p_{2} \models \varphi_{2}$. Then, we construct process $p_{i}^{\prime}$ by modifying $p_{i}$, so that $I\left(p_{i}^{\prime}\right)=S$ and $p_{i}^{\prime} \models \varphi_{i}$, for $i=1,2$. First, we set $p_{i}^{\prime}=p_{i}+\sum_{a \in S \backslash I\left(p_{i}\right)} a . q$, where $q$ is any process that does not satisfy $\psi$. Second, for every $a \in I\left(p_{i}\right) \backslash S$, we remove every transition $p_{i}^{\prime} \xrightarrow{a} p^{\prime}$ from $p_{i}^{\prime}$. We argue that $p_{i}^{\prime} \models \varphi_{i}$. If $a \in S \backslash I\left(p_{i}\right)$, from Corollary 138 and the fact that $\varphi_{1} \wedge \varphi_{2}$ occurs in $\varphi^{\prime}$ not in the scope of some $\langle b\rangle$, if $[a]$ ff occurs in $\varphi_{i}$ then it occurs in the scope of some $\langle b\rangle, b \in A$. So, $p_{i}+a . q \models \varphi_{i}$. Similarly, if $a \in I\left(p_{i}\right) \backslash S$, then any $\langle a\rangle \psi$ can occur in $\varphi_{i}$ only in the scope of some $\langle b\rangle$, $b \in A$. Therefore, if $p_{i}^{\prime} \models \varphi_{i}$ and we remove all transitions $p_{i}^{\prime} \xrightarrow{a} p^{\prime}$, the resulting process still satisfies $\varphi_{i}$. We now consider process $p_{1}^{\prime}+p_{2}^{\prime}$. As $I\left(p_{1}^{\prime}+p_{2}^{\prime}\right)=I\left(p_{1}^{\prime}\right)=I\left(p_{2}^{\prime}\right)$, we have that $p_{i}^{\prime} \lesssim R S p_{1}^{\prime}+p_{2}^{\prime}$, and so $p_{1}^{\prime}+p_{2}^{\prime} \models \varphi_{1} \wedge \varphi_{2}$, which in turn implies that $p_{1}^{\prime}+p_{2}^{\prime} \models\langle a\rangle \psi$. This means that for some $i=1,2, p_{i}^{\prime} \xrightarrow{a} p^{\prime}$ such that $p^{\prime} \models \psi$. Since $p_{1} \not \models\langle a\rangle \psi$, if $p_{1}^{\prime} \xrightarrow{a} p^{\prime \prime}$, then $p_{1} \xrightarrow{a} p^{\prime \prime}$ and $p^{\prime \prime} \not \vDash \psi$, or $p^{\prime \prime}=q$ and $q \not \vDash \psi$. So, $p_{2} \models\langle a\rangle \psi$.
$(\mathrm{b})(\Rightarrow)$ The proof is along the lines of the previous proof. Assume that $\varphi_{1} \not \models[a] \psi$, and let $p_{1}$ such that $p_{1} \models \varphi_{1}$ and $p_{1} \not \models[a] \psi$. Suppose that the same holds for $p_{2}$ and let $p_{2}$ such that $p_{2} \models \varphi_{2}$ and $p_{2} \not \models[a] \psi$. So, both $p_{1}$ and $p_{2}$ have an $a$-transition. As in the case of (a), we can construct $p_{i}^{\prime}$ by removing and adding transitions. In this case, for every $b \in S \backslash I\left(p_{i}\right)$, we add transitions b. $q$ as above, where $q$ can be any process, and we remove all transitions $p_{i} \xrightarrow{b} p^{\prime}$ for every $b \in I\left(p_{i}\right) \backslash S$ except for the $a$-transitions. At the end, $p_{i}^{\prime} \models \varphi_{i}$ and $I\left(p_{i}\right)=S \cup\{a\}$. As in the proof of (a), $p_{1}^{\prime} \wedge p_{2}^{\prime} \models \varphi_{1} \wedge \varphi_{2}$ and so $p_{1}^{\prime} \wedge p_{2}^{\prime} \models[a]$ ff. But $I\left(p_{1}\right)=I\left(p_{2}\right)=S \cup\{a\}$, contradiction. As a result, $\varphi_{2} \models[a]$ ff.

If $\varphi^{s} \neq \mathbf{t t}$ and it does not contain disjunctions, then $\varphi^{s}$ is characteristic within $\mathcal{L}_{R S}$.

- Lemma 145. Let $\varphi \in \mathcal{L}_{R S}$ be a formula given by the grammar $\varphi::=\varphi \wedge \varphi|\langle a\rangle \varphi|[a]$ ff. If $\varphi$ is saturated and for every $\langle a\rangle \psi \in \operatorname{Sub}(\varphi), \psi$ is saturated, then $\varphi$ is prime and a process $p_{\varphi}$ for which $\varphi$ is characteristic within $\mathcal{L}_{R S}$ can be constructed in polynomial time.

Proof. Since a saturated formula is consistent, $\varphi$ is prime iff $\varphi$ is characteristic within $\mathcal{L}_{R S}$. We describe a polynomial-time recursive algorithm that constructs $p_{\varphi}$ and we prove that $\varphi$ is characteristic for $p_{\varphi}$. Since $\varphi$ is saturated, $I(\varphi)=\{S\}$, for some $S \subseteq A$. Moreover, w.l.o.g. $\varphi=\bigwedge_{i=1}^{k} \varphi_{i}$, where $k \geq 1$, every $\varphi_{i}$ is of the form $\langle a\rangle \varphi^{\prime}$ or $[a] \mathrm{ff}$, and $\varphi^{\prime}$ is given by the same grammar as $\varphi$. We construct $p_{\varphi}$ such that for every $\varphi_{i}=\langle a\rangle \varphi^{\prime}, p_{\varphi} \xrightarrow{a} p_{\varphi^{\prime}}$, where $p_{\varphi^{\prime}}$ is constructed recursively, and $p_{\varphi}$ has no other outgoing edge. First, we show that $p_{\varphi} \models \varphi$. Let $\varphi_{i}=\langle a\rangle \varphi^{\prime}$. Then, $p_{\varphi} \xrightarrow{a} p_{\varphi^{\prime}}$ and from inductive hypothesis, $p_{\varphi^{\prime}} \models \varphi^{\prime}$. So, $p_{\varphi} \models \varphi_{i}$. If $\varphi_{i}=[a]$ ff , then there is no $\varphi_{i}$ such that $\varphi_{i}=\langle a\rangle \varphi^{\prime}$, since $\varphi$ is consistent. So $p_{\varphi} \nrightarrow$ and $p_{\varphi} \models \varphi_{i}$. As a result, $p_{\varphi} \models \varphi_{i}$ for every $1 \leq i \leq k$. To prove that $\varphi$ is characteristic for $p_{\varphi}$, we show that for every $p, p \models \varphi$ iff $p_{\varphi} \lesssim_{R S} p$. Let $p \models \varphi$. Since $p_{\varphi} \models \varphi$ is also true, from Lemma $12, I(p)=I\left(p_{\varphi}\right)=S$. If $p_{\varphi} \xrightarrow{a} p^{\prime}$, then from construction, $p^{\prime}=p_{\varphi^{\prime}}$, where $\varphi_{i}=\langle a\rangle \varphi^{\prime}$ for some $1 \leq i \leq k$, and as we showed above, $p_{\varphi^{\prime}} \models \varphi^{\prime}$. So, $p \models \varphi_{i}$ and $p \xrightarrow{a} p^{\prime \prime}$ such that $p^{\prime \prime} \models \varphi^{\prime}$. From inductive hypothesis, $p_{\varphi^{\prime}} \lesssim_{R S} p^{\prime \prime}$. So $p_{\varphi} \lesssim_{R S} p$. Inversely, assume that $p_{\varphi} \lesssim_{R S} p$. Let $\varphi_{i}=\langle a\rangle \varphi^{\prime}$. We have that $p_{\varphi} \xrightarrow{a} p_{\varphi^{\prime}}$ and $p_{\varphi^{\prime}} \models \varphi^{\prime}$. Hence, $p \xrightarrow{a} p^{\prime \prime}$ such that $p_{\varphi^{\prime}} \lesssim_{R S} p^{\prime \prime}$, and so $p^{\prime \prime} \models \varphi^{\prime}$. So, $p \models\langle a\rangle \varphi^{\prime}$. Let $\varphi_{i}=[a] \mathrm{ff}$. Then, $p_{\varphi} \stackrel{a}{\nrightarrow}$, and so $p \stackrel{a}{\nrightarrow}$, which implies that $p \models[a]$ ff. So, $p \models \varphi_{i}$, for every $1 \leq i \leq k$.

- Lemma 146. Let $\varphi \in \mathcal{L}_{R S}$ be a saturated formula given by the grammar $\varphi::=\varphi \wedge \varphi \mid \varphi \vee$ $\varphi|\langle a\rangle \varphi|[a]$ ff such that for every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi), \varphi^{\prime}$ is saturated; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be the $D N F$ of $\varphi$. Then, $\varphi_{i}$ is saturated and for every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}\left(\varphi_{i}\right), \varphi^{\prime}$ is saturated.

Proof. From Lemma 42, $\varphi \equiv \bigvee_{i=1}^{k} \varphi_{i}$, and so $I(\varphi)=\bigcup_{i=1}^{k} I\left(\varphi_{i}\right)$. Consequently, $I\left(\varphi_{i}\right)=$ $I(\varphi)$ for every $1 \leq i \leq k$, which implies that $I\left(\varphi_{i}\right)$ is a singeton and $\varphi_{i}$ is saturated. If $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}\left(\varphi_{i}\right)$ for some $1 \leq i \leq k$, then $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi)$ and so $\varphi^{\prime}$ is saturated.

Let $\varphi \in \mathcal{L}_{R S}$ be a saturated formula given by the grammar $\varphi::=\varphi \wedge \varphi \mid \varphi \vee$ $\varphi|\langle a\rangle \varphi|[a]$ ff such that for every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi), \varphi^{\prime}$ is saturated; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. The proofs of Proposition 147-Corollary 151 are analogous to the proofs of Proposition 79-Corollary 85, where here we also make use of the fact that every $\varphi_{i}$ is characteristic for $p_{\varphi_{i}}$ from Lemmas 145 and 146.

- Proposition 147. Let $\varphi \in \mathcal{L}_{R S}$ be a saturated formula given by the grammar $\varphi::=$ $\varphi \wedge \varphi|\varphi \vee \varphi|\langle a\rangle \varphi \mid[a]$ ff such that for every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi), \varphi^{\prime}$ is saturated; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. Then, $\varphi$ is prime iff $\varphi \models \varphi_{j}$ for some $1 \leq j \leq k$.
- Lemma 148. Let $\varphi \in \mathcal{L}_{R S}$ be a saturated formula given by the grammar $\varphi::=\varphi \wedge \varphi \mid \varphi \vee$ $\varphi|\langle a\rangle \varphi|[a]$ ff such that for every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi), \varphi^{\prime}$ is saturated; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be the $D N F$ of $\varphi$. If for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}, 1 \leq i, j \leq k$, there is some process $q$ such that $q \lesssim R S p_{\varphi_{i}}, q \lesssim R S p_{\varphi_{j}}$, and $q \models \varphi$, then there is some process $q$ such that $q \lesssim R S p_{\varphi_{i}}$ for every $1 \leq i \leq k$, and $q \models \varphi$.
- Corollary 149. Let $\varphi \in \mathcal{L}_{R S}$ be a saturated formula given by the grammar $\varphi::=\varphi \wedge$ $\varphi|\varphi \vee \varphi|\langle a\rangle \varphi \mid[a]$ ff such that for every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi), \varphi^{\prime}$ is saturated; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. If for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}, 1 \leq i, j \leq k$, there is some process $q$ such that $q \lesssim_{R S} p_{\varphi_{i}}, q \lesssim_{R S} p_{\varphi_{j}}$, and $q \models \varphi$, then there is some $1 \leq m \leq k$, such that $p_{\varphi_{m}} \lesssim R S p_{\varphi_{i}}$ for every $1 \leq i \leq k$.
- Proposition 150. Let $\varphi \in \mathcal{L}_{R S}$ be a saturated formula given by the grammar $\varphi::=$ $\varphi \wedge \varphi|\varphi \vee \varphi|\langle a\rangle \varphi \mid[a]$ ff such that for every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi), \varphi^{\prime}$ is saturated; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. Then, $\varphi$ is prime iff for every pair $p_{\varphi_{i}}, p_{\varphi_{j}}, 1 \leq i, j \leq k$, there is some process $q$ such that $q \lesssim_{R S} p_{\varphi_{i}}, q \lesssim_{R S} p_{\varphi_{j}}$, and $q \models \varphi$.
- Corollary 151. Let $\varphi \in \mathcal{L}_{R S}$ be a saturated formula given by the grammar $\varphi::=\varphi \wedge$ $\varphi|\varphi \vee \varphi|\langle a\rangle \varphi \mid[a]$ ff such that for every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi), \varphi^{\prime}$ is saturated; let also $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. Then, $\varphi$ is prime iff for every pair $\varphi_{i}, \varphi_{j}$ there is some $1 \leq m \leq k$ such that $\varphi_{i} \models \varphi_{m}$ and $\varphi_{j} \models \varphi_{m}$.
- Corollary 152. Let $\varphi \in \mathcal{L}_{R S}$ be a formula such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some $[a]$; let also $\varphi^{s}$ be the output of $\operatorname{SATUR}(\varphi)$ and $\bigvee_{i=1}^{k} \varphi_{i}^{s}$ be $\varphi^{s}$ in DNF. Then, $\varphi^{s}$ is prime iff $\varphi^{s} \models \varphi_{j}^{s}$ for some $1 \leq j \leq k$, such that $\varphi_{j}^{s} \neq \mathbf{t t}$.

Proof. The proof is analogous to the proof of Corollary 119, where here we need that from Lemmas 140, 145, and 146, $\varphi_{j}^{s}$ is prime, for every $1 \leq i \leq k$.

- Proposition 153. Let $\varphi \in \mathcal{L}_{R S}$ be a formula such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some $[a]$; let also $\varphi^{s}$ be the output of $\operatorname{SATUR}(\varphi)$. There is a polynomial-time algorithm that decides whether $\varphi^{s}$ is prime.

Proof. We describe algorithm Prime ${ }^{\text {sat }}$ which takes $\varphi^{s}$ and decides whether $\varphi^{s}$ is prime. If $\varphi^{s}=\mathbf{t t}$, Prime $^{\text {sat }}$ rejects. Otherwise, from Lemma 140, tt $\notin \varphi^{s}$. Then, Prime ${ }^{\text {sat }}$ constructs the alternating graph $G_{\varphi^{s}}=(V, E, A, s, t)$ by starting with vertex $\left(\varphi^{s}, \varphi^{s} \Rightarrow \varphi^{s}\right)$ and repeatedly applying the rules for ready simulation, i.e. the rules from Table 1 , where rule $\left(\mathrm{L} \wedge_{i}\right)$, where $i=1,2$, is replaced by the following two rules:

$$
\frac{\varphi_{1} \wedge \varphi_{2}, \varphi \Rightarrow\langle a\rangle \psi}{\varphi_{1},\left.\varphi \Rightarrow\langle a\rangle \psi\right|_{\exists} \varphi_{2}, \varphi \Rightarrow\langle a\rangle \psi}\left(\mathrm{L} \wedge_{i}^{\circ}\right) \quad \frac{\varphi_{1} \wedge \varphi_{2}, \varphi \Rightarrow[a] \mathrm{ff}}{\varphi_{1},\left.\varphi \Rightarrow[a] \mathrm{ff}\right|_{\exists} \varphi_{2}, \varphi \Rightarrow[a] \mathrm{ff}}\left(\mathrm{~L} \wedge_{i}^{\square}\right)
$$

and ( tt ) is replaced by the rule ( $\square$ ) as given below:

$$
\frac{[a] \mathbf{f f},[a] \mathbf{f f} \Rightarrow[a] \mathbf{f f}}{\text { TRUE }}
$$

Then, Prime ${ }^{\text {sat }}$ calls $\operatorname{ReACH}_{a}\left(G_{\varphi^{s}}\right)$, where $s$ is $\left(\varphi^{s}, \varphi^{s} \Rightarrow \varphi^{s}\right)$ and $t=$ True, and accepts $\varphi^{s}$ iff there is an alternating path from $s$ to $t$. The correctness of Prime ${ }^{\text {sat }}$ can be proven similarly to the correctness of Prime ${ }^{\triangleright}$, by using analogous results proven in this subsection for ready simulation, i.e. Lemma 144 and Corollaries 150 and 152.

Finally, as in the case of complete simulation, we have the following results.

- Proposition 154. Let $\varphi \in \mathcal{L}_{R S}$ be a formula such that if $\psi \in \operatorname{Sub}(\varphi)$ is inconsistent, then $\psi=\mathrm{ff}$ and occurs in the scope of some $[a]$; let also $\varphi^{s}$ be the output of $\operatorname{SATUR}(\varphi)$. If $\varphi^{s}$ is prime, there is a polynomial-time algorithm that constructs a process for which $\varphi^{s}$ is characteristic within $\mathcal{L}_{R S}$.
- Corollary 155. Let $|A|=k, k \geq 1$. Deciding characteristic formulae within $\mathcal{L}_{R S}$ is polynomial-time solvable.

Corollary 156. Let $|A|=k, k \geq 1$ and $\varphi \in \mathcal{L}_{R S}$. If $\varphi$ is consistent and prime, then there is a polynomial-time algorithm that constructs a process for which $\varphi$ is characteristic within $\mathcal{L}_{R S}$.

## C.3.2 The case of $|A|$ being unbounded

The coNP-hardness of deciding pimality in $\mathcal{L}_{R S}$ was demonstrated in Proposition 19. To prove that the problem belongs to coNP, we first provide some properties of prime formulae.

- Definition 157. Let $\varphi \in \mathcal{L}_{R S}$ be a formula given by the grammar $\varphi::=\mathbf{t t} \mid \varphi \wedge$
$\varphi|\langle a\rangle \varphi|[a]$ ff. We define process $p_{\varphi}$ inductively as follows.
- If either $\varphi=[a]$ ff or $\varphi=\mathbf{t t}$, then $p_{\varphi}=0$.
- If $\varphi=\langle a\rangle \varphi^{\prime}$, then $p_{\varphi}=a . p_{\varphi^{\prime}}$.
- If $\varphi=\varphi_{1} \wedge \varphi_{2}$, then $p_{\varphi}=p_{\varphi_{1}}+p_{\varphi_{2}}$.
- Lemma 158. Let $\varphi \in \mathcal{L}_{R S}$ be a consistent formula given by the grammar $\varphi::=\mathbf{t t} \mid \varphi \wedge$ $\varphi|\langle a\rangle \varphi|[a] \mathrm{ff}$. Then,
(a) $p_{\varphi} \models \varphi$, and
(b) if $\mathbf{t t} \notin \operatorname{Sub}(\varphi), \varphi$ is saturated and for every $\langle a\rangle \varphi^{\prime} \in \operatorname{Sub}(\varphi), \varphi^{\prime}$ is saturated, then $\varphi$ is characteristic within $\mathcal{L}_{R S}$ for $p_{\varphi}$.

Proof. The proof of (a) is similar to the proof of Lemma 116, whereas the proof of (b) is analogous to the proof of Lemma 145.

- Lemma 159. Let $\varphi$ be a consistent and saturated formula given by the grammar $\varphi::=$ tt $|\varphi \wedge \varphi|\langle a\rangle \varphi \mid[a]$ ff. If $\varphi \models \psi$ for some prime $\psi$ and $\operatorname{SATUR}(\varphi) \neq \mathbf{t t}$, then $\operatorname{Satur}(\varphi) \models \psi$.

Proof. We denote $\operatorname{Satur}(\varphi)$ by $\varphi^{s}$. Note that $\psi$ is characteristic within $\mathcal{L}_{R S}$ for some process, which we denote by $p_{\psi}$. For every process $p, p \models \varphi \Longrightarrow p \models \psi$ by assumption, and from Corollary 40, $p_{\psi} \lesssim_{R S} p$. Since $\varphi^{s} \neq \mathbf{t t}$ and $\varphi^{s}$ does not contain disjunctions, $\varphi^{s}$ is characteristic within $\mathcal{L}_{R S}$ from Lemmas 140 and 145. Thus, $\varphi^{s}$ is characteristic within $\mathcal{L}_{R S}$ for $p_{\varphi^{s}}$, where $p_{\varphi^{s}}$ is the process that corresponds to $\varphi^{s}$ and is constructed as described in Definition 157. We prove that $p_{\psi} \lesssim_{R S} p_{\varphi^{s}}$ by induction on the type of substitutions made by procedure Satur in $\varphi$.

- Let $\varphi^{s}=\varphi\left[\mathbf{t t} \wedge \varphi^{\prime} / \varphi^{\prime}\right]$. Then $\varphi^{s} \equiv \varphi$ and as was shown above $p_{\psi} \lesssim{ }_{R S} p$ for every $p$ that satisfies $\varphi$, or equivalently, for every $p$ that satisfies $\varphi^{s}$. In particular, $p_{\varphi^{s}}$ described in Definition 157, satisfies $\varphi^{s}$ from Lemma 158.
- Let $\varphi^{s}$ be derived from $\varphi$ by substituting an occurrence of $\langle a\rangle \varphi^{\prime}$ with $\mathbf{t t}$, where $\varphi^{\prime}$ is a non-saturated formula. Then, there is a process $p_{t t}=0$ such that $p_{\varphi^{s}} \xrightarrow{t} p_{t t}, t \in A^{*}$, and $p_{t t}$ corresponds to this occurrence of $\mathbf{t t}$ that substituted $\langle a\rangle \varphi^{\prime}$ in $\varphi$. We consider two copies of $p_{\varphi^{s}}$, namely $p_{\varphi^{s}}^{1}$ and $p_{\varphi^{s}}^{2}$, that are as follows: for $i=1,2, p_{\varphi^{s}}^{i}$ is $p_{\varphi^{s}}$ where $p_{t t}$ is substituted with $p_{t t}^{i}=a . p_{i}$, where $p_{1}, p_{2}$ are two processes that satisfy $\varphi^{\prime}$ and $I\left(p_{1}\right) \neq I\left(p_{2}\right)$. The existence of $p_{1}, p_{2}$ is guaranteed by Lemma 128. Then, $p_{\varphi^{s}}^{i} \models \varphi$, and by assumption, $p_{\varphi^{s}}^{i} \models \psi$ and $p_{\psi} \lesssim_{R S} p_{\varphi^{s}}^{i}$ from Corollary 40, for both $i=1,2$. If there is $p_{\psi} \xrightarrow{t} p^{\prime}$, such that $p_{\varphi^{s}}^{1} \xrightarrow{t} p_{1}$ and $p^{\prime} \lesssim_{R S} p_{1}$, then $p^{\prime} \mathbb{L}_{R S} p_{2}$, since $I\left(p_{1}\right) \neq I\left(p_{2}\right)$, and so there is $p_{\varphi^{s}}^{2} \xrightarrow{t} q_{2}$ such that $p^{\prime} \lesssim_{R S} q_{2}$ and $q_{2} \neq p_{2}$. Note that $q_{2}$ is the copy of some $q$ such that $p_{\varphi^{s}} \xrightarrow{t} q$ and $p^{\prime} \lesssim_{R S} q$ by the definition of $p_{\varphi^{s}}^{2}$. As a result, for every $p_{\psi} \xrightarrow{a} p^{\prime}$, there is $p_{\varphi^{s}} \xrightarrow{a} p^{\prime \prime}$ such that $p^{\prime} \lesssim_{R S} p^{\prime \prime}$. So, $p_{\psi} \lesssim_{R S} p_{\varphi^{s}}$.
Since $\psi, \varphi^{s}$ are characteristic within $\mathcal{L}_{R S}$ for $p_{\psi}$ and $p_{\varphi^{s}}$, respectively, we have that $\varphi^{s} \models \psi$ from Corollary 40.
- Lemma 160. Let $\varphi$ be a consistent and saturated formula given by the grammar $\varphi::=$
tt $|\varphi \wedge \varphi|\langle a\rangle \varphi \mid[a]$ ff. If $\varphi \models \psi$ for some prime $\psi$, then $\operatorname{SATUR}(\varphi) \neq \mathbf{t t}$.

Proof. Let $\varphi^{s}$ denote $\operatorname{SATUR}(\varphi)$ and suppose that $\varphi^{s}=\mathbf{t t}$. Let also $p_{\psi}$ and $p_{\varphi^{s}}$ be as in the proof of Lemma 159. In the proof of Lemma 159, we showed that $p_{\psi} \lesssim_{R S} p_{\varphi^{s}}$. In this case, from Definition 157, $p_{\varphi^{s}}=0$, which means that $p_{\psi}=0$ and $\psi \equiv \mathbf{0}$. Since $\varphi \models \psi, \varphi \equiv \mathbf{0}$ as well. Then, it is not possible that $\varphi^{s}=\mathbf{t t}$ because of the type of the substitutions made by Satur, contradiction.

- Lemma 161. Let $\varphi \in \mathcal{L}_{R S}$ and $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. Then, $\varphi$ is prime iff there is some prime $\varphi_{i}$, where $1 \leq i \leq k$, such that for every consistent $\varphi_{j}$, where $1 \leq j \leq k$, $\operatorname{SATUR}\left(\varphi_{j}\right) \models \varphi_{i}$.

Proof. For every $\varphi \in \mathcal{L}_{R S}$, let $\varphi^{s}$ denote $\operatorname{Satur}(\varphi)$.
$(\Leftarrow)$ Assume that for every consistent $\varphi_{j}, \varphi_{j}^{s} \models \varphi_{i}$, for some prime $\varphi_{i}$. For every $\varphi \in \mathcal{L}_{R S}$, it holds that $\varphi \models \varphi^{s}$ as was shown in the proof of Proposition 143. Hence, $\varphi_{j} \models \varphi_{j}^{s}$ and so $\varphi_{j} \models \varphi_{i}$. Consequently, for every $\varphi_{j}, \varphi_{j} \models \varphi_{i}$. From Lemmas 42 and 44 and the fact that $\varphi_{i} \models \varphi, \varphi \equiv \varphi_{i}$, which implies that $\varphi$ is prime.
$(\Rightarrow)$ Let $\varphi$ be prime. Then, from Lemma 42 and Definition 4, there is some $\varphi_{i}$ such that $\varphi \models \varphi_{i}$. This means that $\varphi \equiv \varphi_{i}$ and so $\varphi_{i}$ is prime. From Lemma $44, \varphi_{j} \models \varphi_{i}$ for every $1 \leq j \leq k$. Assume that there is some $1 \leq j \leq k$ such that $\varphi_{j}$ is consistent. Then, from Lemmas 159 and $160, \varphi_{j}^{s} \neq$ tt and $\varphi_{j}^{s} \models \varphi_{i}$.

- Lemma 162. Let $\varphi \in \mathcal{L}_{R S}$ and $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. Then, $\varphi$ is prime iff (a) for every consistent $\varphi_{i}, 1 \leq i \leq k$, $\operatorname{SATUR}\left(\varphi_{i}\right) \neq \mathbf{t t}$, and (b) for every consistent $\varphi_{i}, \varphi_{j}, 1 \leq i, j \leq k$, there is some $\varphi_{m}, 1 \leq m \leq k$, such that $\operatorname{SATUR}\left(\varphi_{i}\right) \models \varphi_{m}$ and $\operatorname{SATUR}\left(\varphi_{j}\right) \models \varphi_{m}$.

Proof. For every $\varphi \in \mathcal{L}_{R S}$, let $\varphi^{s}$ denote $\operatorname{Satur}(\varphi)$.
$(\Rightarrow)$ This direction is immediate from Lemmas 160 and 161.
$(\Leftarrow)$ If $\varphi$ is inconsistent, then $\varphi$ is prime and we are done. Assume that $\varphi$ is consistent and (a) and (b) are true. It suffices to show that there is some $\varphi_{m}, 1 \leq m \leq k$, such that for every $1 \leq i \leq k, \varphi_{i}^{s} \models \varphi_{m}$. Then, $\varphi_{m}^{s} \models \varphi_{m}$ and consequently, $\varphi_{m} \equiv \varphi_{m}^{s} \neq \mathbf{t t}$, which implies that $\varphi_{i}$ is prime. from Lemma $161, \varphi$ is prime. Let $\varphi_{1}^{s}, \ldots, \varphi_{k}^{s}$ be $k$ consistent formulae such that for every pair $\varphi_{i}^{s}, \varphi_{j}^{s}$ there is some $\varphi_{m}$ such that $\varphi_{i}^{s} \models \varphi_{m}$ and $\varphi_{j}^{s} \models \varphi_{m}$. We prove by strong induction on $k$ that there is $\varphi_{m}$ such that for every $\varphi_{i}^{s}, \varphi_{i}^{s} \models \varphi_{m}$. For $k=2$, the argument is trivial. Let the argument hold for $k \leq n-1$ and assume we have $n$ consistent formulae $\varphi_{1}^{s}, \ldots, \varphi_{n}^{s}$. From assumption, we have that for every pair $\varphi_{i}^{s}, \varphi_{n}^{s}, 1 \leq i \leq n-1$, there is $\varphi_{\text {in }}$ such that $\varphi_{i}^{s} \models \varphi_{i n}$ and $\varphi_{n}^{s} \models \varphi_{i n}$. Then, since $\varphi_{1 n}, \ldots, \varphi_{n-1, n}$ are at most $n-1$ formulae, from inductive hypothesis there is some $\varphi_{m}, 1 \leq m \leq n$, such that $\varphi_{i n}^{s} \models \varphi_{m}$, for every $1 \leq i \leq n-1$. As a result, $\varphi_{i}^{s}, \varphi_{n}^{s} \models \varphi_{i n} \models \varphi_{\text {in }}^{s} \models \varphi_{m}$, which means that for every $1 \leq i \leq n, \varphi_{i}^{s} \models \varphi_{m}$, which was to be shown.

- Lemma 163. Let $\varphi \in \mathcal{L}_{R S}$ be a consistent formula given by the grammar $\varphi::=\varphi \wedge$
$\varphi|\langle a\rangle \varphi|[a] \mathrm{ff}$. Then, deciding whether $\varphi$ is saturated can be done in polynomial time.
Proof. W.l.o.g. $\varphi=\bigwedge_{i=1}^{m} \varphi_{i}$, where $\varphi_{i}$ is either [a]ff or $\langle a\rangle \varphi^{\prime}$, where $\varphi^{\prime}$ is given by the same grammar as $\varphi$. Let $\psi=\operatorname{Prop}(\varphi)$. Then, $\psi=\bigwedge_{i=1}^{m} \psi_{i}$, where $\psi_{i}$ is either $x_{a}$ or $\neg x_{a}$. It is not hard to see that $\varphi$ is saturated iff for every $x_{a}$, exactly one of $x_{a}, \neg x_{a}$ occurs in $\psi$.
- Proposition 164. Let $|A|$ be unbounded. Deciding prime formulae in $\mathcal{L}_{R S}$ is in coNP.

Proof. We now describe algorithm Prime ${ }_{\mathrm{RS}}^{\mathrm{u}}$ that decides primality of $\varphi \in \mathcal{L}_{R S}$. Let $\bigvee_{i=1}^{k} \varphi_{i}$ be the DNF of $\varphi$. Given $\varphi \in \mathcal{L}_{R S}$, Prime ${ }_{\mathrm{RS}}^{\mathrm{u}}$ calls the coNP algorithm for unsatisfiability of $\varphi$. If a universal guess of that algorithm accepts, Prime ${ }_{\mathrm{RS}}^{\mathrm{u}}$ accepts. Otherwise, Prime ${ }_{\mathrm{RS}}^{\mathrm{u}}$ universally guesses a pair $\varphi_{i}, \varphi_{j}$ as described in Lemma 52. Since these formulae do not
contain disjunctions, Prime ${ }_{\mathrm{RS}}^{\mathrm{u}}$ decides in polynomial time whether $\varphi_{i}, \varphi_{j}$ are consistent as explained in the proof of Lemma 58. If at least one of them is inconsistent, Prime ${ }_{\mathrm{RS}}^{\mathrm{u}}$ accepts. Otherwise, it computes $\varphi_{i}^{s}=\operatorname{Satur}\left(\varphi_{i}\right)$ and $\varphi_{j}^{s}=\operatorname{Satur}\left(\varphi_{j}\right)$, which can be done in polynomial time from Lemma 163. If at least one of $\varphi_{i}^{s}, \varphi_{j}^{s}$ is $\mathbf{t t}$, then it rejects. Otherwise, Prime ${ }_{\mathrm{RS}}^{\mathrm{u}}$ needs to check whether there is some $\varphi_{m}$ such that $\varphi_{i}^{s} \models \varphi_{m}$ and $\varphi_{j}^{s} \models \varphi_{m}$. It does that by constructing a DAG $G_{\varphi}^{i j}$ similarly to the proof of Proposition 153. It starts with vertex $s=\left(\varphi_{i}, \varphi_{j} \Rightarrow \varphi\right)$ and applies the rules that were introduced in the proof of Proposition 153 for ready simulation. Next, it solves $\mathrm{REACH}_{a}$ on $G_{\varphi}^{i j}$, where $t=$ True. Prime ${ }_{\mathrm{RS}}^{\mathrm{u}}$ accepts iff there is an alternating path from $s$ to $t$. The correctness of these last steps can be proven similarly to the case of $\mathcal{L}_{R S}$ with a bounded action set. In particular, a variant of Lemma 144 holds here since $\varphi_{i}, \varphi_{j}$ are consistent and prime. Prime ${ }_{\mathrm{RS}}^{\mathrm{u}}$ is correct due to Lemma 162.

- Corollary 165. Let $|A|$ be unbounded. Deciding prime formulae in $\mathcal{L}_{R S}$ is coNP-complete.
- Corollary 166. Let $|A|$ be unbounded. Deciding characteristic formulae within $\mathcal{L}_{R S}$ (a) is US-hard, and (b) belongs to DP.
Proof. (a) Let $\varphi$ be an instance of UniqueSat. We construct $\varphi^{\prime} \mathcal{L}_{R S}$, which is $\varphi$, where $x_{i}$ is substituted with $\left\langle a_{i}\right\rangle \mathbf{0}$ and $\neg x_{i}$ is substituted with $\left[a_{i}\right]$ ff. Note that $\varphi$ has exactly one satisfying assignment iff there is exactly one $p \in P$ such that $p \models \varphi^{\prime}$. But $\varphi^{\prime}$ is satisfied by exactly one process iff $\varphi^{\prime}$ is characteristic within $\mathcal{L}_{R S}$.
(b) This is immediate from Proposition 9 and membership of $\mathcal{L}_{R S}$-satisfiability and primality to NP and coNP, respectively.

## C. 4 Primality in $\mathcal{L}_{T S}$

## C.4.1 The case of $|A|>1$

- Proposition 20. Let $|A|>1$. Deciding prime formulae within $\mathcal{L}_{T S}$ is coNP-hard.

Proof. We show that the complement of the problem is NP-hard. We describe a polynomialtime reduction from Sat to deciding non-prime formulae within $\mathcal{L}_{T S}$, which is based on the proof of Propositions 19 and 68. The main difference is that here, the $\mathcal{L}_{T S}$ formulae that encode the literals of $\varphi$, are all characteristic within $\mathcal{L}_{T S}$.

Let $A=\{0,1\}$ and $\varphi$ be a propositional formula over the variables $x_{0}, \ldots, x_{n-1}$. We consider an additional variable $x_{n}$. We associate a positive literal $x_{i}, i=0, \ldots, n$, with the binary representation of $i$, i.e. $b_{i 1} \ldots b_{i k}$, where every $b_{i j} \in\{0,1\}$ and $k=\lceil\log (n+1)\rceil$. The binary string $b_{i_{1}} \ldots b_{i k}$ can now be mapped to formula enc $\left(x_{i}\right)=\left[\overline{b_{i_{1}}}\right] \mathbf{f f} \wedge\left\langle b_{i_{1}}\right\rangle\left(\left[\overline{b_{i 2}}\right] \mathrm{ff} \wedge\right.$ $\left.\left\langle b_{i 2}\right\rangle\left(\ldots\left(\left[\overline{b_{i k}}\right] \mathrm{ff} \wedge\left\langle b_{i k}\right\rangle \mathbf{0}\right) \ldots\right)\right)$, where $\bar{b}=\left\{\begin{array}{ll}1, & \text { if } b=0, \\ 0, & \text { if } b=1\end{array}\right.$. We map a negative literal $\neg x_{i}$ to $\operatorname{enc}\left(\neg x_{i}\right)=\left[b_{i 1}\right]\left[b_{i 2}\right] \ldots\left[b_{i k}\right]$ ff. We use the encodings of literals to construct a formula similar to $\varphi^{\prime \prime}$ in the proof of Proposition 19. We set $\varphi^{\prime}=\left(\varphi \wedge \neg x_{n}\right) \vee\left(x_{n} \wedge \bigwedge_{i=1}^{n-1} \neg x_{i}\right)$. Define $\varphi^{\prime \prime}$ to be $\varphi^{\prime}$ where every literal $l$ has been substituted with enc $(l)$. Similarly to the proof of Proposition 19, we can show that $\varphi$ is satisfiable iff $\varphi^{\prime \prime}$ is not characteristic for a process within $\mathcal{L}_{T S}$. It is crucial that enc $(l)$ is characteristic for every $l$, and so in the case that $\varphi$ is inconsistent, $\varphi^{\prime \prime}$ is characteristic.

## C.4.2 The case of bounded $|A|$ and bounded modal depth

- Proposition 21. Let $|A|=k$ and $\varphi \in \mathcal{L}_{T S}$ with $\operatorname{md}(\varphi)=d$, where $k, d \geq 1$ are constants. Then, there is an algorithm that decides whether $\varphi$ is consistent and prime in linear time.

Proof. We describe algorithm $\operatorname{Char}_{T S}^{k, d}$ that decides characteristic formulae within $\mathcal{L}_{T S}$ and analyze its complexity. Char ${ }_{T S}^{k, d}$ computes all processes over $A$ that have depth less than or equal to $d+1$. We denote the set of processes over $A$ with modal depth less than or equal to $i$ by $P^{i}$. Char ${ }_{T S}^{k, d}$ also computes the set of processes in $P^{d+1}$ that satisfy $\varphi$, which we denote by $P_{\mathrm{sat}}^{d+1}$. It does so by solving model checking for every process in $P^{d+1}$. Then, Char $_{T S}^{k, d}$ checks whether there is a process $p \in P^{d}$ such that $p \models \varphi$ and for every $q \in P^{d+1}$, $q \models \varphi \Longrightarrow p \lesssim_{T S} q$. The algorithm accepts iff such a $p \in P^{d}$ exists. To show the correctness of $\mathrm{Char}_{T S}^{k, d}$, we prove the following claim.
Claim. $\varphi$ is consistent and prime iff there is $p \in P^{d}$ such that $p \models \varphi$ and for every $q \in P^{d+1}$, $q \models \varphi \Longrightarrow p \lesssim_{T S} q$.
Proof of Claim. Assume that $\varphi$ is consistent and prime. Since $\varphi$ is consistent, then it must be satisfied in a process with depth less than or equal to $d$. So, there is $q$ that satisfies $\varphi$ and $\operatorname{depth}(q)=m \leq d$. Since $\varphi$ is prime, and so characteristic within $\mathcal{L}_{T S}$, there is $p$ such that for every $p^{\prime}, p^{\prime} \models \varphi \Leftrightarrow p \lesssim_{T S} p^{\prime}$. In particular, $p^{\prime} \lesssim_{T S} q$, and since $\operatorname{traces}\left(p^{\prime}\right)=\operatorname{traces}(q)$, it holds that $\operatorname{depth}\left(p^{\prime}\right)=\operatorname{depth}(q)=m$. So, $\operatorname{depth}\left(p^{\prime}\right) \in P^{d}$. Inversely, assume that there is $p \in P^{d}$ that satisfies $\varphi$ and for every $q \in P^{d+1}, q \models \varphi \Longrightarrow p \lesssim_{T S} q$. Then, $\operatorname{depth}(p)=m$, for some $m \leq d$. This implies that if $q \in P^{d+1}$ with $\operatorname{depth}(q)=d+1$, then $q \not \vDash \varphi$, because if such a $q$ satisfies $\varphi, p \lesssim_{T S} q$ and $\operatorname{traces}(p) \neq \operatorname{traces}(q)$, which is impossible. Consequently, for every $q \in P$, if $\operatorname{depth}(q) \geq d+1$, then $q \not \vDash \varphi$, since $\operatorname{md}(\varphi)=d$. This, in turn, implies that for every $q \in P, q \models \varphi \Longrightarrow p \lesssim_{T S} q$. For the other direction, if $p \lesssim_{T S} q$, then $q \models \varphi$ from Proposition 6. As a result $\varphi$ is characteristic within $\mathcal{L}_{T S}$ for $p$.

We analyze its complexity. By an easy induction on the depth of processes, we can show that the cardinality of $P^{d+1}$ is $\mathcal{O}\left(2^{k^{d+1}}\right)$ and the size of a process in $P^{d+1}$ is $\mathcal{O}\left(k^{d+1}\right)$. Trace simulation needs to be checked on processes of constant size, and this can be done in constant time from Corollary 184. Model checking can be done in linear time in $|p|$ and $|\varphi|$ by Proposition 50. Overall the algorithm requires linear time in $|\varphi|$ if $k$ and $d$ are considered constants.

- Corollary 167. Let $|A|=k$, where $k \geq 1$ is a constant and $\varphi \in \mathcal{L}_{T S}$ with $\operatorname{md}(\varphi)=d$. Deciding whether $\varphi$ is characteristic within $\mathcal{L}_{T S}$ can be done in $\mathcal{O}\left(2^{2 k^{d+1}} \cdot k^{d+1} \cdot|\varphi|\right)$.

## C. 5 Primality in $\mathcal{L}_{3 S}$

## C.5.1 The case of $|A|>1$

We prove here PSPACE-hardness of deciding primality in $\mathcal{L}_{3 S}$ when $|A|>1$, by reducing validity of $\overline{\mathcal{L}}_{3 S}$ to it.

- Proposition 23. Let $|A|>1$. Deciding prime formulae within $\mathcal{L}_{3 S}$ is PSPACE-hard.

Proof. $\overline{\mathcal{L}}_{3 S}$-validity is PSPACE-hard from Theorem 74 and the fact that $\mathcal{L}_{2 S} \subseteq \overline{\mathcal{L}}_{3 S}$. The proof of Theorem 25 can be slightly adjusted to show that $\overline{\mathcal{L}}_{3 S}$-validity efficiently reduces to deciding whether a formula $\varphi \in \mathcal{L}_{3 S}$ is prime in $\mathcal{L}_{3 S}$.

## D The complexity of deciding preorders in van Glabbeek's branching time spectrum

In part D of the appendix, we demonstrate the gap between deciding $p \lesssim x q$, for any $X \in\{S, C S, R S, 2 S, B S\}$, and deciding $p \lesssim_{T S} q$, where $p, q$ are finite processes. This is closely related to the gap shown in Section 4.

Proposition 168. The following equivalence relations are decidable in polynomial time over finite processes:

- simulation equivalence [30, 26],
- complete simulation equivalence [26],
- ready simulation equivalence [30, 26],
- 2-nested simulation equivalence [21, 41], and
- bisimilarity [38, 30].

The same result holds true for the preorders underlying those equivalence relations.
On the contrary, we prove here that deciding the TS preorder on finite processes is PSPACE-complete under polytime Turing reductions. The problem becomes coNP-complete under polytime Turing reductions on finite loop-free processes. The hardness results are by reduction from trace equivalence of two processes. Therefore, we first define trace equivalence $\left(\equiv_{\text {trace }}\right)$, show the relationship between the TS preorder and $\equiv_{\text {trace }}$, and then establish the complexity of deciding $\lesssim_{T S}$.

- Definition 169 ([19]). We say that $p, q \in P$ are trace equivalent, denoted by $p \equiv_{\text {trace }} q$, if $\operatorname{traces}(p)=\operatorname{traces}(q)$.

The logic that characterizes $\equiv_{\text {trace }}$ contains formulae that are formed using only tt and diamond operators.

- Proposition 170 ([19]). $p \equiv_{\text {trace }} q$ iff $\mathcal{L}_{\text {trace }}(p)=\mathcal{L}_{\text {trace }}(q)$, where $\mathcal{L}_{\text {trace }}$ is defined by the grammar $\varphi_{\text {trace }}::=\mathbf{t t} \mid\langle a\rangle \varphi_{\text {trace }}$.

Unlike the equivalences of Proposition 168, checking whether two finite processes are trace equivalent is PSPACE-complete.

- Proposition 171. ([30, Lemma 4.2]). Given two finite processes $p$ and $q$, deciding whether $p \equiv_{\text {trace }} q$ is PSPACE-complete.

First, we prove that deciding $\equiv_{\text {trace }}$ reduces to deciding $\lesssim_{T S}$ on two different instances, hence we obtain a hardness result for the latter.

- Proposition 172. Given two finite processes $p$ and $q$, deciding $p \lesssim_{T S} q$ is PSPACE-hard under polytime Turing reductions.

Proof. From Lemma 30, there is a polynomial-time algorithm that decides $\equiv_{\text {trace }}$ using two oracle calls to $\lesssim_{T S}$. Since $\equiv_{\text {trace }}$ is PSPACE-hard by Proposition 171 , $\lesssim_{T S}$ is also PSPACE-hard under polytime Turing reductions.

To prove that deciding $\lesssim_{T S}$ on finite processes can be done in polynomial space, we first show in Lemma 174 how to define it recursively using $\equiv_{\text {trace }}$.

- Definition 173. Let $T=\left\{(p, q) \mid p \equiv_{\text {trace }} q\right\}$. We define $\leq_{k}^{T}$ recursively as follows:
- $p \leq_{0}^{T} q$ for all $(p, q) \in T$.
- $p \leq_{i+1}^{T} q$ iff $(p, q) \in T$ and $p \xrightarrow{a} p^{\prime}$ implies that there is $q \xrightarrow{a} q^{\prime}$ and $p^{\prime} \leq_{i}^{T} q^{\prime}$.
- Lemma 174. For finite processes, $\lesssim_{T S}=\bigcap_{i=0}^{+\infty} \leq_{i}^{T}$.

Proof. The proof is analogous to the proof of Proposition 3.3 in [26].
$\lesssim_{T S} \subseteq \bigcap_{i=0}^{+\infty} \leq_{i}^{T}$ : The proof is by induction on $i$. By definition of $\lesssim_{T S}, p \lesssim_{T S} q$ implies that $p \equiv_{\text {trace }} q$, and so $p \leq_{0}^{T} q$. For the inductive step, assume that $\lesssim_{T S} \subseteq \leq_{k}^{T}$. Let $p \lesssim_{T S} q$ and $p \xrightarrow{a} p^{\prime}$. Then, there is $q \xrightarrow{a} q^{\prime}$ with $p^{\prime} \lesssim_{T S} q^{\prime}$. By inductive hypothesis, $p^{\prime} \leq_{k}^{T} q^{\prime}$. Thus, $p \leq_{k+1}^{T} q$.
$\bigcap_{i=0}^{+\infty} \leq_{i}^{T} \subseteq \lesssim_{T S}$ : Let $R=\bigcap_{i=0}^{+\infty} \leq_{i}^{T}$ and $(p, q) \in R$. The following claim holds.
From the fact that the processes are finite, there is $m \geq 0$, such that for all $(s, t)$, $(s, t) \in R$ iff $s \leq_{m}^{T} t$.

Let $m$ be as stated in the claim. Since $(p, q) \in R$, we have that $p \leq_{m+1}^{T} q$. By definition of $\leq_{m+1}^{T}$, for every $p \xrightarrow{a} p^{\prime}$, there is $q \xrightarrow{a} q^{\prime}$, such that $p^{\prime} \leq_{m}^{T} q^{\prime}$. Then $\left(p^{\prime}, q^{\prime}\right) \in R$ from the claim. Therefore, $R$ is a $T$-simulation, i.e. a simulation that is a subset of $T=\{(p, q) \mid$ $\left.p \equiv_{\text {trace }} q\right\}$. The latter holds because $(p, q) \in R$ implies $(p, q) \in \leq_{0}^{T}$. By definition, $\lesssim_{T S}$ is the largest $T$-simulation, so $R \subseteq \lesssim_{T S}$.

The following corollary comes also from [26].

- Corollary 175 ([26]). For finite processes, let $n=\left|\left\{(p, q) \mid p \equiv_{\text {trace }} q\right\}\right|$. It holds that $\lesssim_{T S}=\bigcap_{i=0}^{n^{2}} \leq_{i}^{T}$.

Corollary 175 means that to check whether $p \lesssim_{T S} q$, with $|p|+|q|=m$, it suffices to check whether $p \leq_{i}^{T} q$, for every $0 \leq i \leq m^{4}$, since $\left|\left\{(p, q) \mid p \equiv_{\text {trace }} q\right\}\right| \leq m^{2}$. The following lemma implies that it actually suffices to check only $p \leq_{m^{4}}^{T} q$. In Proposition 177, we show that this can be done in polynomial space.

- Lemma 176. For every $i \in \mathbb{N}$, it holds that $\leq_{i+1}^{T} \subseteq \leq_{i}^{T}$.

Proof. We prove the lemma by induction. If $i=0$, then $p \leq_{1}^{T} q$ implies that $(p, q) \in T$, which means that $p \leq_{0}^{T} q$. Suppose that $\leq_{k}^{T} \subseteq^{\leq_{k-1}^{T}}$ and let $p \leq_{k+1}^{T} q$. Then, $(p, q) \in T$ and for every $p \xrightarrow{a} p^{\prime}$ there is $q \xrightarrow{a} q^{\prime}$ and $p^{\prime} \leq_{k} q^{\prime}$. By inductive hypothesis, $p^{\prime} \leq_{k-1}^{T} q^{\prime}$, which implies that $p \leq_{k}^{T} q$, and so $\leq_{k+1}^{T} \subseteq \leq_{k}^{T}$.

- Proposition 177. Given two finite processes $p$ and $q$, deciding $p \lesssim_{T S} q$ is in PSPACE.

Proof. Let two processes $p, q$ with $|p|+|q|=m$. Then, $\left|\left\{(p, q) \mid p \equiv_{\text {trace }} q\right\}\right| \leq m^{2}$. Given $p$ and $q$, and $k \in \mathbb{N}$, Algorithm 3 decides whether $p \leq_{k}^{T} q$. By Corollary 175 and Lemma 176, it holds that $p \lesssim_{T S} q$ iff $p \leq_{m^{4}}^{T} q$. Thus, Algorithm 3 on input ( $p, q, m^{4}$ ) solves the problem. The space complexity of Algorithm 3 is determined by the polynomial space needed to check whether two processes have the same traces.

In the sequel, we prove that deciding $\lesssim_{T S}$ on finite loop-free processes is coNP-complete under polytime Turing reductions. To this end, we first show that deciding trace equivalence of two finite loop-free processes is coNP-complete. The proof follows the proof of coNPcompleteness of deciding equivalence of two star-free regular expressions [27, Theorem $2.7(1)]$. Then, the hardness result of our problem is immediate from the reduction given in Proposition 172. Finally, we describe an NP algorithm that decides $\mathbb{L}_{T S}$ on finite loop-free processes, hence its complement $\lesssim_{T S}$ lies in coNP.

Proposition 178. Given two finite loop-free processes $p$ and $q$, deciding $p \equiv_{\text {trace }} q$ is coNP-complete.

Algorithm 3 Procedure Check $\leq_{i}^{T}$ on input $(p, q, k)$ checks whether $p \leq_{k}^{T} q$ holds

```
procedure Check \(_{\leq_{i}^{T}}(p, q, k)\)
    if \(\operatorname{traces}(p)=\operatorname{traces}(q)\) and \(k=0\) then accept
    if \(\operatorname{traces}(p)=\operatorname{traces}(q)\) and \(k>0\) then
    next \(\leftarrow \leftarrow 0\)
    for \(a \in\) Act do
        for state \(p^{\prime}\) do
            if \(\left(p, a, p^{\prime}\right) \in \longrightarrow\) then next \(p \leftarrow\) next \(p+1\)
        for \(j \leftarrow 1\) to nextp do \(\operatorname{tr}[j]:=\) false
        \(j \leftarrow 1\)
        for \(a \in A\) do
            for \(p \xrightarrow{a} p^{\prime}\) do
                for \(q \xrightarrow{a} q^{\prime}\) do
                    if Check \(_{\leq_{i}^{T}}\left(p^{\prime}, q^{\prime}, k-1\right)\) accepts then \(\operatorname{tr}[j] \leftarrow\) true
            \(j \leftarrow j+1\)
    for \(j \leftarrow 1\) to nextp do
        if \(\operatorname{tr}[j]=\) false then reject
    accept
end procedure
```

Proof. The coNP-complete problem DNF-TAUTOLOGY reduces to deciding $\equiv_{\text {trace }}$ on finite loop-free processes. Let $\varphi=c_{1} \vee \cdots \vee c_{m}$ be a DNF formula with variables $x_{1}, \ldots, x_{n}$. We construct a process $p_{0}$ with $A=\{0,1\}$ as follows: for every clause $c_{i}$, we add a path $p_{i 0}, p_{i 1}, \ldots, p_{i n}$, where $p_{i 0}=p_{0}$, for every $1 \leq i \leq m$, such that:

- $\left(p_{i j-1}, p_{i j}\right) \in \xrightarrow{1}$ if $x_{j}$ is a literal in $c_{i}$,
- $\left(p_{i j-1}, p_{i j}\right) \in \xrightarrow{0}$ if $\neg x_{j}$ is a literal in $c_{i}$,
- $\left(p_{i j-1}, p_{i j}\right) \in \xrightarrow{1}$ and $\left(p_{i j-1}, p_{i j}\right) \in \xrightarrow{0}$ if none of $x_{j}, \neg x_{j}$ is a literal in $c_{i}$.

We can also easily construct process $q$ with $\operatorname{traces}(q)=\{0,1\}^{n}$ in polynomial time. Formula $\varphi$ is a tautology iff $\operatorname{traces}\left(p_{0}\right)=\operatorname{traces}(q)$. Thus, deciding $\equiv_{\text {trace }}$ is coNP-hard.

To check whether $p \equiv_{\text {trace }} q$ holds, for finite loop-free processes $p$ and $q$, it suffices to verify that every trace of $p$ is also a trace of $q$ and vice versa. Each such verification fails iff one can guess a trace $t$ of one of the two processes that is not a trace of the other. Moreover, since $p$ and $q$ are finite and loop-free, the length of $t$ is at most the maximum depth of those two processes. This implies that checking whether $p \not \equiv_{\text {trace }} q$ is in NP and therefore deciding whether $p \equiv_{\text {trace }} q$ holds is in coNP.

- Proposition 179. Given two finite loop-free processes $p$ and $q$, deciding $p \lesssim_{T S} q$ is coNP-hard under polytime Turing reductions.

Proof. The proposition follows from the reduction described in the proof of Proposition 172 and the coNP-hardness of deciding $\equiv_{\text {trace }}$ on finite loop-free processes that was proven in Proposition 178.

The algorithm for deciding $\mathcal{L}_{T S}$ on finite loop-free processes described in Proposition 181 uses the algorithm given in the following lemma as a subroutine.

- Lemma 180. Given $n$ pairs of finite loop-free processes $\left(p_{1}, q_{1}\right), \ldots,\left(p_{n}, q_{n}\right)$, deciding whether $p_{i} \not \equiv_{\text {trace }} q_{i}$, for every $i \in\{1, \ldots, n\}$, is NP-complete.

Proof. Membership in NP: Consider the non-deterministic polynomial-time Turing machine that, for every $i \in\{1, \ldots, n\}$, guesses a trace $t_{i}$ and verifies that $t_{i}$ belongs to exactly one of $\operatorname{traces}\left(p_{i}\right)$ and $\operatorname{traces}\left(q_{i}\right)$. The problem is NP-hard even for $i=1$ from Proposition 178.

- Proposition 181. Given finite loop-free processes $p$ and $q$, deciding $p \mathcal{L}_{T S} q$ is in NP.

Proof. Let $p, q$ be two finite loop-free processes with $|p|+|q|=m$. By Corollary 175 and Lemma 176, it holds that $p \lesssim_{T S} q$ iff $p \leq_{m^{4}}^{T} q$. Therefore, $p \mathbb{Z}_{T S} q$ iff Algorithm 3 rejects on input ( $p, q, m^{4}$ ).
Claim 1. Algorithm 3 rejects on input $\left(p, q, m^{4}\right)$ iff either $\operatorname{traces}(p) \neq \operatorname{traces}(q)$ or at some point it examines a pair $\left(p^{*}, q^{*}\right) \in S_{p} \times S_{q}$, such that $\operatorname{traces}\left(p^{*}\right)=\operatorname{traces}\left(q^{*}\right)$ and there is $p^{*} \xrightarrow{a} p^{* *}$ such that for every $q^{*} \xrightarrow{a} q^{* *}, \operatorname{traces}\left(p^{* *}\right) \neq \operatorname{traces}\left(q^{* *}\right)$.
Claim 1 states that Algorithm 3 rejects on input ( $p, q, m^{4}$ ) iff it finds two states in $S_{p}$ and $S_{q}$, respectively, that are not trace equivalent. We call these states non-equivalent witnesses.

Let $M$ denote the non-deterministic polynomial-time Turing machine that does the following: Guess a set of pairs $B a d \subseteq S_{p} \times S_{q}$ and for all $\left(p^{\prime}, q^{\prime}\right) \in B a d$, verify that $\operatorname{traces}\left(p^{\prime}\right) \neq \operatorname{traces}\left(q^{\prime}\right)$. Call Algorithm 3 on input ( $p, q, m^{4}$ ), where for every $\left(p^{\prime}, q^{\prime}\right) \in S_{p} \times S_{q}$ consider that $\operatorname{traces}\left(p^{\prime}\right) \neq \operatorname{traces}\left(q^{\prime}\right)$ iff $\left(p^{\prime}, q^{\prime}\right) \in$ Bad. Accept iff Algorithm 3 rejects.
Claim 2. $M$ has an accepting path iff $p \mathbb{Z}_{T S} q$.
Proof of Claim 2. If $M$ has an accepting path, then $M$ guesses a set Bad on this path that makes Algorithm 3 reject on $\left(p, q, m^{4}\right)$. By Claim 1 and the fact that Algorithm 3 considers that two processes are not trace equivalent iff their pair belongs to Bad, this means that Algorithm 3 finds two non-equivalent witnesses in Bad. Since $M$ verifies that for all $\left(p^{\prime}, q^{\prime}\right) \in B a d, \operatorname{traces}\left(p^{\prime}\right) \neq \operatorname{traces}\left(q^{\prime}\right)$, Algorithm 3 correctly rejects. Conversely, if $p \not \mathbb{Z}_{T S} q$, then Algorithm 3 rejects on input ( $p, q, m^{4}$ ), which in turn implies that Algorithm 3 on ( $p, q, m^{4}$ ) finds two non-equivalent witnesses $p^{* *}$ and $q^{* *}$ by Claim 1 . Hence, there is a path of $M$ on which $M$ guesses Bad such that $\left(p^{* *}, q^{* *}\right) \in B a d$, and so the path is accepting. $\&$

The following two corollaries are immediately derived from Propositions 178, 179, and 181.

- Corollary 182. Given two finite loop-free processes $p$ and $q$, deciding $p \lesssim_{T S} q$ is coNPcomplete under polytime Turing reductions.
- Corollary 183. If deciding $\equiv_{\text {trace }}$ on finite loop-free processes is in P , then $\mathrm{P}=\mathrm{NP}$. The same holds for deciding $\lesssim_{T S}$.
- Corollary 184. Let $p, q$ be finite loop-free processes. If the size of $p$ and $q$ is bounded by a constant, then $p \lesssim_{T S} q$ can be solved in constant time.

Proof. The NP algorithm for deciding $p \mathbb{Z}_{T S} q$ that was provided in the proof of Proposition 181 can give a deterministic algorithm for the same problem running in exponential time w.r.t. $|p|$ and $|q|$. If $|p|$ and $|q|$ are bounded by a constant, then the running time of the algorithm is also bounded by a constant.

## E Finding characteristic formulae: the gap between trace simulation preorder and the rest of the preorders

Full proofs of results of Section 4 can be found in this part of the appendix.

Figure 1 Process $p_{2}$ for which $\langle a\rangle(\langle a\rangle \mathbf{t t} \wedge\langle b\rangle \mathbf{t t}) \wedge\langle b\rangle(\langle a\rangle \mathbf{t t} \wedge\langle b\rangle \mathbf{t t})$ is characteristic within $\mathcal{L}_{S}$.

## E. 1 The simulation, complete simulation, ready simulation, n-nested simulation, and bisimilarity

Let $X \in\{S, C S\}$ or $X=R S$ and $|A|$ is bounded by a constant. If formulae are given in explicit form, then finding the characteristic formula for a finite loop-free process is not in P , unless $P=N P$.

- Lemma 185. Let $X \in\{S, C S\}$ or $X=R S$ and $|A|=k$, where $k \geq 1$ is a constant. Assume that $\varphi$ is characteristic for a finite loop-free process $p$ within $\mathcal{L}_{X}$ and is given in explicit form. Then there is an algorithm that generates all traces of $p$ in polynomial time with respect to $|\varphi|$.

Proof. Let $X=S$ and let $\varphi$ be a formula in explicit form that is characteristic for some finite, loop-free process $p$ within $\mathcal{L}_{S}$. Note that if $\varphi$ is also characteristic for some process $q$, then by Corollary 39, $p \equiv_{S} q$. Then, by Definition 7 , for every $\psi \in \mathcal{L}_{S}, p \models \psi$ iff $q \models \psi$, which implies that for every $\psi \in \mathcal{L}_{T}, p \models \psi$ iff $q \models \psi$, since $\mathcal{L}_{T} \subseteq \mathcal{L}_{S}$. Then, $\operatorname{traces}(p)=\operatorname{traces}(q)$ by Definition 169 and Proposition 170. To generate all traces of $p$, we find process $q$ for which $\varphi$ is characteristic within $\mathcal{L}_{S}$ as described in the proof of Corollary 91. Process $q$ is of polynomial size w.r.t. $|\varphi|$. By traversing all paths of $q$, which can be done using the Depth-First Search algorithm, we can generate all traces of $q$ in time polynomial in $|q|$, and so polynomial in $|\varphi|$. Using Corollaries 125 and 156 and the fact that $\mathcal{L}_{T} \subseteq \mathcal{L}_{X}, X \in\{C S, R S\}$, we can prove the lemma for $X=C S$ and $X=R S$ with a bounded action set.

- Remark 186. Lemma 185 does not imply that given a finite loop-free process $p$, there is an algorithm that generates all traces of $p$ in polynomial time. For example, let $p_{2}$ be the process shown in Figure 1. The characteristic formula for $p_{2}$ within $\mathcal{L}_{S}$ is $\chi\left(p_{2}\right)=$ $\langle a\rangle(\langle a\rangle \mathbf{t t} \wedge\langle b\rangle \mathbf{t t}) \wedge\langle b\rangle(\langle a\rangle \mathbf{t t} \wedge\langle b\rangle \mathbf{t t})$. In general, consider processes $p_{n}, n \in \mathbb{N}$, defined inductively as follows: $p_{0}=0$ and for every $n>0, p_{n}=a \cdot p_{n-1}+b \cdot p_{n-1}$. We have that $\left|\chi\left(p_{n}\right)\right|=2^{n} \cdot l_{0}+2^{n-1} \cdot 3+3$, where $l_{0}=\left|\chi\left(p_{0}\right)\right|=|\mathbf{t t}|=1$. Lemma 185 guarantees that all traces of $p_{n}$ can be generated in polynomial time with respect to $\left|\chi\left(p_{n}\right)\right|$, which is exponential in $\left|p_{n}\right|$.

Proposition 27. Let $X \in\{S, C S\}$ or $X=R S$ and $|A|$ is bounded by a constant. If finding the characteristic formula within $\mathcal{L}_{X}$ for a given finite loop-free process can be done in polynomial time when the output is given in explicit form, then $\mathrm{P}=\mathrm{NP}$.

Proof. Suppose that there is an algorithm $\mathcal{A}$ that finds the characteristic formula within $\mathcal{L}_{S}$ for a given finite loop-free process in polynomial time. We show that trace equivalence between finite loop-free processes can be solved in polynomial time, which implies $\mathrm{P}=\mathrm{NP}$ by Propositions 49 and 178. Given an input pair of finite loop-free processes $(p, q)$ for the
problem of deciding trace equivalence, consider algorithm $\mathcal{B}$ which finds the characteristic formulae $\chi(p)$ and $\chi(q)$ for $p$ and $q$, respectively, by using $\mathcal{A}$ as a subroutine. Then, it generates the traces of $p$ and $q$ in polynomial time w.r.t. $|\chi(p)|$ and $|\chi(q)|$, respectively, as described in Lemma 185, and checks whether $\operatorname{traces}(p)=\operatorname{traces}(q)$. It is not hard to see that $\mathcal{B}$ decides trace equivalence of $p$ and $q$ in polynomial time. The proof is analogous in the case of $X=C S$ and $X=R S$ with a bounded action set.

However, if the output of the problem is given in declarative form, then finding characteristic formulae within $\mathcal{L}_{X}, X \in\{S, C S, R S, 2 S, B S\}$, can be done in polynomial time.

- Proposition 187 ([29,5]). Given a finite loop-free process $p$, the characteristic formula within $\mathcal{L}_{X}, X \in\{S, C S, R S, 2 S, B S\}$, denoted by $\chi_{X}(p)$, is inductively defined as follows:

1. $\mathcal{L}_{S}: \chi_{S}(p)=\bigwedge_{a \in A} \bigwedge_{p \xrightarrow{a} p_{p^{\prime}}}\langle a\rangle \chi_{S}\left(p^{\prime}\right)$.
2. $\mathcal{L}_{C S}: \chi_{C S}(p)= \begin{cases}\mathbf{0}, & \text { if } p \nrightarrow \\ \bigwedge_{a \in A} \bigwedge_{p \xrightarrow{a} p^{\prime}}\langle a\rangle \chi_{C S}\left(p^{\prime}\right), & \text { otherwise. }\end{cases}$
3. $\mathcal{L}_{R S}: \chi_{R S}(p)=\bigwedge_{a \in A} \bigwedge_{\substack{a \\ p \rightarrow p^{\prime}}}\langle a\rangle \chi_{R S}\left(p^{\prime}\right) \wedge \bigwedge_{\substack{a \\ a \in A: p \nrightarrow}}[a] \mathrm{ff}$.
4. $\mathcal{L}_{2 S}: \chi_{2 S}(p)=\bar{\chi}_{S}(p) \wedge \bigwedge_{a \in A} \bigwedge_{p \xrightarrow{a} p^{\prime}}\langle a\rangle \chi_{2 S}\left(p^{\prime}\right)$, where $\bar{\chi}_{S}(p)=\bigwedge_{a \in A}[a] \bigvee_{p \xrightarrow{a} p^{\prime}} \bar{\chi}_{S}\left(p^{\prime}\right)$.
5. $\mathcal{L}_{B S}: \chi_{B S}(p)=\bigwedge_{p \xrightarrow{a} p^{\prime}}\langle a\rangle \chi_{B S}\left(p^{\prime}\right) \wedge \bigwedge_{a \in A}[a] \bigvee_{p \xrightarrow{a} p^{\prime}} \chi_{B S}\left(p^{\prime}\right)$.

Similarly to Proposition 187(4), we define $\chi_{3 S}(p)$ for a finite loop-free process $p$.

- Definition 188. Given a finite loop-free process p, formula $\chi_{3 S}(p)$ is inductively defined as follows:

$$
\chi_{3 S}(p)=\bar{\chi}_{2 S}(p) \wedge \bigwedge_{a \in A} \bigwedge_{p \xrightarrow{a} p^{\prime}}\langle a\rangle \chi_{3 S}\left(p^{\prime}\right), \text { where } \bar{\chi}_{2 S}(p)=\bigwedge_{a \in A}[a]\left(\bigvee_{p \xrightarrow{a} p^{\prime}} \bar{\chi}_{2 S}\left(p^{\prime}\right)\right) \wedge \chi_{S}(p) .
$$

We prove that $\chi_{3 S}(p)$ is characteristic for $p$ within $\mathcal{L}_{3 S}$ below.

- Lemma 189. For every finite loop-free process $q, q \models \bar{\chi}_{2 S}(p)$ iff $q \lesssim 2 S p$.

Proof. We prove both implications on depth $(q)$.
$(\Rightarrow)$ Assume that $q \models \bar{\chi}_{2 S}(p)$ and $q \xrightarrow{a} q^{\prime}$. Then, since $q \models \bar{\chi}_{2 S}(p)$, we have that $q^{\prime} \models$ $\bigvee_{p \xrightarrow{a} p^{\prime}} \bar{\chi}_{2 S}\left(p^{\prime}\right)$. Thus, there is some $p^{\prime}$ such that $p \xrightarrow{a} p^{\prime}$ and $q^{\prime} \models \bar{\chi}_{2 S}\left(p^{\prime}\right)$. By inductive hypothesis, $q^{\prime} \lesssim_{2 S} p^{\prime}$, which also implies that $q^{\prime} \lesssim_{S} p^{\prime}$. This means that $q \lesssim_{S} p$. Moreover, since $q \models \bar{\chi}_{2 S}(p)$, we have that $q \models \chi_{S}(p)$, and so $p \lesssim_{S} q$. Consequently, (a) for every $q \xrightarrow{a} q^{\prime}$, there is $p \xrightarrow{a} p^{\prime}$ such that $q^{\prime} \lesssim_{2 S} p^{\prime}$ and (b) $p \equiv_{S} q$, which implies that $q \lesssim_{2 S} p$. $(\Leftarrow)$ Assume that $q \lesssim_{2 S} p$ and $q \xrightarrow{a} q^{\prime}$. Since $q \lesssim_{2 S} p$, there is $p \xrightarrow{a} p^{\prime}$ such that $q^{\prime} \lesssim 2 S p^{\prime}$. By inductive hypothesis, $q^{\prime} \models \bar{\chi}_{2 S}\left(p^{\prime}\right)$. As a result, $q \models \bigwedge_{a \in A}[a] \bigvee_{p \xrightarrow{a} p_{p^{\prime}}} \bar{\chi}_{2 S}\left(p^{\prime}\right)$. Moreover, since $q \lesssim_{2 S} p$, we have that $p \lesssim_{S} q$, and so $q \models \chi_{S}(p)$. Consequently, $q \models \bar{\chi}_{2 S}(p)$.

- Proposition 190. Let $p$ be a finite loop-free process. Then, $\chi_{3 S}(p)$ is characteristic for $p$ within $\mathcal{L}_{3 S}$.

Proof. We show that for every finite loop-free process $q, p \lesssim_{3 S} q$ iff $q \models \chi_{3 S}(p)$. We prove both implications by induction on depth $(q)$.
$(\Rightarrow)$ We first show that $q \models\langle a\rangle \chi_{3 S}\left(p^{\prime}\right)$ for every $p \xrightarrow{a} p^{\prime}$. Let $p \xrightarrow{a} p^{\prime}$. Since $p \lesssim_{3 S} q$, there is $q \xrightarrow{a} q^{\prime}$ such that $p^{\prime} \lesssim_{3 S} q^{\prime}$. By inductive hypothesis, $q^{\prime} \models \chi_{3 S}\left(p^{\prime}\right)$, so $q \models\langle a\rangle \chi_{3 S}\left(p^{\prime}\right)$ and we are done. Second, we show that $q \models \bar{\chi}_{2 S}(p)$. Since $p \lesssim 3 S q$, we have that $q \lesssim_{2 S} p$. By Lemma 189, $q \models \bar{\chi}_{2 S}(p)$.
$(\Leftarrow)$ Assume that $q \models \chi_{3 S}(p)$. Reasoning as above, we see that $p \lesssim_{3 S} q$ by examining the two types of conjuncts if $\chi_{3 S}(p)$.

We can extend the results for preorder $3 S$ to every preorder $n S$, where $n \geq 3$, as follows.

- Proposition 191. Given a finite loop-free process $p$, the characteristic formula within $\mathcal{L}_{n S}$, where $n \geq 3$, denoted by $\chi_{n S}(p)$, can be inductively constructed as follows:

$$
\begin{gathered}
\chi_{n S}(p)=\bar{\chi}_{(n-1) S}(p) \wedge \bigwedge_{a \in A} \bigwedge_{p \xrightarrow{a} p^{\prime}}\langle a\rangle \chi_{n S}\left(p^{\prime}\right), \text { where } \\
\bar{\chi}_{(n-1) S}(p)=\bigwedge_{a \in A}[a]\left(\bigvee_{p \xrightarrow{a} p^{\prime}} \bar{\chi}_{(n-1) S}\left(p^{\prime}\right)\right) \wedge \chi_{(n-2) S}(p) .
\end{gathered}
$$

- Proposition 28. For every $X \in\{n S, C S, R S, B S\}$, where $n \geq 1$, there is a polynomial-time algorithm that, given a finite loop-free process $p$, outputs a formula in declarative form that is characteristic for $p$ within $\mathcal{L}_{X}$.

Proof. Let $X=2 S$ and p be a finite loop-free process. Consider the algorithm that recursively constructs $\chi_{2 S}(p)$ given in Proposition 187(4). The algorithm has to construct $\chi_{2 S}\left(p^{\prime}\right)$ and $\bar{\chi}_{S}\left(p^{\prime}\right)$ for every $p^{\prime} \in \operatorname{reach}(p)$, so a linear number of equations. We prove that for every $p^{\prime} \in \operatorname{reach}(p), \bar{\chi}_{S}\left(p^{\prime}\right)$ is of linear size by induction on $\operatorname{depth}\left(p^{\prime}\right)$. If $\operatorname{depth}\left(p^{\prime}\right)=0$, i.e. $p^{\prime}=0$, then $\bar{\chi}_{S}\left(p^{\prime}\right)=\bigwedge_{a \in A}[a]$ ff. Let $\operatorname{depth}\left(p^{\prime}\right)=d>0$. Then, $\left|\bar{\chi}_{S}\left(p^{\prime}\right)\right|=\mathcal{O}\left(\sum_{p^{\prime}}^{a} \xrightarrow{a} p^{\prime \prime}\left|\bar{\chi}_{S}\left(p^{\prime \prime}\right)\right|+\right.$ $|A|)$. By inductive definition, $\left|\bar{\chi}_{S}\left(p^{\prime \prime}\right)\right|$ is linear in $\left|p^{\prime \prime}\right|$, and so $\left|\bar{\chi}_{S}\left(p^{\prime}\right)\right|$ is linear in $\left|p^{\prime}\right|$. Using a similar argument, we can show that $\chi_{2 S}\left(p^{\prime}\right)$ is of linear size. Thus, the algorithm constructs a linear number of equations, each of which is of linear size in $|p|$. The proofs for $X \in\{n S, C S, R S, B S\}, n \neq 2$, are analogous.

- Remark 192. Proposition 28 implies alternative polynomial-time algorithms for preorder checking for preorders CS, RS, BS, and nS, where $n \geq 1$. From Proposition 51, model checking is in $\mathcal{O}(|p| \cdot \operatorname{decl}(\varphi))$, so the reduction described in Proposition 41(a) is of polynomial time complexity. Other examples of polynomial-time algorithms for deciding preorders (or equivalence relations) by computing characteristic formulae and applying a model-checking algorithm can be found in $[42,22]$.

## E. 2 The trace simulation preorder

Now we prove the complexity gap between finding characteristic formulae for preorders S , CS, RS, 2S, and BS, and the same search problem for preorder TS. In the former case, there are characteristic formulae that have declaration size and equational length polynomial in the size of the processes they characterize and they can be efficiently computed. On the contrary, for TS, even if characteristic formulae are always of polynomial declaration size and polynomial equational length, they cannot be efficiently computed, unless $P=N P$.

- Proposition 29. Assume that for every finite loop-free process $p$, there is a characteristic formula within $\mathcal{L}_{T S}$ for $p$, denoted by $\chi(p)$, such that both $\operatorname{decl}(\chi(p))$ and eqlen $(\chi(p))$ are in $\mathcal{O}\left(|p|^{k}\right)$ for some $k \in \mathbb{N}$. Given a finite loop-free process $p$, if $\chi(p)$ can be computed in polynomial time, then $\mathrm{P}=\mathrm{NP}$.

Proof. From Proposition 41(a), given two finite loop-free processes $p$ and $q$, we can decide $p \lesssim_{T S} q$ by finding $\varphi_{p}$ of the proposition and checking whether $q \models \varphi_{p}$. If the hypotheses of the proposition are true, then this reduction requires polynomial time, which combined with Propositions 179 and 49, implies $\mathrm{P}=\mathrm{NP}$.

We give an example of a family of processes, namely $\left(p_{i}\right)_{i \in \mathbb{N}}$, such that $p_{i}$ has a characteristic formula $\phi_{i}$ within $\mathcal{L}_{T S}$ such that $\operatorname{decl}\left(\phi_{i}\right)$ is linear and eqlen $\left(\phi_{i}\right)$ is exponential in $\left|p_{i}\right|$.

- Example 193. Consider process $p_{2}$ from Figure 1 with the only difference that here $A=\{a, b, c\}$. A characteristic formula within $\mathcal{L}_{T S}$ for $p_{2}$ is the one given by the equations:

$$
\begin{aligned}
\phi_{2} & =\langle a\rangle \phi_{1} \wedge\langle b\rangle \phi_{1} \wedge[c] \mathbf{f f} \wedge[a][c] \mathbf{f f} \wedge[b][c] \mathbf{f f} \wedge[a][a][c] \mathbf{f f} \wedge[a][b][c] \mathbf{f f} \wedge[b][a][c] \mathbf{f f} \wedge[b][b][c] \mathbf{f f} \\
\phi_{1} & =\langle a\rangle \phi_{0} \wedge\langle b\rangle \phi_{0} \wedge[c] \mathbf{f f} \wedge[a][c] \mathbf{f f} \wedge[b][c] \mathbf{f f} \\
\phi_{0} & =[a] \mathbf{f f} \wedge[b] \mathbf{f f} \wedge[c] \mathbf{f f} .
\end{aligned}
$$

In general, for the process $p_{n}$ defined in Remark 186 with the only difference that $A=\{a, b, c\}$, there is a characteristic formula $\phi_{n}$ with $\operatorname{decl}\left(\phi_{n}\right)=n+1$ and eqlen $\left(\phi_{n}\right)=\left(4+2^{0} \cdot 2+2^{1}\right.$. $\left.3+\cdots+2^{n} \cdot(n+2)\right)+2^{n+1}$, where 4 corresponds to the symbols $\langle a\rangle \phi_{n-1}$ and $\langle b\rangle \phi_{n-1}$, $2^{0} \cdot 2+2^{1} \cdot 3+\cdots+2^{n} \cdot(n+2)$ is the number of symbols of all subformulae in $\phi_{n}$ starting with $[a c t]$ for some $a c t \in\{a, b, c\}$, and $2^{n+1}$ is the number of $\wedge$ symbols in $\phi_{n}$.

For any process $p$, let $\operatorname{ExcTraces}(p)$ be the formula that describes which traces do not belong to $\operatorname{traces}(p)$. This formula can be written in the language given by the following grammar:

$$
\phi_{E T}::=\mathrm{ff}\left|[a] \phi_{E T}\right| \phi_{E T} \wedge \phi_{E T} .
$$

For example, let $A=\{a, b\}$ and $p$ be a process with $\operatorname{traces}(p)=\{\varepsilon, a, a b, b\}$. Then, $\operatorname{ExcTraces}(p)=[b][a] \mathbf{f f} \wedge[b][b] \mathbf{f f} \wedge[a][a] \mathbf{f f} \wedge[a][b][a] \mathbf{f f} \wedge[a][b][b] \mathbf{f f}$.

- Proposition 194. Given a finite loop-free process $p$, the characteristic formula $\chi(p)$ within $\mathcal{L}_{T S}$ can be inductively constructed as follows: $\chi(p)=\bigwedge_{a \in A} \bigwedge_{p \xrightarrow{a} q}\langle a\rangle \chi(q) \wedge \operatorname{Exc} \operatorname{Traces}(p)$.
- Corollary 195. There is an algorithm that given a finite loop-free process p, outputs a formula $\varphi$ in declarative form that is characteristic within $\mathcal{L}_{T S}$ for $p$ and has polynomial declaration size and exponential equational length in $|p|$.

Proof. Immediate from Proposition 194.

## F A note on deciding characteristic formulae modulo equivalence relations

The reader can find the full proof of Theorem 33 below.

- Theorem 33. Let $X \in\{C S, R S, T S, 2 S, 3 S, B S\}$. Validity in $\overline{\mathcal{L}}_{X}$ reduces in polynomial time to deciding characteristic formulae with respect to $\equiv_{X}$.

Proof. Given $\varphi \in \overline{\mathcal{L}}_{X}$, where $X \in\{C S, R S, T S, 2 S, 3 S, B S\}$, we construct a formula $\varphi^{\prime} \in \mathcal{L}_{X}$ such that $\varphi$ is valid if and only if $\varphi^{\prime}$ is characteristic modulo $\equiv_{X}$ for some $p$. Let $\varphi_{c h}$ be a characteristic formula modulo $\equiv_{X}$ for process $p_{c h}$ and $\varphi_{n c h} \in \mathcal{L}_{X}$ be a formula that is not characteristic modulo $\equiv_{X}$. For each $X \in\{C S, R S, T S, 2 S\}$, the formulae $\varphi_{c h}$ and $\varphi_{n c h}$ exist by Proposition 32 and the discussion in the paragraph following its proof. In the same way, we can show that characteristic formulae modulo $\equiv_{3 S}$ or $\equiv_{B S}$ exist. Given $\varphi \in \overline{\mathcal{L}}_{X}$, it can be determined in linear time whether $p_{c h} \models \varphi$. We distinguish the following two cases:

- Assume that $p_{c h} \not \vDash \varphi$. Then $\varphi$ is not valid and we set $\varphi^{\prime}=\varphi_{\text {nch }}$.
- Assume that $p_{c h} \models \varphi$. In this case, we set $\varphi^{\prime}=\neg \varphi \vee \varphi_{c h}$. We show that $\varphi$ is valid if and only if $\varphi^{\prime}$ is characteristic modulo $\equiv_{X}$ for some process $p$.
= For the implication from left to right, assume that $\varphi$ is valid. Then $\neg \varphi \vee \varphi_{c h}$ is equivalent to $\varphi_{c h}$, which is characteristic for $p_{c h}$ modulo $\equiv_{X}$.
- Conversely, assume that $\neg \varphi \vee \varphi_{c h}$ is characteristic for some process $p$ modulo $\equiv_{X}$. Let $q$ be any process. We show that $q \models \varphi$ and therefore that $\varphi$ is valid. If $p_{c h} \equiv_{X} q$, then $\mathcal{L}_{X}\left(p_{c h}\right)=\mathcal{L}_{X}(q)$ and, since $p_{c h} \models \varphi$ by assumption, it holds that $q \models \varphi$. Suppose now that $p_{c h} \not 三_{X} q$. Since we have that $p_{c h} \models \neg \varphi \vee \varphi_{c h}$ and $\neg \varphi \vee \varphi_{c h}$ is characteristic for $p$ modulo $\equiv_{X}$, it follows that $\varphi_{c h} \equiv \neg \varphi \vee \varphi_{c h}$. Therefore, $q \not \vDash \neg \varphi \vee \varphi_{c h}$, which implies that $q \models \varphi$, and we are done.

[^0]:    ${ }^{1}$ The above definition can also be phrased as follows: A formula $\varphi \in \mathcal{L}_{X}$ is characteristic for $p$ modulo $\equiv_{X}$ iff, for all $q \in P$, it holds that $q \vDash \varphi \Leftrightarrow p \equiv_{X} q$. This version of the definition is used, in the setting of bisimilarity, in references such as [1, 29].
