# Global existence of solutions to the fully parabolic chemotaxis system with logistic source under nonlinear Neumann boundary condition

Minh Le

June 5, 2024

#### Abstract

We study the existence of global boundedness solutions to the fully parabolic chemotaxis systems with logistic sources,  $ru - \mu u^2$ , under nonlinear Neumann boundary conditions,  $\frac{\partial u}{\partial \nu} = |u|^p$  where  $p > 1$  in smooth bounded domain  $\Omega \subset \mathbb{R}^n$  with  $n \geq 2$ . A recent study by Le (2023) has shown that the logistic sources can ensure that solutions are global and bounded when  $n = 2$  with  $p < \frac{3}{2}$  and  $n = 3$  with  $p < \frac{7}{5}$ . In this paper, we extend the previous findings by demonstrating the existence of global bounded solutions when  $p < \frac{3}{2}$  in any spatial dimension  $n \geq 2$ .

### 1 Introduction

In this paper, we consider the following PDEs arising from chemotaxis

<span id="page-0-0"></span>
$$
\begin{cases} u_t = \Delta u - \nabla \cdot (u \nabla v) + au - \mu u^2 & x \in \Omega, t \in (0, T_{\text{max}}), \\ \tau v_t = \Delta v + u - v & x \in \Omega, t \in (0, T_{\text{max}}), \end{cases}
$$
(1.1)

in a smooth, convex, bounded domain  $\Omega \subset \mathbb{R}^n$  with  $n \geq 2$ , where  $a, \mu > 0$  and  $\tau \in \{0, 1\}$ . The system [\(1.1\)](#page-0-0) is complemented with the nonnegative initial conditions in  $C^2(\overline{\Omega})$ , not identically zero:

$$
u(x,0) = u_0(x), \qquad v(x,0) = v_0(x), \qquad x \in \Omega,
$$
\n(1.2)

and the nonlinear Neumann boundary conditions

<span id="page-0-1"></span>
$$
\frac{\partial u}{\partial \nu} = |u|^p, \qquad \frac{\partial v}{\partial \nu} = 0, \qquad x \in \partial \Omega, t \in (0, T_{\text{max}}), \tag{1.3}
$$

where  $p > 1$  and  $\nu$  is the outward normal vector.

Under the homogeneous Neumann boundary conditions, the system [\(1.1\)](#page-0-0) when  $a = \mu = 0$ used to describe the movement of cells toward chemical concentration known as chemotaxis has been first introduced in [\[4](#page-5-0)]. This system in 2d has an intriguing property known as critical mass, which states that if the total mass is less than a certain value solutions are global and bounded (see  $\left[2, 1, 11, 14, 15\right]$  $\left[2, 1, 11, 14, 15\right]$ ) while it is greater than that value, solutions blow

up in finite time (see [\[12,](#page-5-6) [13](#page-5-7), [18](#page-6-0), [19\]](#page-6-1)). In higher dimensional case  $n \geq 3$ , this property has been proven in [\[23\]](#page-6-2) to fail to hold, precisely it was proven that finite-time blow-up solutions can be constructed for any given initial mass. In attempt to avoid blow-up phenomenon, the logistic sources,  $au - \mu u^2$ , introduced in [\[21\]](#page-6-3) can guarantee that solutions are globally bounded when  $\mu > \frac{n-2}{n}$  with  $\tau = 0$ . The similar result for fully parabolic chemotaxis system when  $\tau > 0$ , was later established in [\[25\]](#page-6-4). Additionally, those interested in further exploration of qualitative and quantitative aspects of chemotaxis systems with logistic sources can consult the following references: [\[3,](#page-5-8) [5,](#page-5-9) [7,](#page-5-10) [8,](#page-5-11) [9,](#page-5-12) [20,](#page-6-5) [24,](#page-6-6) [26,](#page-6-7) [27](#page-6-8)].

In 1990s, nonlinear parabolic equations under the nonlinear Neumann boundary conditions has been studied in [\[10,](#page-5-13) [17](#page-6-9), [16\]](#page-6-10). Particularly, the authors study the global existence and finite-time blow-up solutions of the following equation:

<span id="page-1-0"></span>
$$
\begin{cases}\nU_t = \Delta U - \mu U^Q & x \in \Omega, \ t \in (0, T_{\text{max}}), \\
\frac{\partial U}{\partial \nu} = U^P & x \in \Omega, \ t \in (0, T_{\text{max}}), \\
U(x, 0) = U_0(x) & x \in \overline{\Omega},\n\end{cases}
$$
\n(NEC)

where  $\Omega$  is a smooth bounded domain in  $\mathbb{R}^n$ ,  $Q, P > 1$ ,  $\mu > 0$  and  $U_0 \in W^{1,\infty}(\Omega)$  is a nonnegative function. It was shown that  $P = \frac{Q+1}{2}$  $\frac{+1}{2}$  is critical for the blow up in the following sense:

- 1. if  $P < \frac{Q+1}{2}$  then all solutions of [\(NBC\)](#page-1-0) exist globally and are globally bounded,
- 2. If  $P > \frac{Q+1}{2}$  (or  $P = \frac{Q+1}{2}$  $\frac{+1}{2}$  and  $\mu$  is sufficiently small ) then there exist initial functions U<sub>0</sub> such that the corresponding solutions of [\(NBC\)](#page-1-0) blow-up in  $L^{\infty}$ -norm.

Motivated by those works, [\[6](#page-5-14)] introduces and studies the chemotaxis systems [\(1.1\)](#page-0-0) under the nonlinear Neumann boundary conditions [\(1.3\)](#page-0-1). The main objective of that work is to give an answer to the question: "What is the largest value p so that logistic damping still avoids  $blow-up?$ "

In [\[6](#page-5-14)], it was shown that solutions of the parabolic-elliptic system [\(1.1\)](#page-0-0) when  $\tau = 0$  exist globally and remain bounded in time when  $p < \frac{3}{2}$ . However, in case  $\tau = 1$ , the existence of globally bounded solutions was only shown for  $n = 2$  when  $p < \frac{3}{2}$  and  $n = 3$  when  $p < \frac{7}{5}$ with additional largeness assumption on  $\mu$ . In this paper, we will show that largest value  $p$ so that logistic damping still excludes blow-up is  $\frac{3}{2}$  for the fully parabolic system [\(1.1\)](#page-0-0) when  $\tau = 1$  in any spacial dimension. This result is consistent with the results of [\(NBC\)](#page-1-0) and [\[6\]](#page-5-14) with  $\tau = 0$ , where critical power is shown to be  $P = \frac{Q+1}{2}$  with  $Q = 2$  in our problem. To be more precise, our main result reads as follows:

<span id="page-1-1"></span>**Theorem 1.1.** Let  $\Omega$  be a bounded, convex domain with smooth boundary  $\partial \Omega \in C^{\infty}$  in  $\mathbb{R}^n$ with  $n \geq 2$ . Assume that  $\tau = 1$ ,  $1 < p < \frac{3}{2}$  and initial data  $u_0, v_0$  in Holder space  $C^{2+\frac{1}{2}}(\bar{\Omega})$ are nonnegative, not identically zero such that

$$
\frac{\partial u_0}{\partial \nu} = |u_0|^p.
$$

The system [\(1.1\)](#page-0-0) under boundary condition [\(1.3\)](#page-0-1) possesses a unique nonnegative classical solution  $(u, v) \in (C^{2+p-1}(\bar{\Omega} \times [0, \infty)))^2$ . Moreover,  $u, v > 0$  in  $\Omega \times (0, \infty)$  and remain

bounded in the sense that

$$
\sup_{t>0}\Big\{\|u(\cdot,t)\|_{L^\infty(\Omega)}+\|v(\cdot,t)\|_{W^{1,\infty}(\Omega)}\Big\}<\infty.
$$

The key idea of the proof for  $\tau = 1$  when  $n = 3$  in [\[6](#page-5-14)] motivated by [\[25](#page-6-4)] is to investigate the energy functional

$$
y(t) = \int_{\Omega} u^2 + \frac{1}{3} \int_{\Omega} u |\nabla v|^2 + \int_{\Omega} |\nabla v|^4.
$$
 (1.4)

This allows us to take advantages of the term  $-\mu u^2$ , but also raises difficulties on the boundary terms when doing integral by parts. This method works well in 3D but requires  $p < \frac{7}{5}$ , which is far from the critical power  $p = \frac{3}{2}$  $\frac{3}{2}$  in the parabolic-elliptic case. However, it cannot be utilized for higher dimensional cases when  $n \geq 4$ . Instead of using this idea, there is another way to deal with fully parabolic chemotaxis problems [\[28\]](#page-6-11) by only considering the energy functional  $\int_{\Omega} u^p$ . This eases the computational significantly since we do not need the deal with the chemical concentration function  $v$  directly. This can be done thanks to the help of Lemma [2.2,](#page-3-0) which enables us to bound  $\Delta v$  by u directly.

In the following sections, we will briefly recall the local-wellposedness results for system [\(1.1\)](#page-0-0) as well as some important estimates in Section [2,](#page-2-0) and prove the main theorem in Section [3.](#page-3-1)

#### <span id="page-2-0"></span>2 Preliminaries

Let us commence this section by stating the local existence result established in [\[6\]](#page-5-14)[Theorem 2.2].

<span id="page-2-1"></span>**Lemma 2.1.** Assume that  $\Omega$  is a open convex bounded domain in  $\mathbb{R}^n$ , where  $n \geq 1$  with smooth boundary  $\partial\Omega \in C^{\infty}$  and nonnegative functions  $u_0, v_0$  are in  $C^{2+p-1}(\overline{\Omega})$  such that

$$
\frac{\partial u_0}{\partial \nu} = |u_0|^p \qquad on \ \partial \Omega,\tag{2.1}
$$

where  $p \in (1, 2)$ . Then there exists  $T_{\text{max}} \in (0, \infty]$  such that problem [\(1.1\)](#page-0-0) under the boundary condition

$$
\frac{\partial u}{\partial \nu} = |u|^p, \qquad \frac{\partial v}{\partial \nu} = 0, \qquad on \ \partial\Omega \times (0, T_{\text{max}}),
$$

admits a unique nonnegative solution u, v in  $C^{2+p-1,1+\frac{p-1}{2}}(\bar{\Omega}\times[0,T_{\max})$ . Moreover, if  $u_0, v_0$ are not identically zero in  $\Omega$  then u, v are strictly positive in  $\Omega \times (0, T_{\text{max}})$ . If  $T_{\text{max}} < \infty$ , then

$$
\limsup_{t \to T_{\text{max}}} \left\{ ||u(\cdot, t)||_{L^{\infty}(\Omega)} + ||v(\cdot, t)||_{W^{1,\infty}(\Omega)} \right\} = \infty.
$$
\n(2.2)

The forthcoming lemma concerned with the maximal Sobolev regularity for heat equation serves as a key estimate in the proof of the main result. Interested readers are referred to [\[22\]](#page-6-12)[Lemma 2.3] for details of the proof.

<span id="page-3-0"></span>**Lemma 2.2.** Assuming that  $\Omega \subset \mathbb{R}^n$  with  $n \geq 1$ ,  $p \in (n,\infty)$ ,  $f \in L^p((0,T) \times \Omega)$ ,  $g_0 \in$  $W^{2,p}(\Omega)$  and g is a classical solution to the following system

$$
\begin{cases}\ng_t = \Delta g - g + f & \text{in } \Omega \times (0, T), \\
\frac{\partial g}{\partial \nu} = 0 & \text{on } \partial \Omega \times (0, T), \\
g(\cdot, 0) = g_0 & \text{in } \Omega\n\end{cases}
$$
\n(2.3)

for some  $T \in (0,\infty]$ . There exists  $C = C(n, p, \Omega) > 0$  such that

$$
\int_{t_0}^t e^{\frac{ps}{2}} \int_{\Omega} |\Delta g|^p \, dx \, ds \le C \left( \int_{t_0}^t e^{\frac{ps}{2}} \int_{\Omega} |f|^p \, dx \, ds + e^{\frac{pt_0}{2}} \left( \|\Delta g(\cdot, t_0)\|_{L^p(\Omega)}^p \right) \right) \tag{2.4}
$$

for all  $t \in (t_0, T)$  with  $t_0 := \max\left\{1, \frac{T}{2}\right\}$  $\frac{T}{2}$ .

The following lemma established in [\[6\]](#page-5-14)[Lemma 3.6] allows us to control boundary integrals by using the diffusion and the quadratic degradation.

<span id="page-3-2"></span>Lemma 2.3. If  $r \geq \frac{1}{2}$  $\frac{1}{2}, p \in (1, \frac{3}{2})$  $\frac{3}{2}$ , and  $g \in C^1(\overline{\Omega})$ , then for every  $\epsilon > 0$ , there exists a positive constant  $C = C(\epsilon, \Omega, p, r)$  such that

$$
\int_{\partial\Omega} |g|^{p+2r-1} \le \epsilon \int_{\Omega} |g|^{2r+1} + \epsilon \int_{\Omega} |\nabla g^r|^2 + C. \tag{2.5}
$$

# <span id="page-3-1"></span>3 Proof of the main result

We are now in position to prove our main result.

*Proof of Theorem [1.1.](#page-1-1)* First, we will show that  $u \in L^{\infty}((0,T_{\max});L^{r}(\Omega))$  for some fixed  $r > n$ . A direct calculation shows

$$
\frac{1}{r}\frac{d}{dt}\int_{\Omega}u^{r} = \int_{\Omega}u^{r-1}u_{t}
$$
\n
$$
= \int_{\Omega}u^{r-1}\left[\Delta u - \nabla(u\nabla v) + au - \mu u^{2}\right]
$$
\n
$$
= -\frac{4(r-1)}{r^{2}}\int_{\Omega}|\nabla u^{\frac{r}{2}}|^{2} - \frac{r-1}{r}\int_{\Omega}u^{r}\Delta v + a\int_{\Omega}u^{r}
$$
\n
$$
- \mu \int_{\Omega}u^{r+1} + \int_{\partial\Omega}u^{r+p-1}dS.
$$
\n(3.1)

Applying Lemma [2.3](#page-3-2) with  $\epsilon = \frac{r-1}{r^2}$  $rac{(-1)}{r^2}$  yields

$$
r \int_{\partial \Omega} u^{r+p-1} dS \le \frac{r-1}{r} \int_{\Omega} |\nabla u^{\frac{r}{2}}|^2 + \frac{r-1}{r} \int_{\Omega} u^{r+1} + c_2,\tag{3.2}
$$

where  $c_2 = C(r) > 0$ . In light of Young's inequality, it follows that

<span id="page-3-3"></span>
$$
(ra + \frac{r+1}{2}) \int_{\Omega} u^r \le \frac{r\mu}{4} \int_{\Omega} u^{r+1} + c_3,
$$
\n(3.3)

where  $c_3 = C(r, a, \Omega) > 0$ . By Young's inequality, we have

<span id="page-4-1"></span><span id="page-4-0"></span>
$$
-(r-1)\int_{\Omega} u^r \Delta v \le \frac{r\mu}{4} \int_{\Omega} u^{r+1} + c_4 \int_{\Omega} |\Delta v|^{r+1},\tag{3.4}
$$

where  $c_4 = (r-1)^{r+1} \left(\frac{2}{\mu(r+1)}\right)^r$ . Collecting from [\(3.1\)](#page-3-3) to [\(3.4\)](#page-4-0) leads to

$$
\frac{d}{dt}\int_{\Omega}u^r + \frac{r+1}{2}\int_{\Omega}u^r \le c_4 \int_{\Omega} |\Delta v|^{r+1} - \left(\frac{r\mu}{2} - \frac{r-1}{r}\right)\int_{\Omega}u^{r+1} + c_5,\tag{3.5}
$$

where  $c_5 = c_2 + c_3$ . Choosing  $\mu$  sufficiently large such that  $\frac{r\mu}{4} > \frac{r-1}{r}$  $\frac{-1}{r}$  and plugging into [\(3.5\)](#page-4-1) implies

<span id="page-4-3"></span><span id="page-4-2"></span>
$$
\frac{d}{dt}\int_{\Omega}u^r + \frac{r+1}{2}\int_{\Omega}u^r \le c_4 \int_{\Omega} |\Delta v|^{r+1} - \frac{r\mu}{2}\int_{\Omega}u^{r+1} + c_5. \tag{3.6}
$$

Multiplying both sides of [\(3.6\)](#page-4-2) by  $e^{(r+1)t}$  and integrating from  $t_0$  to t where  $t_0 = \min\left\{1, \frac{T_{\text{max}}}{2}\right\}$  $\frac{\max}{2}$ , entails

$$
\int_{\Omega} u^r(\cdot, t) \le c_4 \int_{t_0}^t e^{-\frac{(r+1)(t-s)}{2}} \int_{\Omega} |\Delta v(\cdot, s)|^{r+1} - \frac{r\mu}{4} \int_{t_0}^t e^{-\frac{(r+1)(t-s)}{2}} \int_{\Omega} u^{r+1}(\cdot, s) + \int_{\Omega} u^r(\cdot, t_0) + \frac{2c_5}{r+1}.
$$
\n(3.7)

Applying Lemma [2.2](#page-3-0) to the first term of the right hand side of [\(3.7\)](#page-4-3) yields

$$
c_4 \int_{t_0}^t e^{-\frac{(r+1)(t-s)}{2}} \int_{\Omega} |\Delta v(\cdot, s)|^{r+1} \leq c_6 \int_{t_0}^t e^{-\frac{(r+1)(t-s)}{2}} \int_{\Omega} u^{r+1}(\cdot, s) + c_6 e^{-\frac{(r+1)(t-t_0)}{2}} \int_{\Omega} |\Delta v(\cdot, t_0)|^{r+1},
$$
(3.8)

where  $c_6 = C(n, r, \Omega) > 0$ . From [\(3.7\)](#page-4-3) and [\(3.8\)](#page-4-4), we obtain

<span id="page-4-4"></span>
$$
\int_{\Omega} u^r(\cdot, t) \le \left(c_6 - \frac{r\mu}{4}\right) \int_{t_0}^t e^{-\frac{(r+1)(t-s)}{2}} \int_{\Omega} u^{r+1}(\cdot, s) + c_7,\tag{3.9}
$$

where  $c_7 = c_6 e^{-\frac{(r+1)(t-t_0)}{2}} \int_{\Omega} |\Delta v(\cdot, t_0)|^{r+1} + \int_{\Omega} u^r(\cdot, t_0) + \frac{2c_5}{r+1}$ . Choosing  $\mu > \frac{4c_6}{r}$  yields that  $u \in L^{\infty}((0,T_{\max});L^r(\Omega))$  for some  $r > n$ . Applying Moser-iteration procedure established in [\[6](#page-5-14)] [Lemma 5.2] for nonlinear Neumann boundary conditions implies that  $L^{\infty}((0,T_{\max});L^{\infty}(\Omega)).$ This, together with Lemma [2.1](#page-2-1) implies that  $T_{\text{max}} = \infty$  and  $u, v$  are in  $C^{2+p-1}(\bar{\Omega} \times [0, \infty)).$ The proof is now complete. П
