## Abstract

Let  $(G, G_1)$  be a symmetric pair of holomorphic type, and we consider a pair of Hermitian symmetric spaces  $D_1 = G_1/K_1 \subset D = G/K$ , realized as bounded symmetric domains in complex vector spaces  $\mathfrak{p}_1^+ \subset \mathfrak{p}^+$  respectively. Then the universal covering group  $\tilde{G}$  of  $G$  acts unitarily on the weighted Bergman space  $\mathcal{H}_\lambda(D) \subset \mathcal{O}(D)$  on  $D$ . Its restriction to the subgroup  $\tilde{G}_1$  decomposes discretely and multiplicity-freely, and its branching law is given explicitly by Hua–Kostant–Schmid–Kobayashi’s formula in terms of the  $K_1$ -decomposition of the space  $\mathcal{P}(\mathfrak{p}_2^+)$  of polynomials on the orthogonal complement  $\mathfrak{p}_2^+$  of  $\mathfrak{p}_1^+$  in  $\mathfrak{p}^+$ . The object of this article is to compute explicitly the inner product  $\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \rangle_\lambda$  for  $f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+) \subset \mathcal{P}(\mathfrak{p}_2^+)$ ,  $x = (x_1, x_2), z \in \mathfrak{p}^+ = \mathfrak{p}_1^+ \oplus \mathfrak{p}_2^+$ , and to construct explicitly  $\tilde{G}_1$ -intertwining operators (symmetry breaking operators)  $\mathcal{H}_\lambda(D)|_{\tilde{G}_1} \rightarrow \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+))$  from holomorphic discrete series representations of  $\tilde{G}$  to those of  $\tilde{G}_1$ , which are unique up to constant multiple for sufficiently large  $\lambda$ . In this article, we treat the case  $\mathfrak{p}^+, \mathfrak{p}_2^+$  are both simple of tube type and  $\text{rank } \mathfrak{p}^+ = \text{rank } \mathfrak{p}_2^+$ . When  $\text{rank } \mathfrak{p}^+ = 3$ , we treat all partitions  $\mathbf{k}$ , and when  $\text{rank } \mathfrak{p}^+$  is general, we treat partitions of the form  $\mathbf{k} = (k, \dots, k, k-l)$ . This article is a continuation of the author’s previous article [34].

## 1 Introduction

The purpose of this article is to compute explicitly the weighted Bergman inner product of polynomials on some subspace of a bounded symmetric domain, and study the decomposition of the restriction of a holomorphic discrete series representation to some subgroup in detail. This article is a direct continuation of the author's previous article [34], and also related to the works [33, 35]. In this article, we construct symmetry breaking operators for pairs of representations that were missing in [34].

We consider a Hermitian symmetric space  $D \simeq G/K$ , realized as a bounded symmetric domain  $D \subset \mathfrak{p}^+$  in a complex vector space  $\mathfrak{p}^+$  centered at the origin. We assume that  $G$  is connected, and  $K$  is the isotropy subgroup at  $0 \in \mathfrak{p}^+$ . Let  $\tilde{G}, \tilde{K}$  denote the universal covering groups of  $G, K$ , let  $(\tau, V)$  be a finite-dimensional representation of  $\tilde{K}$ , and we consider the homogeneous vector bundle  $\tilde{G} \times_{\tilde{K}} V \rightarrow \tilde{G}/\tilde{K} \simeq D$ . Then we can trivialize this bundle, and the space of holomorphic sections is identified with the space  $\mathcal{O}(D, V) = \mathcal{O}_\tau(D, V)$  of  $V$ -valued holomorphic functions on  $D$ , on which  $\tilde{G}$  acts by

$$(\hat{\tau}(g)f)(x) := \tau(\kappa(g^{-1}, x))^{-1} f(g^{-1}x) \quad (g \in \tilde{G}, x \in D, f \in \mathcal{O}(D, V)),$$

by using some function  $\tau: \tilde{G} \times D \rightarrow \tilde{K}^{\mathbb{C}}$ . According to the choice of the representation  $(\tau, V)$  of  $\tilde{K}$ , there may or may not exist a Hilbert subspace  $\mathcal{H}_\tau(D, V) \subset \mathcal{O}_\tau(D, V)$  on which  $\tilde{G}$  acts unitarily. The classification of  $(\tau, V)$  such that  $\mathcal{H}_\tau(D, V)$  exists is given by [6, 14]. Especially, if the  $\tilde{G}$ -invariant inner product of  $\mathcal{H}_\tau(D, V)$  is given by an integral on  $D$ , then this is called a *weighted Bergman inner product* and  $(\hat{\tau}, \mathcal{H}_\tau(D, V))$  is called a *holomorphic discrete series representation*. When  $(\tau, V)$  is of the form  $(\tau, V) = (\chi^{-\lambda} \otimes \tau_0, V)$  with a suitably normalized character  $\chi$  of  $\tilde{K}$  and a fixed representation  $(\tau_0, V)$  of  $K$ , we write  $\mathcal{H}_\tau(D, V) =: \mathcal{H}_\lambda(D, V) \subset \mathcal{O}_\tau(D, V) =: \mathcal{O}_\lambda(D, V)$ . In addition, if  $(\tau, V) = (\chi^{-\lambda}, \mathbb{C})$ , then we write  $\mathcal{H}_\tau(D, V) =: \mathcal{H}_\lambda(D) \subset \mathcal{O}_\tau(D, V) =: \mathcal{O}_\lambda(D)$ .

Let us give a concrete example. We consider

$$G = SO^*(2s) := \left\{ g \in GL(2s, \mathbb{C}) \mid {}^t g \begin{pmatrix} 0 & I \\ I & 0 \end{pmatrix} g = \begin{pmatrix} 0 & I \\ I & 0 \end{pmatrix}, g \begin{pmatrix} 0 & I \\ -I & 0 \end{pmatrix} = \begin{pmatrix} 0 & I \\ -I & 0 \end{pmatrix} \bar{g} \right\}.$$

Then  $G$  acts transitively on

$$D := \{x \in \text{Alt}(s, \mathbb{C}) \mid I - xx^* \text{ is positive definite}\} \subset \mathfrak{p}^+ := \text{Alt}(s, \mathbb{C})$$

by the linear fractional transform

$$\begin{pmatrix} a & b \\ c & d \end{pmatrix} .x := (ax + b)(cx + d)^{-1}.$$

Next let  $\lambda \in \mathbb{C}$ , and let  $(\tau_0, V)$  be an irreducible representation of  $K^\mathbb{C} = GL(s, \mathbb{C})$ . Then the universal covering group  $\tilde{G}$  acts on  $\mathcal{O}(D)$  by

$$\left( \tau_\lambda \left( \begin{pmatrix} a & b \\ c & d \end{pmatrix}^{-1} \right) f \right) (x) := \det(cx + d)^{-\lambda/2} \tau_0({}^t(cx + d)) f((ax + b)(cx + d)^{-1}).$$

We note that  $\det(cx + d)^{-\lambda/2}$  is not well-defined on  $G \times D$  unless  $\lambda \in 2\mathbb{Z}$ , but is well-defined on the universal covering space  $\tilde{G} \times D$ . If  $\lambda \in \mathbb{R}$  is sufficiently large, then this preserves the weighted Bergman inner product

$$\langle f, g \rangle_\lambda := C_\lambda \int_D (f(x), g(x))_{\tau_0} \det(I - xx^*)^{(\lambda - 2(s-1))/2} dx,$$

and the corresponding Hilbert space  $\mathcal{H}_\lambda(D, V) \subset \mathcal{O}(D, V)$  gives a holomorphic discrete series representation, with the lowest  $\tilde{K}$ -type  $\chi^{-\lambda} \otimes V = \det^{-\lambda/2} \otimes V$ .

Next we consider an involution  $\sigma$  on  $G$ , and let  $G_1 := (G^\sigma)_0$  be the identity component of the group of fixed points by  $\sigma$ . Without loss of generality we may assume  $\sigma$  stabilizes  $K$ , and let  $K_1 := G_1 \cap K$ . Then  $D_1 := G_1 \cdot 0 \simeq G_1/K_1$  is either a complex submanifold or a totally real submanifold of  $D \simeq G/K$ . The pair  $(G, G_1)$  is called a symmetric pair of *holomorphic type* for the former case, and of *anti-holomorphic type* for the latter case (see [18, Section 3.4]). In the following we assume  $(G, G_1)$  is of holomorphic type. Then  $\sigma$  induces a holomorphic action on  $\mathfrak{p}^+ \simeq T_0(G/K)$ , and let  $(\mathfrak{p}^+)^\sigma =: \mathfrak{p}_1^+$ ,  $(\mathfrak{p}^+)^{-\sigma} =: \mathfrak{p}_2^+$ , so that  $\mathfrak{p}^+ = \mathfrak{p}_1^+ \oplus \mathfrak{p}_2^+$  holds. Now we consider the restriction of a holomorphic discrete series representation  $\mathcal{H}_\tau(D, V)$  of  $\tilde{G}$  to the subgroup  $\tilde{G}_1$ . Then the restriction  $\mathcal{H}_\tau(D, V)|_{\tilde{G}_1}$  decomposes into a Hilbert direct sum of irreducible representations of  $\tilde{G}_1$ , and this decomposition is given in terms of the decomposition of  $\mathcal{P}(\mathfrak{p}_2^+) \otimes (V|_{\tilde{K}_1})$  under  $\tilde{K}_1$ , where  $\mathcal{P}(\mathfrak{p}_2^+)$  denotes the space of polynomials on  $\mathfrak{p}_2^+$ . That is, if  $\mathcal{P}(\mathfrak{p}_2^+) \otimes (V|_{\tilde{K}_1})$  is decomposed under  $\tilde{K}_1$  as

$$\mathcal{P}(\mathfrak{p}_2^+) \otimes (V|_{\tilde{K}_1}) \simeq \bigoplus_j m(\tau, \rho_j) (\rho_j, W_j) \quad (m(\tau, \rho_j) \in \mathbb{Z}_{\geq 0}),$$

then  $\mathcal{H}_\tau(D, V)|_{\tilde{G}_1}$  is decomposed abstractly into the Hilbert direct sum

$$\mathcal{H}_\tau(D, V)|_{\tilde{G}_1} \simeq \sum_j^\oplus m(\tau, \rho_j) \mathcal{H}_{\rho_j}(D_1, W_j)$$

(see Kobayashi [18, Lemma 8.8], [17, Section 8]). For earlier results, see also [15], [31]). We note that if the unitary subrepresentation  $\mathcal{H}_\tau(D, V)$  is not holomorphic discrete, then its  $\tilde{K}$ -finite part  $\mathcal{H}_\tau(D, V)|_{\tilde{K}}$  may be strictly smaller than  $\mathcal{O}_\tau(D, V)|_{\tilde{K}} = \mathcal{P}(\mathfrak{p}^+) \otimes V$ , and the above decomposition may not hold in general.

One of main problems on the restriction of representations is to determine the  $\tilde{G}_1$ -intertwining operators

$$\begin{aligned} \mathcal{F}_{\tau\rho_j}^\downarrow : \mathcal{H}_\tau(D, V)|_{\tilde{G}_1} &\longrightarrow \mathcal{H}_{\rho_j}(D_1, W_j) & \text{or} & & \mathcal{O}_\tau(D, V)|_{\tilde{G}_1} &\longrightarrow \mathcal{O}_{\rho_j}(D_1, W_j), \\ \mathcal{F}_{\tau\rho_j}^\uparrow : \mathcal{H}_{\rho_j}(D_1, W_j) &\longrightarrow \mathcal{H}_\tau(D, V)|_{\tilde{G}_1} & \text{or} & & \mathcal{O}_{\rho_j}(D_1, W_j) &\longrightarrow \mathcal{O}_\tau(D, V)|_{\tilde{G}_1}. \end{aligned}$$

$\mathcal{F}_{\tau\rho_j}^\downarrow$  is called a symmetry breaking operator (SBO) and  $\mathcal{F}_{\tau\rho_j}^\uparrow$  is called a holographic operator, according to the terminology introduced in [24, 25] and [26] respectively. Such a problem is proposed by Kobayashi from the viewpoint of the representation theory (see [20]), and studied from various viewpoints for holomorphic discrete series, principal series, and complementary series representations. For example, differential SBOs for tensor products of holomorphic discrete series representations of  $SL(2, \mathbb{R})$  are called Rankin–Cohen brackets. The study of such operators is initiated by [4, 39] from the viewpoint of automorphic forms, and their generalizations for larger groups are studied by e.g., [2, 3, 36, 37, 38]. Similarly, the study of differential SBOs for spherical principal series representations of  $(G, G_1) = (SO_0(1, n+1), SO_0(1, n))$  is initiated by Juhl [16] from the viewpoint of conformal geometry on the sphere  $S^n$ , and generalized to the indefinite case [23]. Also, differential SBOs for symmetric pairs  $(G, G_1)$  of higher split rank are studied by e.g., Ibukiyama–Kuzumaki–Ochiai [13] and the author [33, 34, 35]. In addition, the complete classification of general (possibly non-differential) SBOs for spherical principal series representations of  $(G, G_1) = (O(1, n+1), O(1, n))$  is given by Kobayashi–Speh [27], and general SBOs for various symmetric pairs are being studied by e.g., [10, 11, 12, 22, 28, 32]. On the other hand, the study of holographic operators is recently initiated by Kobayashi–Pevzner [26] and is studied by, e.g., [29, 33].

Especially, it is proved by [19, 24] that in the holomorphic setting, symmetry breaking operators  $\mathcal{F}_{\tau\rho_j}^\downarrow: \mathcal{O}_\tau(D, V)|_{\tilde{G}_1} \rightarrow \mathcal{O}_{\rho_j}(D_1, W_j)$  are always given by differential operators, that is,  $\mathcal{F}_{\tau\rho_j}^\downarrow$  are given by the form

$$\mathcal{F}_{\tau\rho_j}^\downarrow: \mathcal{O}_\tau(D, V)|_{\tilde{G}_1} \longrightarrow \mathcal{O}_{\rho_j}(D_1, W_j), \quad f(x) = f(x_1, x_2) \longmapsto F_{\tau\rho_j}^\downarrow \left( \frac{\partial}{\partial x} \right) f(x) \Big|_{x_2=0}$$

for some operator-valued polynomials  $F_{\tau\rho_j}^\downarrow(z) \in \mathcal{P}(\mathfrak{p}^-) \otimes \text{Hom}_{\mathbb{C}}(V, W_j)$  on the dual space  $\mathfrak{p}^-$  of  $\mathfrak{p}^+$  (localness theorem), and  $F_{\tau\rho_j}^\downarrow(z)$  are characterized as polynomial solutions of certain systems of differential equations (F-method). This F-method gives a new insight on the study of differential symmetry breaking operators, which unifies Rankin–Cohen brackets and Juhl’s operators, and gives new results [21, 23, 25]. Also, in [33], the author proved that when  $\mathcal{H}_\tau(D, V) \subset \mathcal{O}_\tau(D, V)$  is holomorphic discrete,  $F_{\tau\rho_j}^\downarrow(z)$  is given by the inner product

$$F_{\tau\rho_j}^\downarrow(z) = \left\langle e^{(x|z)_{\mathfrak{p}^+}}, K(x_2) \right\rangle_{\mathcal{H}_\tau(D, V), x}, \quad K(x_2) \in (\mathcal{P}(\mathfrak{p}_2^+) \otimes \text{Hom}_{\mathbb{C}}(\overline{V}, \overline{W}_j))^{\tilde{K}_1}$$

up to constant multiple. Here  $(\cdot|\cdot)_{\mathfrak{p}^+}$  is a suitable non-degenerate pairing on  $\mathfrak{p}^+ \times \mathfrak{p}^-$ . Especially, if  $\mathcal{H}_\tau(D, V) = \mathcal{H}_\lambda(D)$  is a unitary highest weight representation of scalar type, then since its restriction  $\mathcal{H}_\lambda(D)|_{\tilde{G}_1}$  decomposes multiplicity-freely by [18, Theorem A], symmetry breaking operators from  $\mathcal{H}_\lambda(D)|_{\tilde{G}_1}$  are unique up to constant multiple. On the other hand, if  $\lambda$  is not in the holomorphic discrete range, we do not know a priori whether symmetry breaking operators from  $\mathcal{O}_\lambda(D)|_{\tilde{G}_1}$  are unique or not. Indeed, for tensor product case, the space of symmetry breaking operators from  $\mathcal{O}_\lambda(D) \hat{\otimes} \mathcal{O}_\mu(D)$  may become greater than 1-dimensional for some  $(\lambda, \mu) \in \mathbb{C}$  (see [25, Section 9], [35, Section 8]).

In the following, we assume  $G$  is simple, and consider the branching of the holomorphic discrete series representations of scalar type  $\mathcal{H}_\tau(D, V) = \mathcal{H}_\lambda(D)$ . We recall that  $G_1 = (G^\sigma)_0$ , and set  $G_2 := (G^{\sigma\vartheta})_0$ , where  $\vartheta$  is the Cartan involution of  $G$  corresponding to  $K$ . We additionally assume that both  $G$  and the non-compact part of  $G_2$  are of tube type, or equivalently, both  $\mathfrak{p}^+$  and  $\mathfrak{p}_2^+$  have unital Jordan algebra structures. Then one of the following holds.

- (1)  $\mathfrak{p}_2^+$  is a direct sum of two simple Jordan algebras, and  $\text{rank } \mathfrak{p}_2^+ = \text{rank } \mathfrak{p}^+$ .
- (2)  $\mathfrak{p}_2^+$  is simple, and  $\text{rank } \mathfrak{p}_2^+ = \text{rank } \mathfrak{p}^+ / 2$ .
- (3)  $\mathfrak{p}_2^+$  is simple, and  $\text{rank } \mathfrak{p}_2^+ = \text{rank } \mathfrak{p}^+$ .

For Case (1), i.e., when  $(G, G_1, G_2)$  is one of

$$\begin{array}{lll}
(SO_0(2, d+2), & SO_0(2, d) \times SO(2), & SO_0(2, 2) \times SO(d) \quad ), \\
(Sp(r, \mathbb{R}), & U(r', r''), & Sp(r', \mathbb{R}) \times Sp(r'', \mathbb{R}) \quad ), \\
(U(r, r), & U(r', r'') \times U(r'', r'), & U(r', r') \times U(r'', r'') \quad ), \\
(SO^*(4r), & U(2r', 2r''), & SO^*(4r') \times SO^*(4r'') \quad ), \\
(E_{7(-25)}, & U(1) \times E_{6(-14)}, & SL(2, \mathbb{R}) \times Spin_0(2, 10) \quad )
\end{array}$$

( $r = r' + r''$ ), let  $\mathfrak{p}_2^+ = \mathfrak{p}_{11}^+ \oplus \mathfrak{p}_{22}^+$ . Then the decomposition of  $\mathcal{H}_\lambda(D)|_{\tilde{G}_1}$  is given by the form

$$\mathcal{H}_\lambda(D)|_{\tilde{G}_1} \simeq \sum_{(\mathbf{k}, \mathbf{l}) \in \mathbb{Z}_{++}^r \times \mathbb{Z}_{++}^{r''}} \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_{11}^+) \boxtimes \mathcal{P}_{\mathbf{l}}(\mathfrak{p}_{22}^+)),$$

where  $\mathbb{Z}_{++}^r := \{\mathbf{k} = (k_1, \dots, k_r) \in \mathbb{Z}^r \mid k_1 \geq \dots \geq k_r \geq 0\}$ , and  $\varepsilon_1 \in \{1, 2\}$ . If  $\mathbf{k} = (k, \dots, k)$  and  $\mathbf{l} = (l, \dots, l)$ , then  $\mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{(k, \dots, k)}(\mathfrak{p}_{11}^+) \boxtimes \mathcal{P}_{(l, \dots, l)}(\mathfrak{p}_{22}^+))$  is of scalar type. In [33, 34], the author constructed the intertwining operators

$$\begin{aligned}
\mathcal{F}_{\lambda, \mathbf{k}, \mathbf{l}}^\uparrow &: \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_{11}^+) \boxtimes \mathcal{P}_{\mathbf{l}}(\mathfrak{p}_{22}^+))_{\tilde{K}_1} \longrightarrow \mathcal{H}_\lambda(D)_{\tilde{K}}|_{\mathfrak{g}_1}, \\
\mathcal{F}_{\lambda, \mathbf{k}, \mathbf{l}}^\downarrow &: \mathcal{H}_\lambda(D)|_{\tilde{G}_1} \longrightarrow \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_{11}^+) \boxtimes \mathcal{P}_{\mathbf{l}}(\mathfrak{p}_{22}^+)),
\end{aligned}$$

when  $\mathbf{k}$  is of the form  $\mathbf{k} = (k, \dots, k)$  ( $k \in \mathbb{Z}_{\geq 0}$ ) and  $\mathbf{l} \in \mathbb{Z}_{++}^{r''}$  is arbitrary. Next, for Case (2), i.e., when  $(G, G_1, G_2)$  is one of

$$\begin{array}{lll}
(SO_0(2, n), & SO_0(2, n-1), & SO_0(2, 1) \times SO(n-1) \quad ), \\
(Sp(2r_2, \mathbb{R}), & Sp(r_2, \mathbb{R}) \times Sp(r_2, \mathbb{R}), & U(r_2, r_2) \quad ), \\
(SU(2r_2, 2r_2), & Sp(2r_2, \mathbb{R}), & SO^*(4r_2) \quad ),
\end{array}$$

the decomposition of  $\mathcal{H}_\lambda(D)|_{\tilde{G}_1}$  is given by the form

$$\mathcal{H}_\lambda(D)|_{\tilde{G}_1} \simeq \sum_{\mathbf{k} \in \mathbb{Z}_{++}^{r_2}} \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)).$$

If  $\mathbf{k} = (k, \dots, k)$ , then  $\mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{(k, \dots, k)}(\mathfrak{p}_2^+)) \simeq \mathcal{H}_{\varepsilon_1(\lambda+k)}(D_1)$  is of scalar type. In [33, 34], the author constructed the intertwining operators  $\mathcal{F}_{\lambda, \mathbf{k}}^\uparrow, \mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  when  $\mathbf{k}$  is of the form  $\mathbf{k} = (k+1, \dots, k+1, k, \dots, k)$ , so that  $\mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+))$  is multiplicity-free under the maximal compact subgroup  $\tilde{K}_1 \subset \tilde{G}_1$ . Next, for Case (3), i.e., when  $(G, G_1, G_2)$  is one of

$$\begin{array}{lll}
(SO_0(2, n), & SO_0(2, n') \times SO(n''), & SO_0(2, n'') \times SO(n') \quad ), \\
(SU(r, r), & SO^*(2r), & Sp(r, \mathbb{R}) \quad ), \\
(SO^*(4r), & SO^*(2r) \times SO^*(2r), & U(r, r) \quad ), \\
(E_{7(-25)}, & SU(2, 6), & SU(2) \times SO^*(12) \quad )
\end{array}$$

( $n'' \geq 3$ ), the decomposition of  $\mathcal{H}_\lambda(D)|_{\tilde{G}_1}$  is given by the form

$$\mathcal{H}_\lambda(D)|_{\tilde{G}_1} \simeq \sum_{\mathbf{k} \in \mathbb{Z}_{++}^{r_2}} \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)).$$

If  $\mathbf{k} = (k, \dots, k)$ , then  $\mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{(k, \dots, k)}(\mathfrak{p}_2^+)) \simeq \mathcal{H}_{\varepsilon_1(\lambda+2k)}(D_1)$  is of scalar type. In [33], the author constructed the holographic operators  $\mathcal{F}_{\lambda, \mathbf{k}}^\uparrow$  when  $\mathbf{k}$  is of the form one of

- (3-a)  $\mathbf{k} = (k + l, k, \dots, k)$  ( $k, l \in \mathbb{Z}_{\geq 0}$ ),  
(3-b)  $\mathbf{k} = (k, \dots, k, k - l)$  ( $k, l \in \mathbb{Z}_{\geq 0}$ ,  $k \geq l$ ),  
(3-c)  $\mathbf{k} = (k_1, k_2, k_3) \in \mathbb{Z}_{++}^3$  (when  $r = \text{rank } \mathfrak{p}^+ = 3$ ),

so that  $\mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+))$  is multiplicity-free under  $\tilde{K}_1 \subset \tilde{G}_1$  for classical  $G$ , and in [34], the author constructed the symmetry breaking operators  $\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  when  $\mathbf{k}$  is of the form (3-a). In any case, if  $\mathbf{k} = (k, \dots, k)$ ,  $\mathbf{l} = (l, \dots, l)$ , then  $\mathcal{F}_{\lambda, \mathbf{k}, \mathbf{l}}^\uparrow$ ,  $\mathcal{F}_{\lambda, \mathbf{k}}^\uparrow$  are given by infinite-order differential operators whose symbols are given by multivariate  ${}_0F_1$  functions, and  $\mathcal{F}_{\lambda, \mathbf{k}, \mathbf{l}}^\downarrow$ ,  $\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  are given by finite-order differential operators whose symbols are given by multivariate  ${}_2F_1$  polynomials (or equivalently, Heckman–Opdam’s hypergeometric polynomials of type  $BC$ , see [1]). In this article, we consider  $(G, G_1, G_2)$  of Case (3), and we construct the symmetry breaking operators  $\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  when  $\mathbf{k}$  is of the form (3-b) and (3-c). The result for (3-c) is conjectured in [35, Section 7], and this is verified in this paper.

In addition, in [35], the author determined the operator norms of  $\mathcal{F}_{\lambda, \mathbf{k}, \mathbf{l}}^\downarrow$ ,  $\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  for all  $(\mathbf{k}, \mathbf{l})$ ,  $\mathbf{k}$  under a suitable normalization, and determined the Parseval–Plancherel type formula. Also, in the same paper, the author found polynomials  $b_{\mathbf{k}, \mathbf{l}}(\lambda)$ ,  $b_{\mathbf{k}}(\lambda) \in \mathbb{C}[\lambda]$  such that

$$\begin{aligned} b_{\mathbf{k}, \mathbf{l}}(\lambda) \left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} & \quad (f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_{11}^+) \boxtimes \mathcal{P}_{\mathbf{l}}(\mathfrak{p}_{22}^+)), \\ b_{\mathbf{k}}(\lambda) \left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} & \quad (f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)) \end{aligned}$$

are holomorphically continued for all  $\lambda \in \mathbb{C}$  for all  $(\mathbf{k}, \mathbf{l})$ ,  $\mathbf{k}$ . This result gives some information on the branching of  $\mathcal{O}_\lambda(D)_{\tilde{K}|_{\mathfrak{g}_1}}$  for  $\lambda$  such that  $\mathcal{O}_\lambda(D)_{\tilde{K}}$  is reducible. By [34], when  $f(x_2) \neq 0$ , the above give non-zero polynomials for all  $\lambda \in \mathbb{C}$  if, for example,  $(G, G_1, G_2)$  is of Case (1) and  $\mathbf{k} = (k, \dots, k)$ ,  $\mathbf{l} \in \mathbb{Z}_{++}^{\min\{r', r''\}} \subset \mathbb{Z}_{++}^{r''}$ ,  $(G, G_1, G_2)$  is of Case (2) and  $\mathbf{k} = (k + 1, \dots, k + 1, k, \dots, k)$ , or  $(G, G_1, G_2)$  is of Case (3) with  $r$  even and  $\mathbf{k} = (k + l, k, \dots, k)$  ((3-a)). However, for many other cases, the non-zerosness of the above formula is not proved. In this paper, we prove the non-zerosness for  $(G, G_1, G_2)$  of Case (3) (with  $r$  both even and odd) and  $\mathbf{k}$  is of the form either (3-a), (3-b) or (3-c).

This paper is organized as follows. In Section 2, we review Jordan triple systems, Jordan algebras and holomorphic discrete series representations. In Section 3, we consider the case  $\text{rank } \mathfrak{p}^+ = 3$  and general  $\mathbf{k} \in \mathbb{Z}_{++}^3$ , i.e., consider (3-c) case. In Section 4, we consider  $\mathfrak{p}^+$  of general rank, and  $\mathbf{k}$  of the form (3-b). For the convenience of the readers, we also rewrite the results for  $\mathbf{k}$  of the form (3-a) given in [34].

## 2 Preliminaries

In this section we review Jordan triple systems, Jordan algebras and holomorphic discrete series representations. We use almost the same notations as in [34, 35], and readers who read [34, 35] can skip this section, except for Section 2.6. For detail see, e.g., [7, Parts III, V], [9], [30], [40].

### 2.1 Hermitian positive Jordan triple systems

We consider a Hermitian positive Jordan triple system  $(\mathfrak{p}^+, \mathfrak{p}^-, \{\cdot, \cdot, \cdot\}, \bar{\cdot})$ , where  $\mathfrak{p}^\pm$  are finite-dimensional vector spaces over  $\mathbb{C}$ , with a non-degenerate bilinear form  $(\cdot | \cdot)_{\mathfrak{p}^\pm} : \mathfrak{p}^\pm \times$

$\mathfrak{p}^\mp \rightarrow \mathbb{C}$ ,  $\{\cdot, \cdot, \cdot\}: \mathfrak{p}^\pm \times \mathfrak{p}^\mp \times \mathfrak{p}^\pm \rightarrow \mathfrak{p}^\pm$  is a  $\mathbb{C}$ -trilinear map satisfying

$$\begin{aligned} \{x, y, z\} &= \{z, y, x\}, \\ \{u, v, \{x, y, z\}\} &= \{\{u, v, x\}, y, z\} - \{x, \{v, u, y\}, z\} + \{x, y, \{u, v, z\}\}, \\ (\{u, v, x\}|y)_{\mathfrak{p}^\pm} &= (x|\{v, u, y\})_{\mathfrak{p}^\pm} \end{aligned}$$

for any  $u, x, z \in \mathfrak{p}^\pm$ ,  $v, y \in \mathfrak{p}^\mp$ , and  $\bar{\cdot}: \mathfrak{p}^\pm \rightarrow \mathfrak{p}^\mp$  is a  $\mathbb{C}$ -antilinear involutive isomorphism satisfying  $(x|\bar{x})_{\mathfrak{p}^\pm} \geq 0$  for any  $x \in \mathfrak{p}^\pm$ . Let  $D, B: \mathfrak{p}^\pm \times \mathfrak{p}^\mp \rightarrow \text{End}_{\mathbb{C}}(\mathfrak{p}^\pm)$ ,  $Q: \mathfrak{p}^\pm \times \mathfrak{p}^\pm \rightarrow \text{Hom}_{\mathbb{C}}(\mathfrak{p}^\mp, \mathfrak{p}^\pm)$ ,  $\bar{Q}: \mathfrak{p}^\pm \rightarrow \text{Hom}_{\mathbb{C}}(\mathfrak{p}^\mp, \mathfrak{p}^\pm)$  be the maps given by

$$\begin{aligned} D(x, y)z &= Q(x, z)y := \{x, y, z\}, \\ Q(x) &:= \frac{1}{2}Q(x, x), \\ B(x, y) &:= I_{\mathfrak{p}^\pm} - D(x, y) + Q(x)Q(y) \end{aligned}$$

for  $x, z \in \mathfrak{p}^\pm$ ,  $y \in \mathfrak{p}^\mp$ , let  $h = h_{\mathfrak{p}^\pm}: \mathfrak{p}^\pm \times \mathfrak{p}^\mp \rightarrow \mathbb{C}$  be the *generic norm*, which is a polynomial on  $\mathfrak{p}^+ \times \mathfrak{p}^-$  irreducible on each simple Jordan triple subsystem, and write  $B(x) := B(x, \bar{x})$ ,  $h(x) := h(x, \bar{x})$ . If  $\mathfrak{p}^+$  is simple, then  $B(x, y)$  and  $h(x, y)$  are related as

$$h(x, y)^p = \text{Det}_{\mathfrak{p}^+} B(x, y) \quad (x \in \mathfrak{p}^+, y \in \mathfrak{p}^-) \quad (2.1)$$

for some  $p \in \mathbb{Z}_{>0}$ .

If  $e \in \mathfrak{p}^+$  is a tripotent, i.e.,  $\{e, \bar{e}, e\} = 2e$ , then  $D(e, \bar{e}) \in \text{End}_{\mathbb{C}}(\mathfrak{p}^+)$  has the eigenvalues 0, 1, 2. For  $j = 0, 1, 2$  let

$$\begin{aligned} \mathfrak{p}^+(e)_j &= \mathfrak{p}^+(\bar{e})_j := \{x \in \mathfrak{p}^+ \mid D(e, \bar{e})x = jx\} \subset \mathfrak{p}^+, \\ \mathfrak{p}^-(\bar{e})_j &= \mathfrak{p}^-(e)_j := \{x \in \mathfrak{p}^- \mid D(\bar{e}, e)x = jx\} \subset \mathfrak{p}^-, \end{aligned} \quad (2.2)$$

so that  $\mathfrak{p}^\pm = \mathfrak{p}^\pm(e)_2 \oplus \mathfrak{p}^\pm(e)_1 \oplus \mathfrak{p}^\pm(e)_0$  holds (*Peirce decomposition*). A non-zero tripotent  $e \in \mathfrak{p}^+$  is called *primitive* if  $\mathfrak{p}^+(e)_2 = \mathbb{C}e$ , and *maximal* if  $\mathfrak{p}^+(e)_0 = \{0\}$ . If  $\mathfrak{p}^+(e)_2 = \mathfrak{p}^+$  holds for some (or equivalently any) maximal tripotent  $e \in \mathfrak{p}^+$ , then we say that  $\mathfrak{p}^+$  is of *tube type*. Throughout the paper we assume that the bilinear form  $(\cdot|\cdot)_{\mathfrak{p}^\pm}: \mathfrak{p}^\pm \times \mathfrak{p}^\mp \rightarrow \mathbb{C}$  is normalized such that  $(e|\bar{e})_{\mathfrak{p}^+} = (\bar{e}|e)_{\mathfrak{p}^-} = 1$  holds for any primitive tripotent  $e \in \mathfrak{p}^+$ . If  $\mathfrak{p}^+$  is simple, then under this normalization  $(x|y)_{\mathfrak{p}^+}$  and  $D(x, y)$  are related as

$$p(x|y)_{\mathfrak{p}^+} = \text{Tr}_{\mathfrak{p}^+} D(x, y) \quad (x \in \mathfrak{p}^+, y \in \mathfrak{p}^-) \quad (2.3)$$

with the same  $p \in \mathbb{Z}_{>0}$  as in (2.1).

## 2.2 Jordan algebras

Next we consider a complex Jordan algebra  $\mathfrak{n}^{+\mathbb{C}}$  with the Euclidean real form  $\mathfrak{n}^+ \subset \mathfrak{n}^{+\mathbb{C}}$  and the unit element  $e \in \mathfrak{n}^+$ , that is, the product on  $\mathfrak{n}^{+\mathbb{C}}$  satisfies

$$x \circ y = y \circ x, \quad x^2 \circ (x \circ y) = x \circ (x^2 \circ y) \quad (x, y \in \mathfrak{n}^{+\mathbb{C}}),$$

where  $x^2 := x \circ x$ , and there exists a symmetric bilinear form  $(\cdot|\cdot)_{\mathfrak{n}^+}: \mathfrak{n}^{+\mathbb{C}} \times \mathfrak{n}^{+\mathbb{C}} \rightarrow \mathbb{C}$ , which is positive definite on  $\mathfrak{n}^+$ , satisfying

$$(x \circ y|z)_{\mathfrak{n}^+} = (x|y \circ z)_{\mathfrak{n}^+} \quad (x, y, z \in \mathfrak{n}^{+\mathbb{C}}).$$

Let  $L: \mathfrak{n}^{+\mathbb{C}} \rightarrow \text{End}_{\mathbb{C}}(\mathfrak{n}^{+\mathbb{C}})$ ,  $D_{\mathfrak{n}^+}, P: \mathfrak{n}^{+\mathbb{C}} \times \mathfrak{n}^{+\mathbb{C}} \rightarrow \text{End}_{\mathbb{C}}(\mathfrak{n}^{+\mathbb{C}})$ ,  $P: \mathfrak{n}^{+\mathbb{C}} \rightarrow \text{End}_{\mathbb{C}}(\mathfrak{n}^{+\mathbb{C}})$  be the maps given by

$$\begin{aligned} L(x)y &:= x \circ y, \\ D_{\mathfrak{n}^+}(x, y)z = P(x, z)y &:= 2(x \circ (y \circ z) + z \circ (y \circ x) - (x \circ z) \circ y), \\ P(x)y &:= 2x \circ (x \circ y) - x^2 \circ y = \frac{1}{2}P(x, x)y, \end{aligned}$$

let  $\text{tr}_{\mathfrak{n}^+}$ ,  $\det_{\mathfrak{n}^+}$  be the trace form and the determinant polynomial of  $\mathfrak{n}^{+\mathbb{C}}$ , and we normalize  $(\cdot| \cdot)_{\mathfrak{n}^+}$  by  $(x|e)_{\mathfrak{n}^+} = \text{tr}_{\mathfrak{n}^+}(x)$ . If  $\mathfrak{n}^{+\mathbb{C}}$  is simple of rank  $r$ , dimension  $n$ , then we have

$$(x|y)_{\mathfrak{n}^+} = \text{tr}_{\mathfrak{n}^+}(x \circ y) = \frac{r}{n} \text{Tr}(L(x \circ y)) = \frac{r}{2n} \text{Tr}(D_{\mathfrak{n}^+}(x, y)), \quad \det_{\mathfrak{n}^+}(x)^{2n/r} = \text{Det}(P(x)).$$

For  $x \in \mathfrak{n}^{+\mathbb{C}}$ , if  $\det_{\mathfrak{n}^+}(x) \neq 0$ , then the inverse  $x^{-1}$  and the adjugate element  $x^{\sharp}$  are given by

$$x^{-1} := P(x)^{-1}x, \quad x^{\sharp} := \det_{\mathfrak{n}^+}(x)x^{-1}.$$

Then the directional derivatives of  $x^{-1}$  and  $\det_{\mathfrak{n}^+}(x)$  are given by

$$\left. \frac{d}{dt} \right|_{t=0} (x + ty)^{-1} = -P(x)^{-1}y, \quad \left. \frac{d}{dt} \right|_{t=0} \det_{\mathfrak{n}^+}(x + ty) = \det_{\mathfrak{n}^+}(x)(x^{-1}|y)_{\mathfrak{n}^+} = (x^{\sharp}|y)_{\mathfrak{n}^+}.$$

In addition, let

$$\begin{aligned} \Omega &:= (\text{connected component of } \{x \in \mathfrak{n}^+ \mid P(x) \text{ is positive definite}\} \text{ which contains } e) \\ &= (\text{connected component of } \{x \in \mathfrak{n}^+ \mid \det_{\mathfrak{n}^+}(x) > 0\} \text{ which contains } e) \end{aligned}$$

be the *symmetric cone*.

For a given Hermitian positive Jordan triple system  $\mathfrak{p}^{\pm}$ , if it is of tube type, then for a fixed maximal tripotent  $e \in \mathfrak{p}^+$ ,

$$Q(\bar{e}): \mathfrak{p}^+ \longrightarrow \mathfrak{p}^-, \quad Q(e): \mathfrak{p}^- \longrightarrow \mathfrak{p}^+$$

are mutually inverse, and  $\mathfrak{p}^+$  becomes a Jordan algebra by the product

$$x \circ y := \frac{1}{2}\{x, \bar{e}, y\} \quad (x, y \in \mathfrak{p}^+),$$

with the unit element  $e \in \mathfrak{p}^+$ , and the Euclidean real form

$$\mathfrak{n}^+ = \{x \in \mathfrak{p}^+ \mid Q(e)\bar{x} = x\}.$$

Then the corresponding operations and the generic norm are given by

$$\begin{aligned} D_{\mathfrak{n}^+}(x, y) &= D(x, Q(\bar{e})y), \quad P(x, y) = Q(x, y)Q(\bar{e}), \quad P(x) = Q(x)Q(\bar{e}), \\ (x|y)_{\mathfrak{n}^+} &= (x|Q(\bar{e})y)_{\mathfrak{p}^+} = (y|Q(\bar{e})x)_{\mathfrak{p}^+}, \quad h_{\mathfrak{n}^+}(x, y) = h_{\mathfrak{p}^+}(x, Q(\bar{e})y). \end{aligned}$$

Throughout the paper, for a Hermitian positive Jordan triple system  $\mathfrak{p}^{\pm}$  of tube type, when a maximal tripotent  $e \in \mathfrak{p}^+$  is fixed, we omit  $Q(e), Q(\bar{e})$ , and identify  $\mathfrak{p}^+ = \mathfrak{p}^-$  by the identity map, so that  $\bar{\cdot}: \mathfrak{p}^{\pm} \rightarrow \mathfrak{p}^{\mp} = \mathfrak{p}^{\pm}$  is the complex conjugate with respect to the Euclidean real form  $\mathfrak{n}^+ \subset \mathfrak{p}^+$ , and the corresponding operations are

$$\begin{aligned} D_{\mathfrak{n}^+}(x, y) &= D(x, y), \quad P(x, y) = Q(x, y), \quad P(x) = Q(x), \\ (x|y)_{\mathfrak{n}^+} &= (x|y)_{\mathfrak{p}^+}, \quad h_{\mathfrak{n}^+}(x, y) = h_{\mathfrak{p}^+}(x, y). \end{aligned}$$

Conversely, a complex unital Jordan algebra  $\mathfrak{n}^{+\mathbb{C}}$  with the Euclidean real form  $\mathfrak{n}^+ \subset \mathfrak{n}^{+\mathbb{C}}$  becomes a Hermitian positive Jordan triple system by  $\{x, y, z\} = D_{\mathfrak{n}^+}(x, y)z$  and by the complex conjugate  $\bar{\cdot}: \mathfrak{n}^{+\mathbb{C}} \rightarrow \mathfrak{n}^{+\mathbb{C}}$  with respect to  $\mathfrak{n}^+$ .

### 2.3 Structure groups and the Kantor–Koecher–Tits construction

In this subsection we consider some Lie algebras corresponding to Jordan triple systems  $\mathfrak{p}^\pm$ . For  $l \in \text{End}_{\mathbb{C}}(\mathfrak{p}^+)$ , let  $\bar{l}, {}^t l \in \text{End}_{\mathbb{C}}(\mathfrak{p}^-)$ ,  $l^* \in \text{End}_{\mathbb{C}}(\mathfrak{p}^+)$  be the elements given by  $\overline{lx} = \bar{l}x$ ,  $(lx|y)_{\mathfrak{p}^+} = (x|{}^t l y)_{\mathfrak{p}^+} = (x|\bar{l}^* y)_{\mathfrak{p}^+}$  for  $x, y \in \mathfrak{p}^+$ . Then the *Structure group*  $\text{Str}(\mathfrak{p}^+)$  and the *automorphism group*  $\text{Aut}(\mathfrak{p}^+)$  are defined as

$$\begin{aligned}\text{Str}(\mathfrak{p}^+) &:= \{l \in GL_{\mathbb{C}}(\mathfrak{p}^+) \mid \{lx, {}^t l^{-1}y, lz\} = l\{x, y, z\} \quad (x, z \in \mathfrak{p}^+, y \in \mathfrak{p}^-)\}, \\ \text{Aut}(\mathfrak{p}^+) &:= \{k \in \text{Str}(\mathfrak{p}^+) \mid k^{-1} = k^*\}.\end{aligned}$$

Let  $\mathfrak{str}(\mathfrak{p}^+) = \mathfrak{k}^{\mathbb{C}}$  and  $\mathfrak{der}(\mathfrak{p}^+) = \mathfrak{k}$  denote the Lie algebras of  $\text{Str}(\mathfrak{p}^+)$  and  $\text{Aut}(\mathfrak{p}^+)$  respectively. Then  $D(\mathfrak{p}^+, \mathfrak{p}^-) = \mathfrak{str}(\mathfrak{p}^+)$  holds.

Next we recall the *Kantor–Koecher–Tits construction*. As vector spaces let

$$\begin{aligned}\mathfrak{g}^{\mathbb{C}} &:= \mathfrak{p}^+ \oplus \mathfrak{k}^{\mathbb{C}} \oplus \mathfrak{p}^-, \\ \mathfrak{g} &:= \{(x, k, \bar{x}) \mid x \in \mathfrak{p}^+, k \in \mathfrak{k}\} \subset \mathfrak{g}^{\mathbb{C}},\end{aligned}$$

and give the Lie algebra structure on  $\mathfrak{g}^{\mathbb{C}}$  by

$$[(x, k, y), (z, l, w)] := (kz - lx, [k, l] + D(x, w) - D(z, y), -{}^t k w + {}^t l y).$$

Then  $\mathfrak{g}^{\mathbb{C}}$  becomes a Lie algebra and  $\mathfrak{g}$  becomes a real form of  $\mathfrak{g}^{\mathbb{C}}$ . Let  $(\cdot|\cdot)_{\mathfrak{g}^{\mathbb{C}}} : \mathfrak{g}^{\mathbb{C}} \times \mathfrak{g}^{\mathbb{C}} \rightarrow \mathbb{C}$  be the  $\mathfrak{g}^{\mathbb{C}}$ -invariant bilinear form normalized such that  $(x|y)_{\mathfrak{g}^{\mathbb{C}}} = (x|y)_{\mathfrak{p}^+}$  holds for any  $x \in \mathfrak{p}^+$ ,  $y \in \mathfrak{p}^-$ . We fix a connected complex Lie group  $G^{\mathbb{C}}$  with the Lie algebra  $\mathfrak{g}^{\mathbb{C}}$ , and let  $G, K^{\mathbb{C}}, K, P^+, P^- \subset G^{\mathbb{C}}$  be the connected closed subgroups corresponding to the Lie algebras  $\mathfrak{g}, \mathfrak{k}^{\mathbb{C}}, \mathfrak{k}, \mathfrak{p}^+, \mathfrak{p}^- \subset \mathfrak{g}^{\mathbb{C}}$  respectively. Then  $\text{Ad}|_{\mathfrak{p}^+} : K^{\mathbb{C}} \rightarrow \text{Str}(\mathfrak{p}^+)_0$  gives a covering map, and for  $l \in K^{\mathbb{C}}$ ,  $x \in \mathfrak{p}^+$ , we abbreviate  $\text{Ad}(l)x =: lx$ .

Next suppose  $\mathfrak{p}^+$  is of tube type. We fix a tripotent  $e \in \mathfrak{p}^+$ , regard  $\mathfrak{p}^+$  as a Jordan algebra, and let  $\mathfrak{n}^+ \subset \mathfrak{p}^+$  be the Euclidean real form. Also, let

$$\begin{aligned}\mathfrak{n}^- &:= \overline{\mathfrak{n}^+} = Q(\bar{e})\mathfrak{n}^+ && \subset \mathfrak{p}^-, \\ \mathfrak{l} &:= D(\mathfrak{n}^+, \mathfrak{n}^-) = [\mathfrak{n}^+, \mathfrak{n}^-] && \subset \mathfrak{k}^{\mathbb{C}}, \\ {}^c\mathfrak{g} &:= \mathfrak{n}^+ \oplus \mathfrak{l} \oplus \mathfrak{n}^- && \subset \mathfrak{g}^{\mathbb{C}}.\end{aligned}$$

These become real forms of the right hand sides. Let  ${}^cG \subset G^{\mathbb{C}}$  be the connected closed subgroup corresponding to the Lie algebra  ${}^c\mathfrak{g} \subset \mathfrak{g}^{\mathbb{C}}$ , and let  $L := K^{\mathbb{C}} \cap {}^cG$ ,  $K_L := L \cap K$ ,  $\mathfrak{k}_l := \mathfrak{l} \cap \mathfrak{k}$ . Then  $G$  and  ${}^cG$  are isomorphic via the Cayley transform in  $G^{\mathbb{C}}$ ,  $L$  acts transitively on the symmetric cone  $\Omega \subset \mathfrak{n}^+$ , and  $K_L$  acts on  $\mathfrak{n}^+$  as Jordan algebra automorphisms. Also, for  $l \in \mathfrak{k}^{\mathbb{C}} \subset \text{End}_{\mathbb{C}}(\mathfrak{p}^+) = \text{End}_{\mathbb{C}}(\mathfrak{n}^{+\mathbb{C}})$ , we abbreviate  $Q(e) {}^t l Q(\bar{e}) =: {}^t l \in \mathfrak{k}^{\mathbb{C}}$ , and extend it to the anti-automorphism on  $K^{\mathbb{C}}$ .

### 2.4 Simultaneous Peirce decomposition

In this subsection we assume  $\mathfrak{p}^+$  is simple, or equivalently, the corresponding Lie algebra  $\mathfrak{g}$  is simple. We fix a Jordan frame  $\{e_1, \dots, e_r\} \subset \mathfrak{p}^+$ , i.e., a maximal set of primitive tripotents in  $\mathfrak{p}^+$  satisfying  $D(e_i, \bar{e}_j) = 0$  for  $i \neq j$ , where  $r = \text{rank } \mathfrak{p}^+ = \text{rank}_{\mathbb{R}} \mathfrak{g}$ . Using this, let

$$\begin{aligned}\mathfrak{p}_{ij}^+ &:= \{x \in \mathfrak{p}^+ \mid D(e_l, \bar{e}_l)x = (\delta_{il} + \delta_{jl})x \quad (l = 1, \dots, r)\}, & \mathfrak{p}_{ij}^- &:= \overline{\mathfrak{p}_{ij}^+} \quad (1 \leq i \leq j \leq r), \\ \mathfrak{p}_{0j}^+ &:= \{x \in \mathfrak{p}^+ \mid D(e_l, \bar{e}_l)x = \delta_{jl}x \quad (l = 1, \dots, r)\}, & \mathfrak{p}_{0j}^- &:= \overline{\mathfrak{p}_{0j}^+} \quad (1 \leq i \leq r),\end{aligned}$$

so that

$$\mathfrak{p}^\pm = \bigoplus_{\substack{0 \leq i \leq j \leq r \\ (i,j) \neq (0,0)}} \mathfrak{p}_{ij}^\pm$$

holds. This is called the *simultaneous Peirce decomposition*. Using this decomposition, we define integers  $(d, b, p, n)$  by

$$\begin{aligned} d &:= \dim \mathfrak{p}_{ij}^+ \quad (1 \leq i < j \leq r), & b &:= \dim \mathfrak{p}_{0j}^+ \quad (1 \leq j \leq r), \\ p &:= 2 + d(r-1) + b, & n &:= \dim \mathfrak{p}^+ = r + \frac{d}{2}r(r-1) + br. \end{aligned} \quad (2.4)$$

We note that if  $r = 1$ , then  $d$  is not determined uniquely, and any number is allowed. Then  $p$  coincides with the one in (2.1), (2.3).

## 2.5 Space of polynomials on Jordan triple systems

In this subsection we consider the space  $\mathcal{P}(\mathfrak{p}^\pm)$  of polynomials on the Jordan triple system  $\mathfrak{p}^\pm$ , on which  $K^\mathbb{C}$  acts by

$$\begin{aligned} (Ad|_{\mathfrak{p}^+}(l))^\vee f(x) &= f(l^{-1}x) & (l \in K^\mathbb{C}, f \in \mathcal{P}(\mathfrak{p}^+), x \in \mathfrak{p}^+), \\ (Ad|_{\mathfrak{p}^-}(l))^\vee f(y) &= f({}^tly) & (l \in K^\mathbb{C}, f \in \mathcal{P}(\mathfrak{p}^-), y \in \mathfrak{p}^-). \end{aligned}$$

We assume  $\mathfrak{p}^+$  is simple, fix a Jordan frame  $\{e_1, \dots, e_r\} \subset \mathfrak{p}^+$ , and consider the tripotents  $e^k := \sum_{j=1}^k e_j$ . Then the subalgebras

$$\mathfrak{p}^+(e^k)_2 = \bigoplus_{1 \leq i \leq j \leq k} \mathfrak{p}_{ij}^+$$

are of tube type, and have Jordan algebra structures. Let  $\mathfrak{n}^+(e^k) \subset \mathfrak{p}^+(e^k)_2$  be the Euclidean real forms, and we extend the determinant polynomials  $\det_{\mathfrak{n}^+(e^k)}$  on  $\mathfrak{p}^+(e^k)_2$  to polynomials on  $\mathfrak{p}^+$ . We also write  $e^r =: e$ ,  $\mathfrak{n}^+(e^r) =: \mathfrak{n}^+$ . Using these, for

$$\mathfrak{m} \in \mathbb{Z}_{++}^r := \{\mathfrak{m} = (m_1, \dots, m_r) \in \mathbb{Z}^r \mid m_1 \geq m_2 \geq \dots \geq m_r \geq 0\},$$

we define the polynomial  $\Delta_{\mathfrak{m}}^{\mathfrak{n}^+}(x)$  on  $\mathfrak{p}^+$  by

$$\Delta_{\mathfrak{m}}^{\mathfrak{n}^+}(x) := \prod_{k=1}^r \det_{\mathfrak{n}^+(e^k)}(x)^{m_k - m_{k+1}},$$

where we set  $m_{r+1} := 0$ , and let

$$\begin{aligned} \mathcal{P}_{\mathfrak{m}}(\mathfrak{p}^+) &:= \text{span}_{\mathbb{C}}\{\Delta_{\mathfrak{m}}^{\mathfrak{n}^+}(l^{-1}x) \mid l \in K^\mathbb{C}\} \subset \mathcal{P}(\mathfrak{p}^+), \\ \mathcal{P}_{\mathfrak{m}}(\mathfrak{p}^-) &:= \{\overline{f(\overline{y})} \mid f(x) \in \mathcal{P}_{\mathfrak{m}}(\mathfrak{p}^+)\} \subset \mathcal{P}(\mathfrak{p}^-). \end{aligned}$$

Then the following holds.

**Theorem 2.1** (Hua–Kostant–Schmid, [7, Part III, Theorem V.2.1]). *Under the  $K^\mathbb{C}$ -action,  $\mathcal{P}(\mathfrak{p}^\pm)$  is decomposed into the sum of irreducible submodules as*

$$\mathcal{P}(\mathfrak{p}^\pm) = \bigoplus_{\mathfrak{m} \in \mathbb{Z}_{++}^r} \mathcal{P}_{\mathfrak{m}}(\mathfrak{p}^\pm).$$

Next suppose  $\mathfrak{p}^+$  is of tube type. For  $\mu \in \mathbb{C}$ , let

$$\underline{\mu}_r := \underbrace{(\mu, \dots, \mu)}_r \in \mathbb{C}^r,$$

and for  $\mathbf{m} \in \mathbb{Z}_{++}^r + \underline{\mu}_r$ , let

$$\mathcal{P}_{\mathbf{m}}(\mathfrak{p}^\pm) := \mathcal{P}_{\mathbf{m} - \underline{\mu}_r}(\mathfrak{p}^\pm) \det_{\mathfrak{n}^\pm}(x)^\mu \subset \mathcal{P}(\mathfrak{p}^\pm) \det_{\mathfrak{n}^\pm}(x)^\mu,$$

where  $\det_{\mathfrak{n}^-}(x)$  is the determinant polynomial on  $\mathfrak{p}^- = \mathfrak{n}^{-\mathbb{C}}$ . Then  $\mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+) \simeq \mathcal{P}_{-\mathbf{m}^\vee}(\mathfrak{p}^-)$  holds as a  $\tilde{K}^{\mathbb{C}}$ -module, where  $\mathbf{m}^\vee := (m_r, \dots, m_1)$  and  $\tilde{K}^{\mathbb{C}}$  is the universal covering group of  $K^{\mathbb{C}}$ . In addition, for  $\lambda \in \mathbb{C}$ ,  $\mathbf{s} \in \mathbb{C}^r$ ,  $\mathbf{m} \in (\mathbb{Z}_{\geq 0})^r$ , let

$$\Gamma_r^d(\lambda + \mathbf{s}) := (2\pi)^{dr(r-1)/4} \prod_{j=1}^r \Gamma\left(\lambda + s_j - \frac{d}{2}(j-1)\right), \quad (2.5)$$

$$(\lambda + \mathbf{s})_{\mathbf{m},d} := \prod_{j=1}^r \binom{\lambda + s_j - \frac{d}{2}(j-1)}{m_j}, \quad (2.6)$$

where  $(\lambda)_m := \lambda(\lambda+1)(\lambda+2)\cdots(\lambda+m-1)$ , and we abbreviate  $\Gamma_r^d(\lambda + \underline{0}_r) =: \Gamma_r^d(\lambda)$ ,  $\Gamma_r^d(\mathbf{0} + \mathbf{s}) =: \Gamma_r^d(\mathbf{s})$ ,  $(\lambda + \underline{0}_r)_{\mathbf{m},d} =: (\lambda)_{\mathbf{m},d}$ ,  $(\mathbf{0} + \mathbf{s})_{\mathbf{m},d} =: (\mathbf{s})_{\mathbf{m},d}$ . Then the following hold.

**Lemma 2.2** (Gindikin, [9, Lemma XI.2.3, Section IX.3]). *Let  $\mathbf{m} \in \mathbb{Z}_{++}^r$ ,  $f \in \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+)$ .*

(1) *For  $\operatorname{Re} \lambda > \frac{n}{r} - 1$ ,  $w \in \Omega + \sqrt{-1}\mathfrak{n}^+$ , we have*

$$\int_{\Omega} e^{-(z|w)_{\mathfrak{n}^+}} f(z) \det_{\mathfrak{n}^+}(z)^{\lambda - \frac{n}{r}} dz = \Gamma_r^d(\lambda + \mathbf{m}) f(w^{-1}) \det_{\mathfrak{n}^+}(w)^{-\lambda}.$$

(2) *For  $\operatorname{Re} \lambda > \frac{2n}{r} - 1$ ,  $z, a \in \Omega$ , we have*

$$\frac{\Gamma_r^d(\lambda + \mathbf{m})}{(2\pi\sqrt{-1})^n} \int_{a + \sqrt{-1}\mathfrak{n}^+} e^{(z|w)_{\mathfrak{n}^+}} f(w^{-1}) \det_{\mathfrak{n}^+}(w)^{-\lambda} dw = f(z) \det_{\mathfrak{n}^+}(z)^{\lambda - \frac{n}{r}},$$

and this does not depend on the choice of  $a \in \Omega$ .

**Lemma 2.3** ([9, Proposition VII.1.6]). *For  $k \in \mathbb{Z}_{\geq 0}$ ,  $\mathbf{m} \in \mathbb{Z}_{++}^r + \mathbb{C}\underline{1}_r := \bigcup_{\mu \in \mathbb{C}} (\mathbb{Z}_{++}^r + \underline{\mu}_r)$ ,  $f(x) \in \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+)$ , we have*

$$\begin{aligned} \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^k f(x) &= \binom{\frac{d}{2}(r-1) + 1 - k + \mathbf{m}}{\underline{k}_r, d} f(x) \det_{\mathfrak{n}^+}(x)^{-k} \\ &= (-1)^{kr} (-\mathbf{m}^\vee)_{\underline{k}_r, d} f(x) \det_{\mathfrak{n}^+}(x)^{-k}. \end{aligned}$$

## 2.6 Projection of some polynomials

In this subsection, we assume  $\mathfrak{p}^+ = \mathfrak{n}^{+\mathbb{C}}$  is of tube type. For  $\mathbf{m} \in \mathbb{Z}_{++}^r$ , let

$$\operatorname{Proj}_{\mathbf{m}}^{\mathfrak{p}^+} : \mathcal{P}(\mathfrak{p}^+) \longrightarrow \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+)$$

be the orthogonal projection. Also, let  $y \in \mathfrak{p}^+$  be an element of rank 1. Then for  $\mathbf{k} \in \mathbb{Z}_{++}^r$ ,  $l \in \mathbb{Z}_{\geq 0}$ ,  $f(x) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}^+)$ , as a function of  $x$  we have

$$(x|y)_{\mathfrak{n}^+}^l f(x) = \sum_{\substack{\mathbf{m} \in \mathbb{Z}_{++}^r, |\mathbf{m}| = |\mathbf{k}| + l \\ k_{j-1} \geq m_j \geq k_j}} \operatorname{Proj}_{\mathbf{m}}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l f(x)), \quad (2.7)$$

where we set  $k_0 := +\infty$ . More generally, for  $\mu \in \mathbb{C}$ ,  $\mathbf{m} \in \mathbb{Z}_{++}^r + \underline{\mu}_r$ , let

$$\text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+} : \mathcal{P}(\mathfrak{p}^+) \det_{\mathfrak{n}^+}(x)^\mu \longrightarrow \overline{\mathcal{P}}_{\mathbf{m}}(\mathfrak{p}^+) = \mathcal{P}_{\mathbf{m}-\underline{\mu}_r}(\mathfrak{p}^+) \det_{\mathfrak{n}^+}(x)^\mu$$

be the orthogonal projection, with the same symbol.

**Lemma 2.4.** *Suppose that  $\mathfrak{p}^+ = \mathfrak{n}^{+\mathbb{C}}$  is of tube type. We fix a primitive idempotent  $e' \in \mathfrak{n}^+$ , let  $\mathfrak{p}^+(e')_2 = \mathbb{C}e' =: \mathfrak{p}^{+'}$ ,  $\mathfrak{p}^+(e')_0 =: \mathfrak{p}^{+''}$  be as in (2.2), and for  $x \in \mathfrak{p}^+$ , let  $x' \in \mathfrak{p}^{+'}$ ,  $x'' \in \mathfrak{p}^{+''}$  be the orthogonal projections. Also, let  $y \in \mathfrak{p}^+$  be an element of rank 1.*

(1) *For  $\mu \in \mathbb{C}$ ,  $\mathbf{m} \in \mathbb{Z}_{++}^r + \underline{\mu}_r$ ,  $k, l \in \mathbb{Z}_{\geq 0}$ ,  $f(x) \in \mathcal{P}(\mathfrak{p}^+) \det_{\mathfrak{n}^+}(x)^\mu$ , we have*

$$\text{Proj}_{\mathbf{m}+\underline{k}_r}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l \det_{\mathfrak{n}^+}(x)^k f(x)) = \det_{\mathfrak{n}^+}(x)^k \text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l f(x)).$$

(2) *For  $\mathbf{k} \in \mathbb{Z}_{++}^{r-1}$ ,  $\mathbf{m} \in \mathbb{Z}_{++}^r$ ,  $k, l \in \mathbb{Z}_{\geq 0}$  with  $k \leq \min\{l, m_r\}$  and for  $f(x'') \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}^{+''})$ , we have*

$$\begin{aligned} & \text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l f(x'')) \\ &= \frac{(-l)_k (-\mathbf{k}^\vee)_{\underline{k}_r-1, d}}{(-\mathbf{m}^\vee)_{\underline{k}_r, d}} \det_{\mathfrak{n}^+}(x)^k (e'|y)_{\mathfrak{n}^+}^k \text{Proj}_{\mathbf{m}-\underline{k}_r}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^{l-k} \det_{\mathfrak{n}^{+''}}(x'')^{-k} f(x'')). \end{aligned}$$

(3) *For  $\mathbf{k} \in \mathbb{Z}_{++}^{r-1}$ ,  $l \in \mathbb{Z}_{\geq 0}$  with  $l \leq k_{r-1}$  and for  $f(x'') \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}^{+''})$ , we have*

$$\text{Proj}_{(\mathbf{k}, l)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l f(x'')) = \frac{(-\mathbf{k}^\vee)_{\underline{k}_r-1, d}}{(-\frac{d}{2} - \mathbf{k}^\vee)_{\underline{k}_r-1, d}} \det_{\mathfrak{n}^+}(x)^l (e'|y)_{\mathfrak{n}^+}^l \det_{\mathfrak{n}^{+''}}(x'')^{-l} f(x'').$$

(4) *For  $\mathbf{k} \in \mathbb{Z}_{++}^{r-1}$ ,  $l \in \mathbb{Z}_{\geq 0}$  with  $l \geq k_1$  and for  $f(x'') \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}^{+''})$ , we have*

$$\text{Proj}_{(l, \mathbf{k})}^{\mathfrak{p}^+} ((x|e')_{\mathfrak{n}^+}^l f(x'')) \Big|_{x=x'+x'' \in \mathfrak{p}^{+'} \oplus \mathfrak{p}^{+''}} = \frac{(-l)_{\mathbf{k}, d}}{(-l - \frac{d}{2})_{\mathbf{k}, d}} (x'|e')_{\mathfrak{n}^+}^l f(x'').$$

(5) *There exists an element  $y \in \mathfrak{p}^+$  of rank 1 such that for  $\mu \in \mathbb{C}$ ,  $\mathbf{k}, \mathbf{m} \in \mathbb{Z}_{++}^r + \underline{\mu}_r$ ,  $l \in \mathbb{Z}_{\geq 0}$  with  $k_{j-1} \geq m_j \geq k_j$ ,  $|\mathbf{m}| = |\mathbf{k}| + l$  we have*

$$\text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l \Delta_{\mathbf{k}}^{\mathfrak{n}^+}(x)) \neq 0.$$

*Proof.* (1) Clear from  $\mathcal{P}_{\mathbf{m}+\underline{k}_r}(\mathfrak{p}^+) = \det_{\mathfrak{n}^+}(x)^k \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+)$ .

(2) Suppose  $k_r = 0$ ,  $f(x) = f(x'') \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}^{+''})$ , and we apply  $\det_{\mathfrak{n}^+}(\frac{\partial}{\partial x})^k$  to the both sides of (2.7). Then the right hand side is computed as

$$\begin{aligned} & \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^k \sum_{\substack{\mathbf{m} \in \mathbb{Z}_{++}^r, |\mathbf{m}| = |\mathbf{k}| + l \\ k_{j-1} \geq m_j \geq k_j}} \text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l f(x'')) \\ &= \sum_{\substack{\mathbf{m} \in \mathbb{Z}_{++}^r, |\mathbf{m}| = |\mathbf{k}| + l \\ k_{j-1} \geq m_j \geq k_j \\ k_{r-1} \geq m_r \geq k}} (-1)^{kr} (-\mathbf{m}^\vee)_{\underline{k}_r, d} \det_{\mathfrak{n}^+}(x)^{-k} \text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l f(x'')). \end{aligned}$$

Similarly, for the left hand side, since  $y$  is of rank 1, the operator  $\det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^k e^{(x|y)_{\mathfrak{n}^+}}$  is characterized by

$$\begin{aligned} \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^k e^{(x|y)_{\mathfrak{n}^+}} e^{(x|z)_{\mathfrak{n}^+}} &= \det_{\mathfrak{n}^+} (y+z)^k e^{(x|y)_{\mathfrak{n}^+}} e^{(x|z)_{\mathfrak{n}^+}} \\ &= (\det_{\mathfrak{n}^+} (z) + (z^\sharp | y)_{\mathfrak{n}^+})^k e^{(x|y)_{\mathfrak{n}^+}} e^{(x|z)_{\mathfrak{n}^+}} \\ &= \sum_{l'=0}^k \sum_{l''=0}^{\infty} \binom{k}{l'} \frac{1}{l''!} \det_{\mathfrak{n}^+} (z)^{k-l'} (z^\sharp | y)_{\mathfrak{n}^+}^{l'} (x|y)_{\mathfrak{n}^+}^{l''} e^{(x|z)_{\mathfrak{n}^+}} \quad (z \in \mathfrak{p}^+), \end{aligned}$$

and by taking the homogeneous terms with respect to  $y$ , we have

$$\det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^k (x|y)_{\mathfrak{n}^+}^l = l! \sum_{l'+l''=l} \binom{k}{l'} \frac{1}{l''!} (x|y)_{\mathfrak{n}^+}^{l''} \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^{k-l'} \left( \left( \frac{\partial}{\partial x} \right)^\sharp \middle| y \right)_{\mathfrak{n}^+}^{l'}.$$

Then since  $\det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^{k-l'} f(x'')$  vanishes for  $l' < k$ , we get

$$\begin{aligned} \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^k (x|y)_{\mathfrak{n}^+}^l f(x'') &= \frac{l!}{(l-k)!} (x|y)_{\mathfrak{n}^+}^{l-k} \left( \left( \frac{\partial}{\partial x} \right)^\sharp \middle| y \right)_{\mathfrak{n}^+}^k f(x'') \\ &= (-1)^k (-l)_k (x|y)_{\mathfrak{n}^+}^{l-k} (e'|y)_{\mathfrak{n}^+}^k \det_{\mathfrak{n}^{+\prime\prime}} \left( \frac{\partial}{\partial x''} \right)^k f(x'') \\ &= (-1)^{kr} (-l)_k (-\mathbf{k}^\vee)_{\underline{k}_{r-1}, d} (e'|y)_{\mathfrak{n}^+}^k (x|y)_{\mathfrak{n}^+}^{l-k} \det_{\mathfrak{n}^{+\prime\prime}} (x'')^{-k} f(x'') \\ &= (-1)^{kr} (-l)_k (-\mathbf{k}^\vee)_{\underline{k}_{r-1}, d} (e'|y)_{\mathfrak{n}^+}^k \sum_{\substack{\mathbf{m} \in \mathbb{Z}_{++}^r, |\mathbf{m}| = |\mathbf{k}| + l \\ k_{j-1} \geq m_j \geq k_j \\ k_{r-1} \geq m_r \geq k}} \text{Proj}_{\mathbf{m} - \underline{k}_r}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^{l-k} \det_{\mathfrak{n}^{+\prime\prime}} (x'')^{-k} f(x'')). \end{aligned}$$

Comparing the both sides, for  $m_r \geq k$  we have

$$\begin{aligned} (-\mathbf{m}^\vee)_{\underline{k}_r, d} \det_{\mathfrak{n}^+} (x)^{-k} \text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l f(x'')) \\ = (-l)_k (-\mathbf{k}^\vee)_{\underline{k}_{r-1}, d} (e'|y)_{\mathfrak{n}^+}^k \text{Proj}_{\mathbf{m} - \underline{k}_r}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^{l-k} \det_{\mathfrak{n}^{+\prime\prime}} (x'')^{-k} f(x'')), \end{aligned}$$

and we get the desired formula.

(3) In (2), we set  $\mathbf{m} = (\mathbf{k}, l)$ ,  $k = l$ . Then we have

$$\begin{aligned} \text{Proj}_{(\mathbf{k}, l)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l f(x'')) \\ &= \frac{(-l)_l (-\mathbf{k}^\vee)_{\underline{l}_{r-1}, d}}{(-l, \mathbf{k}^\vee)_{\underline{l}_r, d}} \det_{\mathfrak{n}^+} (x)^l (e'|y)_{\mathfrak{n}^+}^l \text{Proj}_{(\mathbf{k}, l) - \underline{l}_r}^{\mathfrak{p}^+} (\det_{\mathfrak{n}^{+\prime\prime}} (x'')^{-l} f(x'')) \\ &= \frac{(-l)_l (-\mathbf{k}^\vee)_{\underline{l}_{r-1}, d}}{(-l)_l (-\frac{d}{2} - \mathbf{k}^\vee)_{\underline{l}_{r-1}, d}} \det_{\mathfrak{n}^+} (x)^l (e'|y)_{\mathfrak{n}^+}^l \det_{\mathfrak{n}^{+\prime\prime}} (x'')^{-l} f(x'') \\ &= \frac{(-\mathbf{k}^\vee)_{\underline{l}_{r-1}, d}}{(-\frac{d}{2} - \mathbf{k}^\vee)_{\underline{l}_{r-1}, d}} \det_{\mathfrak{n}^+} (x)^l (e'|y)_{\mathfrak{n}^+}^l \det_{\mathfrak{n}^{+\prime\prime}} (x'')^{-l} f(x''). \end{aligned}$$

(4) Since the map

$$\mathcal{P}_{\mathbf{k}}(\mathfrak{p}^{+\prime\prime}) \longrightarrow \mathcal{P}(\mathfrak{p}^{+\prime}) \otimes \mathcal{P}(\mathfrak{p}^{+\prime\prime}), \quad f(x'') \mapsto \text{Proj}_{(l, \mathbf{k})}^{\mathfrak{p}^+} ((x|e')_{\mathfrak{n}^+}^l f(x'')) \Big|_{x=x'+x'' \in \mathfrak{p}^{+\prime} \oplus \mathfrak{p}^{+\prime\prime}}$$

is  $\mathfrak{k}^{\mathbb{C}''} := [\mathfrak{p}^{+''}, \mathfrak{p}^{+''}]$ -equivariant, it is enough to prove when  $f(x'') \in \mathcal{P}(\mathfrak{p}^{+''})$  is a lowest weight vector. We fix a Jordan frame  $\{e_2, \dots, e_r\}$  of  $\mathfrak{n}^{+''}$  so that  $\{e_1 = e', e_2, \dots, e_r\}$  is a Jordan frame of  $\mathfrak{n}^+$ , and define  $\Delta_{\mathbf{k}}^{\mathfrak{n}^{+''}}(x'') \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}^{+''})$ ,  $\Delta_{\mathbf{m}}^{\mathfrak{n}^+}(x) \in \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+)$  by using these Jordan frames. We prove

$$\text{Proj}_{(l, \mathbf{k})}((x|e')_{\mathfrak{n}^+}^l \Delta_{\mathbf{k}}^{\mathfrak{n}^{+''}}(x'')) = \frac{(-l)_{\mathbf{k}, d}}{(-l - \frac{d}{2})_{\mathbf{k}, d}} \Delta_{(l, \mathbf{k})}^{\mathfrak{n}^+}(x) \quad (2.8)$$

by induction on  $r = \text{rank } \mathfrak{p}^+$ . When  $\mathbf{k} = \underline{0}_{r-1}$  (“ $r = 1$  case”), this is trivial. Next we assume (2.8) for  $r - 1$ , and prove it for  $r$ . Then by (2) with  $k = k_{r-1}$ ,  $y = e'$ , we have

$$\begin{aligned} & \text{Proj}_{(l, \mathbf{k})}((x|e')_{\mathfrak{n}^+}^l \Delta_{\mathbf{k}}^{\mathfrak{n}^{+''}}(x'')) \\ &= \frac{(-l)_{k_{r-1}} (-\mathbf{k}^\vee)_{\underline{k}_{r-1}, d}}{(-\mathbf{k}^\vee, l)_{\underline{k}_{r-1}, d}} \\ & \quad \times \det_{\mathfrak{n}^+}(x)^{k_{r-1}} \text{Proj}_{(l, \mathbf{k}) - \underline{k}_{r-1}}^{\mathfrak{p}^+}((x|e')_{\mathfrak{n}^+}^{l-k_{r-1}} \det_{\mathfrak{n}^{+''}}(x'')^{-k_{r-1}} \Delta_{\mathbf{k}}^{\mathfrak{n}^{+''}}(x'')) \\ &= \frac{(-l)_{k_{r-1}} (-\mathbf{k}^\vee)_{\underline{k}_{r-1}, d}}{(-\mathbf{k}^\vee)_{\underline{k}_{r-1}, d} (-l - \frac{d}{2}(r-1))_{k_{r-1}, d}} \\ & \quad \times \det_{\mathfrak{n}^+}(x)^{k_{r-1}} \text{Proj}_{(l, \mathbf{k}) - \underline{k}_{r-1}}^{\mathfrak{p}^+}((x|e')_{\mathfrak{n}^+}^{l-k_{r-1}} \Delta_{\mathbf{k} - \underline{k}_{r-1}}^{\mathfrak{n}^{+''}}(x'')) \\ &= \frac{(-l)_{k_{r-1}}}{(-l - \frac{d}{2}(r-1))_{k_{r-1}}} \det_{\mathfrak{n}^+}(x)^{k_{r-1}} \frac{(-l + k_{r-1})_{\mathbf{k} - \underline{k}_{r-1}, d}}{(-l + k_{r-1} - \frac{d}{2})_{\mathbf{k} - \underline{k}_{r-1}, d}} \Delta_{(l, \mathbf{k}) - \underline{k}_{r-1}}^{\mathfrak{n}^+}(x) \\ &= \frac{(-l)_{k_{r-1}}}{(-l - \frac{d}{2}(r-1))_{k_{r-1}}} \frac{(-l)_{\mathbf{k}, d}}{(-l - \frac{d}{2})_{\mathbf{k}, d}} \frac{(-l - \frac{d}{2})_{\underline{k}_{r-1}, d}}{(-l)_{\underline{k}_{r-1}, d}} \Delta_{(l, \mathbf{k})}^{\mathfrak{n}^+}(x) \\ &= \frac{(-l)_{\mathbf{k}, d}}{(-l - \frac{d}{2})_{\mathbf{k}, d}} \frac{(-l)_{\underline{k}_{r-1}, d}}{(-l)_{\underline{k}_{r-1}, d}} \Delta_{(l, \mathbf{k})}^{\mathfrak{n}^+}(x) = \frac{(-l)_{\mathbf{k}, d}}{(-l - \frac{d}{2})_{\mathbf{k}, d}} \Delta_{(l, \mathbf{k})}^{\mathfrak{n}^+}(x), \end{aligned}$$

where we have applied the induction hypothesis (2.8) for  $\mathfrak{p}^+(e_r)_0 = \mathfrak{p}^+(\sum_{j=1}^{r-1} e_j)_2 \subset \mathfrak{p}^+$  at the 3rd equality. This proves (2.8) for all  $r$ . Then since

$$\Delta_{(l, \mathbf{k})}^{\mathfrak{n}^+}(x)|_{x=x'+x'' \in \mathfrak{p}^+ \oplus \mathfrak{p}^{+''}} = (x'|e')_{\mathfrak{n}^+}^l \Delta_{\mathbf{k}}^{\mathfrak{n}^{+''}}(x'')$$

holds, we get the desired formula.

(5) Let  $\{e_1, \dots, e_r\} \subset \mathfrak{n}^+$  be the Jordan frame defining  $\Delta_{\mathbf{k}}^{\mathfrak{n}^+}(x)$ , and we take an element  $y \in \mathfrak{p}^+$  of rank 1 such that  $(e_j|y)_{\mathfrak{n}^+} \neq 0$  holds for all  $j = 1, \dots, r$ . We prove

$$\text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l \Delta_{\mathbf{k}}^{\mathfrak{n}^+}(x)) \neq 0 \quad (2.9)$$

by induction on  $r$ . When  $r = 1$  this is clear. Next we assume (2.9) for  $r - 1$ , and prove it for  $r$ . Then by (1) we have

$$\text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l \Delta_{\mathbf{k}}^{\mathfrak{n}^+}(x)) = \det_{\mathfrak{n}^+}(x)^{k_r} \text{Proj}_{\mathbf{m} - \underline{k}_r}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l \Delta_{\mathbf{k} - \underline{k}_r}^{\mathfrak{n}^+}(x)),$$

and it suffices to prove (2.9) when  $k_r = 0$ . Then by applying (2) for  $e' = e_r$ ,  $k = m_r$  so that  $\mathfrak{p}^{+''} = \mathfrak{p}^+(e_r)_0 = \mathfrak{p}^+(\sum_{j=1}^{r-1} e_j)_2$ , we have

$$\begin{aligned} & \text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l \Delta_{\mathbf{k}}^{\mathfrak{n}^+}(x)) = \text{Proj}_{\mathbf{m}}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l \Delta_{\mathbf{k}}^{\mathfrak{n}^{+''}}(x'')) \\ &= \frac{(-l)_{m_r} (-\mathbf{k}^\vee)_{\underline{m}_r, d}}{(-\mathbf{m}^\vee)_{\underline{m}_r, d}} \det_{\mathfrak{n}^+}(x)^{m_r} (e_r|y)_{\mathfrak{n}^+}^{m_r} \text{Proj}_{\mathbf{m} - \underline{m}_r}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^{l-m_r} \Delta_{\mathbf{k} - \underline{m}_r}^{\mathfrak{n}^{+''}}(x'')), \end{aligned}$$

and it suffices to prove (2.9) when  $k_r = m_r = 0$ . Then for  $k_r = 0$ , by restricting

$$(x|y)_{\mathfrak{n}^+}^l \Delta_{\mathfrak{k}^+}^{\mathfrak{n}^{++}}(x'') = \sum_{\substack{\mathfrak{m} \in \mathbb{Z}_{++}^r, |\mathfrak{m}|=|\mathfrak{k}|+l \\ k_{j-1} \geq m_j \geq k_j}} \text{Proj}_{\mathfrak{m}^+}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l \Delta_{\mathfrak{k}^+}^{\mathfrak{n}^{++}}(x'')),$$

to the subalgebra  $\mathfrak{p}^{++} = \mathfrak{p}^+(e_r)_0 \subset \mathfrak{p}^+$ , we get

$$\begin{aligned} & \sum_{\substack{\mathfrak{m} \in \mathbb{Z}_{++}^r, |\mathfrak{m}|=|\mathfrak{k}|+l \\ k_{j-1} \geq m_j \geq k_j \\ m_r=0}} \text{Proj}_{\mathfrak{m}^+}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l \Delta_{\mathfrak{k}^+}^{\mathfrak{n}^{++}}(x''))|_{\mathfrak{p}^{++}} = (x|y)_{\mathfrak{n}^+}^l \Delta_{\mathfrak{k}^+}^{\mathfrak{n}^{++}}(x'')|_{\mathfrak{p}^{++}} \\ & = (x''|y'')_{\mathfrak{n}^{++}}^l \Delta_{\mathfrak{k}^+}^{\mathfrak{n}^{++}}(x'') = \sum_{\substack{\mathfrak{m} \in \mathbb{Z}_{++}^{r-1}, |\mathfrak{m}|=|\mathfrak{k}|+l \\ k_{j-1} \geq m_j \geq k_j}} \text{Proj}_{\mathfrak{m}^{++}}^{\mathfrak{p}^{++}}((x''|y'')_{\mathfrak{n}^{++}}^l \Delta_{\mathfrak{k}^+}^{\mathfrak{n}^{++}}(x'')), \end{aligned}$$

and hence for  $k_r = m_r = 0$  we have

$$\text{Proj}_{\mathfrak{m}^+}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l \Delta_{\mathfrak{k}^+}^{\mathfrak{n}^{++}}(x''))|_{\mathfrak{p}^{++}} = \text{Proj}_{\mathfrak{m}^{++}}^{\mathfrak{p}^{++}}((x''|y'')_{\mathfrak{n}^{++}}^l \Delta_{\mathfrak{k}^+}^{\mathfrak{n}^{++}}(x'')).$$

By the induction hypothesis, this is non-zero. Hence (2.9) holds for all  $r$ .  $\square$

Also, the following holds.

**Proposition 2.5.** *Suppose that  $\mathfrak{p}^+$  is of tube type and  $\text{rank } \mathfrak{p}^+ \geq 2$ . Let  $k, l, m \in \mathbb{Z}_{\geq 0}$ ,  $m \leq k, l$ , and let  $y, z \in \mathfrak{p}^+$  be elements of rank 1. Then we have*

$$\begin{aligned} & \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k) \\ & = \frac{(-1)^m}{(-k-l+m-\frac{d}{2}(r-1))_m m!} \sum_{j=m}^{\min\{k,l\}} \frac{(-k)_j (-l)_j}{(-k-l+2m-\frac{d}{2}(r-1)+1)_{j-m} (j-m)!} \\ & \quad \times (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j, \\ & \text{Proj}_{(k+l-m, m, \underline{0}_{r-2})}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x|z)_{\mathfrak{n}^+}^k) \\ & = \frac{(-1)^m}{(-k-l+m-\frac{d}{2})_m m!} \sum_{j=m}^{\min\{k,l\}} \frac{(-k)_j (-l)_j}{(-k-l+2m-\frac{d}{2}+1)_{j-m} (j-m)!} \\ & \quad \times (x|y)_{\mathfrak{n}^+}^{l-j} (x|z)_{\mathfrak{n}^+}^{k-j} ((x|y)_{\mathfrak{n}^+} (x|z)_{\mathfrak{n}^+} - (P(x)y|z)_{\mathfrak{n}^+})^j. \end{aligned}$$

*Proof.* (1) First we prove

$$\bigoplus_{j=0}^{\min\{k,l\}} \mathbb{R} (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j = \bigoplus_{m=0}^{\min\{k,l\}} \mathbb{R} \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k). \quad (2.10)$$

Indeed, by the definition of  $\text{Proj}_{\mathfrak{m}^+}^{\mathfrak{p}^+}$  we have

$$(x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k = \sum_{m=0}^{\min\{k,l\}} \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k).$$

We fix a primitive idempotent  $e' \in \mathfrak{n}^+$ , and let  $\mathfrak{n}^+(e')_0 =: \mathfrak{n}^{+\prime}$ . Then since  $z$  is of rank 1,  $z = ge'$  holds for some  $g \in K^{\mathbb{C}}$ . Then as in the proof of Lemma 2.4 (2), for  $j = 0, 1, \dots, \min\{k, l\}$  we have

$$\begin{aligned}
& \det_{\mathfrak{n}^+}(x)^{j-k} \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^j \det_{\mathfrak{n}^+}(x)^k (x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k \\
&= \det_{\mathfrak{n}^+}(g^{-1}x)^{j-k} \det_{\mathfrak{n}^+} \left( {}^t g \frac{\partial}{\partial x} \right)^j \det_{\mathfrak{n}^+}(g^{-1}x)^k (g^{-1}x|{}^t g y)_{\mathfrak{n}^+}^l ((g^{-1}x)^{-1}|e')_{\mathfrak{n}^+}^k \\
&= \det_{\mathfrak{n}^+}(w)^{j-k} \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial w} \right)^j (w|{}^t g y)_{\mathfrak{n}^+}^l \det_{\mathfrak{n}^{\prime\prime}}(w'')^k \Big|_{w=g^{-1}x} \\
&= (-1)^{jr} (-l)_j (-k)_{\underline{j}_{r-1}, d} \det_{\mathfrak{n}^+}(w)^{j-k} (w|{}^t g y)_{\mathfrak{n}^+}^{l-j} \det_{\mathfrak{n}^{\prime\prime}}(w'')^{k-j} (e'|{}^t g y)_{\mathfrak{n}^+}^j \Big|_{w=g^{-1}x} \\
&= (-1)^{jr} (-l)_j (-k)_{\underline{j}_{r-1}, d} (g^{-1}x|{}^t g y)_{\mathfrak{n}^+}^{l-j} ((g^{-1}x)^{-1}|e')_{\mathfrak{n}^+}^{k-j} ({}^t g y|e')_{\mathfrak{n}^+}^j \\
&= (-1)^{jr} (-l)_j (-k)_{\underline{j}_{r-1}, d} (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j. \tag{2.11}
\end{aligned}$$

On the other hand, for  $j, m = 0, 1, \dots, \min\{k, l\}$  we have

$$\begin{aligned}
& \det_{\mathfrak{n}^+}(x)^{j-k} \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^j \det_{\mathfrak{n}^+}(x)^k \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k) \\
&= (-1)^{jr} (-m, \underline{k}_{r-2}, k+l-m)_{\underline{j}, d} \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k), \tag{2.12}
\end{aligned}$$

and hence

$$\begin{aligned}
& (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j \in \mathbb{R} \det_{\mathfrak{n}^+}(x)^{j-k} \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^j \det_{\mathfrak{n}^+}(x)^k (x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k \\
&= \mathbb{R} \det_{\mathfrak{n}^+}(x)^{j-k} \det_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x} \right)^j \det_{\mathfrak{n}^+}(x)^k \sum_{m=0}^{\min\{k, l\}} \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k) \\
&\subset \bigoplus_{m=j}^{\min\{k, l\}} \mathbb{R} \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k).
\end{aligned}$$

Therefore, the left hand side of (2.10) is contained in the right hand side. Since both sides have the dimension  $\min\{k, l\} + 1$ , we get (2.10).

Next we determine  $\text{Proj}_{(l, \underline{0}_{r-2}, -k)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k)$ . By (2.10) this is of the form

$$\text{Proj}_{(l, \underline{0}_{r-2}, -k)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k) = \sum_{j=0}^{\min\{k, l\}} a_j (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j$$

for some  $a_j \in \mathbb{C}$ . Then since

$$\begin{aligned}
& \det_{\mathfrak{n}^+}(x)^k \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k) \in \mathcal{P}_{(k+l-m, \underline{k}_{r-2}, m)}(\mathfrak{p}^+), \\
& \det_{\mathfrak{n}^+}(x)^k (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} \in \mathcal{P}_{(\underline{k}_{r-1}, j)}(\mathfrak{p}^+)
\end{aligned}$$

vanish for  $m, j \geq 1$  if  $x$  is not invertible, we have

$$\begin{aligned}
& \det_{\mathfrak{n}^+}(x)^k \text{Proj}_{(l, \underline{0}_{r-2}, -k)}^{\mathfrak{p}^+} ((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k) = (x|y)_{\mathfrak{n}^+}^l (x^{\#}|z)_{\mathfrak{n}^+}^k, \\
& \det_{\mathfrak{n}^+}(x)^k \sum_{j=0}^{\min\{k, l\}} a_j (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j = a_0 (x|y)_{\mathfrak{n}^+}^l (x^{\#}|z)_{\mathfrak{n}^+}^k
\end{aligned}$$

for non-invertible  $x$ , and hence we get  $a_0 = 1$ . To determine other  $a_j$ , we consider the differential operator

$$\mathcal{L} := \sum_{\alpha\beta} (P(x)e_\alpha^\vee | e_\beta^\vee)_{\mathfrak{n}^+} \frac{\partial^2}{\partial x_\alpha \partial x_\beta},$$

where  $\{e_\alpha\}, \{e_\alpha^\vee\} \subset \mathfrak{n}^+$  are mutually dual bases of  $\mathfrak{n}^+$  and  $\frac{\partial}{\partial x_\alpha}$  is the directional derivative along  $e_\alpha$ . Then by [9, Proposition VI.4.4],  $\text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k)$  is the eigenfunction of  $\mathcal{L}$  with the eigenvalue

$$\begin{aligned} & (l-m)^2 - (l-m) + (m-k)^2 - (m-k)(1+d(r-1)) \\ & = 2m^2 - m(2k+2l+d(r-1)) + k^2 + l^2 + k(1+d(r-1)) - l, \end{aligned}$$

which are distinct for all  $m = 0, 1, \dots, \min\{k, l\}$ . Also, we have

$$\begin{aligned} & \mathcal{L}(x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j \\ & = (\mathcal{L}(x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j + (x|y)_{\mathfrak{n}^+}^{l-j} (\mathcal{L}(x^{-1}|z)_{\mathfrak{n}^+}^{k-j}) (y|z)_{\mathfrak{n}^+}^j \\ & \quad + 2 \sum_{\alpha\beta} (P(x)e_\alpha^\vee | e_\beta^\vee)_{\mathfrak{n}^+} \left( \frac{\partial}{\partial x_\alpha} (x|y)_{\mathfrak{n}^+}^{l-j} \right) \left( \frac{\partial}{\partial x_\beta} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} \right) (y|z)_{\mathfrak{n}^+}^j \\ & = ((l-j)^2 - (l-j)) (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j \\ & \quad + ((j-k)^2 - (j-k)(1+d(r-1))) (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j \\ & \quad - 2(l-j)(k-j) (P(x)y|P(x)^{-1}z)_{\mathfrak{n}^+} (x|y)_{\mathfrak{n}^+}^{l-j-1} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j-1} (y|z)_{\mathfrak{n}^+}^j \\ & = (2j^2 - j(2k+2l+d(r-1)) + k^2 + l^2 + k(1+d(r-1)) - l) (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j \\ & \quad - 2(l-j)(k-j) (x|y)_{\mathfrak{n}^+}^{l-j-1} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j-1} (y|z)_{\mathfrak{n}^+}^{j+1}. \end{aligned}$$

Hence we have

$$\begin{aligned} 0 & = (\mathcal{L} - (k^2 + l^2 + k(1+d(r-1)) - l)) \text{Proj}_{(l, \underline{0}_{r-2}, -k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k) \\ & = \sum_{j=0}^{\min\{k, l\}} a_j ((2j^2 - j(2k+2l+d(r-1))) (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j \\ & \quad - 2(l-j)(k-j) (x|y)_{\mathfrak{n}^+}^{l-j-1} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j-1} (y|z)_{\mathfrak{n}^+}^{j+1}) \\ & = 2 \sum_{j=0}^{\min\{k, l\}-1} \left( a_{j+1} \left( j-k-l - \frac{d}{2}(r-1) + 1 \right) (j+1) - a_j (j-k)(j-l) \right) \\ & \quad \times (x|y)_{\mathfrak{n}^+}^{l-j-1} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j-1} (y|z)_{\mathfrak{n}^+}^{j+1}, \end{aligned}$$

and since  $a_0 = 1$ , we have

$$a_j = \frac{(-k)_j (-l)_j}{(-k-l - \frac{d}{2}(r-1) + 1)_j j!},$$

that is, we get

$$\begin{aligned} & \text{Proj}_{(l, \underline{0}_{r-2}, -k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k) \\ & = \sum_{j=0}^{\min\{k, l\}} \frac{(-k)_j (-l)_j}{(-k-l - \frac{d}{2}(r-1) + 1)_j j!} (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j. \end{aligned}$$

Finally we determine  $\text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k)$  for  $m \geq 1$ . If  $z = e' \in \mathfrak{n}^+$  is a primitive idempotent, then by Lemma 2.4 (2) we have

$$\begin{aligned}
& \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k) \\
&= \det_{\mathfrak{n}^+}(x)^{-k} \text{Proj}_{(k+l-m, \underline{k}_{r-2}, m)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l \det_{\mathfrak{n}^+}(x'')^k) \\
&= \frac{(-l)_m (-k)_{\underline{m}_{r-1}, d}}{(-m, \underline{k}_{r-2}, k+l-m)_{\underline{m}_r, d}} \\
&\quad \times \det_{\mathfrak{n}^+}(x)^{m-k} \text{Proj}_{(k+l-2m, \underline{k-m}_{r-2}, 0)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^{l-m} \det_{\mathfrak{n}^+}(x'')^{k-m}) (e'|y)_{\mathfrak{n}^+}^m \\
&= \frac{(-l)_m (-k)_m (-k - \frac{d}{2})_{\underline{m}_{r-2}, d}}{(-m)_m (-k - \frac{d}{2})_{\underline{m}_{r-2}, d} (-k-l+m - \frac{d}{2}(r-1))_m} \\
&\quad \times \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^{l-m} (x^{-1}|z)_{\mathfrak{n}^+}^{k-m}) (y|z)_{\mathfrak{n}^+}^m \\
&= \frac{(-1)^m (-l)_m (-k)_m}{(-k-l+m - \frac{d}{2}(r-1))_m m!} \\
&\quad \times \sum_{j=0}^{\min\{k-m, l-m\}} \frac{(-k+m)_j (-l+m)_j}{(-k-l+2m - \frac{d}{2}(r-1) + 1)_{j,j}!} (x|y)_{\mathfrak{n}^+}^{l-m-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-m-j} (y|z)_{\mathfrak{n}^+}^{j+m} \\
&= \frac{(-1)^m}{(-k-l+m - \frac{d}{2}(r-1))_m m!} \sum_{j=m}^{\min\{k,l\}} \frac{(-k)_j (-l)_j (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j}{(-k-l+2m - \frac{d}{2}(r-1) + 1)_{j-m} (j-m)!}.
\end{aligned}$$

For general  $z \in \mathfrak{p}^+$  of rank 1, when  $z = ge'$  with  $g \in K^{\mathbb{C}}$ , by replacing  $x, y$  with  $g^{-1}x, {}^tgy$  and applying the above, we get the desired formula.

(2) First we consider the case  $\text{rank } \mathfrak{p}^+ = 2$ . Then for  $x, z \in \mathfrak{p}^+$  we have

$$(x|z)_{\mathfrak{n}^+} = (x^\sharp|z^\sharp)_{\mathfrak{n}^+} = \det_{\mathfrak{n}^+}(x)(x^{-1}|z^\sharp)_{\mathfrak{n}^+},$$

and  $z^\sharp$  is of rank 1 if  $z$  is of rank 1. Hence by (1) we have

$$\begin{aligned}
& \text{Proj}_{(k+l-m, m)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x|z)_{\mathfrak{n}^+}^k) = \det_{\mathfrak{n}^+}(x)^k \text{Proj}_{(l-m, m-k)}^{\mathfrak{p}^+}((x|y)_{\mathfrak{n}^+}^l (x^{-1}|z^\sharp)_{\mathfrak{n}^+}^k) \\
&= \frac{(-1)^m}{(-k-l+m - \frac{d}{2})_m m!} \det_{\mathfrak{n}^+}(x)^k \sum_{j=m}^{\min\{k,l\}} \frac{(-k)_j (-l)_j (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z^\sharp)_{\mathfrak{n}^+}^{k-j} (y|z^\sharp)_{\mathfrak{n}^+}^j}{(-k-l+2m - \frac{d}{2} + 1)_{j-m} (j-m)!} \\
&= \frac{(-1)^m}{(-k-l+m - \frac{d}{2})_m m!} \sum_{j=m}^{\min\{k,l\}} \frac{(-k)_j (-l)_j (x|y)_{\mathfrak{n}^+}^{l-j} (x|z)_{\mathfrak{n}^+}^{k-j} (y|z^\sharp)_{\mathfrak{n}^+}^j \det_{\mathfrak{n}^+}(x)^j}{(-k-l+2m - \frac{d}{2} + 1)_{j-m} (j-m)!}.
\end{aligned}$$

Hence it suffices to show

$$(x|y)_{\mathfrak{n}^+} (x|z)_{\mathfrak{n}^+} - (P(x)y|z)_{\mathfrak{n}^+} = (y|z^\sharp)_{\mathfrak{n}^+} \det_{\mathfrak{n}^+}(x). \quad (2.13)$$

Indeed, when  $y = z$  we have

$$\begin{aligned}
(x|y)_{\mathfrak{n}^+}^2 - (P(x)y|y)_{\mathfrak{n}^+} &= (e|P(x^{1/2})y)_{\mathfrak{n}^+}^2 - (P(x^{1/2})y|P(x^{1/2})y)_{\mathfrak{n}^+} \\
&= 2 \det_{\mathfrak{n}^+}(P(x^{1/2})y) = 2 \det_{\mathfrak{n}^+}(x) \det_{\mathfrak{n}^+}(y) = \det_{\mathfrak{n}^+}(x)(y|y^\sharp)_{\mathfrak{n}^+},
\end{aligned}$$

and by polarization we get (2.13). Thus we get the desired formula when  $\mathfrak{p}^+$  is of rank 2. For  $\mathfrak{p}^+$  of general rank, since the both sides of the desired formula depend only on the rank 2 subalgebra containing  $y$  and  $z$ , this is reduced to the rank 2 case.  $\square$

**Remark 2.6.** By (2.11), (2.12) and Proposition 2.5, for  $i = 0, 1, \dots, \min\{k, l\}$  we have

$$\begin{aligned}
& (-l)_i (-k)_i (x|y)_{\mathfrak{n}^+}^{l-i} (x^{-1}|z)_{\mathfrak{n}^+}^{k-i} (y|z)_{\mathfrak{n}^+}^i \\
&= \sum_{m=i}^{\min\{k,l\}} (-m)_i \left( -k-l+m - \frac{d}{2}(r-1) \right)_i \text{Proj}_{(l-m, \mathfrak{q}_{r-2}, m-k)}^{\mathfrak{p}^+} \left( (x|y)_{\mathfrak{n}^+}^l (x^{-1}|z)_{\mathfrak{n}^+}^k \right) \\
&= \sum_{m=i}^{\min\{k,l\}} \frac{(-1)^{m-i}}{\left( -k-l+i+m - \frac{d}{2}(r-1) \right)_{m-i} (m-i)!} \\
&\quad \times \sum_{j=m}^{\min\{k,l\}} \frac{(-k)_j (-l)_j}{\left( -k-l+2m - \frac{d}{2}(r-1) + 1 \right)_{j-m} (j-m)!} (x|y)_{\mathfrak{n}^+}^{l-j} (x^{-1}|z)_{\mathfrak{n}^+}^{k-j} (y|z)_{\mathfrak{n}^+}^j,
\end{aligned}$$

that is, for  $j = i+1, i+2, \dots, \min\{k, l\}$  we have

$$\begin{aligned}
& \sum_{m=i}^j \frac{(-1)^{m-i}}{\left( -k-l+i+m - \frac{d}{2}(r-1) \right)_{m-i} (m-i)!} \frac{(-k)_j (-l)_j}{\left( -k-l+2m - \frac{d}{2}(r-1) + 1 \right)_{j-m} (j-m)!} \\
&= \sum_{m=0}^{j-i} \frac{(-1)^m (-k)_j (-l)_j}{\left( -k-l+2i+m - \frac{d}{2}(r-1) \right)_m m! \left( -k-l+2i+2m - \frac{d}{2}(r-1) + 1 \right)_{j-i-m} (j-i-m)!} \\
&= 0.
\end{aligned}$$

In general, for  $\mu \in \mathbb{C}$ ,  $j \in \mathbb{Z}_{>0}$ , we can directly verify

$$\begin{aligned}
& \sum_{m=0}^j \frac{(-1)^m}{(\mu+m)_m m! (\mu+2m+1)_{j-m} (j-m)!} = \sum_{m=0}^j \frac{(-1)^m (\mu)_m (\mu+2m) (\mu+j+m+1)_{j-m}}{(\mu)_{2j+1} m! (j-m)!} \\
&= \frac{(-1)^j}{(\mu)_{2j+1}} \sum_{m=0}^j \frac{(\mu)_m (\mu+2m)}{m!} \frac{(-\mu-2j)_{j-m}}{(j-m)!} = 0,
\end{aligned}$$

by comparing the coefficients for  $t^j$  of

$$\begin{aligned}
& \sum_{q=0}^{\infty} \sum_{m=0}^q \frac{(\mu)_m (\mu+2m)}{m!} \frac{(-\mu-2j)_{q-m}}{(q-m)!} t^q = \sum_{m=0}^{\infty} \frac{(\mu)_m (\mu+2m)}{m!} t^m \sum_{n=0}^{\infty} \frac{(-\mu-2j)_n}{n!} t^n \\
&= \mu(1+t)(1-t)^{-\mu-1} (1-t)^{\mu+2j} = \mu(1+t)(1-t)^{2j-1} = -\frac{\mu}{j} \sum_{q=0}^{\infty} \frac{(-2j)_q (-j+q)}{q!} t^q.
\end{aligned}$$

## 2.7 Holomorphic discrete series representations

In this subsection we review holomorphic discrete series representations. First we recall the bounded symmetric domain realization (Harish-Chandra realization) of the Hermitian symmetric space  $G/K$  via the Borel embedding,

$$\begin{array}{ccc}
G/K & \longrightarrow & G^{\mathbb{C}}/K^{\mathbb{C}}P^- \\
\downarrow \wr & & \uparrow \text{exp} \\
D^{\mathbb{C}} & \longrightarrow & \mathfrak{p}^+
\end{array}$$

where

$$\begin{aligned} D &= (\text{connected component of } \{x \in \mathfrak{p}^+ \mid B(x) \text{ is positive definite}\} \text{ which contains } 0) \\ &= (\text{connected component of } \{x \in \mathfrak{p}^+ \mid h(x) > 0\} \text{ which contains } 0). \end{aligned}$$

Here we write  $B(x) := B(x, \bar{x})$ ,  $h(x) := h(x, \bar{x})$ . Then its Bergman–Shilov boundary  $\Sigma \subset \partial D$  consists of all maximal tripotents in  $\mathfrak{p}^+$ . For  $g \in G^{\mathbb{C}}$ ,  $x \in D$ , if  $g \exp(x) \in P^+ K^{\mathbb{C}} P^-$  holds, then we write

$$g \exp(x) = \exp(\pi^+(g, x)) \kappa(g, x) \exp(\pi^-(g, x)),$$

where  $\pi^{\pm}(g, x) \in \mathfrak{p}^{\pm}$  and  $\kappa(g, x) \in K^{\mathbb{C}}$ . Then the map  $\pi^+ : G \times D \rightarrow D$  gives an action of  $G$  on  $D$ , and we abbreviate  $\pi^+(g, x) =: gx$ .

Next let  $(\tau, V)$  be an irreducible holomorphic representation of the universal covering group  $\tilde{K}^{\mathbb{C}}$  of  $K^{\mathbb{C}}$ , with the  $\tilde{K}$ -invariant inner product  $(\cdot, \cdot)_{\tau}$ . Then the universal covering group  $\tilde{G}$  of  $G$  acts on the space  $\mathcal{O}(D, V) = \mathcal{O}_{\tau}(D, V)$  of  $V$ -valued holomorphic functions on  $D$  by

$$(\hat{\tau}(g)f)(x) := \tau(\kappa(g^{-1}, x))^{-1} f(g^{-1}x) \quad (g \in \tilde{G}, x \in D, f \in \mathcal{O}(D, V)),$$

where we lift the map  $\kappa : G \times D \rightarrow K^{\mathbb{C}}$  to the universal covering spaces, and represent by the same symbol  $\kappa : \tilde{G} \times D \rightarrow \tilde{K}^{\mathbb{C}}$ . Its differential action is given by

$$(d\hat{\tau}(z, k, w)f)(x) = d\tau(k - D(x, w))f(x) + \left. \frac{d}{dt} \right|_{t=0} f(x - t(z + kx - Q(x)w)) \quad (2.14)$$

for  $z \in \mathfrak{p}^+$ ,  $k \in \mathfrak{k}^{\mathbb{C}}$ ,  $w \in \mathfrak{p}^-$ . This becomes a highest weight representation with the minimal  $\tilde{K}$ -type  $(\tau, V)$ . If this contains a unitary subrepresentation  $\mathcal{H}_{\tau}(D, V) \subset \mathcal{O}_{\tau}(D, V)$ , then its reproducing kernel is proportional to  $\tau(B(x, \bar{y}))$ , and such unitary subrepresentation is unique. Here we lift the map  $B : D \times \bar{D} \rightarrow \text{Str}(\mathfrak{p}^+)_{\mathbb{C}} \subset \text{End}_{\mathbb{C}}(\mathfrak{p}^+)$  to the universal covering space, and represent by the same symbol  $B : D \times \bar{D} \rightarrow \tilde{K}^{\mathbb{C}}$ . Especially, if the  $\tilde{G}$ -invariant inner product is given by the converging integral

$$\langle f, g \rangle_{\hat{\tau}} := C_{\tau} \int_D (\tau(B(x)^{-1})f(x), g(x))_{\tau} \text{Det}_{\mathfrak{p}^+}(B(x))^{-1} dx$$

(a *weighted Bergman inner product*), then  $(\hat{\tau}, \mathcal{H}_{\tau}(D, V))$  is called a *holomorphic discrete series representation*. Here we normalize the Lebesgue measure  $dx$  on  $D \subset \mathfrak{p}^+$  with respect to the inner product  $(\cdot, \cdot)_{\mathfrak{p}^+}$ , and determine the constant  $C_{\tau}$  such that  $\|v\|_{\hat{\tau}} = \|v\|_{\tau}$  holds for all constant functions  $v \in V$ .

Next, let  $\chi : \tilde{K}^{\mathbb{C}} \rightarrow \mathbb{C}^{\times}$  be the character of  $\tilde{K}^{\mathbb{C}}$  normalized such that

$$d\chi([x, y]) = (x|y)_{\mathfrak{p}^+} \quad (x \in \mathfrak{p}^+, y \in \mathfrak{p}^-), \quad (2.15)$$

so that  $h(x, y) = \chi(B(x, y))$  holds, and we fix a representation  $(\tau_0, V)$  of  $K^{\mathbb{C}}$ . When  $(\tau, V)$  is of the form  $(\tau, V) = (\chi^{-\lambda} \otimes \tau_0, V)$ , we write  $\mathcal{H}_{\tau}(D, V) = \mathcal{H}_{\lambda}(D, V) \subset \mathcal{O}_{\tau}(D, V) = \mathcal{O}_{\lambda}(D, V)$ . In addition, if  $(\tau, V) = (\chi^{-\lambda}, \mathbb{C})$ , then we write  $\mathcal{H}_{\tau}(D, V) = \mathcal{H}_{\lambda}(D) \subset \mathcal{O}_{\tau}(D, V) = \mathcal{O}_{\lambda}(D)$  and  $\hat{\tau} = \tau_{\lambda}$ .

In the rest of this subsection we assume  $\mathfrak{p}^+$  is simple and  $(\tau, V) = (\chi^{-\lambda}, \mathbb{C})$ . Then  $\mathcal{H}_{\lambda}(D)$  is holomorphic discrete if  $\lambda > p - 1$ , and then the inner product is given by

$$\begin{aligned} \langle f, g \rangle_{\lambda} &= \langle f, g \rangle_{\lambda, \mathfrak{p}^+} := C_{\lambda} \int_D f(x) \overline{g(x)} h(x)^{\lambda-p} dx, \\ C_{\lambda} &:= \frac{1}{\pi^n} \frac{\Gamma_r^d(\lambda)}{\Gamma_r^d(\lambda - \frac{n}{r})}, \end{aligned} \quad (2.16)$$

where  $\Gamma_r^d(\lambda)$  is as in (2.5). We consider another inner product on  $\mathcal{P}(\mathfrak{p}^+)$ , called the *Fischer inner product* (see e.g. [9, Section XI.1]), defined by

$$\langle f, g \rangle_F = \langle f, g \rangle_{F, \mathfrak{p}^+} := \frac{1}{\pi^n} \int_{\mathfrak{p}^+} f(x) \overline{g(x)} e^{-(x|\overline{x})_{\mathfrak{p}^+}} dx = g \left( \overline{\frac{\partial}{\partial x}} \right) f(x) \Big|_{x=0}. \quad (2.17)$$

Here  $\overline{g(\overline{\cdot})}$  is a holomorphic polynomial on  $\mathfrak{p}^-$ , and we normalize  $\frac{\partial}{\partial x}$  with respect to the bilinear form  $(\cdot|\cdot)_{\mathfrak{p}^+} : \mathfrak{p}^+ \times \mathfrak{p}^- \rightarrow \mathbb{C}$ . Then the following holds.

**Theorem 2.7** (Faraut–Korányi, [8], [7, Part III, Corollary V.3.9]). *For  $\lambda > p - 1$ ,  $\mathbf{m} \in \mathbb{Z}_{++}^r$ ,  $f \in \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+)$ ,  $g \in \mathcal{P}(\mathfrak{p}^+)$ , we have*

$$\langle f, g \rangle_{\lambda} = \frac{1}{(\lambda)_{\mathbf{m}, d}} \langle f, g \rangle_F,$$

where  $(\lambda)_{\mathbf{m}, d}$  is as in (2.6).

Since the reproducing kernel on  $\mathcal{P}(\mathfrak{p}^+)$  with respect to  $\langle \cdot, \cdot \rangle_F$  is given by  $e^{(x|\overline{y})_{\mathfrak{p}^+}}$ , the following holds.

**Corollary 2.8.** *For  $\lambda > p - 1$ ,  $\mathbf{m} \in \mathbb{Z}_{++}^r$ ,  $f(x) \in \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+)$ , we have*

$$\left\langle f(x), e^{(x|\overline{y})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} = \frac{1}{(\lambda)_{\mathbf{m}, d}} f(y).$$

Here the subscript  $x$  stands for the variable of integration. By this theorem,  $\langle \cdot, \cdot \rangle_{\lambda}$  is meromorphically continued for all  $\lambda \in \mathbb{C}$ , and the  $\tilde{K}$ -finite part  $\mathcal{O}_{\lambda}(D)_{\tilde{K}} = \chi^{-\lambda} \otimes \mathcal{P}(\mathfrak{p}^+)$  is reducible as a  $(\mathfrak{g}, \tilde{K})$ -module if and only if  $\lambda$  is a pole of  $\langle \cdot, \cdot \rangle_{\lambda}$ . Especially, for  $j = 1, 2, \dots, r$ ,  $\lambda \in \frac{d}{2}(j-1) - \mathbb{Z}_{\geq 0}$ ,

$$M_j(\lambda) = M_j^{\mathfrak{g}}(\lambda) := \bigoplus_{\substack{\mathbf{m} \in \mathbb{Z}_{++}^r \\ m_j \leq \frac{d}{2}(j-1) - \lambda}} \chi^{-\lambda} \otimes \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+) \subset \chi^{-\lambda} \otimes \mathcal{P}(\mathfrak{p}^+) = \mathcal{O}_{\lambda}(D)_{\tilde{K}} \quad (2.18)$$

gives a  $(\mathfrak{g}, \tilde{K})$ -submodule. Moreover,  $\langle \cdot, \cdot \rangle_{\lambda}$  is positive definite on  $\mathcal{P}(\mathfrak{p}^+)$  for  $\lambda > \frac{d}{2}(r-1)$ , and on  $M_j^{\mathfrak{g}}(\frac{d}{2}(j-1))$  for  $\lambda = \frac{d}{2}(j-1)$ ,  $j = 1, \dots, r$ , that is,  $\mathcal{O}_{\lambda}(D)_{\tilde{K}}$  contains a unitary submodule  $\mathcal{H}_{\lambda}(D)$  if  $\lambda$  sits in the *Wallach set*

$$\lambda \in \left\{ 0, \frac{d}{2}, d, \dots, \frac{d}{2}(r-1) \right\} \cup \left( \frac{d}{2}(r-1), \infty \right), \quad (2.19)$$

and its  $\tilde{K}$ -finite part is given by

$$\mathcal{H}_{\lambda}(D)_{\tilde{K}} = \begin{cases} \chi^{-\lambda} \otimes \mathcal{P}(\mathfrak{p}^+) & (\lambda > \frac{d}{2}(r-1)), \\ M_j^{\mathfrak{g}}(\frac{d}{2}(j-1)) & (\lambda = \frac{d}{2}(j-1), j = 1, 2, \dots, r). \end{cases}$$

In addition, the quotient module  $\mathcal{O}_{\lambda}(D)_{\tilde{K}}/M_r(\lambda)$  ( $\lambda \in \frac{d}{2}(r-1) - \mathbb{Z}_{\geq 0}$ ) also gives an infinitesimally unitary module (see [8]). Also by the corollary, for  $\mathbf{k} \in \mathbb{Z}_{++}^r$ ,  $f(x) \in \mathcal{P}(\mathfrak{p}^+)$ ,  $(\lambda)_{\mathbf{k}, d} \langle f(x), e^{(x|\overline{y})_{\mathfrak{p}^+}} \rangle_{\lambda, x}$  is holomorphically continued for all  $\lambda \in \mathbb{C}$  if and only if

$$f(x) \in \bigoplus_{\substack{\mathbf{m} \in \mathbb{Z}_{++}^r \\ m_j \leq k_j (j=1, \dots, r)}} \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+)$$

holds, and if this is satisfied, then for  $j = 1, \dots, r$ ,

$$f(x) \in M_j(\lambda) \quad \text{holds if} \quad \lambda \in \frac{d}{2}(j-1) - k_j - \mathbb{Z}_{\geq 0}.$$

## 2.8 Classification

A simple Hermitian positive Jordan triple system  $\mathfrak{p}^\pm$  is isomorphic to one of the following.

$$\begin{array}{lll} \mathfrak{p}^\pm = \mathbb{C}^n & (n \geq 3), & \text{Sym}(r, \mathbb{C}), & M(q, s; \mathbb{C}), \\ & & \text{Alt}(s, \mathbb{C}), & \text{Herm}(3, \mathbb{O})^\mathbb{C}, & M(1, 2; \mathbb{O})^\mathbb{C}. \end{array}$$

Here  $\text{Sym}(r, \mathbb{C})$  and  $\text{Alt}(s, \mathbb{C})$  denote the spaces of symmetric and alternating matrices over  $\mathbb{C}$  respectively, and  $\text{Herm}(3, \mathbb{O})^\mathbb{C}$  denotes the complexification of the space of  $3 \times 3$  Hermitian matrices over the octonions  $\mathbb{O}$ . Then the corresponding Lie groups  $G$  and their maximal compact subgroups  $K$  are given by

$$(G, K) = \begin{cases} (SO_0(2, n), SO(2) \times SO(n)) & (\mathfrak{p}^\pm = \mathbb{C}^n), \\ (Sp(r, \mathbb{R}), U(r)) & (\mathfrak{p}^\pm = \text{Sym}(r, \mathbb{C})), \\ (SU(q, s), S(U(q) \times U(s))) & (\mathfrak{p}^\pm = M(q, s; \mathbb{C})), \\ (SO^*(2s), U(s)) & (\mathfrak{p}^\pm = \text{Alt}(s, \mathbb{C})), \\ (E_{7(-25)}, U(1) \times E_6) & (\mathfrak{p}^\pm = \text{Herm}(3, \mathbb{O})^\mathbb{C}), \\ (E_{6(-14)}, U(1) \times Spin(10)) & (\mathfrak{p}^\pm = M(1, 2; \mathbb{O})^\mathbb{C}) \end{cases}$$

(up to covering), and the numbers  $(n, r, d, b, p)$  (see (2.4)) are given by

$$(n, r, d, b, p) = \begin{cases} (n, 2, n-2, 0, n) & (\mathfrak{p}^\pm = \mathbb{C}^n, n \geq 3), \\ (\frac{1}{2}r(r+1), r, 1, 0, r+1) & (\mathfrak{p}^\pm = \text{Sym}(r, \mathbb{C})), \\ (qs, \min\{q, s\}, 2, |q-s|, q+s) & (\mathfrak{p}^\pm = M(q, s; \mathbb{C})), \\ (\frac{1}{2}s(s-1), \frac{s}{2}, 4, 0, 2(s-1)) & (\mathfrak{p}^\pm = \text{Alt}(s, \mathbb{C}), s: \text{even}), \\ (\frac{1}{2}s(s-1), \lfloor \frac{s}{2} \rfloor, 4, 2, 2(s-1)) & (\mathfrak{p}^\pm = \text{Alt}(s, \mathbb{C}), s: \text{odd}), \\ (27, 3, 8, 0, 18) & (\mathfrak{p}^\pm = \text{Herm}(3, \mathbb{O})^\mathbb{C}), \\ (16, 2, 6, 4, 12) & (\mathfrak{p}^\pm = M(1, 2; \mathbb{O})^\mathbb{C}). \end{cases}$$

Here, if  $r = 1$ , then  $d$  is not determined uniquely, and any number is allowed. When  $b = 0$ ,  $\mathfrak{p}^\pm$  is of tube type, and has a Jordan algebra structure. That is,  $\mathfrak{p}^\pm = \mathbb{C}^n$ ,  $\text{Sym}(r, \mathbb{C})$ ,  $M(r, \mathbb{C})$ ,  $\text{Alt}(2r, \mathbb{C})$  and  $\text{Herm}(3, \mathbb{O})^\mathbb{C}$  are of tube type. Their corresponding Euclidean real forms  $\mathfrak{n}^+ \subset \mathfrak{p}^+$  are given by

$$\mathfrak{n}^+ = \begin{cases} \mathbb{R}^{1, n-1} \\ \text{Sym}(r, \mathbb{R}) \\ \text{Herm}(r, \mathbb{C}) \\ \text{Herm}(r, \mathbb{H}) \\ \text{Herm}(3, \mathbb{O}) \end{cases} \subset \mathfrak{p}^+ = \begin{cases} \mathbb{C}^n \\ \text{Sym}(r, \mathbb{C}) \\ M(r, \mathbb{C}) \\ \text{Alt}(2r, \mathbb{C}) \\ \text{Herm}(3, \mathbb{O})^\mathbb{C}, \end{cases}$$

where  $\mathbb{R}^{1, n-1} \subset \mathbb{C}^n$  is a real form on which the quadratic form  $\det_{\mathfrak{n}^+}(x)$  has the signature  $(1, n-1)$ . For these cases  $p = \frac{2n}{r} = d(r-1) + 2$  holds.

Next we fix the parametrization of finite-dimensional irreducible representations of  $\widetilde{GL}(s, \mathbb{C})$  and  $Spin(n, \mathbb{C})$  ( $n \geq 3$ ). We take a basis  $\{\epsilon_j\}_{j=1}^s \subset \mathfrak{h}^{\mathbb{C}\vee}$  of the dual space of a Cartan subalgebra  $\mathfrak{h}^\mathbb{C} \subset \mathfrak{gl}(s, \mathbb{C})$  such that the positive root system is given by  $\{\epsilon_i - \epsilon_j \mid 1 \leq i < j \leq s\}$ . For  $\mathfrak{m} \in \mathbb{C}^s$  with  $m_j - m_{j+1} \in \mathbb{Z}_{\geq 0}$ , let  $V_{\mathfrak{m}}^{(s)}$  be the irreducible representation of  $\widetilde{GL}(s, \mathbb{C})$  with the highest weight  $\sum_j m_j \epsilon_j$ , and let  $V_{\mathfrak{m}}^{(s)\vee}$  be that with the

lowest weight  $-\sum_j m_j \epsilon_j$ . If  $\mathbf{m} \in \mathbb{Z}^r$ , then  $V_{\mathbf{m}}^{(s)}$ ,  $V_{\mathbf{m}}^{(s)\vee}$  are reduced to the representations of  $GL(s, \mathbb{C})$ . Similarly, we take a basis  $\{\epsilon_j\}_{j=1}^{\lfloor n/2 \rfloor} \subset \mathfrak{h}^{\mathbb{C}\vee}$  of the dual space of a Cartan subalgebra  $\mathfrak{h}^{\mathbb{C}} \subset \mathfrak{so}(n, \mathbb{C})$  such that the positive root system is given by

$$\begin{aligned} \{\epsilon_i \pm \epsilon_j \mid 1 \leq i < j \leq n/2\} & \quad (n: \text{even}), \\ \{\epsilon_i \pm \epsilon_j \mid 1 \leq i < j \leq \lfloor n/2 \rfloor\} \cup \{\epsilon_j \mid 1 \leq j \leq \lfloor n/2 \rfloor\} & \quad (n: \text{odd}). \end{aligned}$$

For  $\mathbf{m} \in \mathbb{Z}^{\lfloor n/2 \rfloor} \cup (\mathbb{Z} + \frac{1}{2})^{\lfloor n/2 \rfloor}$  with  $m_1 \geq \dots \geq m_{n/2-1} \geq |m_{n/2}|$  for even  $n$ ,  $m_1 \geq \dots \geq m_{\lfloor n/2 \rfloor} \geq 0$  for odd  $n$ , let  $V_{\mathbf{m}}^{[n]}$  be the irreducible representation of  $Spin(n, \mathbb{C})$  with the highest weight  $\sum_j m_j \epsilon_j$ , and let  $V_{\mathbf{m}}^{[n]\vee}$  be that with the lowest weight  $-\sum_j m_j \epsilon_j$ . If  $\mathbf{m} \in \mathbb{Z}^{\lfloor n/2 \rfloor}$ , then  $V_{\mathbf{m}}^{[n]}$ ,  $V_{\mathbf{m}}^{[n]\vee}$  are reduced to the representations of  $SO(n, \mathbb{C})$ . Under this notation, the  $\tilde{K}$ -type decompositions of the holomorphic discrete series representations of scalar type

$$\mathcal{O}_\lambda(D)_{\tilde{K}} = \chi^{-\lambda} \otimes \mathcal{P}(\mathfrak{p}^+) = \chi^{-\lambda} \otimes \bigoplus_{\mathbf{m} \in \mathbb{Z}_{++}^r} \mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+)$$

are given as

$$\chi^{-\lambda} \simeq \begin{cases} \mathbb{C}_{-\lambda} \boxtimes V_{(0, \dots, 0)}^{[n]\vee} & (\mathfrak{p}^+ = \mathbb{C}^n, n \geq 3), \\ V_{(\lambda, \dots, \lambda)}^{(r)\vee} & (\mathfrak{p}^+ = \text{Sym}(r, \mathbb{C})), \\ V_{\left(\frac{s\lambda}{q+s}, \dots, \frac{s\lambda}{q+s}\right)}^{(q)\vee} \boxtimes V_{\left(\frac{q\lambda}{q+s}, \dots, \frac{q\lambda}{q+s}\right)}^{(s)} & (\mathfrak{p}^+ = M(q, s; \mathbb{C})), \\ V_{\left(\frac{\lambda}{2}, \dots, \frac{\lambda}{2}\right)}^{(s)\vee} & (\mathfrak{p}^+ = \text{Alt}(s, \mathbb{C})), \\ \mathbb{C}_{-\lambda} \boxtimes V_{(0, \dots, 0)}^{[10]\vee} & (\mathfrak{p}^+ = M(1, 2; \mathbb{O})^{\mathbb{O}}), \end{cases}$$

$$\mathcal{P}_{\mathbf{m}}(\mathfrak{p}^+) \simeq \begin{cases} \mathbb{C}_{-m_1-m_2} \boxtimes V_{(m_1-m_2, 0, \dots, 0)}^{[n]\vee} & (\mathfrak{p}^+ = \mathbb{C}^n, n \geq 3), \\ V_{(2m_1, \dots, 2m_r)}^{(r)\vee} =: V_{2\mathbf{m}}^{(r)\vee} & (\mathfrak{p}^+ = \text{Sym}(r, \mathbb{C})), \\ V_{\mathbf{m}}^{(q)\vee} \boxtimes V_{(m_1, \dots, m_q, 0, \dots, 0)}^{(s)} =: V_{\mathbf{m}}^{(q)\vee} \boxtimes V_{\mathbf{m}}^{(s)} & (\mathfrak{p}^+ = M(q, s; \mathbb{C}), q \leq s), \\ V_{(m_1, \dots, m_s, 0, \dots, 0)}^{(q)\vee} \boxtimes V_{\mathbf{m}}^{(s)} =: V_{\mathbf{m}}^{(q)\vee} \boxtimes V_{\mathbf{m}}^{(s)} & (\mathfrak{p}^+ = M(q, s; \mathbb{C}), q \geq s), \\ V_{(m_1, m_1, m_2, m_2, \dots, m_{\lfloor s/2 \rfloor}, m_{\lfloor s/2 \rfloor}, (0))}^{(s)\vee} =: V_{\mathbf{m}^2}^{(s)\vee} & (\mathfrak{p}^+ = \text{Alt}(s, \mathbb{C})), \\ \mathbb{C}_{-\frac{3}{4}|\mathbf{m}|} \boxtimes V_{\left(\frac{m_1+m_2}{2}, \frac{m_1-m_2}{2}, \frac{m_1-m_2}{2}, \frac{m_1-m_2}{2}, \frac{m_1-m_2}{2}\right)}^{[10]\vee} & (\mathfrak{p}^+ = M(1, 2; \mathbb{O})^{\mathbb{C}}) \end{cases} \quad (2.20)$$

when  $K^{\mathbb{C}}$  is classical, if we normalize the representations  $\mathbb{C}_{-\lambda}$  of  $\widetilde{SO}(2) \simeq \widetilde{U}(1)$  for the first and the last cases suitably.

## 2.9 Restriction to symmetric subgroups

In this subsection we consider a  $\mathbb{C}$ -linear involution  $\sigma$  on a Hermitian positive Jordan triple system  $\mathfrak{p}^\pm$ , i.e., a Jordan triple system automorphism  $\sigma: \mathfrak{p}^\pm \rightarrow \mathfrak{p}^\pm$  of order 2 which commutes with the  $\mathbb{C}$ -antilinear map  $\bar{\cdot}: \mathfrak{p}^\pm \rightarrow \mathfrak{p}^\mp$ , and extend to the involution of the Lie algebra  $\mathfrak{g}^{\mathbb{C}} = \mathfrak{p}^+ \oplus \mathfrak{k}^{\mathbb{C}} \oplus \mathfrak{p}^-$  by letting  $\sigma$  act on  $\mathfrak{k}^{\mathbb{C}} = \mathfrak{str}(\mathfrak{p}^+) \subset \text{End}_{\mathbb{C}}(\mathfrak{p}^+)$  by  $\sigma(l) := \sigma l \sigma$ .

Also let  $\vartheta := -I_{\mathfrak{p}^+} + I_{\mathfrak{k}^{\mathbb{C}}} - I_{\mathfrak{p}^-}$ . Using these, we set

$$\begin{aligned}\mathfrak{p}_1^\pm &:= (\mathfrak{p}^\pm)^\sigma = \{x \in \mathfrak{p}^\pm \mid \sigma(x) = x\}, \\ \mathfrak{p}_2^\pm &:= (\mathfrak{p}^\pm)^{-\sigma} = \{x \in \mathfrak{p}^\pm \mid \sigma(x) = -x\}, \\ \mathfrak{k}_1^{\mathbb{C}} &:= (\mathfrak{k}^{\mathbb{C}})^\sigma = \{l \in \mathfrak{k}^{\mathbb{C}} \mid \sigma(l) = l\}, \\ \mathfrak{k}_1 &:= \mathfrak{k}^\sigma = \mathfrak{k}_1^{\mathbb{C}} \cap \mathfrak{k}, \\ \mathfrak{g}_1^{\mathbb{C}} &:= (\mathfrak{g}^{\mathbb{C}})^\sigma = \mathfrak{p}_1^+ \oplus \mathfrak{k}_1^{\mathbb{C}} \oplus \mathfrak{p}_1^-, \\ \mathfrak{g}_2^{\mathbb{C}} &:= (\mathfrak{g}^{\mathbb{C}})^{\sigma\vartheta} = \mathfrak{p}_2^+ \oplus \mathfrak{k}_1^{\mathbb{C}} \oplus \mathfrak{p}_2^-, \\ \mathfrak{g}_1 &:= \mathfrak{g}^\sigma = \mathfrak{g}_1^{\mathbb{C}} \cap \mathfrak{g}, \\ \mathfrak{g}_2 &:= \mathfrak{g}^{\sigma\vartheta} = \mathfrak{g}_2^{\mathbb{C}} \cap \mathfrak{g},\end{aligned}$$

and let  $G_1, G_1^{\mathbb{C}}, G_2, G_2^{\mathbb{C}}, K_1, K_1^{\mathbb{C}} \subset G^{\mathbb{C}}$  be the connected closed subgroups corresponding to  $\mathfrak{g}_1, \mathfrak{g}_1^{\mathbb{C}}, \mathfrak{g}_2, \mathfrak{g}_2^{\mathbb{C}}, \mathfrak{k}_1, \mathfrak{k}_1^{\mathbb{C}}$  respectively. Such  $(G, G_1)$  is called a symmetric pair of holomorphic type (see [18, Section 3.4]). Also let  $\tilde{G}_1 \subset \tilde{G}$  and  $\tilde{K}_1^{\mathbb{C}} \subset \tilde{K}^{\mathbb{C}}$  be the connected closed subgroups of the universal covering groups of  $G$  and  $K^{\mathbb{C}}$  corresponding to  $\mathfrak{g}_1$  and  $\mathfrak{k}_1^{\mathbb{C}}$  respectively, and let  $D \subset \mathfrak{p}^+, D_1 \subset \mathfrak{p}_1^+$  be the corresponding bounded symmetric domains, so that  $D \simeq G/K, D_1 \simeq G_1/K_1$  hold. Let  $\chi$  be the character of  $K^{\mathbb{C}}$  given in (2.15). Similarly, we normalize the bilinear form  $(\cdot|\cdot)_{\mathfrak{p}_j^\pm}: \mathfrak{p}_j^+ \times \mathfrak{p}_j^- \rightarrow \mathbb{C}$  ( $j = 1, 2$ ) such that  $(e|\bar{e})_{\mathfrak{p}_j^\pm} = 1$  holds for any primitive tripotent  $e \in \mathfrak{p}_j^+$ , and define the characters  $\chi_j$  ( $j = 1, 2$ ) of  $K_1^{\mathbb{C}}$  by

$$\begin{aligned}d\chi_j([x, y]) &= (x|y)_{\mathfrak{p}_j^\pm} & (x \in \mathfrak{p}_j^+, y \in \mathfrak{p}_j^-), \\ d\chi_j(l) &= 0 & (l \in [\mathfrak{p}_j^+, \mathfrak{p}_j^-]^\perp \subset \mathfrak{k}_1^{\mathbb{C}}).\end{aligned}$$

As in Section 2.7, for  $\lambda \in \mathbb{R}$  and for an irreducible representation  $V$  of  $K_1^{\mathbb{C}}$ , let  $\mathcal{H}_\lambda(D) \subset \mathcal{O}_\lambda(D)$  and  $\mathcal{H}_\lambda(D_1, V) \subset \mathcal{O}_\lambda(D_1, V)$  be the unitary representations of  $\tilde{G}$  and  $\tilde{G}_1$  with the minimal  $\tilde{K}$ -type  $\chi^{-\lambda}$  and with the minimal  $\tilde{K}_1$ -type  $\chi_1^{-\lambda} \otimes V$  respectively, if they exist.

In the following we assume  $G$  is simple. Then  $\mathfrak{p}_2^+$  is a direct sum of at most two simple Jordan triple systems. Let  $\text{rank } \mathfrak{p}^+ =: r, \text{rank } \mathfrak{p}_2^+ =: r_2$ , and define  $\varepsilon_1, \varepsilon_2 \in \{1, 2\}$  by  $d\chi|_{\mathfrak{k}_1^{\mathbb{C}}} = \varepsilon_j d\chi_j$ , or equivalently, by

$$(x|y)_{\mathfrak{p}^+} = \varepsilon_j (x|y)_{\mathfrak{p}_j^\pm} \quad (j = 1, 2, x \in \mathfrak{p}_j^+, y \in \mathfrak{p}_j^-). \quad (2.21)$$

When  $\mathfrak{p}_2^+$  is not simple, we write  $\mathfrak{p}_2^+ =: \mathfrak{p}_{11}^+ \oplus \mathfrak{p}_{22}^+, \mathfrak{p}_1^+ =: \mathfrak{p}_{12}^+$ , and let  $\text{rank } \mathfrak{p}_{11}^+ =: r', \text{rank } \mathfrak{p}_{22}^+ =: r''$ . Now we consider the restriction of the representation  $\mathcal{H}_\lambda(D)$  of  $\tilde{G}$  to the subgroup  $\tilde{G}_1$ . If  $\lambda$  satisfies (2.19), then the unitary representation  $\mathcal{H}_\lambda(D)$  exists,  $\mathcal{H}_\lambda(D)|_{\tilde{G}_1}$  is discretely decomposable, and every  $\tilde{G}_1$ -submodule in  $\mathcal{H}_\lambda(D)|_{\tilde{G}_1}$  contains a  $\mathfrak{p}_1^+$ -null vector, that is, has an intersection with  $(\mathcal{H}_\lambda(D)_{\tilde{K}})_{\mathfrak{p}_1^+} = (\chi_1^{-\varepsilon_1 \lambda} \otimes \mathcal{P}(\mathfrak{p}_2^+)) \cap \mathcal{H}_\lambda(D)_{\tilde{K}}$ . Especially,  $\mathcal{H}_\lambda(D)_{\tilde{K}} = \chi^{-\lambda} \otimes \mathcal{P}(\mathfrak{p}^+)$  holds if  $\lambda > \frac{d}{2}(r-1)$ , and  $\mathcal{H}_\lambda(D)$  is holomorphic discrete if  $\lambda > p-1$ . For such  $\lambda$ , according to the decomposition

$$\begin{aligned}\mathcal{P}(\mathfrak{p}_2^+) &= \bigoplus_{\mathbf{k} \in \mathbb{Z}_{++}^{r_2}} \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+) & (\mathfrak{p}_2^+ : \text{simple}), \\ \mathcal{P}(\mathfrak{p}_2^+) &= \bigoplus_{\mathbf{k} \in \mathbb{Z}_{++}^{r'}} \bigoplus_{\mathbf{l} \in \mathbb{Z}_{++}^{r''}} \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_{11}^+) \boxtimes \mathcal{P}_{\mathbf{l}}(\mathfrak{p}_{22}^+) & (\mathfrak{p}_2^+ : \text{non-simple})\end{aligned}$$

(Theorem 2.1), the following holds.

**Theorem 2.9** (Kobayashi, [18, Theorems 8.3]). *For  $\lambda > \frac{d}{2}(r-1)$ , the restriction of  $\mathcal{H}_\lambda(D)$  to the subgroup  $\tilde{G}_1$  is decomposed into the Hilbert direct sum of irreducible representations as*

$$\begin{aligned}\mathcal{H}_\lambda(D)|_{\tilde{G}_1} &\simeq \sum_{\mathbf{k} \in \mathbb{Z}_{++}^{r_2}} \oplus \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)) && (\mathfrak{p}_2^+ : \text{simple}), \\ \mathcal{H}_\lambda(D)|_{\tilde{G}_1} &\simeq \sum_{\mathbf{k} \in \mathbb{Z}_{++}^{r_1}} \oplus \sum_{\mathbf{l} \in \mathbb{Z}_{++}^{r_2}} \oplus \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_{11}^+) \boxtimes \mathcal{P}_{\mathbf{l}}(\mathfrak{p}_{22}^+)) && (\mathfrak{p}_2^+ : \text{non-simple}).\end{aligned}$$

In the following, when  $\mathfrak{p}_2^+$  is not simple, we write  $\mathcal{P}_{(\mathbf{k}, \mathbf{l})}(\mathfrak{p}_2^+) := \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_{11}^+) \boxtimes \mathcal{P}_{\mathbf{l}}(\mathfrak{p}_{22}^+)$ . Then by the above decomposition, for each  $\lambda > \frac{d}{2}(r-1)$  and  $\mathbf{k} \in \mathbb{Z}_{++}^{r_2}$  or  $\mathbf{k} \in \mathbb{Z}_{++}^{r_1} \times \mathbb{Z}_{++}^{r_2}$ , there exist  $\tilde{G}_1$ -intertwining operators

$$\begin{aligned}\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow : \mathcal{H}_\lambda(D)|_{\tilde{G}_1} &\longrightarrow \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)), \\ \mathcal{F}_{\lambda, \mathbf{k}}^\uparrow : \mathcal{H}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)) &\longrightarrow \mathcal{H}_\lambda(D)|_{\tilde{G}_1},\end{aligned}$$

which are unique up to constant multiple.  $\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  is called a *symmetry breaking operator*, and  $\mathcal{F}_{\lambda, \mathbf{k}}^\uparrow$  is called a *holographic operator*, according to the terminology introduced in [24, 25] and [26] respectively. Then the construction of  $\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  is reduced to the computation of some inner product. In the following, let  $V_{\mathbf{k}}$  be an abstract  $K_1$ -module isomorphic to  $\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ , let  $\|\cdot\|_{\varepsilon_1 \lambda, \mathbf{k}, \mathfrak{p}_1^+}$  be the  $\tilde{G}_1$ -invariant norm on  $\mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{\mathbf{k}})$  normalized such that  $\|v\|_{\varepsilon_1 \lambda, \mathbf{k}, \mathfrak{p}_1^+} = |v|_{V_{\mathbf{k}}}$  holds for all constant functions  $v \in V_{\mathbf{k}}$ , and let  $\|\cdot\|_{F, \mathfrak{p}^+}$  be the Fischer norm on  $\mathfrak{p}^+$  given in (2.17).

**Theorem 2.10** ([33, Theorem 3.10 (1)], [35, Proposition 2.9]). *For  $\lambda > p-1$  and for  $\mathbf{k} \in \mathbb{Z}_{++}^{r_2}$  (when  $\mathfrak{p}_2^+$  is simple) or  $\mathbf{k} \in \mathbb{Z}_{++}^{r_1} \times \mathbb{Z}_{++}^{r_2}$  (when  $\mathfrak{p}_2^+$  is not simple), let  $C_{\mathfrak{p}^+, \mathfrak{p}_2^+}(\lambda, \mathbf{k}) \in \mathbb{C}$  be the constant satisfying*

$$\left\langle f(x_2), e^{(x|z)_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \Big|_{z_1=0} = C_{\mathfrak{p}^+, \mathfrak{p}_2^+}(\lambda, \mathbf{k}) f(z_2) \quad (f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)).$$

We take a vector-valued polynomial  $\mathbf{K}_{\mathbf{k}}(x_2) \in \mathcal{P}(\mathfrak{p}_2^+, \overline{V_{\mathbf{k}}})^{K_1}$  normalized such that

$$\left\langle f(x_2), \mathbf{K}_{\mathbf{k}}(x_2) \right\rangle_{F, \mathfrak{p}^+} \Big|_{V_{\mathbf{k}}}^2 = \|f\|_{F, \mathfrak{p}^+}^2 \quad (f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)),$$

and define the vector-valued polynomial  $F_{\lambda, \mathbf{k}}^\downarrow(z) \in \mathcal{P}(\mathfrak{p}^-, V_{\mathbf{k}})$  by

$$F_{\lambda, \mathbf{k}}^\downarrow(z) := \frac{1}{C_{\mathfrak{p}^+, \mathfrak{p}_2^+}(\lambda, \mathbf{k})} \left\langle e^{(x|z)_{\mathfrak{p}^+}}, \mathbf{K}_{\mathbf{k}}(x_2) \right\rangle_{\lambda, x}. \quad (2.22)$$

Then the differential operator

$$\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow : \mathcal{H}_\lambda(D)|_{\tilde{G}_1} \longrightarrow \mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{\mathbf{k}}), \quad (\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow f)(x_1) := F_{\lambda, \mathbf{k}}^\downarrow \left( \frac{\partial}{\partial x} \right) f(x) \Big|_{x_2=0} \quad (2.23)$$

becomes a symmetry breaking operator satisfying

$$\|\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow f\|_{\varepsilon_1 \lambda, \mathbf{k}, \mathfrak{p}_1^+}^2 = \|f\|_{F, \mathfrak{p}^+}^2 \quad (f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)).$$

Its operator norm is given by

$$\|\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow\|_{\text{op}}^2 = C_{\mathfrak{p}^+, \mathfrak{p}_2^+}(\lambda, \mathbf{k})^{-1}.$$

The notion of symmetry breaking operator is extended to the map

$$\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow : \mathcal{O}_\lambda(D)|_{\tilde{G}_1} \longrightarrow \mathcal{O}_{\varepsilon_1 \lambda}(D_1, \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+))$$

for all  $\lambda \in \mathbb{C}$ . Especially, the operators constructed in the above theorem are meromorphically continued for all  $\lambda \in \mathbb{C}$ , and give symmetry breaking operators on  $\mathcal{O}_\lambda(D)$  for all  $\lambda \in \mathbb{C}$  except for poles. Moreover, symmetry breaking operators for holomorphic settings are always given by differential operators (localness theorem, [24, Theorem 5.3]). However, the uniqueness of  $\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  for non-unitary range is not trivial. Indeed, the uniqueness of symmetry breaking operators for tensor product case fails for non-unitary range. See [25, Section 9], [35, Section 8]. The symbols of differential symmetry breaking operators are characterized as polynomial solutions of some differential equations as follows. For  $\lambda \in \mathbb{C}$ , let  $\mathcal{B}_\lambda^{\mathfrak{p}^\pm}$  be the vector-valued differential operator

$$\begin{aligned} \mathcal{B}_\lambda^{\mathfrak{p}^\pm} : \mathcal{P}(\mathfrak{p}^\pm) &\longrightarrow \mathcal{P}(\mathfrak{p}^\pm) \otimes \mathfrak{p}^\mp, \\ \mathcal{B}_\lambda^{\mathfrak{p}^\pm} f(z) &:= \sum_{\alpha, \beta} \frac{1}{2} Q(e_\alpha^\mp, e_\beta^\mp) z \frac{\partial^2 f}{\partial z_\alpha^\mp \partial z_\beta^\mp}(z) + \lambda \sum_\alpha e_\alpha^\mp \frac{\partial f}{\partial z_\alpha^\mp}(z), \end{aligned} \quad (2.24)$$

where  $\{e_\alpha^\mp\} \subset \mathfrak{p}^\mp$  is a basis of  $\mathfrak{p}^\mp$ , and  $\{z_\alpha^\pm\}$  is the coordinate of  $\mathfrak{p}^\pm$  dual to  $\{e_\alpha^\mp\}$  (*Bessel operator* [5], [9, Section XV.2]), let

$$(\mathcal{B}_\lambda^{\mathfrak{p}^\pm})_1 : \mathcal{P}(\mathfrak{p}^\pm) \longrightarrow \mathcal{P}(\mathfrak{p}^\pm) \otimes \mathfrak{p}_1^\mp$$

be the orthogonal projection of  $\mathcal{B}_\lambda^{\mathfrak{p}^\pm}$  onto  $\mathfrak{p}_1^\mp$ , and let

$$\text{Sol}_{\mathcal{P}(\mathfrak{p}^\pm)}((\mathcal{B}_\lambda^{\mathfrak{p}^\pm})_1) := \{f(z) \in \mathcal{P}(\mathfrak{p}^\pm) \mid (\mathcal{B}_\lambda^{\mathfrak{p}^\pm})_1 f = 0\}.$$

**Theorem 2.11** (F-method, [25, Theorem 3.1]). *Let  $V$  be a  $K_1^{\mathbb{C}}$ -module, and  $V^\vee$  be its contragredient. Then we have*

$$\begin{aligned} \text{Hom}_{\tilde{G}_1}(\mathcal{O}_\lambda(D), \mathcal{O}_{\varepsilon_1 \lambda}(D_1, V)) &\simeq \text{Hom}_{\mathfrak{k}_1^{\mathbb{C}} \oplus \mathfrak{p}_1^-}(\chi_1^{\varepsilon_1 \lambda} \otimes V^\vee, \text{ind}_{\mathfrak{k}^{\mathbb{C}} \oplus \mathfrak{p}^-}^{\mathfrak{g}^{\mathbb{C}}}(\chi^\lambda)) \\ &\simeq \left( \text{Sol}_{\mathcal{P}(\mathfrak{p}^-)}((\mathcal{B}_\lambda^{\mathfrak{p}^-})_1) \otimes V \right)^{K_1}. \end{aligned}$$

Especially, if  $\lambda > \frac{d}{2}(r-1)$  then since  $\mathcal{H}_\lambda(D)|_{\tilde{G}_1}$  decomposes multiplicity-freely, the space of symmetry breaking operators is 1-dimensional for each  $V \simeq \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ , and combining the above two theorems, for  $\lambda > \frac{d}{2}(r-1)$  we get

$$\text{Hom}_{K_1}(\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+), \text{Sol}_{\mathcal{P}(\mathfrak{p}^+)}((\mathcal{B}_\lambda^{\mathfrak{p}^+})_1)) = \mathbb{C} \left( f(x_2) \mapsto \left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \right).$$

In this article, we consider the symmetry breaking operators for the case  $\mathfrak{p}^+, \mathfrak{p}_2^+$  are simple of tube type and  $\varepsilon_2 = 1$ , so that  $r = r_2$  holds. In [34, Section 6], we treated  $\mathbf{k} = (k+l, k, \dots, k)$  case. In this article, we treat general  $\mathbf{k} \in \mathbb{Z}_{++}^3$  for  $r = 3$  case in Section 3, and treat  $\mathbf{k} = (k, \dots, k, k-l)$  case for general  $r$  in Section 4.

### 3 Rank 3 case

In this section we treat  $\mathfrak{p}^\pm = (\mathfrak{p}^\pm)^\sigma \oplus (\mathfrak{p}^\pm)^{-\sigma} = \mathfrak{p}_1^\pm \oplus \mathfrak{p}_2^\pm$  such that  $\mathfrak{p}^\pm, \mathfrak{p}_2^\pm$  are both simple, of tube type, and of rank 3, that is, we treat

$$\begin{aligned} (\mathfrak{p}^\pm, \mathfrak{p}_1^\pm, \mathfrak{p}_2^\pm) &= (\text{Herm}(3, \mathbb{F})^\mathbb{C}, \text{Alt}(3, \mathbb{F}')^\mathbb{C}, \text{Herm}(3, \mathbb{F}')^\mathbb{C}) \quad ((\mathbb{F}, \mathbb{F}') = (\mathbb{C}, \mathbb{R}), (\mathbb{H}, \mathbb{C}), (\mathbb{O}, \mathbb{H})) \\ &= \begin{cases} (M(3, \mathbb{C}), \text{Alt}(3, \mathbb{C}), \text{Sym}(3, \mathbb{C})) & ((\mathbb{F}, \mathbb{F}') = (\mathbb{C}, \mathbb{R})), \\ (\text{Alt}(6, \mathbb{C}), \text{Alt}(3, \mathbb{C}) \oplus \text{Alt}(3, \mathbb{C}), M(3, \mathbb{C})) & ((\mathbb{F}, \mathbb{F}') = (\mathbb{H}, \mathbb{C})), \\ (\text{Herm}(3, \mathbb{O})^\mathbb{C}, M(2, 6; \mathbb{C}), \text{Alt}(6, \mathbb{C})) & ((\mathbb{F}, \mathbb{F}') = (\mathbb{O}, \mathbb{H})). \end{cases} \end{aligned}$$

Then the corresponding symmetric pairs  $(G, (G^\sigma)_0, (G^{\sigma\theta})_0) = (G, G_1, G_2)$  are given by

$$(G, G_1, G_2) = \begin{cases} (SU(3, 3), SO^*(6), Sp(3, \mathbb{R})) & ((\mathbb{F}, \mathbb{F}') = (\mathbb{C}, \mathbb{R})), \\ (SO^*(12), SO^*(6) \times SO^*(6), U(3, 3)) & ((\mathbb{F}, \mathbb{F}') = (\mathbb{H}, \mathbb{C})), \\ (E_{7(-25)}, SU(2, 6), SU(2) \times SO^*(12)) & ((\mathbb{F}, \mathbb{F}') = (\mathbb{O}, \mathbb{H})). \end{cases}$$

(up to covering). We have  $(d, d_2) = (\dim_{\mathbb{R}} \mathbb{F}, \dim_{\mathbb{R}} \mathbb{F}') \in \{(2, 1), (4, 2), (8, 4)\}$ , and  $\varepsilon_1 = 2$  for  $(\mathbb{F}, \mathbb{F}') = (\mathbb{C}, \mathbb{R})$ ,  $\varepsilon_1 = 1$  for  $(\mathbb{F}, \mathbb{F}') = (\mathbb{H}, \mathbb{C}), (\mathbb{O}, \mathbb{H})$ .  $\mathfrak{p}^+$  and  $\mathfrak{p}_2^+$  have Jordan algebra structures with the Euclidean real forms  $\mathfrak{n}^+ = \text{Herm}(3, \mathbb{F})$  and  $\mathfrak{n}_2^+ = \text{Herm}(3, \mathbb{F}')$  respectively.

#### 3.1 Jordan algebra structure on $\text{Herm}(3, \mathbb{F})^\mathbb{C}$

First we look at the Jordan algebra structure on  $\mathfrak{p}^+ = \mathfrak{n}^{+\mathbb{C}} = \text{Herm}(3, \mathbb{F})^\mathbb{C}$  for  $\mathbb{F} = \mathbb{R}, \mathbb{C}, \mathbb{H}, \mathbb{O}$  given by

$$x \circ y := \frac{1}{2}(xy + yx),$$

with the unit element  $e = I_3$ , the Euclidean real form  $\mathfrak{n}^+ = \text{Herm}(3, \mathbb{F})$ , the symmetric cone  $\Omega = \text{Herm}_+(3, \mathbb{F}) \subset \mathfrak{n}^+$  (the set of positive definite matrices), and the associative bilinear form  $(\cdot|\cdot) = (\cdot|\cdot)_{\mathfrak{n}^+} : \mathfrak{n}^{+\mathbb{C}} \times \mathfrak{n}^{+\mathbb{C}} \rightarrow \mathbb{C}$ ,

$$(x|y) = (x|y)_{\mathfrak{n}^+} := \text{Re}_{\mathbb{F}} \text{tr}(xy) = \text{Re}_{\mathbb{F}} \text{tr}(yx),$$

where  $\text{Re}_{\mathbb{F}} : \mathbb{F}^\mathbb{C} = \mathbb{F} \otimes_{\mathbb{R}} \mathbb{C} \rightarrow \mathbb{C}$  is the  $\mathbb{C}$ -linear extension of the  $\mathbb{F}$ -real part. Next, for  $x \in \mathfrak{n}^{+\mathbb{C}}$ , let  $x^\sharp$  be the adjugate matrix given by

$$\begin{pmatrix} a_1 & x_3 & \hat{x}_2 \\ \hat{x}_3 & a_2 & x_1 \\ x_2 & \hat{x}_1 & a_3 \end{pmatrix} := \begin{pmatrix} a_2 a_3 - x_1 \hat{x}_1 & \hat{x}_2 \hat{x}_1 - a_3 x_3 & x_3 x_1 - a_2 \hat{x}_2 \\ x_1 x_2 - a_3 \hat{x}_3 & a_3 a_1 - x_2 \hat{x}_2 & \hat{x}_3 \hat{x}_2 - a_1 x_1 \\ \hat{x}_1 \hat{x}_3 - a_2 x_2 & x_2 x_3 - a_1 \hat{x}_1 & a_1 a_2 - x_3 \hat{x}_3 \end{pmatrix} \quad (a_i \in \mathbb{C}, x_i \in \mathbb{F}^\mathbb{C}),$$

where  $x_i \mapsto \hat{x}_i$  is the  $\mathbb{C}$ -linear extension of the  $\mathbb{F}$ -conjugate, and for  $x, y \in \text{Herm}(3, \mathbb{F})^\mathbb{C}$ , let  $x \times y$  be the *Freudenthal product* given by

$$x \times y := (x + y)^\sharp - x^\sharp - y^\sharp,$$

so that  $x \times x = 2x^\sharp$ . Then the determinant polynomial, the inverse element, the generic norm, and the map  $P(x) \in \text{End}_{\mathbb{C}}(\mathfrak{n}^{+\mathbb{C}})$  are given by

$$\begin{aligned} \det(x) = \det_{\mathfrak{n}^+}(x) &:= \frac{1}{3}(x|x^\sharp), & x^{-1} &:= \frac{1}{\det(x)}x^\sharp, \\ h(x, y) &:= 1 - (x|y) + (x^\sharp|y^\sharp) - \det(x)\det(y), & P(x)y &:= (x|y)x - x^\sharp \times y. \end{aligned}$$

$xx^\sharp = x^\sharp x = \det(x)I$  holds for  $\mathbb{F} = \mathbb{R}, \mathbb{C}, \mathbb{H}$ , and  $\frac{1}{2}(xx^\sharp + x^\sharp x) = \det(x)I$  holds for  $\mathbb{F} = \mathbb{O}$ . Also, for  $x, y, z \in \mathfrak{n}^{+\mathbb{C}}$  we have

$$(x \times y|z) = (y \times z|x) = (z \times x|y), \quad (x^\sharp)^\sharp = \det(x)x.$$

If  $\mathbb{F} = \mathbb{R}, \mathbb{C}, \mathbb{H}$ , then by taking the directional derivative of  $zz^\sharp = \det(z)I$  along  $y$ , we get

$$yz^\sharp + z(z \times y) = (z^\sharp|y)I, \quad (3.1)$$

and by substituting  $z = x^\sharp$  and multiplying  $\det(x)^{-1}x$  from the left, we get

$$P(x)y = (x|y)x - x^\sharp \times y = xyx.$$

We note that these do not hold for  $\mathbb{F} = \mathbb{O}$ . Let  $\bar{\cdot}: \mathfrak{n}^{+\mathbb{C}} \rightarrow \mathfrak{n}^{+\mathbb{C}}$  be the complex conjugate with respect to the real form  $\mathfrak{n}^+ \subset \mathfrak{n}^{+\mathbb{C}}$ . Then the bounded symmetric domain  $D \subset \mathfrak{p}^+ = \mathfrak{n}^{+\mathbb{C}}$  is the connected component of  $\{x \in \mathfrak{n}^{+\mathbb{C}} \mid h(x, \bar{x}) > 0\}$  which contains the origin.

Next we consider the Cayley–Dickson extension  $\mathbb{F} = \mathbb{F}' \oplus \mathbb{F}'\mathbf{j}$  for  $(\mathbb{F}, \mathbb{F}') = (\mathbb{C}, \mathbb{R}), (\mathbb{H}, \mathbb{C}), (\mathbb{O}, \mathbb{H})$ , and as in [41, 42] we consider the involution  $\sigma$  on  $\mathfrak{p}^\pm = \text{Herm}(3, \mathbb{F})$ ,

$$\sigma \begin{pmatrix} a_1 & x_3 + y_3\mathbf{j} & \hat{x}_2 - y_2\mathbf{j} \\ \hat{x}_3 - y_3\mathbf{j} & a_2 & x_1 + y_1\mathbf{j} \\ x_2 + y_2\mathbf{j} & \hat{x}_1 - y_1\mathbf{j} & a_3 \end{pmatrix} := - \begin{pmatrix} a_1 & x_3 - y_3\mathbf{j} & \hat{x}_2 + y_2\mathbf{j} \\ \hat{x}_3 + y_3\mathbf{j} & a_2 & x_1 - y_1\mathbf{j} \\ x_2 - y_2\mathbf{j} & \hat{x}_1 + y_1\mathbf{j} & a_3 \end{pmatrix}$$

( $a_i \in \mathbb{C}, x_i, y_i \in \mathbb{F}'^{\mathbb{C}}$ ), so that we have

$$\begin{aligned} (\mathfrak{p}_1^\pm, \mathfrak{p}_2^\pm) &:= ((\mathfrak{p}^\pm)^\sigma, (\mathfrak{p}^\pm)^{-\sigma}) = (\text{Alt}(3, \mathbb{F}')^{\mathbb{C}}\mathbf{j}, \text{Herm}(3, \mathbb{F}')^{\mathbb{C}}), \\ (\mathfrak{n}_1^+, \mathfrak{n}_2^+) &:= ((\mathfrak{n}^+)^\sigma, (\mathfrak{n}^+)^{-\sigma}) = (\text{Alt}(3, \mathbb{F}')\mathbf{j}, \text{Herm}(3, \mathbb{F}')). \end{aligned}$$

$\mathfrak{p}_2^+ = \mathfrak{n}_2^{+\mathbb{C}}$  becomes a Jordan subalgebra with the Euclidean real form  $\mathfrak{n}_2^+$  and the symmetric cone  $\Omega_2 := \Omega \cap \mathfrak{n}_2^+ \subset \mathfrak{n}_2^+$ , but  $\mathfrak{p}_1^+ = \mathfrak{n}_1^{+\mathbb{C}}$  is not. We identify  $\mathfrak{p}_1^+ = \mathfrak{n}_1^{+\mathbb{C}} = \text{Alt}(3, \mathbb{F}')^{\mathbb{C}}\mathbf{j}$  with  $(\mathbb{F}'^{\mathbb{C}})^3$  (the space of row vectors) by

$$(\mathbb{F}'^{\mathbb{C}})^3 \xrightarrow{\sim} \text{Alt}(3, \mathbb{F}')^{\mathbb{C}}\mathbf{j}, \quad (y_1, y_2, y_3) \mapsto \begin{pmatrix} 0 & y_3\mathbf{j} & -y_2\mathbf{j} \\ -y_3\mathbf{j} & 0 & y_1\mathbf{j} \\ y_2\mathbf{j} & -y_1\mathbf{j} & 0 \end{pmatrix}.$$

In the following, we use lowercase Greek alphabets and capital Latin alphabets to express elements in  $\mathfrak{n}_1^{+\mathbb{C}} \simeq (\mathbb{F}'^{\mathbb{C}})^3$  and  $\mathfrak{n}_2^{+\mathbb{C}} = \text{Herm}(3, \mathbb{F}')^{\mathbb{C}}$  respectively. For  $\xi, \eta \in (\mathbb{F}'^{\mathbb{C}})^3$ , let

$$(\xi|\eta) := \text{Re}_{\mathbb{F}'}(\xi^t \hat{\eta}).$$

Then for  $x = (x_1, x_2) = (\xi, X), y = (y_1, y_2) = (\eta, Y) \in \mathfrak{n}^{+\mathbb{C}} = (\mathbb{F}'^{\mathbb{C}})^3 \oplus \text{Herm}(3, \mathbb{F}')^{\mathbb{C}}$  we have

$$\begin{aligned} (x|y)_{\mathfrak{n}^+} &= (x_1|y_1)_{\mathfrak{n}^+} + (x_2|y_2)_{\mathfrak{n}^+} = 2(\xi|\eta) + (X|Y), \\ (\xi, X)^\sharp &= (-\xi X, X^\sharp - {}^t \hat{\xi} \xi), \\ \det((\xi, X)) &= \det(X) - \xi X^t \hat{\xi}, \\ P((\xi, X))(\eta, Y) &= (\xi^t \hat{\eta} \xi + \eta X^\sharp + (X|Y)\xi - \xi XY, \\ &\quad XYX + ({}^t \hat{\xi} \xi) \times Y + 2(\xi|\eta)X - X^t \hat{\xi} \eta - {}^t \hat{\eta} \xi X). \end{aligned}$$

$\mathfrak{p}_1^\pm, \mathfrak{p}_2^\pm$  are preserved by the action of  $K_1 := G_1 \cap G_2$ . Especially, the action of the real form  $L_2 = K_1^\mathbb{C} \cap L \subset K_1^\mathbb{C}$ ,

$$L_2 := \begin{cases} \{1\} \times GL(3, \mathbb{R}) \\ \{1\} \times GL(3, \mathbb{C}) \\ Sp(1) \times GL(3, \mathbb{H}) \end{cases} \subset L := \begin{cases} \{g \in GL(3, \mathbb{C}) \mid \det(g) \in \mathbb{R}\} & ((\mathbb{F}, \mathbb{F}') = (\mathbb{C}, \mathbb{R})), \\ GL(3, \mathbb{H}) & ((\mathbb{F}, \mathbb{F}') = (\mathbb{H}, \mathbb{C})), \\ \mathbb{R}_{>0} \times E_{6(-26)} & ((\mathbb{F}, \mathbb{F}') = (\mathbb{O}, \mathbb{H})), \end{cases}$$

on  $\mathfrak{n}_1^+ \oplus \mathfrak{n}_2^+ = \mathbb{F}'^3 \oplus \text{Herm}(3, \mathbb{F}')$  is given by, for  $g = (g_1, g_2) \in L_2$ ,

$$gx = (gx_1, gx_2) = (\chi(g_2)g_1\xi g_2^{-1}, g_2 X^t \hat{g}_2),$$

and this preserves the symmetric cone  $\Omega_2 \subset \mathfrak{n}_2^+$ .

### 3.2 Definition of some functions

In this subsection we define some functions on  $\mathfrak{p}_1^\pm \oplus \mathfrak{p}_2^\pm$ . First we note that, for  $m \in \mathbb{Z}_{\geq 0}$ ,  $(y_1, x_2) = (\eta, X) \in \mathfrak{p}_1^\mp \oplus \mathfrak{p}_2^\pm$ ,  $(x_1, x_2) = (\xi, X) \in \mathfrak{p}_1^\pm \oplus \mathfrak{p}_2^\pm$ , we have

$$\begin{aligned} (-((y_1)^\sharp | (x_2)^\sharp))^m &= (\eta X^{\sharp t} \hat{\eta})^m \in \mathcal{P}_{2m}(\mathfrak{p}_1^\mp)_{y_1} \otimes \mathcal{P}_{(m, m, 0)}(\mathfrak{p}_2^\pm)_{x_2}, \\ \left( -\frac{((x_1)^\sharp | x_2)}{\det_{\mathfrak{n}_2^\pm}(x_2)} \right)^m &= \left( \frac{\xi X^t \hat{\xi}}{\det(X)} \right)^m \in \mathcal{P}_{2m}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{(0, -m, -m)}(\mathfrak{p}_2^\pm)_{x_2}, \end{aligned}$$

where  $\mathcal{P}_m(\mathfrak{p}_1^\mp)$  is the space of homogeneous polynomials on  $\mathfrak{p}_1^\mp$  of degree  $m$ . Next let  $\mathbf{k} \in \mathbb{Z}_{++}^3 + \mathbb{C}\mathbf{1}_3 = \mathbb{Z}_{++}^3 + \mathbb{C}(1, 1, 1)$ , and take  $f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^\pm) = \mathcal{P}_{(k_1 - k_3, k_2 - k_3, 0)}(\mathfrak{p}_2^\pm) \det_{\mathfrak{n}_2^\pm}(x_2)^{k_3}$ . Then we have

$$\begin{aligned} (-((y_1)^\sharp | (x_2)^\sharp))^m f(x_2) &\in \bigoplus_{\substack{\mathbf{l} \in \mathbb{Z}^3, |\mathbf{l}|=m \\ 0 \leq l_1 \leq k_1 - k_2 \\ 0 \leq l_2 \leq k_2 - k_3 \\ 0 \leq l_3}} \mathcal{P}_{2m}(\mathfrak{p}_1^\mp)_{y_1} \otimes \mathcal{P}_{(k_1 + l_2 + l_3, k_2 + l_1 + l_3, k_3 + l_1 + l_2)}(\mathfrak{p}_2^\pm)_{x_2}, \\ \left( -\frac{((x_1)^\sharp | x_2)}{\det_{\mathfrak{n}_2^\pm}(x_2)} \right)^m f(x_2) &\in \bigoplus_{\substack{\mathbf{l} \in \mathbb{Z}^3, |\mathbf{l}|=m \\ 0 \leq l_1 \\ 0 \leq l_2 \leq k_1 - k_2 \\ 0 \leq l_3 \leq k_2 - k_3}} \mathcal{P}_{2m}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{(k_1 - l_2 - l_3, k_2 - l_1 - l_3, k_3 - l_1 - l_2)}(\mathfrak{p}_2^\pm)_{x_2}. \end{aligned}$$

According to these decompositions, for  $\mathbf{l} \in (\mathbb{Z}_{\geq 0})^3$  we define the polynomials  $F_{\mathbf{k}, \mathbf{l}}^\uparrow[f](y_1, x_2) = F_{\mathbf{k}, \mathbf{l}}^\uparrow[f](\eta, X)$  and  $F_{\mathbf{k}, \mathbf{l}}^\downarrow[f](x_1, x_2) = F_{\mathbf{k}, \mathbf{l}}^\downarrow[f](\xi, X)$  by

$$\begin{aligned} F_{\mathbf{k}, \mathbf{l}}^\uparrow[f](y_1, x_2) &:= \text{Proj}_{(k_1 + l_2 + l_3, k_2 + l_1 + l_3, k_3 + l_1 + l_2), x_2}^{\mathfrak{p}_2^\pm} \left( \frac{1}{|\mathbf{l}|!} (-((y_1)^\sharp | (x_2)^\sharp))^{|\mathbf{l}|} f(x_2) \right) \\ &\in \mathcal{P}_{2|\mathbf{l}|}(\mathfrak{p}_1^\mp)_{y_1} \otimes \mathcal{P}_{(k_1 + l_2 + l_3, k_2 + l_1 + l_3, k_3 + l_1 + l_2)}(\mathfrak{p}_2^\pm)_{x_2}, \\ F_{\mathbf{k}, \mathbf{l}}^\downarrow[f](x_1, x_2) &:= \text{Proj}_{(k_1 - l_2 - l_3, k_2 - l_1 - l_3, k_3 - l_1 - l_2), x_2}^{\mathfrak{p}_2^\pm} \left( \frac{1}{|\mathbf{l}|!} \left( -\frac{((x_1)^\sharp | x_2)}{\det_{\mathfrak{n}_2^\pm}(x_2)} \right)^{|\mathbf{l}|} f(x_2) \right) \\ &\in \mathcal{P}_{2|\mathbf{l}|}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{(k_1 - l_2 - l_3, k_2 - l_1 - l_3, k_3 - l_1 - l_2)}(\mathfrak{p}_2^\pm)_{x_2}. \end{aligned}$$

Under the identification  $\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^\pm) \simeq \mathcal{P}_{-\mathbf{k}^\vee}(\mathfrak{p}_2^\mp)$ ,  $f \mapsto f((\cdot)^{-1})$ , where  $\mathbf{k}^\vee := (k_3, k_2, k_1)$ , these are related as

$$F_{\mathbf{k}, \mathbf{l}}^\downarrow[f](x_1, x_2) = F_{-\mathbf{k}^\vee, \mathbf{l}^\vee}^\uparrow[f((\cdot)^{-1})](x_1, x_2^{-1}).$$

We also set

$$\begin{aligned}\tilde{F}_{\mathbf{k},\mathbf{l}}[f](x_1, x_2) &:= F_{\mathbf{k},\mathbf{l}}^\downarrow[f](x_1, x_2) \det_{\mathfrak{n}_2^\pm}(x_2)^{|\mathbf{l}|} = \text{Proj}_{\mathfrak{k}+1, x_2}^{\mathfrak{p}_2^\pm} \left( \frac{1}{|\mathbf{l}|!} (-(x_1)^\# | x_2) \right)^{|\mathbf{l}|} f(x_2) \\ &\in \mathcal{P}_{2|\mathbf{l}|}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{\mathbf{k}+1}(\mathfrak{p}_2^\pm)_{x_2}.\end{aligned}$$

Since  $F_{\mathbf{k},\mathbf{l}}^\uparrow[f](y_1, x_2)$  is recovered from  $F_{\mathbf{k},\mathbf{l}}^\downarrow[f](x_1, x_2)$ , in the following we only consider  $F_{\mathbf{k},\mathbf{l}}^\downarrow[f](x_1, x_2)$ . For  $\mathbf{k} \in \mathbb{Z}_{++}^3 + \mathbb{C}\underline{\mathbf{1}}_3$ , let  $d_{\mathbf{k}}^{\mathfrak{p}_2^\pm} := \dim \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^\pm)$ , and let  $\Sigma_2 \subset \mathfrak{p}_2^\pm$  be the Bergman-Shilov boundary of  $D_2 := D \cap \mathfrak{p}_2^\pm$ .

**Proposition 3.1.** *Let  $\mathbf{k} \in \mathbb{Z}_{++}^3 + \mathbb{C}\underline{\mathbf{1}}_3$ ,  $f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^\pm)$ ,  $\mathbf{l} \in (\mathbb{Z}_{\geq 0})^3$  with  $0 \leq l_2 \leq k_1 - k_2$ ,  $0 \leq l_3 \leq k_2 - k_3$ .*

(1) *For  $x_1 \in \mathfrak{p}_1^\pm$ ,  $x_2 = ge \in \mathfrak{p}_2^\pm$  with  $g \in \tilde{K}_1^\mathbb{C}$ , we have*

$$|F_{\mathbf{k},\mathbf{l}}^\downarrow[f](x_1, x_2)| \leq \frac{\sqrt{d_{\mathbf{k}}^{\mathfrak{p}_2^\pm} d_{(|\mathbf{l}|, 0, 0)}^{\mathfrak{p}_2^\pm}}}{|\mathbf{l}|!} \frac{(g^{-1}x_1 | \overline{g^{-1}x_1})_{\mathfrak{p}_2^\pm}^{|\mathbf{l}|}}{2^{|\mathbf{l}|}} \|f(g(\cdot))\|_{L^2(\Sigma_2)}.$$

(2) *If  $f(x_2) \neq 0$ , then  $F_{\mathbf{k},\mathbf{l}}^\downarrow[f](x_1, x_2) \neq 0$ .*

*Proof.* (1) Since  $f(x_2) \mapsto F_{\mathbf{k},\mathbf{l}}^\downarrow[f](x_1, x_2)$  is  $\tilde{K}_1^\mathbb{C}$ -equivariant, we have

$$F_{\mathbf{k},\mathbf{l}}^\downarrow[f](x_1, x_2) = F_{\mathbf{k},\mathbf{l}}^\downarrow[f](x_1, ge) = F_{\mathbf{k},\mathbf{l}}^\downarrow[f(g(\cdot))](g^{-1}x_1, e),$$

and hence it suffices to prove when  $x_2 = e$ , so that  $F_{\mathbf{k},\mathbf{l}}^\downarrow[f](x_1, e) = \tilde{F}_{\mathbf{k},\mathbf{l}}[f](\xi, e)$ . Next, since the reproducing kernel of  $\mathcal{P}_{\mathbf{k}+1}(\mathfrak{p}_2^\pm)$  with respect to the  $L^2(\Sigma_2)$ -inner product is given by  $K'_{\mathbf{k}+1}(X, Z) := d_{\mathbf{k}+1}^{\mathfrak{p}_2^\pm} \Phi_{\mathbf{k}+1}^{\mathfrak{n}_2^\pm}(P(\overline{Z}^{1/2})X) = d_{\mathbf{k}+1}^{\mathfrak{p}_2^\pm} \Phi_{\mathbf{k}+1}^{\mathfrak{n}_2^\pm}(P(X^{1/2})\overline{Z})$ , where  $\Phi_{\mathbf{k}}^{\mathfrak{n}_2^\pm}(X) := \int_{K_1 \cap K_L} \Delta_{\mathbf{k}}^{\mathfrak{n}_2^\pm}(kX) dk$  (see [9, Proposition XII.2.4]), we have

$$\begin{aligned}|\tilde{F}_{\mathbf{k},\mathbf{l}}[f](\xi, e)| &= |\langle \tilde{F}_{\mathbf{k},\mathbf{l}}[f](\xi, \cdot), K'_{\mathbf{k}+1}(\cdot, e) \rangle_{L^2(\Sigma_2)}| \\ &\leq \|\tilde{F}_{\mathbf{k},\mathbf{l}}[f](\xi, \cdot)\|_{L^2(\Sigma_2)} \|K'_{\mathbf{k}+1}(\cdot, e)\|_{L^2(\Sigma_2)} \\ &= \|\tilde{F}_{\mathbf{k},\mathbf{l}}[f](\xi, \cdot)\|_{L^2(\Sigma_2)} \sqrt{K'_{\mathbf{k}+1}(e, e)} = \sqrt{d_{\mathbf{k}+1}^{\mathfrak{p}_2^\pm}} \|\tilde{F}_{\mathbf{k},\mathbf{l}}[f](\xi, \cdot)\|_{L^2(\Sigma_2)}.\end{aligned}$$

Now since  $\tilde{F}_{\mathbf{k},\mathbf{l}}[f](\xi, X)$  is defined by the orthogonal projection of  $(\xi X^t \hat{\xi})^{|\mathbf{l}|} f(X) / |\mathbf{l}|!$ , we have

$$\|\tilde{F}_{\mathbf{k},\mathbf{l}}[f](\xi, \cdot)\|_{L^2(\Sigma_2)} \leq \left\| \frac{1}{|\mathbf{l}|!} (\xi X^t \hat{\xi})^{|\mathbf{l}|} f(X) \right\|_{L^2(\Sigma_2), X} \leq \frac{1}{|\mathbf{l}|!} \|\xi X^t \hat{\xi}\|_{L^\infty(\Sigma_2), X}^{|\mathbf{l}|} \|f\|_{L^2(\Sigma_2)},$$

and for  $X \in \Sigma_2$  we have

$$|\xi X^t \hat{\xi}| = |(\xi | \xi X)| \leq \sqrt{(\xi | \bar{\xi})(\xi X | \bar{\xi} X)} = (\xi | \bar{\xi}) = \frac{1}{2}(x_1 | \bar{x}_1)_{\mathfrak{p}^+}.$$

We also have

$$d_{\mathbf{k}+1}^{\mathfrak{p}_2^\pm} = \dim \mathcal{P}_{\mathbf{k}+1}(\mathfrak{p}_2^\pm) \leq \dim(\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^\pm) \otimes \mathcal{P}_{(|\mathbf{l}|, 0, 0)}(\mathfrak{p}_2^\pm)) = d_{\mathbf{k}}^{\mathfrak{p}_2^\pm} d_{(|\mathbf{l}|, 0, 0)}^{\mathfrak{p}_2^\pm}.$$

Hence the proposition follows.

(2) Again since  $f(x_2) \mapsto F_{\mathbf{k},1}^\downarrow[f](x_1, x_2)$  is  $\widetilde{K}_1^{\mathbb{C}}$ -equivariant, it is enough to prove when  $f(x_2) = \Delta_{\mathbf{k}}^{n_2^+}(x_2) = \Delta_{\mathbf{k}}^{n_2^+}(X)$ . Then since  ${}^t\hat{\xi}\xi \in \mathfrak{p}_2^+$  is at most of rank 1 for  $x_1 = \xi \in \mathfrak{p}_1^+$  and every rank 1 element is written as this form, by Lemma 2.4 (5) we have

$$F_{\mathbf{k},1}^\downarrow[\Delta_{\mathbf{k}}^{n_2^+}](x_1, x_2) = \frac{1}{|\mathbf{1}|!} \det(X)^{-|\mathbf{1}|} \text{Proj}_{\mathbf{k}+1, X}^{\mathfrak{p}_2^+} \left( (X|{}^t\hat{\xi}\xi)^{|\mathbf{1}|} \Delta_{\mathbf{k}}^{n_2^+}(X) \right) \neq 0$$

for some  $x_1 = \xi \in \mathfrak{p}_1^+$ . Hence we get the desired formula.  $\square$

The following proposition gives some examples of  $F_{\mathbf{k},1}^\downarrow[f](x_1, x_2)$ .

**Proposition 3.2.** *Let  $x = (x_1, x_2) = (\xi, X) \in \mathfrak{p}_1^+ \oplus \mathfrak{p}_2^+$ .*

(1) *For  $k \in \mathbb{C}$ ,  $\mathbf{l} \in (\mathbb{Z}_{\geq 0})^3$ ,  $\mathbf{k} \in \mathbb{Z}_{++}^3$ ,  $f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ , we have*

$$F_{\mathbf{k}+(k,k,k), \mathbf{l}}^\downarrow[f \det_{n_2^+}^k](x_1, x_2) = \det_{n_2^+}(x_2)^k F_{\mathbf{k}, \mathbf{l}}^\downarrow[f](x_1, x_2).$$

(2) *For  $k \in \mathbb{C}$ ,  $l \in \mathbb{Z}_{\geq 0}$ , we have*

$$\begin{aligned} F_{\binom{k,k,k}{l,0,0}}^\downarrow[\det_{n_2^+}^k](x_1, x_2) &= \frac{1}{l!} \left( -\frac{((x_1)^\#|x_2)}{\det_{n_2^+}(x_2)} \right)^l \det_{n_2^+}(x_2)^k = \frac{1}{l!} \left( \frac{\xi X {}^t\hat{\xi}}{\det(X)} \right)^l \det(X)^k, \\ F_{\binom{k,k,k}{0,0,l}}^\uparrow[\det_{n_2^+}^k](x_1, x_2) &= \frac{1}{l!} \left( -((x_1)^\#|(x_2)^\#) \right)^l \det_{n_2^+}(x_2)^k = \frac{1}{l!} (\xi X {}^\#t\hat{\xi})^l \det(X)^k. \end{aligned}$$

(3) *Let  $e' \in \mathfrak{n}_2^+$  be a primitive idempotent, and let  $\mathfrak{p}^+(e')_0 =: \mathfrak{p}^{+\prime}$ ,  $\mathfrak{p}_2^+(e')_0 =: \mathfrak{p}_2^{+\prime}$  be as in (2.2). Then for  $f(x_2'') \in \mathcal{P}_{(k_1, k_2)}(\mathfrak{p}_2^{+\prime})$ ,  $l = 0, 1, \dots, k_2$ , we have*

$$\begin{aligned} F_{(k_1, k_2, 0), (0, 0, l)}^\downarrow[f](x_1, x_2) &= \frac{(-k_2)_l (-k_1 - \frac{d_2}{2})_l}{(-k_2 - \frac{d_2}{2})_l (-k_1 - d_2)_l l!} \left( -\frac{\det_{n_2^{+\prime}}(x_1'')}{\det_{n_2^{+\prime}}(x_2'')} \right)^l f(x_2'') \\ &= \frac{(-k_2)_l (-k_1 - \frac{d_2}{2})_l}{(-k_2 - \frac{d_2}{2})_l (-k_1 - d_2)_l l!} \left( \frac{{}^t\hat{\xi}\xi|e'}{\det_{n_2^{+\prime}}(X'')} \right)^l f(X''). \end{aligned}$$

(4) *Let  $w_2 = W \in \mathfrak{p}_2^+$  be of rank 1. Then for  $k, l_1, l_2 \in \mathbb{Z}_{\geq 0}$  with  $l_2 \leq k$  we have*

$$\begin{aligned} F_{(k, 0, 0), (l_1, l_2, 0)}^\downarrow[(\cdot|w_2)_{n_2^+}^k](x_1, x_2) &= F_{(0, 0, -k), (0, l_2, l_1)}^\uparrow[\left((\cdot)^{-1}|w_2\right)_{n_2^+}^k](x_1, x_2^{-1}) \\ &= \frac{(-1)^{l_1} \det_{n_2^+}(x_2)^{-l_1 - l_2}}{(-k - l_1 - \frac{d_2}{2})_{l_2} l_2! (l_1 + l_2)!} \sum_{j=l_2}^{\min\{k, l_1 + l_2\}} \frac{(-k)_j (-l_1 - l_2)_j}{(-k - l_1 + l_2 - \frac{d_2}{2} + 1)_{j-l_2} (j-l_2)!} \\ &\quad \times (x_2|(x_1)^\#)^{l_1 + l_2 - j} (x_2|w_2)^{k-j} \left( (x_2|(x_1)^\#)(x_2|w_2) - (x_2(x_1)^\#x_2|w_2) \right)^j \\ &= \frac{(-1)^{l_2}}{(-k - l_1 - \frac{d_2}{2})_{l_2} l_2! (l_1 + l_2)!} \sum_{j=l_2}^{\min\{k, l_1 + l_2\}} \frac{(-k)_j (-l_1 - l_2)_j}{(-k - l_1 + l_2 - \frac{d_2}{2} + 1)_{j-l_2} (j-l_2)!} \\ &\quad \times (X|{}^t\hat{\xi}\xi)^{l_1 + l_2 - j} (X|W)^{k-j} \left( (X|{}^t\hat{\xi}\xi)(X|W) - (X{}^t\hat{\xi}\xi X|W) \right)^j \det(X)^{-l_1 - l_2}. \end{aligned}$$

(5) Let  $w_2 = W \in \mathfrak{p}_2^+$  be of rank 1. Then for  $k, l_1, l_3 \in \mathbb{Z}_{\geq 0}$  with  $l_3 \leq k$  we have

$$\begin{aligned}
& F_{(0,0,-k),(l_1,0,l_3)}^\downarrow [(\cdot|w_2)_{\mathfrak{n}_2^+}^k](x_1, x_2) = F_{(k,0,0),(l_3,0,l_1)}^\uparrow [(\cdot|w_2)_{\mathfrak{n}_2^+}^k](x_1, x_2^{-1}) \\
&= \frac{(-1)^{l_1}}{(-k-l_1-d_2)_{l_3} l_3! (l_1+l_3)!} \sum_{j=l_3}^{\min\{k, l_1+l_3\}} \frac{(-k)_j (-l_1-l_3)_j}{(-k-l_1+l_3-d_2+1)_{j-l_3} (j-l_3)!} \\
&\quad \times (x_2|(x_1)^\#)^{l_1+l_3-j} (x_2^{-1}|w_2)^{k-j} ((x_1)^\#|w_2)^j \det_{\mathfrak{n}_2^+}(x_2)^{-l_1-l_3} \\
&= \frac{(-1)^{l_3}}{(-k-l_1-d_2)_{l_3} l_3! (l_1+l_3)!} \sum_{j=l_3}^{\min\{k, l_1+l_3\}} \frac{(-k)_j (-l_1-l_3)_j}{(-k-l_1+l_3-d_2+1)_{j-l_3} (j-l_3)!} \\
&\quad \times (X|{}^t\hat{\xi}\hat{\xi})^{l_1+l_3-j} (X^{-1}|W)^{k-j} ({}^t\hat{\xi}\hat{\xi}|W)^j \det(X)^{-l_1-l_3}.
\end{aligned}$$

*Proof.* (1) Clear from  $\mathcal{P}_{\mathbf{k}+(k,k,k)}(\mathfrak{p}_2^+) = \det_{\mathfrak{n}_2^+}(x_2)^k \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ .

(2) By the definition of  $F_{\mathbf{k},1}^\downarrow[f](x_1, x_2)$ ,  $F_{\mathbf{k},1}^\uparrow[f](x_1, x_2)$ ,

$$\begin{aligned}
F_{\binom{k,k,k}{(l,0,0)}}^\downarrow, [\det_{\mathfrak{n}_2^+}^k](x_1, x_2) &= \text{Proj}_{\binom{p_2^+}{(k,k-l,k-l)}, x_2} \left( \frac{1}{l!} \left( -\frac{((x_1)^\#|x_2)}{\det_{\mathfrak{n}_2^+}(x_2)} \right)^l \det_{\mathfrak{n}_2^+}(x_2)^k \right) \\
&= \frac{1}{l!} \left( -\frac{((x_1)^\#|x_2)}{\det_{\mathfrak{n}_2^+}(x_2)} \right)^l \det_{\mathfrak{n}_2^+}(x_2)^k = \frac{1}{l!} \left( \frac{\xi X {}^t\hat{\xi}}{\det(X)} \right)^l \det(X)^k, \\
F_{\binom{k,k,k}{(0,0,l)}}^\uparrow, [\det_{\mathfrak{n}_2^+}^k](x_1, x_2) &= \text{Proj}_{\binom{p_2^+}{(k+l,k+l,k)}, x_2} \left( \frac{1}{l!} (-(x_1)^\#|(x_2)^\#)^l \det_{\mathfrak{n}_2^+}(x_2)^k \right) \\
&= \frac{1}{l!} (-(x_1)^\#|(x_2)^\#)^l \det_{\mathfrak{n}_2^+}(x_2)^k = \frac{1}{l!} (\xi X {}^t\hat{\xi})^l \det(X)^k.
\end{aligned}$$

(3) By Lemma 2.4 (3) we have

$$\begin{aligned}
F_{\binom{k_1,k_2,0}{(0,0,l)}}^\downarrow, [f](x_1, x_2) &= \tilde{F}_{\binom{k_1,k_2,0}{(0,0,l)}} [f](x_1, x_2) \det_{\mathfrak{n}_2^+}(x_2)^{-l} \\
&= \frac{(-1)^l}{l!} \text{Proj}_{\binom{p_2^+}{(k_1,k_2,l)}, x_2} ((x_2|(x_1)^\#)^l f(x_2'')) \det_{\mathfrak{n}_2^+}(x_2)^{-l} \\
&= \frac{(-1)^l}{l!} \frac{(-k_2)_l (-k_1 - \frac{d_2}{2})_l}{(-k_2 - \frac{d_2}{2})_l (-k_1 - d_2)_l} \frac{((x_1)^\#|e')^l}{\det_{\mathfrak{n}_2^+}(x_2'')^l} f(x_2''),
\end{aligned}$$

and we have

$$((x_1)^\#|e') = \det_{\mathfrak{n}^+}(x_1''), \quad ({}^t\hat{\xi}\hat{\xi}|e') = -({}^t\hat{\xi}\hat{\xi}|e').$$

(4) By Proposition 2.5 (2) we have

$$\begin{aligned}
& F_{(k,0,0),(l_1,l_2,0)}^\downarrow [(\cdot|w_2)_{\mathfrak{n}_2^+}^k](x_1, x_2) = \tilde{F}_{(k,0,0),(l_1,l_2,0)} [(\cdot|w_2)_{\mathfrak{n}_2^+}^k](x_1, x_2) \det_{\mathfrak{n}_2^+}(x_2)^{-l_1-l_2} \\
&= \frac{(-1)^{l_1+l_2}}{(l_1+l_2)!} \text{Proj}_{\binom{p_2^+}{(k+l_1,l_2,0)}, x_2} ((x_2|w_2)^k (x_2|(x_1)^\#)^{l_1+l_2}) \det_{\mathfrak{n}_2^+}(x_2)^{-l_1-l_2} \\
&= \frac{(-1)^{l_1+l_2}}{(l_1+l_2)!} \frac{(-1)^{l_2}}{(-k-l_1-\frac{d_2}{2})_{l_2} l_2!} \sum_{j=l_2}^{\min\{k, l_1+l_2\}} \frac{(-k)_j (-l_1-l_2)_j}{(-k-l_1+l_2-\frac{d_2}{2}+1)_{j-l_2} (j-l_2)!} \\
&\quad \times (x_2|(x_1)^\#)^{l_1+l_2-j} (x_2|w_2)^{k-j} ((x_2|(x_1)^\#)(x_2|w_2) - (x_2(x_1)^\#x_2|w_2))^j \det_{\mathfrak{n}_2^+}(x_2)^{-l_1-l_2}
\end{aligned}$$

$$\begin{aligned}
&= \frac{1}{(l_1 + l_2)!} \frac{(-1)^{l_2}}{(-k - l_1 - \frac{d_2}{2})_{l_2} l_2!} \sum_{j=l_2}^{\min\{k, l_1 + l_2\}} \frac{(-k)_j (-l_1 - l_2)_j}{(-k - l_1 + l_2 - \frac{d_2}{2} + 1)_{j-l_2} (j-l_2)!} \\
&\quad \times (X|^{t\hat{\xi}\xi})^{l_1 + l_2 - j} (X|W)^{k-j} ((X|^{t\hat{\xi}\xi})(X|W) - (X^{t\hat{\xi}\xi}X|W))^j \det(X)^{-l_1 - l_2}.
\end{aligned}$$

(5) By Proposition 2.5 (1) we have

$$\begin{aligned}
&F_{(0,0,-k), (l_1,0,l_3)}^\downarrow [((\cdot)^{-1}|w_2)_{\mathfrak{n}_2^+}^k](x_1, x_2) = \tilde{F}_{(0,0,-k), (l_1,0,l_3)} [((\cdot)^{-1}|w_2)_{\mathfrak{n}_2^+}^k](x_1, x_2) \det_{\mathfrak{n}_2^+}(x_2)^{-l_1 - l_3} \\
&= \frac{(-1)^{l_1 + l_3}}{(l_1 + l_3)!} \text{Proj}_{(l_1,0,l_3-k), x_2}^{\mathfrak{p}_2^+} ((x_2^{-1}|w_2)^k (x_2|(x_1)^\sharp)^{l_1 + l_3}) \det_{\mathfrak{n}_2^+}(x_2)^{-l_1 - l_3} \\
&= \frac{(-1)^{l_1 + l_3}}{(l_1 + l_3)!} \frac{(-1)^{l_3}}{(-k - l_1 - d_2)_{l_3} l_3!} \sum_{j=l_3}^{\min\{k, l_1 + l_3\}} \frac{(-k)_j (-l_1 - l_3)_j}{(-k - l_1 + l_3 - d_2 + 1)_{j-l_3} (j-l_3)!} \\
&\quad \times (x_2|(x_1)^\sharp)^{l_1 + l_3 - j} (x_2^{-1}|w_2)^{k-j} ((x_1)^\sharp|w_2)^j \det_{\mathfrak{n}_2^+}(x_2)^{-l_1 - l_3} \\
&= \frac{1}{(l_1 + l_3)!} \frac{(-1)^{l_3}}{(-k - l_1 - d_2)_{l_3} l_3!} \sum_{j=l_3}^{\min\{k, l_1 + l_3\}} \frac{(-k)_j (-l_1 - l_3)_j}{(-k - l_1 + l_3 - d_2 + 1)_{j-l_3} (j-l_3)!} \\
&\quad \times (X|^{t\hat{\xi}\xi})^{l_1 + l_3 - j} (X^{-1}|W)^{k-j} ({}^{t\hat{\xi}\xi}W)^j \det(X)^{-l_1 - l_3}. \quad \square
\end{aligned}$$

Using  $F_{\mathbf{k},1}^\downarrow[f](x_1, x_2)$ , for  $\lambda \in \mathbb{C}$ ,  $\mathbf{k} \in \mathbb{Z}_{++}^3 + \mathbb{C}\mathbf{1}_3$  and for  $f(x) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^\pm)$ , we define a function of  $x = (x_1, x_2) \in \Omega$  by

$$\begin{aligned}
&F^\downarrow(\lambda, \mathbf{k}; f; x) \\
&:= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k_1 - k_2 \\ 0 \leq l_3 \leq k_2 - k_3}} \frac{((-k_3, -k_2, -k_1))_{(l_1 + l_2, l_1 + l_3, l_2 + l_3), d_2}}{(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))_{(l_1, l_2, l_3), d_2}} F_{\mathbf{k},1}^\downarrow[f](x_1, x_2) \\
&= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k_1 - k_2 \\ 0 \leq l_3 \leq k_2 - k_3}} \frac{(-k_1 - \frac{d}{2})_{l_2 + l_3} (-k_2 - \frac{d}{4})_{l_1 + l_3} (-k_3)_{l_1 + l_2} F_{\mathbf{k},1}^\downarrow[f](x_1, x_2)}{(-\lambda - k_2 - k_3 + \frac{3}{4}d + 1)_{l_1} (-\lambda - k_1 - k_3 + \frac{1}{2}d + 1)_{l_2} (-\lambda - k_1 - k_2 + \frac{1}{4}d + 1)_{l_3}}, \tag{3.2}
\end{aligned}$$

where  $(\lambda + \mathbf{s})_{\mathbf{m}, d_2}$  is as in (2.6), and recall that  $d_2 = d/2$ . This has continuous parameters  $(\lambda, k_3) \in \mathbb{C}^2$  and discrete parameters  $(k'_1, k'_2) := (k_1 - k_3, k_2 - k_3) \in \mathbb{Z}_{++}^2$ . When we put  $f'(x_2) := f(x_2) \det_{\mathfrak{n}_2^\pm}(x_2)^{-k_3} \in \mathcal{P}_{(k'_1, k'_2, 0)}(\mathfrak{p}_2^\pm)$ , we have

$$\begin{aligned}
F^\downarrow(\lambda, \mathbf{k}; f; x) &= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k'_1 - k'_2 \\ 0 \leq l_3 \leq k'_2}} \frac{(-k_3 - (0, k'_2, k'_1))_{(l_1 + l_2, l_1 + l_3, l_2 + l_3), d_2}}{(-\lambda - 2k_3 + \frac{3}{2}d_2 + 1 - (k'_2, k'_1, k'_1 + k'_2))_{(l_1, l_2, l_3), d_2}} \\
&\quad \times \det_{\mathfrak{n}_2^\pm}(x_2)^{k_3} F_{(k'_1, k'_2, 0), 1}^\downarrow[f'](x_1, x_2),
\end{aligned}$$

and when we fix  $(k'_1, k'_2) \in \mathbb{Z}_{++}^2$ , as a function of  $(\lambda, k_3) \in \mathbb{C}^2$  this has poles at

$$\begin{aligned}
\lambda + 2k_3 &\in \left\{ \frac{3}{2}d_2 + 1 - k'_2 + j \mid j \in \mathbb{Z}_{\geq 0} \right\} \cup \{d_2 + 1 - k'_1 + j \mid j \in \mathbb{Z}, 0 \leq j < k'_1 - k'_2\} \\
&\quad \cup \left\{ \frac{1}{2}d_2 + 1 - (k'_1 + k'_2) + j \mid j \in \mathbb{Z}, 0 \leq j < k'_2 \right\}.
\end{aligned}$$

If we additionally fix  $k_3 \in \mathbb{Z}_{\geq 0}$ , then  $F^\downarrow(\lambda, \mathbf{k}; f; x)$  becomes a polynomial in  $x$ , and the singularities  $\lambda \in \{\frac{3}{2}d_2 + 1 - k'_2 - 2k_3 + j \mid j \in \mathbb{Z}_{\geq k_3}\}$  are removable. We use the same notation  $F^\downarrow(\lambda, \mathbf{k}; f; x)$  to express this polynomial also for these  $\lambda$ .

**Proposition 3.3.** *Suppose  $\lambda \in \mathbb{C}$  is not a pole of  $F^\downarrow(\lambda, \mathbf{k}; f; x)$ . Then  $F^\downarrow(\lambda, \mathbf{k}; f; x)$  converges if  $x_2 = ge$  for some  $g \in K_1^{\mathbb{C}}$  and  $(g^{-1}x_1|\overline{g^{-1}x_1})_{\mathfrak{p}^+} < 2$ . Especially, this converges for  $x = (x_1, x_2) \in \Omega$ .*

*Proof.* By Proposition 3.1, for  $x_1 \in \mathfrak{p}_1^+$ ,  $x_2 \in ge \in \mathfrak{p}_2^+$  with  $g \in \tilde{K}_1^{\mathbb{C}}$ , we have

$$|F^\downarrow(\lambda, \mathbf{k}; f; x)| \leq \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k_1 - k_2 \\ 0 \leq l_3 \leq k_2 - k_3}} \frac{|((-k_3, -k_2, -k_1))_{(l_1+l_2, l_1+l_3, l_2+l_3), d_2}| \sqrt{d_{\mathbf{k}}^{\mathfrak{p}_2^+} d_{(|\mathbf{1}|, 0, 0)}^{\mathfrak{p}_2^+}}}{|(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))_{(l_1, l_2, l_3), d_2}| |\mathbf{1}|!} \\ \times \frac{(g^{-1}x_1|\overline{g^{-1}x_1})_{\mathfrak{p}^+}^{|\mathbf{1}|}}{2^{|\mathbf{1}|}} \|f(g(\cdot))\|_{L^2(\Sigma_2)}.$$

Then

$$d_{(|\mathbf{1}|, 0, 0)}^{\mathfrak{p}_2^+} = \dim \mathcal{P}_{(|\mathbf{1}|, 0, 0)}(\mathfrak{p}_2^+) \leq \dim \mathcal{P}_{|\mathbf{1}|}(\mathfrak{p}_2^+) = \binom{|\mathbf{1}| + n_2 - 1}{n_2 - 1}$$

is of polynomial growth, where  $n_2 := \dim \mathfrak{p}_2^+$ . Also, since  $l_2, l_3$  run over the finite sets, by Stirling's formula, there exist constants  $C_{\lambda, \mathbf{k}}, C'_{\lambda, \mathbf{k}} \in \mathbb{R}_{>0}$  such that

$$\frac{|((-k_3, -k_2, -k_1))_{(l_1+l_2, l_1+l_3, l_2+l_3), d_2}|}{|(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))_{(l_1, l_2, l_3), d_2}| |\mathbf{1}|!} \\ \leq C_{\lambda, \mathbf{k}} \left| \frac{(l_1 + l_2)^{-k_3+l_1+l_2-\frac{1}{2}} e^{-l_1-l_2} (l_1 + l_3)^{-k_2-\frac{1}{2}d_2+l_1+l_3-\frac{1}{2}} e^{-l_1-l_3}}{l_1^{-\lambda+\frac{3}{2}d_2-k_2-k_3+l_1+\frac{1}{2}} e^{-l_1} (l_1 + l_2 + l_3)^{l_1+l_2+l_3+\frac{1}{2}} e^{-l_1-l_2-l_3}} \right| \leq C'_{\lambda, \mathbf{k}} |\mathbf{1}|^{\operatorname{Re} \lambda - 2d_2 - 2}$$

holds. Hence the above converges if  $(g^{-1}x_1|\overline{g^{-1}x_1})_{\mathfrak{p}^+} < 2$ . Especially, if  $x = (x_1, x_2) = (x_1, ge) \in \Omega$  with  $g \in L_2 = K_1^{\mathbb{C}} \cap L$ , then by

$$0 < \det_{\mathfrak{n}^+}(x) = \det_{\mathfrak{n}^+}(x_2) \det_{\mathfrak{n}^+}(e + g^{-1}x_1) = \det_{\mathfrak{n}_2^+}(x_2) \left(1 - \frac{(g^{-1}x_1|\overline{g^{-1}x_1})_{\mathfrak{n}^+}}{2}\right) \\ = \det_{\mathfrak{n}_2^+}(x_2) \left(1 - \frac{(g^{-1}x_1|\overline{g^{-1}x_1})_{\mathfrak{p}^+}}{2}\right),$$

we have  $(g^{-1}x_1|\overline{g^{-1}x_1})_{\mathfrak{p}^+} < 2$ . Hence the above converges if  $x = (x_1, x_2) \in \Omega$ .  $\square$

This  $F^\downarrow(\lambda, \mathbf{k}; f; x)$  has the following property. Recall that  $\underline{k}_3 := (k, k, k)$ .

**Proposition 3.4.** *For  $\lambda \in \mathbb{C}$ ,  $\mathbf{k} \in \mathbb{Z}_{++}^3 + \mathbb{C}\underline{1}_3$ ,  $f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ ,  $k \in \mathbb{Z}_{\geq 0}$ , we have*

$$\det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial x_2} \right)^k F^\downarrow(\lambda, \mathbf{k}; f; x) \\ = (-1)^k ((-k_3, -k_2, -k_1))_{\underline{k}_3, d_2} F^\downarrow(\lambda + 2k, \mathbf{k} - \underline{k}_3; f \det_{\mathfrak{n}_2^+}^{-k}; x).$$

*Proof.* Since  $F_{\mathbf{k},1}^\downarrow[f](x_1, x_2) \in \mathcal{P}_{2|\mathbf{k}|}(\mathfrak{p}_1^+) \otimes \mathcal{P}_{(k_1-l_2-l_3, k_2-l_1-l_3, k_3-l_1-l_2)}(\mathfrak{p}_2^+)$  holds, by Lemma 2.3 we have

$$\begin{aligned}
& \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial x_2} \right)^k ((-k_3, -k_2, -k_1))_{(l_1+l_2, l_1+l_3, l_2+l_3), d_2} F_{\mathbf{k},1}^\downarrow[f](x_1, x_2) \\
&= (-1)^{3k} ((-k_3 + l_1 + l_2, -k_2 + l_1 + l_3, -k_1 + l_2 + l_3))_{(k,k,k), d_2} \\
&\quad \times ((-k_3, -k_2, -k_1))_{(l_1+l_2, l_1+l_3, l_2+l_3), d_2} F_{\mathbf{k},1}^\downarrow[f](x_1, x_2) \det_{\mathfrak{n}_2^+}(x_2)^{-k} \\
&= (-1)^k ((-k_3, -k_2, -k_1))_{(k+l_1+l_2, k+l_1+l_3, k+l_2+l_3), d_2} F_{\mathbf{k}-\underline{k}_3,1}^\downarrow \left[ f \det_{\mathfrak{n}_2^+}^{-k} \right] (x_1, x_2) \\
&= (-1)^k ((-k_3, -k_2, -k_1))_{(k,k,k), d_2} \\
&\quad \times ((-k_3 + k, -k_2 + k, -k_1 + k))_{(l_1+l_2, l_1+l_3, l_2+l_3), d_2} F_{\mathbf{k}-\underline{k}_3,1}^\downarrow \left[ f \det_{\mathfrak{n}_2^+}^{-k} \right] (x_1, x_2),
\end{aligned}$$

and easily we have

$$\begin{aligned}
& \left( -\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2) \right)_{1, d_2} \\
&= \left( -(\lambda + 2k) + \frac{3}{2}d_2 + 1 - ((k_2 - k) + (k_3 - k), (k_1 - k) + (k_3 - k), (k_1 - k) + (k_2 - k)) \right)_{1, d_2}.
\end{aligned}$$

Hence the desired formula follows from the definition of  $F^\downarrow(\lambda, \mathbf{k}; f; x)$ .  $\square$

### 3.3 Results on weighted Bergman inner products

For  $\lambda \in \mathbb{C}$ ,  $\mathbf{k} \in \mathbb{Z}_{++}^3$ , let

$$\begin{aligned}
C^{d, d_2}(\lambda, \mathbf{k}) &:= \frac{\prod_{1 \leq i < j \leq 3} (\lambda - \frac{d}{4}(i+j-2))_{k_i+k_j}}{\prod_{1 \leq i < j \leq 4} (\lambda - \frac{d}{4}(i+j-3))_{k_i+k_j}} \\
&= \frac{(\lambda + k_1 + k_3 - \frac{d}{4})_{k_2-k_3} (\lambda + \max\{k_1, k_2 + k_3\} - \frac{d}{2})_{\min\{k_3, k_1-k_2\}} (\lambda + k_2 - \frac{3}{4}d)_{k_3}}{(\lambda)_{k_1+k_2} (\lambda - \frac{d}{2})_{\min\{k_1, k_2+k_3\}} (\lambda - d)_{k_3}} \\
&= \frac{(\lambda - \frac{d_2}{2} + (k_1 + k_3, \max\{k_1, k_2 + k_3\}, k_2))_{(k_2-k_3, \min\{k_3, k_1-k_2\}, k_3), d_2}}{(\lambda)_{(k_1+k_2, \min\{k_1, k_2+k_3\}, k_3), d}}, \tag{3.3}
\end{aligned}$$

where  $k_4 := 0$ ,  $d_2 = d/2$ . Then the following holds.

**Theorem 3.5.** *Suppose  $\mathbf{k} \in \mathbb{Z}_{++}^3 + \mathbb{C}\underline{1}_3 = \mathbb{Z}_{++}^3 + \mathbb{C}(1, 1, 1)$ ,  $f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ .*

(1) *When  $\mathbf{k} \in \mathbb{Z}_{++}^3$ , for  $\operatorname{Re} \lambda > 2d + 1$  we have*

$$\left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} = C^{d, d_2}(\lambda, \mathbf{k}) F^\downarrow(\lambda, \mathbf{k}; f; z).$$

(2) *When  $\mathbf{k} \in \mathbb{Z}_{++}^3$ , as a function of  $\lambda$ ,*

$$(\lambda)_{(k_1+k_2, \min\{k_1, k_2+k_3\}, k_3), d} \left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x}$$

*is holomorphically continued for all  $\mathbb{C}$ , and give non-zero polynomials in  $z$  for all  $\lambda \in \mathbb{C}$  if  $f(x_2) \neq 0$ .*

(3) For  $\mathbf{k} \in \mathbb{Z}_{++}^3 + \mathbb{C}\underline{\mathbf{1}}_3$ ,  $\lambda \in \mathbb{C}$ , we have

$$\begin{aligned} & F^\downarrow(\lambda, \mathbf{k}; f; z) \\ &= \det_{\mathfrak{n}^+}(z)^{-\lambda+d+1} F^\downarrow\left(-\lambda + 2(d+1), \mathbf{k} + \underline{\lambda - d - \mathbf{1}}_3; f \det_{\mathfrak{n}_2^+}^{\lambda-d-1}; z\right). \end{aligned}$$

Especially if  $\mathbf{k} \in \mathbb{Z}_{++}^3$  and  $\lambda = d + 1 - a$  with  $a = 1, 2, \dots, k_3$ , then  $F^\downarrow(\lambda, \mathbf{k}; f; z)$  is factorized as

$$F^\downarrow(d + 1 - a, \mathbf{k}; f; z) = \det_{\mathfrak{n}^+}(z)^a F^\downarrow\left(d + 1 + a, \mathbf{k} - \underline{a}_3; f \det_{\mathfrak{n}_2^+}^{-a}; z\right).$$

Theorem 3.5 (1), (3) solves [35, Conjecture 7.2], and coincides with [34, Theorem 6.3 (1)] for  $k_2 = k_3$  case. Also, in (2) the holomorphy is already proved in [35, Theorem 6.2], and the non-zerosness is new except for  $k_1 = k_2 = k_3$  or  $k_3 = 0$  ([34, Corollary 6.6 (2)]).

**Remark 3.6.** By [35, Theorem 3.3 (1)], for  $\mathbf{k} \in \mathbb{Z}_{++}^3$ ,  $f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ ,  $\operatorname{Re} \lambda > 2d + 1$  we have

$$\begin{aligned} \left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} &= \frac{1}{(\lambda)_{\underline{2k_{3,3}}, d}} \det_{\mathfrak{n}^+}(z)^{-\lambda+d+1} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k_3} \det_{\mathfrak{n}^+}(z)^{\lambda+2k_3-d-1} \\ &\quad \times \left\langle \det_{\mathfrak{n}_2^+}(x_2)^{-k_3} f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda+2k_3, x}. \end{aligned} \quad (3.4)$$

Combining this with Proposition 3.4 and Theorem 3.5 (1), (3), we have

$$\begin{aligned} & \left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\ &= \frac{C^{d, d_2} (\lambda + 2k_3, \mathbf{k} - \underline{k_{3,3}})}{(\lambda)_{\underline{2k_{3,3}}, d}} \det_{\mathfrak{n}^+}(z)^{-\lambda+d+1} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k_3} \det_{\mathfrak{n}^+}(z)^{\lambda+2k_3-d-1} \\ &\quad \times F^\downarrow\left(\lambda + 2k_3, \mathbf{k} - \underline{k_{3,3}}; f \det_{\mathfrak{n}_2^+}^{-k_3}; z\right) \\ &= \frac{(\lambda + k_1 + k_3 - \frac{d_2}{2})_{k_2 - k_3}}{(\lambda)_{(k_1+k_2, k_2+k_3, 2k_3), d}} \det_{\mathfrak{n}^+}(z)^{-\lambda+d+1} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k_3} \\ &\quad \times F^\downarrow\left(-\lambda - 2k_3 + 2(d+1), \mathbf{k} + \underline{\lambda + k_3 - d - \mathbf{1}}_3; f \det_{\mathfrak{n}_2^+}^{\lambda+k_3-d-1}; z\right) \\ &= C^{d, d_2}(\lambda, \mathbf{k}) \det_{\mathfrak{n}^+}(z)^{-\lambda+d+1} F^\downarrow\left(-\lambda + 2(d+1), \mathbf{k} + \underline{\lambda - d - \mathbf{1}}_3; f \det_{\mathfrak{n}_2^+}^{\lambda-d-1}; z\right) \\ &= C^{d, d_2}(\lambda, \mathbf{k}) F^\downarrow(\lambda, \mathbf{k}; f; z). \end{aligned}$$

First we prove (1). By [35, Theorem 6.1], we have

$$\frac{\left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \Big|_{z_1=0}}{f(z_2)} = \frac{\prod_{1 \leq i < j \leq 3} (\lambda - \frac{d}{4}(i+j-2))_{k_i+k_j}}{\prod_{1 \leq i < j \leq 4} (\lambda - \frac{d}{4}(i+j-3))_{k_i+k_j}} = C^{d, d_2}(\lambda, \mathbf{k}).$$

Therefore to prove (1), it is enough to prove that  $\left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x}$  is proportional to  $F^\downarrow(\lambda, \mathbf{k}; f; z)$ , and by the F-method, enough to prove

$$(f(x_2) \mapsto F^\downarrow(\lambda, \mathbf{k}; f; z)) \in \operatorname{Hom}_{K_1}(\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+), \operatorname{Sol}_{\mathcal{P}(\mathfrak{p}^+)}((\mathcal{B}_\lambda)_1)), \quad (3.5)$$

where  $(\mathcal{B}_\lambda)_1$  is the orthogonal projection of  $\mathcal{B}_\lambda = \mathcal{B}_\lambda^{\mathfrak{p}^+} : \mathcal{P}(\mathfrak{p}^+) \rightarrow \mathcal{P}(\mathfrak{p}^+) \otimes \mathfrak{p}^+$  given in (2.24) (with the identification  $\mathfrak{p}^- \simeq \mathfrak{p}^+ = \mathfrak{n}^{+\mathbb{C}}$ ) onto  $\mathfrak{p}_1^+$ . This follows from the next proposition. Recall that we write  $z = (z_1, z_2) = (\zeta, Z) \in \mathfrak{p}_1^+ \oplus \mathfrak{p}_2^+ \simeq (\mathbb{F}'^{\mathbb{C}})^3 \oplus \text{Herm}(3, \mathbb{F}')^{\mathbb{C}}$ , and use lowercase Greek alphabets and capital Latin alphabets to express elements in  $(\mathbb{F}'^{\mathbb{C}})^3$  and in  $\text{Herm}(3, \mathbb{F}')^{\mathbb{C}}$  respectively. Also we abbreviate  $\det_{\mathfrak{n}_2^+}(X) =: \det(X)$ , and let  $(X|Y) := \text{Re}_{\mathbb{F}'} \text{tr}(XY)$ ,  $(\xi|\eta) := \text{Re}_{\mathbb{F}'}(\xi^t \hat{\eta})$ , so that  $((\xi, X)|(\eta, Y))_{\mathfrak{n}^+} = 2(\xi|\eta) + (X|Y)$  holds. Especially we have  $-((z_1)^\#|z_2)_{\mathfrak{n}_2^+} = \zeta Z^t \hat{\zeta}$ . Let  $\Gamma_3^{d_2}(\lambda + \mathbf{s})$  be as in (2.5).

**Proposition 3.7.** *Let  $\lambda \in \mathbb{C}$ ,  $\mathbf{k} \in \mathbb{Z}_{++}^3 + \mathbb{C}\mathbf{1}_3$ ,  $f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ .*

(1) *If  $\text{Re } k_1 < -d_2$ ,  $\text{Re}(\lambda + k_1 + k_2) < -\frac{1}{2}d_2$ , then for  $z = (\zeta, Z) \in \Omega$ ,  $A \in \Omega_2$ , we have*

$$\begin{aligned} & F^\downarrow(\lambda, \mathbf{k}; f; \zeta, Z) \\ &= \frac{\Gamma_3^{d_2}(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))}{\Gamma_3^{d_2}((-k_3, -k_2, -k_1))} \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda + |\mathbf{k}| - 2d_2 - 1} \\ & \quad \times \left( \frac{1}{(2\pi\sqrt{-1})^{n_2}} \int_{A + \sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^\#)} e^{\zeta X^{-1} t \hat{\zeta}} \det(X)^{\lambda + |\mathbf{k}| - \frac{3}{2}d_2 - 1} f(X^{-1}) dX \right) dY. \end{aligned}$$

(2) *Suppose  $\lambda \in \mathbb{C}$  is not a pole of  $F^\downarrow(\lambda, \mathbf{k}; f; \zeta, Z)$ . Then for  $g \in \tilde{K}_1^{\mathbb{C}}$  we have*

$$F^\downarrow(\lambda, \mathbf{k}; f(g(\cdot)); \zeta, Z) = F^\downarrow(\lambda, \mathbf{k}; f; g(\zeta, Z)).$$

(3)  *$F^\downarrow(\lambda, \mathbf{k}; f; \zeta, Z)$  satisfies the differential equation*

$$(\mathcal{B}_\lambda)_1 F^\downarrow(\lambda, \mathbf{k}; f; \zeta, Z) = 0.$$

*Proof.* (1) By the definition of  $\tilde{F}_{\mathbf{k},1}[f]$  and Lemma 2.2, we have

$$\begin{aligned} & \frac{\Gamma_3^{d_2}(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))}{\Gamma_3^{d_2}((-k_3, -k_2, -k_1))} \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda + |\mathbf{k}| - 2d_2 - 1} \\ & \quad \times \left( \frac{1}{(2\pi\sqrt{-1})^{n_2}} \int_{A + \sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^\#)} e^{\zeta X^{-1} t \hat{\zeta}} \det(X)^{\lambda + |\mathbf{k}| - \frac{3}{2}d_2 - 1} f(X^{-1}) dX \right) dY \\ &= \frac{\Gamma_3^{d_2}(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))}{\Gamma_3^{d_2}((-k_3, -k_2, -k_1))} \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda + |\mathbf{k}| - 2d_2 - 1} \\ & \quad \times \left( \frac{1}{(2\pi\sqrt{-1})^{n_2}} \int_{A + \sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^\#)} \det(X)^{\lambda + |\mathbf{k}| - \frac{3}{2}d_2 - 1} \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k_1 - k_2 \\ 0 \leq l_3 \leq k_2 - k_3}} \tilde{F}_{\mathbf{k},1}[f](\zeta, X^{-1}) dX \right) dY \\ &= \frac{1}{\Gamma_3^{d_2}((-k_3, -k_2, -k_1))} \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda + |\mathbf{k}| - 2d_2 - 1} \det(Y^\#)^{-\lambda - |\mathbf{k}| + \frac{1}{2}d_2} \\ & \quad \times \sum_1 \frac{\Gamma_3^{d_2}(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))}{\Gamma_3^{d_2}(-\lambda - |\mathbf{k}| + \frac{3}{2}d_2 + 1 + (k_1 + l_1, k_2 + l_2, k_3 + l_3))} \tilde{F}_{\mathbf{k},1}[f](\zeta, Y^\#) dY \\ &= \frac{1}{\Gamma_3^{d_2}((-k_3, -k_2, -k_1))} \int_{\Omega_2} \sum_1 \frac{e^{-(Y|Z)} \det(Y)^{-|\mathbf{k}| - d_2 - 1} \tilde{F}_{\mathbf{k},1}[f](\zeta, \det(Y)Y^{-1})}{(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))_{(l_1, l_2, l_3), d_2}} dY \\ &= \frac{1}{\Gamma_3^{d_2}((-k_3, -k_2, -k_1))} \int_{\Omega_2} \sum_1 \frac{e^{-(Y|Z)} \det(Y)^{|\mathbf{l}| - d_2 - 1} \tilde{F}_{\mathbf{k},1}[f](\zeta, Y^{-1})}{(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))_{(l_1, l_2, l_3), d_2}} dY \end{aligned}$$

$$\begin{aligned}
&= \sum_{\mathbf{1}} \frac{\Gamma_3^{d_2}(|\mathbf{1}| + (-k_3 - l_3, -k_2 - l_2, -k_1 - l_1)) \det(Z)^{-|\mathbf{1}|} \tilde{F}_{\mathbf{k}, \mathbf{1}}[f](\zeta, Z)}{\Gamma_3^{d_2}((-k_3, -k_2, -k_1))(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))_{(l_1, l_2, l_3), d_2}} \\
&= \sum_{\mathbf{1}} \frac{((-k_3, -k_2, -k_1))_{(l_1 + l_2, l_1 + l_3, l_2 + l_3), d_2} F_{\mathbf{k}, \mathbf{1}}^\downarrow[f](\zeta, Z)}{(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_1 + k_3, k_1 + k_2))_{(l_1, l_2, l_3), d_2}} = F^\downarrow(\lambda, \mathbf{k}; f; \zeta, Z).
\end{aligned}$$

Hence we get the desired formula.

(2) Clear from the  $\tilde{K}_1^{\mathbb{C}}$ -equivariance of  $f(X) \mapsto F_{\mathbf{k}, \mathbf{1}}^\downarrow[f](\zeta, Z)$ .

(3) We take bases  $\{E_\alpha\} \subset \mathfrak{n}_2^+$ ,  $\{\epsilon_\alpha\} \subset \mathfrak{n}_1^+$ , let  $\{E_\alpha^\vee\} \subset \mathfrak{n}_2^+$  be the dual basis of  $\{E_\alpha\}$  with respect to  $(\cdot|\cdot)_{\mathfrak{n}_2^+}$ , and let  $\{\epsilon_\alpha^\vee\} \subset \mathfrak{n}_1^+$  be the dual basis of  $\{\epsilon_\alpha\}$  with respect to the bilinear form  $(\xi|\eta) = \operatorname{Re}_{\mathbb{F}}(\xi^t \eta)$ , so that  $\{\epsilon_\alpha, E_\alpha\}$  and  $\{\frac{1}{2}\epsilon_\alpha^\vee, E_\alpha^\vee\}$  are mutually dual with respect to  $(\cdot|\cdot)_{\mathfrak{n}^+}$ . Also let  $\partial/\partial Z_\alpha$  and  $\partial/\partial \zeta_\alpha$  denote the directional derivatives along  $E_\alpha$  and  $\epsilon_\alpha$  respectively. Then  $(\mathcal{B}_\lambda)_1$  is given by

$$\begin{aligned}
(\mathcal{B}_\lambda)_1 &= \frac{1}{8} \sum_{\alpha\beta} P(\epsilon_\alpha^\vee, \epsilon_\beta^\vee) \zeta \frac{\partial^2}{\partial \zeta_\alpha \partial \zeta_\beta} + \frac{1}{2} \sum_{\alpha\beta} P(E_\alpha^\vee, E_\beta^\vee) \zeta \frac{\partial^2}{\partial Z_\alpha \partial Z_\beta} \\
&\quad + \frac{1}{2} \sum_{\alpha\beta} P(\epsilon_\alpha^\vee, E_\beta^\vee) Z \frac{\partial^2}{\partial \zeta_\alpha \partial Z_\beta} + \frac{\lambda}{2} \sum_{\alpha} \epsilon_\alpha^\vee \frac{\partial}{\partial \zeta_\alpha}.
\end{aligned}$$

We put  $\det(X)^{\lambda + |\mathbf{k}| - \frac{3}{2}d_2 - 1} f(X^{-1}) =: F(X)$ . By (1) it is enough to prove, for  $\operatorname{Re} k_1 < -d_2$ ,  $\operatorname{Re}(\lambda + k_1 + k_2) < -\frac{1}{2}d_2$ ,

$$(\mathcal{B}_\lambda)_1 \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda + |\mathbf{k}| - 2d_2 - 1} \left( \int_{A + \sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^\sharp)} e^{\zeta X^{-1}t\hat{\zeta}} F(X) dX \right) dY = 0.$$

First we consider  $(\mathcal{B}_\lambda)_1 e^{-(Y|Z)} e^{\zeta X^{-1}t\hat{\zeta}}$ . In the following we use the notation  $([\frac{\partial}{\partial w} f]g)h := \frac{\partial f}{\partial w} gh + f \frac{\partial g}{\partial w} h$ . Then we have

$$\begin{aligned}
&(\mathcal{B}_\lambda)_1 e^{-(Y|Z)} e^{\zeta X^{-1}t\hat{\zeta}} \\
&= \left[ \frac{1}{8} \sum_{\alpha\beta} P(\epsilon_\alpha^\vee, \epsilon_\beta^\vee) \zeta \frac{\partial^2}{\partial \zeta_\alpha \partial \zeta_\beta} + \frac{1}{2} \sum_{\alpha\beta} P(E_\alpha^\vee, E_\beta^\vee) \zeta \frac{\partial^2}{\partial Z_\alpha \partial Z_\beta} \right. \\
&\quad \left. + \frac{1}{2} \sum_{\alpha\beta} P(\epsilon_\alpha^\vee, E_\beta^\vee) Z \frac{\partial^2}{\partial \zeta_\alpha \partial Z_\beta} + \frac{\lambda}{2} \sum_{\alpha} \epsilon_\alpha^\vee \frac{\partial}{\partial \zeta_\alpha} \right] e^{-(Y|Z)} e^{\zeta X^{-1}t\hat{\zeta}} \\
&= \left( \frac{1}{8} \sum_{\alpha\beta} P(\epsilon_\alpha^\vee, \epsilon_\beta^\vee) \zeta (4(\zeta X^{-1}|\epsilon_\alpha)(\zeta X^{-1}|\epsilon_\beta) + 2(\epsilon_\alpha X^{-1}|\epsilon_\beta)) + \frac{1}{2} P(Y, Y) \zeta \right. \\
&\quad \left. - \sum_{\alpha} P(\epsilon_\alpha^\vee, Y) Z (\zeta X^{-1}|\epsilon_\alpha) + \lambda \sum_{\alpha} \epsilon_\alpha^\vee (\zeta X^{-1}|\epsilon_\alpha) \right) e^{-(Y|Z)} e^{\zeta X^{-1}t\hat{\zeta}} \\
&= \left( P(\zeta X^{-1}) \zeta + \frac{1}{4} \sum_{\alpha} P(\epsilon_\alpha^\vee, \epsilon_\alpha X^{-1}) \zeta + P(Y) \zeta - P(\zeta X^{-1}, Y) Z + \lambda \zeta X^{-1} \right) e^{-(Y|Z)} e^{\zeta X^{-1}t\hat{\zeta}} \\
&= \left[ P(\zeta X^{-1}) \zeta + \zeta Y^\sharp + \left( \lambda - \frac{d_2}{2} + 1 \right) \zeta X^{-1} + \sum_{\alpha} P(\zeta X^{-1}, Y) E_\alpha^\vee \frac{\partial}{\partial Y_\alpha} \right] e^{-(Y|Z)} e^{\zeta X^{-1}t\hat{\zeta}},
\end{aligned}$$

where at the last equality we have used

$$\sum_{\alpha} P(\epsilon_\alpha^\vee, \epsilon_\alpha X^{-1}) \zeta = \sum_{\alpha} (\epsilon_\alpha^\vee t \hat{\zeta} \epsilon_\alpha X^{-1} + \epsilon_\alpha X^{-1} t \hat{\zeta} \epsilon_\alpha^\vee) = 2(2 - d_2) \zeta X^{-1},$$

which follows from  $\sum_{\alpha} \epsilon_{\alpha}^{\vee t \hat{\zeta}} \epsilon_{\alpha} = \sum_{\alpha} \epsilon_{\alpha}^t \hat{\zeta} \epsilon_{\alpha}^{\vee} = (2 - d_2) \xi$ . Thus we get

$$\begin{aligned}
& (\mathcal{B}_{\lambda})_1 \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^{\sharp})} e^{\zeta X^{-1} t \hat{\zeta}} F(X) dX \right) dY \\
&= \int_{\Omega_2} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} \left( \left[ P(\zeta X^{-1}) \zeta + \zeta Y^{\sharp} + \left( \lambda - \frac{d_2}{2} + 1 \right) \zeta X^{-1} \right. \right. \right. \\
&\quad \left. \left. \left. + \sum_{\alpha} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} \frac{\partial}{\partial Y_{\alpha}} \right] e^{-(Y|Z)} \right) \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^{\sharp})} e^{\zeta X^{-1} t \hat{\zeta}} F(X) dX \right) dY \\
&= \int_{\Omega_2} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} e^{-(Y|Z)} \left( \left[ P(\zeta X^{-1}) \zeta + \zeta Y^{\sharp} + \left( \lambda - \frac{d_2}{2} + 1 \right) \zeta X^{-1} \right. \right. \right. \\
&\quad \left. \left. \left. - \sum_{\alpha} \frac{\partial}{\partial Y_{\alpha}} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} \right] \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^{\sharp})} \right) e^{\zeta X^{-1} t \hat{\zeta}} F(X) dX \right) dY.
\end{aligned}$$

Next we consider

$$\begin{aligned}
& \sum_{\alpha} \frac{\partial}{\partial Y_{\alpha}} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^{\sharp})} \\
&= \sum_{\alpha} P(\zeta X^{-1}, E_{\alpha}) E_{\alpha}^{\vee} \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^{\sharp})} \\
&\quad + (2\lambda + |\mathbf{k}| - 2d_2 - 1) \sum_{\alpha} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} (Y^{-1} | E_{\alpha}) \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^{\sharp})} \\
&\quad + \sum_{\alpha} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} (X|Y \times E_{\alpha}) \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^{\sharp})}.
\end{aligned}$$

Then for the 1st term we have

$$\begin{aligned}
\sum_{\alpha} P(\zeta X^{-1}, E_{\alpha}) E_{\alpha}^{\vee} &= \sum_{\alpha} ((E_{\alpha} | E_{\alpha}^{\vee}) \zeta X^{-1} - \zeta X^{-1} E_{\alpha} E_{\alpha}^{\vee}) \\
&= 3(1 + d_2) \zeta X^{-1} - (1 + d_2) \zeta X^{-1} = 2(1 + d_2) \zeta X^{-1},
\end{aligned}$$

for the 2nd term we have

$$\begin{aligned}
\sum_{\alpha} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} (Y^{-1} | E_{\alpha}) &= P(\zeta X^{-1}, Y) Y^{-1} = (Y|Y^{-1}) \zeta X^{-1} - \zeta X^{-1} Y Y^{-1} \\
&= 3\zeta X^{-1} - \zeta X^{-1} = 2\zeta X^{-1},
\end{aligned}$$

and for the 3rd term we have

$$\begin{aligned}
\sum_{\alpha} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} (X|Y \times E_{\alpha}) &= \sum_{\alpha} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} (X \times Y | E_{\alpha}) \\
&= P(\zeta X^{-1}, Y) (X \times Y) = (Y|X \times Y) \zeta X^{-1} - \zeta X^{-1} Y (X \times Y) \\
&= \zeta X^{-1} (2(X|Y^{\sharp}) I - Y(X \times Y)) = \zeta X^{-1} ((X|Y^{\sharp}) I + X Y^{\sharp}) = (X|Y^{\sharp}) \zeta X^{-1} + \zeta Y^{\sharp},
\end{aligned}$$

where we have used (3.1) at the 5th equality. Hence we have

$$\begin{aligned}
& \left[ P(\zeta X^{-1}) \zeta + \zeta Y^{\sharp} + \left( \lambda - \frac{d_2}{2} + 1 \right) \zeta X^{-1} - \sum_{\alpha} \frac{\partial}{\partial Y_{\alpha}} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} \right] \\
&\quad \times \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^{\sharp})}
\end{aligned}$$

$$\begin{aligned}
&= \left( P(\zeta X^{-1})\zeta + \zeta Y^\sharp + \left( \lambda - \frac{d_2}{2} + 1 \right) \zeta X^{-1} - (X|Y^\sharp)\zeta X^{-1} - \zeta Y^\sharp \right. \\
&\quad \left. - 2(1 + d_2)\zeta X^{-1} - 2(2\lambda + |\mathbf{k}| - 2d_2 - 1)\zeta X^{-1} \right) \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^\sharp)} \\
&= \left[ P(\zeta X^{-1})\zeta + \left( -3\lambda - 2|\mathbf{k}| + \frac{3}{2}d_2 + 1 \right) \zeta X^{-1} - \zeta X^{-1} \sum_{\alpha} (X|E_{\alpha}^{\vee}) \frac{\partial}{\partial X_{\alpha}} \right] \\
&\quad \times \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^\sharp)},
\end{aligned}$$

and we get

$$\begin{aligned}
&(\mathcal{B}_{\lambda})_1 \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^\sharp)} e^{\zeta X^{-1}t\hat{\zeta}} F(X) dX \right) dY \\
&= \int_{\Omega_2} e^{-(Y|Z)} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} \left( \left[ P(\zeta X^{-1})\zeta + \zeta Y^\sharp + \left( \lambda - \frac{d_2}{2} + 1 \right) \zeta X^{-1} \right. \right. \right. \\
&\quad \left. \left. - \sum_{\alpha} \frac{\partial}{\partial Y_{\alpha}} P(\zeta X^{-1}, Y) E_{\alpha}^{\vee} \right] \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^\sharp)} \right) e^{\zeta X^{-1}t\hat{\zeta}} F(X) dX \right) dY \\
&= \int_{\Omega_2} e^{-(Y|Z)} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} \left( \left[ P(\zeta X^{-1})\zeta + \left( -3\lambda - 2|\mathbf{k}| + \frac{3}{2}d_2 + 1 \right) \zeta X^{-1} \right. \right. \right. \\
&\quad \left. \left. - \zeta X^{-1} \sum_{\alpha} (X|E_{\alpha}^{\vee}) \frac{\partial}{\partial X_{\alpha}} \right] \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} e^{(X|Y^\sharp)} \right) e^{\zeta X^{-1}t\hat{\zeta}} F(X) dX \right) dY \\
&= \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^\sharp)} \left( \left[ P(\zeta X^{-1})\zeta \right. \right. \right. \\
&\quad \left. \left. + \left( -3\lambda - 2|\mathbf{k}| + \frac{3}{2}d_2 + 1 \right) \zeta X^{-1} + \sum_{\alpha} \frac{\partial}{\partial X_{\alpha}} \zeta X^{-1} (X|E_{\alpha}^{\vee}) \right] e^{\zeta X^{-1}t\hat{\zeta}} F(X) \right) dX \right) dY.
\end{aligned}$$

Then since we have

$$\begin{aligned}
&\sum_{\alpha} \frac{\partial}{\partial X_{\alpha}} \zeta X^{-1} (X|E_{\alpha}^{\vee}) e^{\zeta X^{-1}t\hat{\zeta}} F(X) \\
&= - \sum_{\alpha} \zeta X^{-1} E_{\alpha} X^{-1} (X|E_{\alpha}^{\vee}) e^{\zeta X^{-1}t\hat{\zeta}} F(X) + \sum_{\alpha} \zeta X^{-1} (E_{\alpha}|E_{\alpha}^{\vee}) e^{\zeta X^{-1}t\hat{\zeta}} F(X) \\
&\quad - \sum_{\alpha} \zeta X^{-1} (X|E_{\alpha}^{\vee}) (\zeta X^{-1} E_{\alpha} X^{-1} t\hat{\zeta}) e^{\zeta X^{-1}t\hat{\zeta}} F(X) + \sum_{\alpha} \zeta X^{-1} (X|E_{\alpha}^{\vee}) e^{\zeta X^{-1}t\hat{\zeta}} \frac{\partial F}{\partial X_{\alpha}}(X) \\
&= -\zeta X^{-1} X X^{-1} e^{\zeta X^{-1}t\hat{\zeta}} F(X) + 3(1 + d_2)\zeta X^{-1} e^{\zeta X^{-1}t\hat{\zeta}} F(X) \\
&\quad - (\zeta X^{-1} X X^{-1} t\hat{\zeta}) \zeta X^{-1} e^{\zeta X^{-1}t\hat{\zeta}} F(X) + \zeta X^{-1} e^{\zeta X^{-1}t\hat{\zeta}} \sum_{\alpha} (X|E_{\alpha}^{\vee}) \frac{\partial F}{\partial X_{\alpha}}(X) \\
&= e^{\zeta X^{-1}t\hat{\zeta}} \left[ (2 + 3d_2)\zeta X^{-1} - P(\zeta X^{-1})\zeta + \zeta X^{-1} \sum_{\alpha} (X|E_{\alpha}^{\vee}) \frac{\partial}{\partial X_{\alpha}} \right] F(X),
\end{aligned}$$

we get

$$\begin{aligned}
&(\mathcal{B}_{\lambda})_1 \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^\sharp)} e^{\zeta X^{-1}t\hat{\zeta}} F(X) dX \right) dY \\
&= \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^\sharp)} \left( \left[ P(\zeta X^{-1})\zeta \right. \right. \right. \\
&\quad \left. \left. + \left( -3\lambda - 2|\mathbf{k}| + \frac{3}{2}d_2 + 1 \right) \zeta X^{-1} + \sum_{\alpha} \frac{\partial}{\partial X_{\alpha}} \zeta X^{-1} (X|E_{\alpha}^{\vee}) \right] e^{\zeta X^{-1}t\hat{\zeta}} F(X) \right) dX \right) dY
\end{aligned}$$

$$\begin{aligned}
&= \int_{\Omega_2} e^{-(Y|Z)} \det(Y)^{2\lambda+|\mathbf{k}|-2d_2-1} \left( \int_{A+\sqrt{-1}\mathfrak{n}_2^+} e^{(X|Y^\sharp)} e^{\zeta X^{-1}t\zeta} \right. \\
&\quad \times \left. \left[ \left( -3\lambda - 2|\mathbf{k}| + \frac{9}{2}d_2 + 3 \right) \zeta X^{-1} + \zeta X^{-1} \sum_{\alpha} (X|E_{\alpha}^{\vee}) \frac{\partial}{\partial X_{\alpha}} \right] F(X) dX \right) = 0,
\end{aligned}$$

where the last equality holds since  $F(X) = \det(X)^{\lambda+|\mathbf{k}|-\frac{3}{2}d_2-1} f(X^{-1})$  is homogeneous of degree  $3\lambda + 2|\mathbf{k}| - \frac{9}{2}d_2 - 3$ . Hence we get the desired formula.  $\square$

Especially, when  $\mathbf{k} \in \mathbb{Z}_{++}^3$  we have (3.5), and this proves Theorem 3.5 (1).

*Proof of Theorem 3.5 (2).* By Theorem 3.5 (1) we have

$$\begin{aligned}
&(\lambda)_{(k_1+k_2, \min\{k_1, k_2+k_3\}, k_3), d} \left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\
&= \left( \lambda - \frac{d_2}{2} + (k_1 + k_3, \max\{k_1, k_2 + k_3\}, k_2) \right)_{(k_2-k_3, \min\{k_3, k_1-k_2\}, k_3), d_2} F^{\downarrow}(\lambda, \mathbf{k}; f; z) \\
&= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k_1 - k_2 \\ 0 \leq l_3 \leq k_2 - k_3 \\ l_1 + l_2 \leq k_3}} \left( \lambda - \frac{d_2}{2} + (k_1 + k_3, \max\{k_1, k_2 + k_3\}, k_2) \right)_{(k_2-k_3-l_3, \min\{k_3, k_1-k_2\}-l_2, k_3-l_1), d_2} \\
&\quad \times (-1)^{|l|} ((-k_3, -k_2, -k_1))_{(l_1+l_2, l_1+l_3, l_2+l_3), d_2} F_{\mathbf{k}, 1}^{\downarrow}[f](z_1, z_2),
\end{aligned}$$

and this is analytically continued for all  $\lambda \in \mathbb{C}$ . Moreover, all  $F_{\mathbf{k}, 1}^{\downarrow}[f](z_1, z_2)$  are non-zero by Proposition 3.1 (2) and linearly independent, and the coefficients of  $F_{\mathbf{k}, (k_3, 0, k_2-k_3)}^{\downarrow}[f](z_1, z_2)$  and  $F_{\mathbf{k}, (\max\{0, k_3-k_1+k_2\}, \min\{k_3, k_1-k_2\}, k_2-k_3)}^{\downarrow}[f](z_1, z_2)$ ,

$$\begin{aligned}
&\left( \lambda - \frac{d_2}{2} + (k_1 + k_3, \max\{k_1, k_2 + k_3\}, k_2) \right)_{(0, \min\{k_3, k_1-k_2\}, 0), d_2} \\
&= (\lambda - d_2 + \max\{k_1, k_2 + k_3\})_{\min\{k_3, k_1-k_2\}}, \\
&\left( \lambda - \frac{d_2}{2} + (k_1 + k_3, \max\{k_1, k_2 + k_3\}, k_2) \right)_{(0, 0, \min\{k_3, k_1-k_2\}), d_2} \\
&= \left( \lambda - \frac{3}{2}d_2 + k_2 \right)_{\min\{k_3, k_1-k_2\}}
\end{aligned}$$

do not vanish simultaneously. Hence  $(\lambda)_{(k_1+k_2, \min\{k_1, k_2+k_3\}, k_3), d} \left\langle f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x}$  is non-zero.  $\square$

*Proof of Theorem 3.5 (3).* By combining Theorem 3.5 (1) and (3.4), for  $\operatorname{Re} \lambda > 2d + 1$ ,  $\mathbf{k} \in \mathbb{Z}_{++}^3$  we have

$$\begin{aligned}
C^{d, d_2}(\lambda, \mathbf{k}) F^{\downarrow}(\lambda, \mathbf{k}; f; z) &= \frac{C^{d, d_2}(\lambda + 2k_3, \mathbf{k} - \underline{k}_{33})}{(\lambda)_{\underline{2k}_{33}, d}} \det_{\mathfrak{n}^+}(z)^{-\lambda+d+1} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k_3} \\
&\quad \times \det_{\mathfrak{n}^+}(z)^{\lambda+2k_3-d-1} F^{\downarrow}(\lambda + 2k_3, \mathbf{k} - \underline{k}_{33}; f \det_{\mathfrak{n}_2^+}^{-k_3}; z),
\end{aligned}$$

that is,

$$\begin{aligned}
F^{\downarrow}(\lambda, \mathbf{k}; f; z) &= \frac{1}{(\lambda - d_2 + \mathbf{k})_{\underline{k}_{33}, d_2}} \det_{\mathfrak{n}^+}(z)^{-\lambda+d+1} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k_3} \\
&\quad \times \det_{\mathfrak{n}^+}(z)^{\lambda+2k_3-d-1} F^{\downarrow}(\lambda + 2k_3, \mathbf{k} - \underline{k}_{33}; f \det_{\mathfrak{n}_2^+}^{-k_3}; z).
\end{aligned}$$

Then this is meromorphically continued for all  $\lambda \in \mathbb{C}$ , and if  $\lambda = d+1-a$ ,  $a = 1, 2, \dots, k_3$ , then the right hand side of

$$\begin{aligned} \det_{\mathfrak{n}^+}(z)^{-a} F^\downarrow(d+1-a, \mathbf{k}; f; z) &= \frac{1}{(d_2+1-a+\mathbf{k})_{\underline{k}_{33}, d_2}} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k_3} \det_{\mathfrak{n}^+}(z)^{2k_3-a} \\ &\quad \times F^\downarrow \left( d+1-a+2k_3, \mathbf{k} - \underline{k}_{33}; f \det_{\mathfrak{n}_2^+}^{-k_3}; z \right) \end{aligned}$$

becomes a polynomial. Hence  $F^\downarrow(d+1-a, \mathbf{k}; f; z)$  is divisible by  $\det_{\mathfrak{n}^+}(z)^a$ . Also, by  $\mathcal{B}_{\frac{a}{r}-a} \det_{\mathfrak{n}^+}(z)^a = \det_{\mathfrak{n}^+}(z)^a \mathcal{B}_{\frac{a}{r}+a}$  (see the proof of [9, Proposition XV.2.4]), we have

$$\begin{aligned} &(\mathcal{B}_{d+1+a})_1 \det_{\mathfrak{n}^+}(z)^{-a} F^\downarrow(d+1-a, \mathbf{k}; f; z) \\ &= \det_{\mathfrak{n}^+}(z)^{-a} (\mathcal{B}_{d+1-a})_1 F^\downarrow(d+1-a, \mathbf{k}; f; z) = 0, \end{aligned}$$

and hence

$$\begin{aligned} &\left( f \det_{\mathfrak{n}_2^+}^{-a} \mapsto \det_{\mathfrak{n}^+}(z)^{-a} F^\downarrow(d+1-a, \mathbf{k}; f; z) \right) \\ &\in \text{Hom}_{K_1^{\mathbb{C}}}(\mathcal{P}_{\mathbf{k}-\underline{a}_3}(\mathfrak{p}_2^+), \text{Sol}_{\mathcal{P}(\mathfrak{p}^+)}((\mathcal{B}_{d+1+a})_1)) \\ &\simeq \mathbb{C} \left( f \det_{\mathfrak{n}_2^+}^{-a} \mapsto F^\downarrow \left( d+1+a, \mathbf{k} - \underline{a}_3; f \det_{\mathfrak{n}_2^+}^{-a}; z \right) \right) \end{aligned}$$

holds. Then comparing the values at  $z_1 = 0$ , for  $a = 1, 2, \dots, k_3$  we get

$$F^\downarrow(d+1-a, \mathbf{k}; f; z) = \det_{\mathfrak{n}^+}(z)^a F^\downarrow \left( d+1+a, \mathbf{k} - \underline{a}_3; f \det_{\mathfrak{n}_2^+}^{-a}; z \right)$$

(see [35, Theorem 6.6] for more general case). We put  $(k'_1, k'_2) := (k_1 - k_3, k_2 - k_3) \in \mathbb{Z}_{++}^2$ , let  $f'(x_2) := \det_{\mathfrak{n}_2^+}(x_2)^{-k_3} f(x_2) \in \mathcal{P}_{(k'_1, k'_2, 0)}(\mathfrak{p}_2^+)$ , and rewrite the above as

$$\begin{aligned} &F^\downarrow \left( d+1-a, (k'_1, k'_2, 0) + \underline{k}_{33}; f' \det_{\mathfrak{n}_2^+}^{k_3}; z \right) \\ &= \det_{\mathfrak{n}^+}(z)^a F^\downarrow \left( d+1+a, (k'_1, k'_2, 0) + \underline{k}_3 - \underline{a}_3; f' \det_{\mathfrak{n}_2^+}^{k_3-a}; z \right) \quad (3.6) \\ &\quad ((a, k_3) \in (\mathbb{Z}_{\geq 0})^2, a \leq k_3). \end{aligned}$$

Now we want to prove this for general  $(a, k_3) \in \mathbb{C}^2$ . We recall that the left hand side of (3.6) is given by

$$\begin{aligned} &F^\downarrow \left( d+1-a, (k'_1, k'_2, 0) + \underline{k}_{33}; f' \det_{\mathfrak{n}_2^+}^{k_3}; z \right) \\ &= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k'_1 - k'_2 \\ 0 \leq l_3 \leq k'_2}} \frac{(-k_3 - (0, k'_2, k'_1))_{(l_1+l_2, l_1+l_3, l_2+l_3), d_2}}{(a - 2k_3 - \frac{d_2}{2} - (k'_2, k'_1, k'_1 + k'_2))_{(l_1, l_2, l_3), d_2}} \det_{\mathfrak{n}_2^+}(z_2)^{k_3} F_{(k'_1, k'_2, 0), 1}^\downarrow[f'](z_1, z_2). \end{aligned} \quad (3.7)$$

Similarly, the right hand side is computed as

$$\begin{aligned}
& \det_{\mathfrak{n}^+}(z)^a F^\downarrow \left( d+1+a, (k'_1, k'_2, 0) + \underline{k_3 - a_3}; f' \det_{\mathfrak{n}_2^+}^{k_3-a}; z \right) \\
&= \sum_{\substack{0 \leq l'_1 \\ 0 \leq l'_2 \leq k'_1 - k'_2 \\ 0 \leq l'_3 \leq k'_2}} \frac{(a - k_3 - (0, k'_2, k'_1))_{(l'_1+l'_2, l'_1+l'_3, l'_2+l'_3), d_2}}{(a - 2k_3 - \frac{d_2}{2} - (k'_2, k'_1, k'_1 + k'_2))_{(l'_1, l'_2, l'_3), d_2}} \det_{\mathfrak{n}_2^+}(z_2)^{k_3-a} F^\downarrow_{(k'_1, k'_2, 0), \mathcal{I}'}[f'](z_1, z_2) \\
&\quad \times \det_{\mathfrak{n}_2^+}(z_2)^a \left( 1 + \frac{((z_1)^\# | z_2)}{\det_{\mathfrak{n}_2^+}(z_2)} \right)^a \\
&= \sum_{\substack{0 \leq l'_1 \\ 0 \leq l'_2 \leq k'_1 - k'_2 \\ 0 \leq l'_3 \leq k'_2}} \frac{(a - k_3 - (0, k'_2, k'_1))_{(l'_1+l'_2, l'_1+l'_3, l'_2+l'_3), d_2}}{(a - 2k_3 - \frac{d_2}{2} - (k'_2, k'_1, k'_1 + k'_2))_{(l'_1, l'_2, l'_3), d_2}} \det_{\mathfrak{n}_2^+}(z_2)^{k_3} F^\downarrow_{(k'_1, k'_2, 0), \mathcal{I}'}[f'](z_1, z_2) \\
&\quad \times \sum_{m=0}^{\infty} \frac{(-a)_m}{m!} \left( -\frac{((z_1)^\# | z_2)}{\det_{\mathfrak{n}_2^+}(z_2)} \right)^m.
\end{aligned}$$

Then we have

$$\begin{aligned}
& \left( f' \mapsto \frac{1}{m!} F^\downarrow_{(k'_1, k'_2, 0), \mathcal{I}'}[f'](z_1, z_2) \left( -\frac{((z_1)^\# | z_2)}{\det_{\mathfrak{n}_2^+}(z_2)} \right)^m \right) \\
&\in \text{Hom}_{K_1^{\mathbb{C}}} \left( \mathcal{P}_{(k'_1, k'_2, 0)}(\mathfrak{p}_2^+), \mathcal{P}_{2|\mathcal{I}'|+2m}(\mathfrak{p}_1^+) \otimes \mathcal{P}_{(k'_1-l'_2-l'_3, k'_2-l'_1-l'_3, -l'_2-l'_3)}(\mathfrak{p}_2^+) \otimes \mathcal{P}_{(0, -m, -m)}(\mathfrak{p}_2^+) \right) \\
&\simeq \bigoplus_{\substack{\mathcal{I}'' \in (\mathbb{Z}_{\geq 0})^3, \\ |\mathcal{I}''|=m}} \text{Hom}_{K_1^{\mathbb{C}}} \left( \mathcal{P}_{(k'_1, k'_2, 0)}(\mathfrak{p}_2^+), \mathcal{P}_{2|\mathcal{I}'|+2m}(\mathfrak{p}_1^+) \otimes \mathcal{P}_{(k'_1-l'_2-l'_3-l''_2-l''_3, k'_2-l'_1-l'_3-l''_1-l''_3, -l'_2-l'_3-l''_2-l''_3)}(\mathfrak{p}_2^+) \right) \\
&= \bigoplus_{\substack{\mathcal{I} \in (\mathbb{Z}_{\geq 0})^3, |\mathcal{I}|=|\mathcal{I}'|+m \\ l_j \geq l'_j}} \text{Hom}_{K_1^{\mathbb{C}}} \left( \mathcal{P}_{(k'_1, k'_2, 0)}(\mathfrak{p}_2^+), \mathcal{P}_{2|\mathcal{I}|}(\mathfrak{p}_1^+) \otimes \mathcal{P}_{(k'_1-l_2-l_3, k'_2-l_1-l_3, -l_2-l_3)}(\mathfrak{p}_2^+) \right),
\end{aligned}$$

and by the Pieri rule,

$$\begin{aligned}
& \text{Hom}_{K_1^{\mathbb{C}}} \left( \mathcal{P}_{(k'_1, k'_2, 0)}(\mathfrak{p}_2^+), \mathcal{P}_{2|\mathcal{I}|}(\mathfrak{p}_1^+) \otimes \mathcal{P}_{(k'_1-l_2-l_3, k'_2-l_1-l_3, -l_2-l_3)}(\mathfrak{p}_2^+) \right) \\
&\simeq \text{Hom}_{K_1^{\mathbb{C}}} \left( \mathcal{P}_{(k'_1, k'_2, 0)}(\mathfrak{p}_2^+) \otimes \mathcal{P}_{2|\mathcal{I}|}(\mathfrak{p}_1^+)^{\vee}, \mathcal{P}_{(k'_1-l_2-l_3, k'_2-l_1-l_3, -l_2-l_3)}(\mathfrak{p}_2^+) \right) \neq \{0\}
\end{aligned}$$

holds only if  $0 \leq l_2 \leq k'_1 - k'_2$ ,  $0 \leq l_3 \leq k'_2$ . Therefore, for  $|\mathcal{I}| = |\mathcal{I}'| + m$  we set

$$\begin{aligned}
& F_{(k'_1, k'_2, 0), \mathcal{I}, \mathcal{I}'}[f'](z_1, z_2) \\
&:= \text{Proj}_{(k'_1-l_2-l_3, k'_2-l_1-l_3, -l_1-l_2), z_2}^{\mathfrak{p}_2^+} \left( \frac{1}{m!} F^\downarrow_{(k'_1, k'_2, 0), \mathcal{I}'}[f'](z_1, z_2) \left( -\frac{((z_1)^\# | z_2)}{\det_{\mathfrak{n}_2^+}(z_2)} \right)^m \right) \\
&\in \mathcal{P}_{2|\mathcal{I}|}(\mathfrak{p}_1^+) \otimes \mathcal{P}_{(k'_1-l_2-l_3, k'_2-l_1-l_3, -l_1-l_2)}(\mathfrak{p}_2^+),
\end{aligned}$$

so that

$$\frac{1}{m!} F^\downarrow_{(k'_1, k'_2, 0), \mathcal{I}'}[f'](z_1, z_2) \left( -\frac{((z_1)^\# | z_2)}{\det_{\mathfrak{n}_2^+}(z_2)} \right)^m = \sum_{\substack{|\mathcal{I}|=|\mathcal{I}'|+m \\ l'_1 \leq l_1 \\ l'_2 \leq l_2 \leq k'_1 - k'_2 \\ l'_3 \leq l_3 \leq k'_2}} F_{(k'_1, k'_2, 0), \mathcal{I}, \mathcal{I}'}[f'](z_1, z_2).$$

Then the right hand side of (3.6) becomes

$$\begin{aligned}
& \det_{\mathfrak{n}^+}(z)^a F^\downarrow\left(d+1+a, (k'_1, k'_2, 0) + \underline{k}_3 - a_3; f' \det_{\mathfrak{n}_2^+}^{k_3-a}; z\right) \\
&= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k'_1 - k'_2 \\ 0 \leq l_3 \leq k'_2}} \sum_{\substack{0 \leq l'_1 \leq l_1 \\ 0 \leq l'_2 \leq l_2 \\ 0 \leq l'_3 \leq l_3}} \frac{(a - k_3 - (0, k'_2, k'_1))_{(l'_1+l'_2, l'_1+l'_3, l'_2+l'_3), d_2} (-a)_{|\mathbb{1}-|\mathbb{1}'|}}{(a - 2k_3 - \frac{d_2}{2} - (k'_2, k'_1, k'_1 + k'_2))_{(l'_1, l'_2, l'_3), d_2}} \\
& \quad \times \det_{\mathfrak{n}_2^+}(z_2)^{k_3} F_{(k'_1, k'_2, 0), \mathbb{1}, \mathbb{1}'}[f'](z_1, z_2). \tag{3.8}
\end{aligned}$$

If  $a, k_3 \in \mathbb{Z}_{\geq 0}$ ,  $a \leq k_3$ , then in (3.7) and (3.8) only  $l_1 + l_2 \leq k_3$  terms remain, and all denominators in the remaining terms are non-zero. Hence for  $l_1 + l_2 \leq k_3$ , by comparing both formulas we get

$$\begin{aligned}
& \frac{(-k_3 - (0, k'_2, k'_1))_{(l_1+l_2, l_1+l_3, l_2+l_3), d_2}}{(a - 2k_3 - \frac{d_2}{2} - (k'_2, k'_1, k'_1 + k'_2))_{(l_1, l_2, l_3), d_2}} F_{(k'_1, k'_2, 0), \mathbb{1}}^\downarrow[f'](z_1, z_2) \\
&= \sum_{0 \leq l'_j \leq l_j} \frac{(a - k_3 - (0, k'_2, k'_1))_{(l'_1+l'_2, l'_1+l'_3, l'_2+l'_3), d_2} (-a)_{|\mathbb{1}-|\mathbb{1}'|}}{(a - 2k_3 - \frac{d_2}{2} - (k'_2, k'_1, k'_1 + k'_2))_{(l'_1, l'_2, l'_3), d_2}} F_{(k'_1, k'_2, 0), \mathbb{1}, \mathbb{1}'}[f'](z_1, z_2).
\end{aligned}$$

Then since  $\{(a, k_3) \in (\mathbb{Z}_{\geq 0})^2 \mid k_3 \geq l_1 + l_2, k_3 \geq a\} \subset \mathbb{C}^2$  is Zariski dense, this holds for all  $(a, k_3) \in \mathbb{C}^2$  without the assumption  $l_1 + l_2 \leq k_3$ , and hence (3.6) holds for all  $(a, k_3) \in \mathbb{C}^2$ . This completes the proof of Theorem 3.5 (3).  $\square$

**Example 3.8.** Let  $\mathbf{k} = (k, k, k)$  with  $k \in \mathbb{C}$  and  $f(x_2) = \det_{\mathfrak{n}_2^+}(x_2)^k$ . Then by Proposition 3.2 (2), for  $x = (x_1, x_2) = (\xi, X) \in \mathfrak{p}^+$  we have

$$\begin{aligned}
F^\downarrow\left(\lambda, \underline{k}_3; \det_{\mathfrak{n}_2^+}^k; x\right) &= \sum_{l=0}^{\infty} \frac{(-k)_{(l, l, 0), d_2}}{(-\lambda - 2k + \frac{3}{2}d_2 + 1)_{(l, 0, 0), d_2}} F_{(k, k, k), (l, 0, 0)}^\downarrow[\det_{\mathfrak{n}_2^+}^k](x_1, x_2) \\
&= \sum_{l=0}^{\infty} \frac{(-k)_l (-k - \frac{d_2}{2})_l}{(-\lambda - 2k + \frac{3}{2}d_2 + 1)_l l!} \left(-\frac{((x_1)^\# | x_2)}{\det_{\mathfrak{n}_2^+}(x_2)}\right)^l \det_{\mathfrak{n}_2^+}(x_2)^k \\
&= {}_2F_1\left(\begin{matrix} -k, -k - \frac{d_2}{2} \\ -\lambda - 2k + \frac{3}{2}d_2 + 1 \end{matrix}; \frac{\xi X^t \hat{\xi}}{\det(X)}\right) \det(X)^k.
\end{aligned}$$

Also, for  $k \in \mathbb{Z}_{\geq 0}$  we have

$$C^{d, d_2}(\lambda, \underline{k}_3) = \frac{(\lambda - \frac{d_2}{2} + (2k, 2k, k))_{(0, 0, k), d_2}}{(\lambda)_{(2k, k, k), d}} = \frac{(\lambda + k - \frac{3}{2}d_2)_k}{(\lambda)_{(2k, k, k), d}}.$$

Combining these we get

$$\begin{aligned}
& \left\langle \det_{\mathfrak{n}_2^+}(x_2)^k, e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\
&= \frac{(\lambda + k - \frac{3}{2}d_2)_k}{(\lambda)_{(2k, k, k), d}} {}_2F_1\left(\begin{matrix} -k, -k - \frac{d_2}{2} \\ -\lambda - 2k + \frac{3}{2}d_2 + 1 \end{matrix}; -\frac{((z_1)^\# | z_2)}{\det_{\mathfrak{n}_2^+}(z_2)}\right) \det_{\mathfrak{n}_2^+}(z_2)^k.
\end{aligned}$$

In addition, Theorem 3.5 (3) is equivalent to

$$\begin{aligned}
& {}_2F_1\left(\begin{matrix} -k, -k - \frac{1}{4}d \\ -\lambda - 2k + \frac{3}{4}d + 1 \end{matrix}; -\frac{((x_1)^\# | x_2)}{\det_{\mathfrak{n}_2^+}(x_2)}\right) \\
&= \left(1 + \frac{((x_1)^\# | x_2)}{\det_{\mathfrak{n}_2^+}(x_2)}\right)^{-\lambda+d+1} {}_2F_1\left(\begin{matrix} -\lambda - k + d + 1, -\lambda - k + \frac{3}{4}d + 1 \\ -\lambda - 2k + \frac{3}{4}d + 1 \end{matrix}; -\frac{((x_1)^\# | x_2)}{\det_{\mathfrak{n}_2^+}(x_2)}\right).
\end{aligned}$$

**Example 3.9.** Let  $\mathbf{k} = (k_1, k_2, 0) \in \mathbb{Z}_{++}^3$ , let  $e' \in \mathfrak{n}_2^+$  be a primitive idempotent, and let  $\mathfrak{p}^+(e')_0 =: \mathfrak{p}^{+\prime}$ ,  $\mathfrak{p}_2^+(e')_0 =: \mathfrak{p}_2^{+\prime}$  be as in (2.2). We take  $f(x_2) = f(x_2'') \in \mathcal{P}_{(k_1, k_2)}(\mathfrak{p}_2^{+\prime})$ . Then by Proposition 3.2 (3), for  $\xi = (\xi, X) \in \mathfrak{p}^+$  we have

$$\begin{aligned}
& F^\downarrow(\lambda, (k_1, k_2, 0); f; x) \\
&= \sum_{l=0}^{k_2} \frac{((0, -k_2, -k_1))_{(0, l, l), d_2}}{(-\lambda + \frac{3}{2}d_2 + 1 - (k_2, k_1, k_1 + k_2))_{(0, 0, l), d_2}} F_{(k_1, k_2, 0), (0, 0, l)}^\downarrow[f](x_1, x_2) \\
&= \sum_{l=0}^{k_2} \frac{(-k_2 - \frac{d_2}{2})_l (-k_1 - d_2)_l}{(-\lambda - k_1 - k_2 + \frac{d_2}{2} + 1)_l} \frac{(-k_2)_l (-k_1 - \frac{d_2}{2})_l}{(-k_2 - \frac{d_2}{2})_l (-k_1 - d_2)_l l!} \left( -\frac{\det_{\mathfrak{n}^{+\prime}}(x_1'')}{\det_{\mathfrak{n}^{+\prime}}(x_2'')} \right)^l f(x_2'') \\
&= \sum_{l=0}^{k_2} \frac{(-k_2)_l (-k_1 - \frac{d_2}{2})_l}{(-\lambda - k_1 - k_2 + \frac{d_2}{2} + 1)_l l!} \left( -\frac{\det_{\mathfrak{n}^{+\prime}}(x_1'')}{\det_{\mathfrak{n}^{+\prime}}(x_2'')} \right)^l f(x_2'') \\
&= {}_2F_1 \left( -k_2, -k_1 - \frac{d_2}{2}; \frac{(t\hat{\xi}\xi|e')}{\det_{\mathfrak{n}_2^{+\prime}}(X'')} \right)^l f(X'').
\end{aligned}$$

We also have

$$C^{d, d_2}(\lambda, (k_1, k_2, 0)) = \frac{(\lambda - \frac{d_2}{2} + (k_1, k_1, k_2))_{(k_2, 0, 0), d_2}}{(\lambda)_{(k_1 + k_2, k_2, 0), d}} = \frac{(\lambda + k_1 - \frac{d_2}{2})_{k_2}}{(\lambda)_{(k_1 + k_2, k_2), d}}.$$

Combining these we get

$$\begin{aligned}
& \left\langle f(x_2''), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\
&= \frac{(\lambda + k_1 - \frac{d_2}{2})_{k_2}}{(\lambda)_{(k_1 + k_2, k_2), d}} {}_2F_1 \left( -k_2, -k_1 - \frac{d_2}{2}; -\frac{\det_{\mathfrak{n}^{+\prime}}(z_1'')}{\det_{\mathfrak{n}^{+\prime}}(z_2'')} \right)^l f(z_2'').
\end{aligned}$$

**Example 3.10.** Let  $\mathbf{k} = (k_1, k_2, k_2)$  with  $k_1 - k_2 \in \mathbb{Z}_{\geq 0}$ ,  $k_2 \in \mathbb{C}$ , let  $w_2 \in \mathfrak{p}_2^+$  be of rank 1, and let  $f(x_2) := (x_2|w_2)_{\mathfrak{n}_2^+}^{k_1 - k_2} \det_{\mathfrak{n}_2^+}(x_2)^{k_2}$ . Then we have

$$\begin{aligned}
& F^\downarrow(\lambda, (k_1, k_2, k_2); f; x) \\
&= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k_1 - k_2}} \frac{((-k_2, -k_2, -k_1))_{(l_1 + l_2, l_1, l_2), d_2}}{(-\lambda + \frac{3}{2}d_2 + 1 - (2k_2, k_1 + k_2, k_1 + k_2))_{(l_1, l_2, 0), d_2}} F_{(k_1, k_2, k_2), (l_1, l_2, 0)}^\downarrow[f](x_1, x_2) \\
&= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_2 \leq k_1 - k_2}} \frac{(-k_2)_{l_1 + l_2} (-k_2 - \frac{d_2}{2})_{l_1} (-k_1 - d_2)_{l_2}}{(-\lambda - 2k_2 + \frac{3}{2}d_2 + 1)_{l_1} (-\lambda - k_1 - k_2 + d_2 + 1)_{l_2}} \\
&\quad \times F_{(k_1 - k_2, 0, 0), (l_1, l_2, 0)}^\downarrow [(\cdot|w_2)_{\mathfrak{n}_2^+}^{k_1 - k_2}](x_1, x_2) \det_{\mathfrak{n}_2^+}(x_2)^{k_2},
\end{aligned}$$

and  $F_{(k_1 - k_2, 0, 0), (l_1, l_2, 0)}^\downarrow [(\cdot|w_2)_{\mathfrak{n}_2^+}^{k_1 - k_2}](x_1, x_2)$  is given in Proposition 3.2 (4). Also, when  $k_2 \in \mathbb{Z}_{\geq 0}$  we have

$$\begin{aligned}
C^{d, d_2}(\lambda, (k_1, k_2, k_2)) &= \frac{(\lambda - \frac{d_2}{2} + (k_1 + k_2, \max\{k_1, 2k_2\}, k_2))_{(0, \min\{k_2, k_1 - k_2\}, k_2), d_2}}{(\lambda)_{(k_1 + k_2, \min\{k_1, 2k_2\}, k_2), d}} \\
&= \frac{(\lambda + \max\{k_1, 2k_2\} - d_2)_{\min\{k_2, k_1 - k_2\}} (\lambda + k_2 - \frac{3}{2}d_2)_{k_2}}{(\lambda)_{(k_1 + k_2, \min\{k_1, 2k_2\}, k_2), d}},
\end{aligned}$$

and  $\langle (x_2|w_2)_{\mathfrak{n}_2^+}^{k_1-k_2} \det_{\mathfrak{n}_2^+}(x_2)^{k_2}, e^{(x|\bar{z})_{\mathfrak{p}^+}} \rangle_{\lambda, x}$  is given by the product of the above two formulas.

**Example 3.11.** Let  $\mathbf{k} = (k_2, k_2, k_3)$  with  $k_2 - k_3 \in \mathbb{Z}_{\geq 0}$ ,  $k_2 \in \mathbb{C}$ , let  $w_2 \in \mathfrak{p}_2^+$  be of rank 1, and let  $f(x_2) := (x_2^{-1}|w_2)_{\mathfrak{n}_2^+}^{k_2-k_3} \det_{\mathfrak{n}_2^+}(x_2)^{k_2}$ . Then we have

$$\begin{aligned} & F^\downarrow(\lambda, (k_2, k_2, k_3); f; x) \\ &= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_3 \leq k_2 - k_3}} \frac{((-k_3, -k_2, -k_2))_{(l_1, l_1 + l_3, l_3), d_2}}{(-\lambda + \frac{3}{2}d_2 + 1 - (k_2 + k_3, k_2 + k_3, 2k_2))_{(l_1, 0, l_3), d_2}} F^\downarrow_{(k_2, k_2, k_3), (l_1, 0, l_3)}[f](x_1, x_2) \\ &= \sum_{\substack{0 \leq l_1 \\ 0 \leq l_3 \leq k_2 - k_3}} \frac{(-k_3)_{l_1} (-k_2 - \frac{d_2}{2})_{l_1 + l_3} (-k_2 - d_2)_{l_3}}{(-\lambda - k_2 - k_3 + \frac{3}{2}d_2 + 1)_{l_1} (-\lambda - 2k_2 + \frac{d_2}{2} + 1)_{l_3}} \\ & \quad \times F^\downarrow_{(0, 0, k_3 - k_2), (l_1, 0, l_3)} [((\cdot)^{-1}|w_2)_{\mathfrak{n}_2^+}^{k_2 - k_3}](x_1, x_2) \det_{\mathfrak{n}_2^+}(x_2)^{k_2}, \end{aligned}$$

and  $F^\downarrow_{(0, 0, k_3 - k_2), (l_1, 0, l_3)} [((\cdot)^{-1}|w_2)_{\mathfrak{n}_2^+}^{k_2 - k_3}](x_1, x_2)$  is given in Proposition 3.2 (5). Also, when  $k_3 \in \mathbb{Z}_{\geq 0}$  we have

$$\begin{aligned} C^{d, d_2}(\lambda, (k_2, k_2, k_3)) &= \frac{(\lambda - \frac{d_2}{2} + (k_2 + k_3, k_2 + k_3, k_2))_{(k_2 - k_3, 0, k_3), d_2}}{(\lambda)_{(2k_2, k_2, k_3), d}} \\ &= \frac{(\lambda + k_2 + k_3 - \frac{d_2}{2})_{k_2 - k_3} (\lambda + k_2 - \frac{3}{2}d_2)_{k_3}}{(\lambda)_{(2k_2, k_2, k_3), d}}, \end{aligned}$$

and  $\langle (x_2^{-1}|w_2)_{\mathfrak{n}_2^+}^{k_2 - k_3} \det_{\mathfrak{n}_2^+}(x_2)^{k_2}, e^{(x|\bar{z})_{\mathfrak{p}^+}} \rangle_{\lambda, x}$  is given by the product of the above two formulas.

### 3.4 Results on restriction of $\mathcal{H}_\lambda(D)$ to subgroups

In this subsection we consider the decomposition of  $\mathcal{H}_\lambda(D)$  under  $\tilde{G}_1$ . Let  $V_{\mathbf{k}}$  be an irreducible  $K_1$ -module isomorphic to  $\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ . Then  $\mathcal{H}_\lambda(D)$  is decomposed under  $\tilde{G}_1$  as

$$\mathcal{H}_\lambda(D)|_{\tilde{G}_1} \simeq \sum_{\mathbf{k} \in \mathbb{Z}_{++}^3}^{\oplus} \mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{\mathbf{k}}).$$

For each case,  $\mathcal{H}_\lambda(D)$  has the minimal  $\tilde{K}$ -type

$$\chi^{-\lambda} \simeq \begin{cases} V_{\frac{\lambda}{2_3}}^{(3)\vee} \boxtimes V_{\frac{\lambda}{2_3}}^{(3)} \simeq V_{\underline{\Delta}_3}^{(3)\vee} \boxtimes V_{\underline{0}_3}^{(3)} \simeq V_{\underline{0}_3}^{(3)\vee} \boxtimes V_{\underline{\Delta}_3}^{(3)} & (G = SU(3, 3)), \\ V_{\frac{\lambda}{2_6}}^{(6)\vee} & (G = SO^*(12)), \\ \chi^{-\lambda} & (G = E_{7(-25)}), \end{cases}$$

and  $\mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{\mathbf{k}})$  has the minimal  $\tilde{K}_1$ -type

$$\chi_1^{-\varepsilon_1 \lambda} \otimes V_{\mathbf{k}} \simeq \begin{cases} V_{\underline{\Delta}_3 + (2k_1, 2k_2, 2k_3)}^{(3)\vee} & (G_1 = SO^*(6)), \\ V_{\frac{\lambda}{2_3} + (k_1, k_2, k_3)}^{(3)\vee} \boxtimes V_{\frac{\lambda}{2_3} + (k_1, k_2, k_3)}^{(3)\vee} & (G_1 = SO^*(6) \times SO^*(6)), \\ V_{\frac{3}{4}\lambda + \frac{1}{2}|\mathbf{k}|_2}^{(2)\vee} \boxtimes V_{\frac{1}{4}\lambda + \frac{1}{2}|\mathbf{k}|_6}^{(6)} - (k_3, k_3, k_2, k_2, k_1, k_1) \\ \simeq V_{\underline{0}_2}^{(2)\vee} \boxtimes V_{\underline{\Delta}_6 + (k_1 + k_2, k_1 + k_2, k_1 + k_3, k_1 + k_3, k_2 + k_3, k_2 + k_3)}^{(6)} & (G_1 = SU(2, 6)). \end{cases}$$

To describe the intertwining operators, for  $\lambda \in \mathbb{C}$ ,  $\mathbf{k} \in \mathbb{Z}_{++}^3 + \mathbb{C}\mathbf{1}_3$ ,  $f(x_2) \in \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ , we define a function  $F^\uparrow(\lambda, \mathbf{k}; f; y_1, x_2)$  on  $\mathfrak{p}_1^- \oplus \mathfrak{p}_2^+$  by

$$\begin{aligned}
& F^\uparrow(\lambda, \mathbf{k}; f; y_1, x_2) \\
& := \sum_{\substack{\mathbf{l} \in \mathbb{Z}^3 \\ 0 \leq l_1 \leq k_1 - k_2 \\ 0 \leq l_2 \leq k_2 - k_3 \\ 0 \leq l_3}} \frac{1}{\left(\lambda - \frac{d_2 - 2}{2} + (k_1 + k_2, k_1 + k_3, k_2 + k_3)\right)_{(l_3, l_2, l_1), d_2}} F_{\mathbf{k}, \mathbf{l}}^\uparrow[f](y_1, x_2) \\
& = \sum_{\substack{\mathbf{l} \in \mathbb{Z}^3 \\ 0 \leq l_1 \leq k_1 - k_2 \\ 0 \leq l_2 \leq k_2 - k_3 \\ 0 \leq l_3}} \frac{F_{\mathbf{k}, \mathbf{l}}^\uparrow[f](y_1, x_2)}{\left(\lambda + k_2 + k_3 - \frac{3}{4}d + 1\right)_{l_1} \left(\lambda + k_1 + k_3 - \frac{1}{2}d + 1\right)_{l_2} \left(\lambda + k_1 + k_2 - \frac{1}{4}d + 1\right)_{l_3}}.
\end{aligned} \tag{3.9}$$

**Theorem 3.12.** *Let  $\operatorname{Re} \lambda > 1 + 2d$ ,  $\mathbf{k} \in \mathbb{Z}_{++}^3$ .*

(1) ([33, Theorems 5.7 (5), 5.12]). *Let  $K_{\mathbf{k}}(x_2) \in (\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+) \otimes \operatorname{Hom}(V_{\mathbf{k}}, \mathbb{C}))^{K_1}$ . Then the linear map*

$$\begin{aligned}
& \mathcal{F}_{\lambda, \mathbf{k}}^\uparrow: \mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{\mathbf{k}})_{\tilde{K}_1} \longrightarrow \mathcal{H}_\lambda(D)_{\tilde{K}}|_{(\mathfrak{g}_1, \tilde{K}_1)}, \\
& (\mathcal{F}_{\lambda, \mathbf{k}}^\uparrow f)(x) := F^\uparrow\left(\lambda, \mathbf{k}; K_{\mathbf{k}}; \frac{1}{\varepsilon_1} \frac{\partial}{\partial x_1}, x_2\right) f(x_1)

*intertwines the  $\tilde{G}_1$ -action, where  $F^\downarrow$  is as in (3.2).*

(3) ([35, Corollary 6.7]). *Suppose  $c_{\mathbf{k}}, c_{\mathbf{k}}^\vee \in \mathbb{R}_{>0}$  satisfy, for  $v \in V_{\mathbf{k}}$ ,*

$$\|K_{\mathbf{k}}(x_2)v\|_{F, x_2}^2 = c_{\mathbf{k}}|v|_{V_{\mathbf{k}}}^2, \quad \|(v, K_{\mathbf{k}}^\vee(\overline{x_2}))\|_{F, x_2}^2 = c_{\mathbf{k}}^\vee|v|_{V_{\mathbf{k}}}^2.$$

*Then the operator norms of  $\mathcal{F}_{\lambda, \mathbf{k}}^\uparrow, \mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  are given by*

$$c_{\mathbf{k}}^{-1} \|\mathcal{F}_{\lambda, \mathbf{k}}^\uparrow\|_{\operatorname{op}}^2 = c_{\mathbf{k}}^\vee \|\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow\|_{\operatorname{op}}^{-2} = C^{d, d_2}(\lambda, \mathbf{k}),$$

*where  $C^{d, d_2}(\lambda, \mathbf{k})$  is as in (3.3).*

**Remark 3.13.** *In [33, Theorem 5.12], the subscripts  $(m_3, m_2, m_1), 2$  are wrong, and  $(m_3, m_2, m_1), 1$  (in (1)),  $(m_3, m_2, m_1), 4$  (in (2)) are correct.*

The differential operators  $\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow$  are meromorphically continued for all  $\lambda \in \mathbb{C}$ , and give  $\tilde{G}_1$ -intertwining operators

$$\mathcal{F}_{\lambda, \mathbf{k}}^\downarrow: \mathcal{O}_\lambda(D)|_{\tilde{G}_1} \longrightarrow \mathcal{O}_{\varepsilon_1 \lambda}(D_1, V_{\mathbf{k}})$$

for all  $\lambda \in \mathbb{C}$  except for poles. Then by Theorem 3.5 (3), for special  $\lambda$  the following holds.

**Theorem 3.14** ([35, Corollary 6.8 (4)]). *Let  $\mathbf{k} \in \mathbb{Z}_{++}^3$ . For  $a = 1, 2, \dots, k_3$ , we fix a  $[K_1, K_1]$ -isomorphism  $V_{\mathbf{k}} \simeq V_{\mathbf{k}-\underline{a}_3}$ , and assume that*

$$K_{\mathbf{k}}^{\vee}(y_2) = \det_{\mathfrak{n}^-}(y_2)^a K_{\mathbf{k}-\underline{a}_3}^{\vee}(y_2) \in (\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^-) \otimes V_{\mathbf{k}})^{K_1}$$

*holds. Then we have*

$$\begin{aligned} \mathcal{F}_{d+1-a, \mathbf{k}}^{\downarrow} &= \mathcal{F}_{d+1+a, \mathbf{k}-\underline{a}_3}^{\downarrow} \circ \det_{\mathfrak{n}^-} \left( \frac{\partial}{\partial x} \right)^a : \\ \mathcal{O}_{d+1-a}(D)|_{\tilde{G}_1} &\longrightarrow \mathcal{O}_{\varepsilon_1(d+1-a)}(D_1, V_{\mathbf{k}}) \simeq \mathcal{O}_{\varepsilon_1(d+1+a)}(D_1, V_{\mathbf{k}-\underline{a}_3}). \end{aligned}$$

For  $\lambda > d$  we have

$$\mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{\mathbf{k}})|_{\tilde{K}_1} \simeq d\tau_{\lambda}(\mathcal{U}(\mathfrak{g}_1))\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+) \subset \mathcal{H}_{\lambda}(D)|_{\tilde{K}},$$

but this does not hold for smaller  $\lambda$  in general. For such  $\lambda$ , by Theorem 3.5 (2) the following holds. For  $i = 1, 2, 3$ ,  $\lambda \in \frac{d}{2}(i-1) - \mathbb{Z}_{\geq 0}$ , let  $M_i^{\mathfrak{g}}(\lambda) \subset \mathcal{O}_{\lambda}(D)|_{\tilde{K}}$  be the  $(\mathfrak{g}, \tilde{K})$ -submodule given in (2.18).

**Theorem 3.15.** *Let  $\mathbf{k} \in \mathbb{Z}_{++}^3$ . For  $i = 1, 2, 3$ ,*

$$d\tau_{\lambda}(\mathcal{U}(\mathfrak{g}_1))\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+) \subset M_i^{\mathfrak{g}}(\lambda)$$

*holds if and only if*

$$\lambda \in \begin{cases} -(k_1 + k_2) - \mathbb{Z}_{\geq 0} & (i = 1), \\ \frac{d}{2} - \min\{k_1, k_2 + k_3\} - \mathbb{Z}_{\geq 0} & (i = 2), \\ d - k_3 - \mathbb{Z}_{\geq 0} & (i = 3). \end{cases}$$

Here, “if” follows from the holomorphy in Theorem 3.5 (2) and this is already given in [35, Corollary 6.8 (1)]. On the other hand, “only if” follows from the non-zerosness in Theorem 3.5 (2) and this is new except for  $k_1 = k_2 = k_3$  or  $k_3 = 0$ .

## 4 General rank case

In this section we treat  $\mathfrak{p}^{\pm} = (\mathfrak{p}^{\pm})^{\sigma} \oplus (\mathfrak{p}^{\pm})^{-\sigma} = \mathfrak{p}_1^{\pm} \oplus \mathfrak{p}_2^{\pm}$  such that  $\mathfrak{p}^{\pm}, \mathfrak{p}_2^{\pm}$  are both simple, classical, of tube type, and  $\text{rank } \mathfrak{p}^{\pm} = \text{rank } \mathfrak{p}_2^{\pm}$ , that is, we treat

$$(\mathfrak{p}^{\pm}, \mathfrak{p}_1^{\pm}, \mathfrak{p}_2^{\pm}) = \begin{cases} (\mathbb{C}^n, \mathbb{C}^{n'}, \mathbb{C}^{n''}) & (n = n' + n'', n'' \geq 3) & \text{(Case 1),} \\ (M(r, \mathbb{C}), \text{Alt}(r, \mathbb{C}), \text{Sym}(r, \mathbb{C})) & & \text{(Case 2),} \\ (\text{Alt}(2r, \mathbb{C}), \text{Alt}(r, \mathbb{C}) \oplus \text{Alt}(r, \mathbb{C}), M(r, \mathbb{C})) & & \text{(Case 3).} \end{cases}$$

Then the corresponding symmetric pairs  $(G, (G^{\sigma})_0, (G^{\sigma\theta})_0) = (G, G_1, G_2)$  are given by

$$(G, G_1, G_2) = \begin{cases} (SO_0(2, n), SO_0(2, n') \times SO(n''), SO_0(2, n'') \times SO(n')) & \text{(Case 1),} \\ (SU(r, r), SO^*(2r), Sp(r, \mathbb{R})) & \text{(Case 2),} \\ (SO^*(4r), SO^*(2r) \times SO^*(2r), U(r, r)) & \text{(Case 3)} \end{cases}$$

(up to covering).  $(r, d, d_2, \varepsilon_1)$  are given as follows, and we define  $\delta$  by the following.

$$(r, d, d_2, \varepsilon_1, \delta) = \begin{cases} (2, n-2, n''-2, 1, n'-2) & \text{(Case 1, } n' \geq 2), \\ (2, n-2, n''-2, 2, -1) & \text{(Case 1, } n' = 1), \\ (r, 2, 1, 2, -1) & \text{(Case 2),} \\ (r, 4, 2, 1, 0) & \text{(Case 3).} \end{cases} \quad (4.1)$$

Especially  $d = 2d_2$  holds if  $r \geq 3$ . We fix a maximal tripotent  $e \in \mathfrak{p}_2^+ \subset \mathfrak{p}^+$ , regard  $\mathfrak{p}_2^+ \subset \mathfrak{p}^+$  as Jordan algebras with the unit element  $e$ , the Euclidean real forms  $\mathfrak{n}_2^+ \subset \mathfrak{n}^+$ , the symmetric cones  $\Omega_2 \subset \Omega$ , and identify  $\mathfrak{p}^+ \simeq \mathfrak{p}^-$ ,  $\mathfrak{p}_2^+ \simeq \mathfrak{p}_2^-$  via  $Q(e), Q(\bar{e})$ .

#### 4.1 Definition of some functions

In this subsection we define some functions on  $\mathfrak{p}_1^\pm \oplus \mathfrak{p}_2^\pm$ . First, for  $\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}$ , let  $\mathbf{m}^2 := (m_1, m_1, m_2, m_2, \dots, m_{\lfloor r/2 \rfloor}, m_{\lfloor r/2 \rfloor}, 0) \in \mathbb{Z}_{++}^r$ , let

$$\mathcal{P}_{\langle \mathbf{m} \rangle}(\mathfrak{p}_1^\pm) := \begin{cases} \mathcal{P}_{(m, m)}(\mathbb{C}^{n'}) & \text{(Case 1, } n' \geq 3), \\ \mathcal{P}_m(\mathbb{C}) \otimes \mathcal{P}_m(\mathbb{C}) & \text{(Case 1, } n' = 2), \\ \mathcal{P}_{2m}(\mathbb{C}) & \text{(Case 1, } n' = 1), \\ \mathcal{P}_{2\mathbf{m}}(\text{Alt}(r, \mathbb{C})) & \text{(Case 2),} \\ \mathcal{P}_{\mathbf{m}}(\text{Alt}(r, \mathbb{C})) \otimes \mathcal{P}_{\mathbf{m}}(\text{Alt}(r, \mathbb{C})) & \text{(Case 3)} \end{cases}$$

(where  $\mathbb{C}^2 = \mathbb{C} \oplus \mathbb{C}$  corresponds to the local isomorphism  $SO_0(2, 2) \simeq SL(2, \mathbb{R}) \times SL(2, \mathbb{R})$ ), and  $\Phi_{\mathbf{m}^2}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2), \tilde{\Phi}_{\mathbf{m}^2}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2) \in \mathcal{P}_{\langle \mathbf{m} \rangle}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{\mathbf{m}^2}(\mathfrak{p}_2^\mp)_{y_2}$  be the polynomials satisfying

$$e^{\frac{1}{2}(x_1 | P(y_2) x_1)_{\mathfrak{n}^\pm}} = \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \frac{d_{\tilde{\mathbf{m}}}^{\tilde{\mathbf{p}}}}{\left(\frac{d}{2}(\lfloor \frac{r}{2} \rfloor - 1) + 1\right)_{\mathbf{m}, d}} \Phi_{\mathbf{m}^2}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2) = \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \tilde{\Phi}_{\mathbf{m}^2}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2),$$

where

$$\tilde{\mathbf{p}} := \begin{cases} \mathbb{C} & \text{(Case 1),} \\ M(\lfloor \frac{r}{2} \rfloor, \mathbb{C}) & \text{(Case 2),} \\ \text{Alt}(2\lfloor \frac{r}{2} \rfloor, \mathbb{C}) & \text{(Case 3),} \end{cases} \quad d_{\tilde{\mathbf{m}}}^{\tilde{\mathbf{p}}} := \dim \mathcal{P}_{\mathbf{m}}(\tilde{\mathbf{p}}) = \begin{cases} 1 & \text{(Case 1),} \\ \dim(V_{\mathbf{m}}^{\lfloor r/2 \rfloor \vee})^{\otimes 2} & \text{(Case 2),} \\ \dim V_{\mathbf{m}^2}^{(2\lfloor r/2 \rfloor) \vee} & \text{(Case 3).} \end{cases}$$

Then for  $\mu \in \mathbb{C}$  we have

$$\begin{aligned} h_{\mathfrak{n}^\pm}(x_1, P(y_2)x_1)^{-\mu/2} &= \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \frac{(\mu)_{\mathbf{m}, d} d_{\tilde{\mathbf{m}}}^{\tilde{\mathbf{p}}}}{\left(\frac{d}{2}(\lfloor \frac{r}{2} \rfloor - 1) + 1\right)_{\mathbf{m}, d}} \Phi_{\mathbf{m}^2}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2) \\ &= \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} (\mu)_{\mathbf{m}, d} \tilde{\Phi}_{\mathbf{m}^2}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2), \\ \det_{\mathfrak{n}^\pm}(x_1 + x_2)^{-\mu} &= \det_{\mathfrak{n}^\pm}(x_2)^{-\mu} h_{\mathfrak{n}^\pm}(x_1, P(x_2^{-1})x_1)^{-\mu/2} \\ &= \det_{\mathfrak{n}^\pm}(x_2)^{-\mu} \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \frac{(\mu)_{\mathbf{m}, d} d_{\tilde{\mathbf{m}}}^{\tilde{\mathbf{p}}}}{\left(\frac{d}{2}(\lfloor \frac{r}{2} \rfloor - 1) + 1\right)_{\mathbf{m}, d}} \Phi_{\mathbf{m}^2}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, x_2^{-1}) \\ &= \det_{\mathfrak{n}^\pm}(x_2)^{-\mu} \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} (\mu)_{\mathbf{m}, d} \tilde{\Phi}_{\mathbf{m}^2}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, x_2^{-1}) \end{aligned} \quad (4.2)$$

(for details see [34, Propositions 2.4, 6.2]).

**Example 4.1.** Let  $\mu = -1$ . Then for  $x = x_1 + x_2 \in \mathfrak{p}^+$  we have

$$\begin{aligned} \det_{\mathfrak{n}^+}(x_1 + x_2) &= \det_{\mathfrak{n}_2^+}(x_2) h_{\mathfrak{n}^+}(x_1, P(x_2^{-1})x_1)^{1/2} \\ &= \det_{\mathfrak{n}_2^+}(x_2) \sum_{j=0}^{\lfloor r/2 \rfloor} (-1)^j \binom{\lfloor r/2 \rfloor}{j} \Phi_{(\underline{1}_j, \underline{0}_{\lfloor r/2 \rfloor - j})}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, x_2^{-1}), \end{aligned}$$

where  $\underline{k}_j := \overbrace{(k, \dots, k)}^j$ , and comparing the homogeneous terms of degree  $2 \lfloor \frac{r}{2} \rfloor$  with respect to  $x_1$ , we have

$$(-1)^{\lfloor r/2 \rfloor} \det_{\mathfrak{n}_2^+}(x_2) \Phi_{\underline{1}_{\lfloor r/2 \rfloor}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, x_2^{-1}) = \begin{cases} \det_{\mathfrak{n}^+}(x_1) & (r: \text{even}), \\ ((x_1)^\# | x_2)_{\mathfrak{n}^+} & (r: \text{odd}), \end{cases}$$

where  $x \mapsto x^\#$  is the adjugate in  $\mathfrak{p}^+ = \mathfrak{n}^{+\mathbb{C}}$ . That is, for  $x_1 \in \mathfrak{p}_1^+$ ,  $y_2 \in \mathfrak{p}_2^-$ , we have

$$\Phi_{\underline{1}_{\lfloor r/2 \rfloor}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2) = \begin{cases} (-1)^{r/2} \det_{\mathfrak{n}^+}(x_1) \det_{\mathfrak{n}_2^-}(y_2) & (r: \text{even}), \\ (-1)^{\lfloor r/2 \rfloor} ((x_1)^\# | (y_2)^\#)_{\mathfrak{n}^+} & (r: \text{odd}). \end{cases}$$

More generally, for  $k \in \mathbb{Z}_{\geq 0}$  we have

$$\Phi_{\underline{k}_{\lfloor r/2 \rfloor}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2) = \Phi_{\underline{1}_{\lfloor r/2 \rfloor}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2)^k = \begin{cases} (-1)^{kr/2} \det_{\mathfrak{n}^+}(x_1)^k \det_{\mathfrak{n}_2^-}(y_2)^k & (r: \text{even}), \\ (-1)^{k \lfloor r/2 \rfloor} ((x_1)^\# | (y_2)^\#)_{\mathfrak{n}^+}^k & (r: \text{odd}). \end{cases}$$

Next, for  $\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}$ ,  $\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor}$ , we define  $\phi_{\pm}(\mathbf{m}, \mathbf{l}) \in \mathbb{Z}^r$  by

$$\begin{aligned} \phi_+(\mathbf{m}, \mathbf{l}) &:= \begin{cases} (m_1 + l_1, m_1, m_2 + l_2, m_2, \dots, m_{r/2} + l_{r/2}, m_{r/2}) & (r: \text{even}), \\ (m_1 + l_1, m_1, m_2 + l_2, m_2, \dots, m_{\lfloor r/2 \rfloor} + l_{\lfloor r/2 \rfloor}, m_{\lfloor r/2 \rfloor}, l_{\lfloor r/2 \rfloor}) & (r: \text{odd}), \end{cases} \\ \phi_-(\mathbf{m}, \mathbf{l}) &:= \begin{cases} (m_1, m_1 - l_1, m_2, m_2 - l_2, \dots, m_{r/2}, m_{r/2} - l_{r/2}) & (r: \text{even}), \\ (m_1, m_1 - l_1, m_2, m_2 - l_2, \dots, m_{\lfloor r/2 \rfloor}, m_{\lfloor r/2 \rfloor} - l_{\lfloor r/2 \rfloor}, -l_{\lfloor r/2 \rfloor}) & (r: \text{odd}). \end{cases} \end{aligned}$$

Then for  $l \in \mathbb{Z}_{\geq 0}$ ,  $f(y_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^\mp)$ , we have

$$\begin{aligned} \tilde{\Phi}_{\mathbf{m}}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2) f(y_2) &\in \bigoplus_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}| = l}} \mathcal{P}_{\langle \mathbf{m} \rangle}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{\phi_+(\mathbf{m}, \mathbf{l})}(\mathfrak{p}_2^\mp)_{y_2}, \\ \tilde{\Phi}_{\mathbf{m}}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2) f(y_2^{-1}) &\in \bigoplus_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}| = l}} \mathcal{P}_{\langle \mathbf{m} \rangle}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{\phi_-(\mathbf{m}, \mathbf{l})}(\mathfrak{p}_2^\mp)_{y_2}, \end{aligned}$$

where  $\mathcal{P}_{\phi_+(\mathbf{m}, \mathbf{l})}(\mathfrak{p}_2^\mp)$ ,  $\mathcal{P}_{\phi_-(\mathbf{m}, \mathbf{l})}(\mathfrak{p}_2^\mp) = \{0\}$  if  $\phi_+(\mathbf{m}, \mathbf{l})$ ,  $\phi_-(\mathbf{m}, \mathbf{l}) \notin \mathbb{Z}_+^r := \{\mathbf{k} \in \mathbb{Z}^r \mid k_1 \geq \dots \geq k_r\}$ . According to these decompositions, for  $\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor}$  with  $|\mathbf{l}| = l$ , we define the polynomials  $F_{\mathbf{m}, \mathbf{l}}^+[f](x_1, y_2)$  and  $F_{\mathbf{m}, \mathbf{l}}^-[f](x_1, y_2)$  by

$$\begin{aligned} F_{\mathbf{m}, \mathbf{l}}^+[f](x_1, y_2) &:= \text{Proj}_{\phi_+(\mathbf{m}, \mathbf{l}), y_2}^{\mathfrak{p}_2^\mp} \left( \tilde{\Phi}_{\mathbf{m}}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2) f(y_2) \right) \in \mathcal{P}_{\langle \mathbf{m} \rangle}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{\phi_+(\mathbf{m}, \mathbf{l})}(\mathfrak{p}_2^\mp)_{y_2}, \\ F_{\mathbf{m}, \mathbf{l}}^-[f](x_1, y_2) &:= \text{Proj}_{\phi_-(\mathbf{m}, \mathbf{l}), y_2}^{\mathfrak{p}_2^\mp} \left( \tilde{\Phi}_{\mathbf{m}}^{\mathfrak{p}_1^\pm, \mathfrak{p}_2^\mp}(x_1, y_2) f(y_2^{-1}) \right) \in \mathcal{P}_{\langle \mathbf{m} \rangle}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{\phi_-(\mathbf{m}, \mathbf{l})}(\mathfrak{p}_2^\mp)_{y_2}. \end{aligned}$$

Then  $F_{\mathbf{m},\mathbf{l}}^+[f](x_1, y_2) \neq 0$  holds only if

$$\begin{aligned} 0 \leq l_1, \quad 0 \leq l_j \leq m_{j-1} - m_j \quad (1 < j \leq \frac{r}{2}) & \quad (r: \text{even}), \\ 0 \leq l_1, \quad 0 \leq l_j \leq m_{j-1} - m_j \quad (1 < j \leq \lfloor \frac{r}{2} \rfloor), \quad 0 \leq l_{\lfloor r/2 \rfloor} \leq m_{\lfloor r/2 \rfloor}, & \quad (r: \text{odd}), \end{aligned} \quad (4.3)$$

and  $F_{\mathbf{m},\mathbf{l}}^-[f](x_1, y_2) \neq 0$  holds only if

$$\begin{aligned} 0 \leq l_j \leq m_j - m_{j+1} \quad (1 \leq j < \frac{r}{2}), \quad 0 \leq l_{r/2} & \quad (r: \text{even}), \\ 0 \leq l_j \leq m_j - m_{j+1} \quad (1 \leq j < \lfloor \frac{r}{2} \rfloor), \quad 0 \leq l_{\lfloor r/2 \rfloor} \leq m_{\lfloor r/2 \rfloor}, \quad 0 \leq l_{\lfloor r/2 \rfloor} & \quad (r: \text{odd}). \end{aligned}$$

If  $r = 3$ , then these polynomials and  $F_{\mathbf{k},\mathbf{l}}^\uparrow[f]$ ,  $F_{\mathbf{k},\mathbf{l}}^\downarrow[f]$  in the previous section are related as

$$\begin{aligned} F_{m,(l_1,l_2)}^+[f](x_1, y_2) &= F_{(l_1+l_2,0,0), (l_2,0,m-l_2)}^\uparrow, \quad [f](x_1, y_2) = F_{(0,0,-l_1-l_2), (m-l_2,0,l_2)}^\downarrow, \quad [f((\cdot)^{-1})](x_1, y_2^{-1}) \\ &\in \mathcal{P}_{(m)}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{(m+l_1,m,l_2)}(\mathfrak{p}_2^\mp)_{y_2}, \\ F_{m,(l_1,l_2)}^-[f](x_1, y_2) &= F_{(0,0,-l_1-l_2), (0,l_1,m-l_1)}^\uparrow, \quad [f((\cdot)^{-1})](x_1, y_2) = F_{(l_1+l_2,0,0), (m-l_1,l_1,0)}^\downarrow, \quad [f](x_1, y_2^{-1}) \\ &\in \mathcal{P}_{(m)}(\mathfrak{p}_1^\pm)_{x_1} \otimes \mathcal{P}_{(m,m-l_1,-l_2)}(\mathfrak{p}_2^\mp)_{y_2}. \end{aligned}$$

For general  $r$ ,  $F_{\mathbf{m},\mathbf{l}}^\pm[f](x_1, y_2)$  satisfies the following. For  $\mathbf{k} \in \mathbb{Z}_+^r$ , let  $d_{\mathbf{k}}^{\mathfrak{p}_2^\pm} := \dim \mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^\pm)$ , and let  $\Sigma_2 \subset \mathfrak{p}_2^+$  be the Bergman–Shilov boundary of  $D_2 := D \cap \mathfrak{p}_2^+$ . For  $x \in \mathfrak{p}^+$ , let  $|x|_\infty := \inf\{t > 0 \mid t^{-1}x \in D\}$  be the spectral norm of  $x$ .

**Proposition 4.2.** *For  $\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}$ ,  $\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor}$ ,  $|\mathbf{l}| = l$ ,  $f(y_2) \in \mathcal{P}_{(l, \mathbb{Q}_{r-1})}(\mathfrak{p}_2^-)$  and for  $x_1 \in \mathfrak{p}_1^+$ ,  $y_2 = ge \in \mathfrak{p}_2^-$  with  $g \in K_1^{\mathbb{C}}$ , we have*

$$\begin{aligned} |F_{\mathbf{m},\mathbf{l}}^+[f](x_1, y_2)| &\leq \frac{\sqrt{d_{\mathbf{m}^2}^{\mathfrak{p}_2^+} d_{(l, \mathbb{Q}_{r-1})}^{\mathfrak{p}_2^+} d_{\mathbf{m}}^{\tilde{\mathfrak{p}}}}}{\left(\frac{d}{2} \left(\lfloor \frac{r}{2} \rfloor - 1\right) + 1\right)_{\mathbf{m},d}} ({}^t g x_1|_\infty)^{2|\mathbf{m}|} \|f(g(\cdot))\|_{L^2(\Sigma_2)}, \\ |F_{\mathbf{m},\mathbf{l}}^-[f](x_1, y_2)| &\leq \frac{\sqrt{d_{\mathbf{m}^2}^{\mathfrak{p}_2^+} d_{(l, \mathbb{Q}_{r-1})}^{\mathfrak{p}_2^+} d_{\mathbf{m}}^{\tilde{\mathfrak{p}}}}}{\left(\frac{d}{2} \left(\lfloor \frac{r}{2} \rfloor - 1\right) + 1\right)_{\mathbf{m},d}} ({}^t g x_1|_\infty)^{2|\mathbf{m}|} \|f({}^t g^{-1}(\cdot))\|_{L^2(\Sigma_2)}. \end{aligned}$$

*Proof.* Since  $f(x_2) \mapsto F_{\mathbf{m},\mathbf{l}}^+[f](x_1, y_2)$ ,  $f(x_2^{-1}) \mapsto F_{\mathbf{m},\mathbf{l}}^-[f](x_1, y_2)$  are  $K_1^{\mathbb{C}}$ -equivariant, we have

$$\begin{aligned} F_{\mathbf{m},\mathbf{l}}^+[f](x_1, y_2) &= F_{\mathbf{m},\mathbf{l}}^+[f](x_1, ge) = F_{\mathbf{m},\mathbf{l}}^+[f(g(\cdot))]({}^t g x_1, e), \\ F_{\mathbf{m},\mathbf{l}}^-[f](x_1, y_2) &= F_{\mathbf{m},\mathbf{l}}^-[f](x_1, ge) = F_{\mathbf{m},\mathbf{l}}^-[f({}^t g^{-1}(\cdot))]({}^t g x_1, e), \end{aligned}$$

and hence it suffices to prove when  $y_2 = e$ . Next, since the reproducing kernel of  $\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^-)$  with respect to the  $L^2(\Sigma_2)$ -inner product is given by  $K'_{\mathbf{k}}(y_2, z_2) := d_{\mathbf{k}}^{\mathfrak{p}_2^+} \Phi_{\mathbf{k}}^{\mathfrak{n}_2^-}(P(\overline{z_2}^{1/2})y_2) = d_{\mathbf{k}}^{\mathfrak{p}_2^+} \Phi_{\mathbf{k}}^{\mathfrak{n}_2^-}(P(y_2^{1/2})\overline{z_2})$ , where  $\Phi_{\mathbf{k}}^{\mathfrak{n}_2^-}(x_2) := \int_{K_1 \cap K_L} \Delta_{\mathbf{k}}^{\mathfrak{n}_2^-}(kx_2) dk$  (see [9, Proposition XII.2.4]), we have

$$\begin{aligned} |F_{\mathbf{m},\mathbf{l}}^\pm[f](x_1, e)| &= |\langle F_{\mathbf{m},\mathbf{l}}^\pm[f](x_1, \cdot), K'_{\phi_\pm(\mathbf{m},\mathbf{l})}(\cdot, e) \rangle_{L^2(\Sigma_2)}| \\ &\leq \|F_{\mathbf{m},\mathbf{l}}^\pm[f](x_1, \cdot)\|_{L^2(\Sigma_2)} \|K'_{\phi_\pm(\mathbf{m},\mathbf{l})}(\cdot, e)\|_{L^2(\Sigma_2)} \\ &= \|F_{\mathbf{m},\mathbf{l}}^\pm[f](x_1, \cdot)\|_{L^2(\Sigma_2)} \sqrt{K'_{\phi_\pm(\mathbf{m},\mathbf{l})}(e, e)} = \sqrt{d_{\phi_\pm(\mathbf{m},\mathbf{l})}^{\mathfrak{p}_2^+}} \|F_{\mathbf{m},\mathbf{l}}^\pm[f](x_1, \cdot)\|_{L^2(\Sigma_2)}. \end{aligned}$$

Now since  $F_{\mathbf{m},1}^\pm[f](x_1, y_2)$  is defined by the orthogonal projection of  $\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1, y_2)f(y_2)$  or  $\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1, y_2)f(y_2^{-1})$ , we have

$$\begin{aligned} \|F_{\mathbf{m},1}^+[f](x_1, \cdot)\|_{L^2(\Sigma_2)} &\leq \|\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1, y_2)f(y_2)\|_{L^2(\Sigma_2), y_2} \leq \|\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1, \cdot)\|_{L^\infty(\Sigma_2)} \|f\|_{L^2(\Sigma_2)}, \\ \|F_{\mathbf{m},1}^-[f](x_1, \cdot)\|_{L^2(\Sigma_2)} &\leq \|\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1, y_2)f(y_2^{-1})\|_{L^2(\Sigma_2), x_2} \leq \|\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1, \cdot)\|_{L^\infty(\Sigma_2)} \|f\|_{L^2(\Sigma_2)}. \end{aligned}$$

In addition, let  $\Sigma_1 \subset \mathfrak{p}_1^+$  be the Bergman–Shilov boundary of  $D_1 := D \cap \mathfrak{p}_1^+$ . Then we have

$$\|\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1, \cdot)\|_{L^\infty(\Sigma_2)} \leq \sup_{\substack{|x_1|_\infty \leq |x_1|_\infty \\ y_2 \in \Sigma_2}} |\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1', y_2)| = (|x_1|_\infty)^{2|\mathbf{m}|} \sup_{\substack{x_1' \in \Sigma_1 \\ y_2 \in \Sigma_2}} |\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1', y_2)|.$$

Also, since  $\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1', y_2)$  is defined by using the roots of  $t^{\lfloor r/2 \rfloor} h_{\mathfrak{n}^+}(t^{-1}x_1', P(y_2)x_1')^{1/2}$ , and these roots have absolute values 1 when  $x_1' \in \Sigma_1$ ,  $y_2 \in \Sigma_2$ , by [9, Theorem XII.1.1] we have

$$|\tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1', y_2)| = \frac{d_{\mathbf{m}}^{\tilde{\mathbf{p}}_1^+, \tilde{\mathbf{p}}_2^-} |\Phi_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(x_1', y_2)|}{\left(\frac{d}{2}(\lfloor \frac{r}{2} \rfloor - 1) + 1\right)_{\mathbf{m}, d}} \leq \frac{d_{\mathbf{m}}^{\tilde{\mathbf{p}}_1^+, \tilde{\mathbf{p}}_2^-}}{\left(\frac{d}{2}(\lfloor \frac{r}{2} \rfloor - 1) + 1\right)_{\mathbf{m}, d}} \quad (x_1' \in \Sigma_1, y_2 \in \Sigma_2).$$

We also have

$$d_{\phi_\pm(\mathbf{m},1)}^{\mathbf{p}_2^\pm} = \dim \mathcal{P}_{\phi_\pm(\mathbf{m},1)}(\mathfrak{p}_2^\pm) \leq \dim(\mathcal{P}_{\mathbf{m}^2}(\mathfrak{p}_2^\pm) \otimes \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^\pm)) = d_{\mathbf{m}^2}^{\mathbf{p}_2^\pm} d_{(l, \underline{0}_{r-1})}^{\mathbf{p}_2^\pm}.$$

Combining these, we get the desired formulas.  $\square$

The following proposition gives some examples of  $F_{\mathbf{m},1}^\pm[f](x_1, y_2)$ .

**Proposition 4.3.** *Let  $\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}$ ,  $\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor}$ ,  $|\mathbf{l}| = l$ .*

(1) *Suppose  $r$  is even. For  $k \in \mathbb{Z}_{\geq 0}$ ,  $f(y_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^-)$ , we have*

$$F_{\mathbf{m}+\underline{k}_{r/2}, 1}^\pm[f](x_1, y_2) = \frac{1}{(-k - \mathbf{m}^\vee)_{\underline{k}_{r/2}, d}} F_{\mathbf{m},1}^\pm[f](x_1, y_2) \det_{\mathfrak{n}^+}(x_1)^k \det_{\mathfrak{n}_2^-}(y_2)^k,$$

where  $\mathbf{m}^\vee = (m_{\lfloor r/2 \rfloor}, \dots, m_1)$ .

(2) *Suppose  $r$  is odd, and let  $w_2 \in \mathfrak{p}_2^+$  be of rank 1. Then for  $k, l, m \in \mathbb{Z}_{\geq 0}$  with  $m \leq k, l$  we have*

$$\begin{aligned} &F_{\underline{k}_{\lfloor r/2 \rfloor}, (l-m, \underline{0}_{\lfloor r/2 \rfloor - 1}, m)}^+ [(\cdot | w_2)_{\mathfrak{n}_2^+}^l](x_1, y_2) \\ &\quad \frac{(-1)^m \det_{\mathfrak{n}_2^+}(y_2)^k}{(-k)_{\underline{k}_{\lfloor r/2 \rfloor}, d} (-k - l + m - \frac{d_2}{2}(r-1))_m m!} \\ &= \frac{1}{(-k)_{\underline{k}_{\lfloor r/2 \rfloor}, d} (-k - l + m - \frac{d_2}{2}(r-1))_m m!} \\ &\quad \times \sum_{j=m}^{\min\{k, l\}} \frac{(-k)_j (-l)_j (y_2^{-1} | (x_1)^\sharp)_{\mathfrak{n}_2^+}^{k-j} (y_2 | w_2)_{\mathfrak{n}_2^+}^{l-j} ((x_1)^\sharp | w_2)_{\mathfrak{n}_2^+}^j}{(-k - l + 2m - \frac{d_2}{2}(r-1) + 1)_{j-m} (j-m)!}. \end{aligned}$$

(3) Suppose  $r$  is odd, and let  $w_2 \in \mathfrak{p}_2^+$  be of rank 1. Then for  $k, l, m \in \mathbb{Z}_{\geq 0}$  with  $m \leq k, l$  we have

$$\begin{aligned} & F_{\underline{k}_{\lfloor r/2 \rfloor}, \underline{0}_{\lfloor r/2 \rfloor - 1}, m, l - m}^- [(\cdot | w_2)_{\mathfrak{n}_2^+}^l](x_1, y_2) \\ &= \frac{(-1)^m \det_{\mathfrak{n}_2^+}(y_2)^k}{(-k)_{\underline{k}_{\lfloor r/2 \rfloor}, d} (-k - l + m - \frac{d_2}{2})_m m!} \sum_{j=m}^{\min\{k, l\}} \frac{(-k)_j (-l)_j}{(-k - l + 2m - \frac{d_2}{2} + 1)_{j-m} (j-m)!} \\ & \quad \times (y_2^{-1} | (x_1)^\sharp)_{\mathfrak{n}_2^+}^{k-j} (y_2^{-1} | w_2)_{\mathfrak{n}_2^+}^{l-j} ((y_2^{-1} | (x_1)^\sharp)_{\mathfrak{n}_2^+} (y_2^{-1} | w_2)_{\mathfrak{n}_2^+} - (P(y_2)^{-1} (x_1)^\sharp | w_2)_{\mathfrak{n}_2^+})^j. \end{aligned}$$

(4) Suppose  $r \geq 3$ . Let  $\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor - 1}$ ,  $l \in \mathbb{Z}_{\geq 0}$ ,  $m_1 \leq l$ , and put  $m_{r/2} := 0$  for even  $r$ . We define  $\mathbf{l}(\mathbf{m}) \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor}$  by

$$\mathbf{l}(\mathbf{m}) := (l - m_1, m_1 - m_2, m_2 - m_3, \dots, m_{\lfloor r/2 \rfloor - 2} - m_{\lfloor r/2 \rfloor - 1}, m_{\lfloor r/2 \rfloor - 1}),$$

so that

$$\begin{aligned} \phi_+(\mathbf{m}, \mathbf{l}(\mathbf{m})) &= \begin{cases} (l, m_1, m_1, m_2, m_2, \dots, m_{r/2-1}, m_{r/2-1}, 0) & (r: \text{even}), \\ (l, m_1, m_1, m_2, m_2, \dots, m_{\lfloor r/2 \rfloor - 1}, m_{\lfloor r/2 \rfloor - 1}) & (r: \text{odd}) \end{cases} \\ &= (l, \mathbf{m}^2) \in \mathbb{Z}_{++}^r. \end{aligned}$$

Let  $e' \in \mathfrak{n}_2^+$  be a primitive idempotent, let  $\mathfrak{p}^+(e')_0 =: \mathfrak{p}^{+''}$  be as in (2.2), let  $\mathfrak{p}_1^+ \cap \mathfrak{p}^{+''} =: \mathfrak{p}_1^{+''}$ ,  $\mathfrak{p}_2^+ \cap \mathfrak{p}^{+''} =: \mathfrak{p}_2^{+''}$ , and for  $x \in \mathfrak{p}^+$  let  $x'' \in \mathfrak{p}^{+''}$  be the orthogonal projection. Then we have

$$\det_{\mathfrak{n}_2^+}(x_2)^l F_{\mathbf{m}, \mathbf{l}(\mathbf{m})}^+ [(\cdot | e')_{\mathfrak{n}_2^+}^l](x_1, x_2^{-1}) = \frac{(-l)_{\mathbf{m}, d}}{(-l - \frac{d}{2})_{\mathbf{m}, d}} \det_{\mathfrak{n}_2^{+''}}(x_2)^l \tilde{\Phi}_{\mathbf{m}}^{\mathfrak{p}_1^{+''}, \mathfrak{p}_2^{+''}}(x_1'', (x_2'')^{-1}).$$

*Proof.* (1) Follows from

$$\begin{aligned} \tilde{\Phi}_{\mathbf{m} + \underline{k}_{r/2}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2) &= \frac{d_{\mathbf{m} + \underline{k}_{r/2}}^{\tilde{\mathfrak{p}}}}{(\frac{d}{2}(\frac{r}{2} - 1) + 1)_{\mathbf{m} + \underline{k}_{r/2}, d}} \Phi_{\mathbf{m} + \underline{k}_{r/2}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2) \\ &= \frac{d_{\mathbf{m}}^{\tilde{\mathfrak{p}}}}{(\frac{d}{2}(\frac{r}{2} - 1) + 1)_{\mathbf{m} + \underline{k}_{r/2}, d}} \Phi_{\mathbf{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2) \Phi_{\underline{1}_{r/2}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2)^k \\ &= \frac{(\frac{d}{2}(\frac{r}{2} - 1) + 1)_{\mathbf{m}, d}}{(\frac{d}{2}(\frac{r}{2} - 1) + 1)_{\mathbf{m} + \underline{k}_{r/2}, d}} \tilde{\Phi}_{\mathbf{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2) \Phi_{\underline{1}_{r/2}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2)^k \\ &= \frac{(-1)^{kr/2}}{(-k - \mathbf{m}^\vee)_{\underline{k}_{r/2}, d}} \tilde{\Phi}_{\mathbf{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2) \Phi_{\underline{1}_{r/2}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2)^k \\ &= \frac{1}{(-k - \mathbf{m}^\vee)_{\underline{k}_{r/2}, d}} \tilde{\Phi}_{\mathbf{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(x_1, y_2) \det_{\mathfrak{n}^+}(x_1)^k \det_{\mathfrak{n}_2^-}(y_2)^k. \end{aligned}$$

(2) Since  $r$  is odd,  $x_1 \in \mathfrak{p}_1^+$  is not invertible, and  $(x_1)^\sharp \in \mathfrak{p}_2^+$  is at most of rank 1. By

Example 4.1 and Proposition 2.5 (1) we have

$$\begin{aligned}
F_{\underline{k}_{\lfloor r/2 \rfloor}, (l-m, \underline{0}_{\lfloor r/2 \rfloor - 1}, m)}^+ [(\cdot | w_2)_{\mathfrak{n}_2^+}^l] (x_1, y_2) &= \text{Proj}_{(k+l-m, \underline{k}_{r-2}, m), y_2}^{\mathfrak{p}_2^-} (\tilde{\Phi}_{\underline{k}_{\lfloor r/2 \rfloor}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-} (x_1, y_2) (y_2 | w_2)_{\mathfrak{n}_2^+}^l) \\
&= \frac{(-1)^{k \lfloor r/2 \rfloor}}{\left(\frac{d}{2} \left(\lfloor \frac{r}{2} \rfloor - 1\right) + 1\right)_{\underline{k}_{\lfloor r/2 \rfloor}, d}} \det_{\mathfrak{n}_2^+} (y_2)^k \text{Proj}_{(l-m, \underline{0}_{r-2}, m-k), y_2}^{\mathfrak{p}_2^-} \left( (y_2^{-1} | (x_1)^\#)_{\mathfrak{n}_2^+}^k (y_2 | w_2)_{\mathfrak{n}_2^+}^l \right) \\
&= \frac{\det_{\mathfrak{n}_2^+} (y_2)^k}{(-k)_{\underline{k}_{\lfloor r/2 \rfloor}, d} \left(-k - l + m - \frac{d_2}{2}(r-1)\right)_m m!} (-1)^m \\
&\quad \times \sum_{j=m}^{\min\{k, l\}} \frac{(-k)_j (-l)_j (y_2^{-1} | (x_1)^\#)_{\mathfrak{n}_2^+}^{k-j} (y_2 | w_2)_{\mathfrak{n}_2^+}^{l-j} ((x_1)^\# | w_2)_{\mathfrak{n}_2^+}^j}{\left(-k - l + 2m - \frac{d_2}{2}(r-1) + 1\right)_{j-m} (j-m)!}.
\end{aligned}$$

(3) By Example 4.1 and Proposition 2.5 (2) we have

$$\begin{aligned}
F_{\underline{k}_{\lfloor r/2 \rfloor}, (\underline{0}_{\lfloor r/2 \rfloor - 1}, m, l-m)}^- [(\cdot | w_2)_{\mathfrak{n}_2^+}^l] (x_1, y_2) &= \text{Proj}_{(\underline{k}_{r-2}, k-m, m-l), y_2}^{\mathfrak{p}_2^-} (\tilde{\Phi}_{\underline{k}_{\lfloor r/2 \rfloor}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-} (x_1, y_2) (y_2^{-1} | w_2)_{\mathfrak{n}_2^+}^l) \\
&= \frac{(-1)^{k \lfloor r/2 \rfloor}}{\left(\frac{d}{2} \left(\lfloor \frac{r}{2} \rfloor - 1\right) + 1\right)_{\underline{k}_{\lfloor r/2 \rfloor}, d}} \det_{\mathfrak{n}_2^+} (y_2)^k \text{Proj}_{(\underline{0}_{r-2}, -m, m-k-l), y_2}^{\mathfrak{p}_2^-} \left( (y_2^{-1} | (x_1)^\#)_{\mathfrak{n}_2^+}^k (y_2^{-1} | w_2)_{\mathfrak{n}_2^+}^l \right) \\
&= \frac{\det_{\mathfrak{n}_2^+} (y_2)^k}{(-k)_{\underline{k}_{\lfloor r/2 \rfloor}, d} \left(-k - l + m - \frac{d_2}{2}\right)_m m!} \sum_{j=m}^{\min\{k, l\}} \frac{(-k)_j (-l)_j}{\left(-k - l + 2m - \frac{d_2}{2} + 1\right)_{j-m} (j-m)!} \\
&\quad \times (y_2^{-1} | (x_1)^\#)_{\mathfrak{n}_2^+}^{k-j} (y_2^{-1} | w_2)_{\mathfrak{n}_2^+}^{l-j} ((y_2^{-1} | (x_1)^\#)_{\mathfrak{n}_2^+} (y_2^{-1} | w_2)_{\mathfrak{p}_2^+} - (P(y_2)^{-1} (x_1)^\# | w_2)_{\mathfrak{n}_2^+})^j.
\end{aligned}$$

(4) Let  $\mathfrak{p}_2^+(e')_2 = \mathbb{C}e' =: \mathfrak{p}_2^{+'}$ , and let  $P_{K_1} \subset K_1^{\mathbb{C}}$  be a maximal parabolic subgroup stabilizing  $\mathcal{P}(\mathfrak{p}_1^{+'}) \subset \mathcal{P}(\mathfrak{p}_1^+)$  and  $\mathcal{P}(\mathfrak{p}_2^{+'}) \subset \mathcal{P}(\mathfrak{p}_2^+)$ . First, we have

$$\begin{aligned}
&(\det_{\mathfrak{n}_2^+} (x_2)^l f(x_2^{-1})) \mapsto \det_{\mathfrak{n}_2^+} (x_2)^l F_{\mathfrak{m}, \mathfrak{l}(\mathfrak{m})}^+ [f](x_1, x_2^{-1}) \\
&\in \text{Hom}_{K_1} (\mathcal{P}_{(\underline{l}_{r-1}, 0)}(\mathfrak{p}_2^+), \mathcal{P}_{(\mathfrak{m})}(\mathfrak{p}_1^+) \otimes \mathcal{P}_{\underline{l}_r - \phi_+(\mathfrak{m}, \mathfrak{l}(\mathfrak{m}))^\vee}(\mathfrak{p}_2^+)) \\
&\simeq \text{Hom}_{K_1} (\mathcal{P}_{(\underline{l}, \underline{0}_{r-1})}(\mathfrak{p}_2^-) \otimes \mathcal{P}_{(\mathfrak{m})}(\mathfrak{p}_1^-), \mathcal{P}_{(\underline{l}, \mathfrak{m}^2)}(\mathfrak{p}_2^-)),
\end{aligned}$$

and this space is 1-dimensional by the Pieri rule for Cases 2, 3. Especially, since  $\det_{\mathfrak{n}_2^+} (x_2)^l (x_2^{-1} | e')_{\mathfrak{n}_2^+}^l = \det_{\mathfrak{n}_2^{+'}} (x_2'')^l \in \mathcal{P}_{(\underline{l}_{r-1}, 0)}(\mathfrak{p}_2^+)$  is relatively invariant under the parabolic subgroup  $P_{K_1}$ ,  $\det_{\mathfrak{n}_2^+} (x_2)^l F_{\mathfrak{m}, \mathfrak{l}(\mathfrak{m})}^+ [(\cdot | e')_{\mathfrak{n}_2^+}^l] (x_1, x_2^{-1}) \in \mathcal{P}_{(\mathfrak{m})}(\mathfrak{p}_1^+) \otimes \mathcal{P}_{\underline{l}_r - (\mathfrak{l}, \mathfrak{m}^2)^\vee}(\mathfrak{p}_2^+)$  is also relatively invariant under  $P_{K_1}$ , with the weight same with  $\det_{\mathfrak{n}_2^+} (x_2)^l (x_2^{-1} | e')_{\mathfrak{n}_2^+}^l = \det_{\mathfrak{n}_2^{+'}} (x_2'')^l$ , and such function is unique up to constant multiple. Hence

$$\det_{\mathfrak{n}_2^+} (x_2)^l F_{\mathfrak{m}, \mathfrak{l}(\mathfrak{m})}^+ [(\cdot | e')_{\mathfrak{n}_2^+}^l] (x_1, x_2^{-1}) = c \det_{\mathfrak{n}_2^{+'}} (x_2'')^l \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^{+'}, \mathfrak{p}_2^{-''}} (x_1', (x_2'')^{-1})$$

holds for some  $c \in \mathbb{C}$ . To determine  $c$ , it is enough to consider the case  $x_1 = x_1'' \in \mathfrak{p}^{+'}$ . Then since  $\tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-} (x_1'', y_2) = \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^{+'}, \mathfrak{p}_2^{-''}} (x_1'', y_2'')$  holds, by Lemma 2.4 (4) we have

$$\begin{aligned}
F_{\mathfrak{m}, \mathfrak{l}(\mathfrak{m})}^+ [(\cdot | e')_{\mathfrak{n}_2^+}^l] (x_1'', x_2^{-1}) \Big|_{\substack{x_2 = x_2' + x_2'' \\ \in \mathfrak{p}^{+'} \oplus \mathfrak{p}^{+'}}} &= \text{Proj}_{(\underline{l}, \mathfrak{m}^2)}^{\mathfrak{p}_2^-} \left( (y_2 | e')_{\mathfrak{n}_2^+}^l \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^{+'}, \mathfrak{p}_2^{-''}} (x_1'', y_2'') \right) \Big|_{\substack{y_2^{-1} = x_2' + x_2'' \\ \in \mathfrak{p}^{+'} \oplus \mathfrak{p}^{+'}}} \\
&= \frac{(-l)_{\mathfrak{m}^2, d_2}}{\left(-l - \frac{d_2}{2}\right)_{\mathfrak{m}^2, d_2}} ((x_2')^{-1} | e')_{\mathfrak{n}_2^+}^l \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^{+'}, \mathfrak{p}_2^{-''}} (x_1'', (x_2'')^{-1}),
\end{aligned}$$

and hence we get

$$c = \frac{(-l)_{\mathbf{m}^2, d_2}}{\left(-l - \frac{d_2}{2}\right)_{\mathbf{m}^2, d_2}} = \frac{(-l)_{\mathbf{m}, d} \left(-l - \frac{d_2}{2}\right)_{\mathbf{m}, d}}{\left(-l - \frac{d_2}{2}\right)_{\mathbf{m}, d} \left(-l - \frac{d}{2}\right)_{\mathbf{m}, d}} = \frac{(-l)_{\mathbf{m}, d}}{\left(-l - \frac{d}{2}\right)_{\mathbf{m}, d}}. \quad \square$$

Using  $F_{\mathbf{m}, \mathbf{l}}^\pm[f](x_1, y_2)$ , for  $l \in \mathbb{Z}_{\geq 0}$ ,  $\mu, \nu \in \mathbb{C}$  and for  $f(x_2) \in \mathcal{P}_{(l, 0, \dots, 0)}(\mathfrak{p}_2^\pm)$ , we define a function  $F_{l, +}^\downarrow(\nu; f; x)$  by

$$F_{l, +}^\downarrow\left(\nu; f; x\right) := \det_{\mathfrak{n}_2^\pm}(x_2)^{-\nu} \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} F_{\mathbf{m}, \mathbf{l}}^- [f](x_1, x_2^{-1}) \\ \times \begin{cases} \frac{(\nu)_{\mathbf{m}, d} \left(\nu - \frac{d_2}{2} - (\mathbb{Q}_{r/2-1}, l)\right)_{\mathbf{m}-1+(\mathbb{Q}_{r/2-1}, l), d}}{\left(\mu - \frac{d_2}{2} - (\mathbb{Q}_{r/2-1}, l)\right)_{\mathbf{m}-1+(\mathbb{Q}_{r/2-1}, l), d}} & (r: \text{even}), \\ \frac{(\nu)_{\mathbf{m}, d} \left(\nu - \frac{d_2}{2}\right)_{\mathbf{m}-\mathbf{l}, d} \left(\nu - \frac{d_2}{2}(r-1) - l\right)_{l-l_{\lfloor r/2 \rfloor}}}{\left(\mu - \frac{d_2}{2}\right)_{\mathbf{m}-\mathbf{l}, d} \left(\mu - \frac{d_2}{2}(r-1) - l\right)_{l-l_{\lfloor r/2 \rfloor}}} & (r: \text{odd}), \end{cases} \quad (4.4)$$

where, when  $r$  is odd, let  $\mathbf{l}' := (l_1, \dots, l_{\lfloor r/2 \rfloor})$  so that  $\mathbf{l} = (\mathbf{l}', l_{\lfloor r/2 \rfloor})$  holds, and we define a function  $F_{l, -}^\downarrow(\nu; f; x)$  by

$$F_{l, -}^\downarrow\left(\nu; f; x\right) := \det_{\mathfrak{n}_2^\pm}(x_2)^{-\nu} \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} F_{\mathbf{m}, \mathbf{l}}^+ [f](x_1, x_2^{-1}) \\ \times \frac{(\nu + (l, \mathbb{Q}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1-(l, \mathbb{Q}_{\lfloor r/2 \rfloor - 1}), d} \left(\nu - \frac{d_2}{2}\right)_{\mathbf{m}, d}}{\left(\mu - \frac{d_2}{2} + (l, \mathbb{Q}_{\lfloor r/2 \rfloor - 1})\right)_{\mathbf{m}+1-(l, \mathbb{Q}_{\lfloor r/2 \rfloor - 1}), d}}, \quad (4.5)$$

where we identify  $\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}$  and  $(\mathbf{m}, 0) \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}$  when  $r$  is odd. Then as a function of  $\mu$ ,  $F_{l, +}^\downarrow(\nu; f; x)$  has poles at

$$\mu \in \bigcup_{i=1}^{r/2-1} \left\{ \frac{d_2}{2} + \frac{d}{2}(i-1) - j \mid \begin{array}{l} j \in \mathbb{Z}, \\ j \geq 0 \end{array} \right\} \cup \left\{ \frac{d_2}{2} + \frac{d}{2}\left(\frac{r}{2}-1\right) - j \mid \begin{array}{l} j \in \mathbb{Z}, \\ j \geq -l \end{array} \right\} \quad (r: \text{even}), \\ \mu \in \bigcup_{i=1}^{\lfloor r/2 \rfloor} \left\{ \frac{d_2}{2} + \frac{d}{2}(i-1) - j \mid \begin{array}{l} j \in \mathbb{Z}, \\ j \geq 0 \end{array} \right\} \cup \left\{ \frac{d_2}{2} + \frac{d}{2}\left(\frac{r}{2}-1\right) - j \mid \begin{array}{l} j \in \mathbb{Z}, \\ -l \leq j < 0 \end{array} \right\} \quad (r: \text{odd})$$

(we note that  $d = 2d_2$  holds if  $r$  is odd), and  $F_{l, -}^\downarrow(\nu; f; x)$  has poles at

$$\mu \in \left\{ \frac{d_2}{2} - j \mid \begin{array}{l} j \in \mathbb{Z}, \\ j \geq l \end{array} \right\} \cup \bigcup_{i=2}^{r/2} \left\{ \frac{d_2}{2} + \frac{d}{2}(i-1) - j \mid \begin{array}{l} j \in \mathbb{Z}, \\ j \geq 0 \end{array} \right\} \quad (r: \text{even}), \\ \mu \in \left\{ \frac{d_2}{2} - j \mid \begin{array}{l} j \in \mathbb{Z}, \\ j \geq l \end{array} \right\} \cup \bigcup_{i=2}^{\lfloor r/2 \rfloor} \left\{ \frac{d_2}{2} + \frac{d}{2}(i-1) - j \mid \begin{array}{l} j \in \mathbb{Z}, \\ j \geq 0 \end{array} \right\} \\ \cup \left\{ \frac{d_2}{2} + \frac{d}{2}\left(\left\lfloor \frac{r}{2} \right\rfloor - 1\right) - j \mid \begin{array}{l} j \in \mathbb{Z}, \\ 0 \leq j < l \end{array} \right\} \quad (r: \text{odd})$$

for generic  $\nu \in \mathbb{C}$ . On the other hand, if  $\nu = -k \in -\mathbb{Z}_{\geq 0}$  then  $F_{l,+}^\downarrow\left(\frac{-k}{\mu}; f; x\right)$  becomes a finite sum and is a polynomial in  $x$ , and if  $\nu = -k \in -\mathbb{Z}_{\geq l}$  then  $F_{l,-}^\downarrow\left(\frac{-k}{\mu}; f; x\right)$  also becomes a polynomial. For these cases, all poles satisfying  $\mu \leq \frac{d_2}{2} - k$  become removable, and we use the same notations  $F_{l,+}^\downarrow\left(\frac{-k}{\mu}; f; x\right)$ ,  $F_{l,-}^\downarrow\left(\frac{-k}{\mu}; f; x\right)$  to express these polynomials also for  $\mu$  at such removable singularities. If  $r = 3$ , then since  $d = 2d_2$  holds,  $F_{l,\pm}^\downarrow\left(\frac{-k}{\mu}; f; x\right)$  and  $F^\downarrow(\lambda, \mathbf{k}; f; x)$  in the previous section are related as

$$\begin{aligned} F^\downarrow\left(\lambda, (k_1, k_2, k_2); f \det_{\mathfrak{n}_2^+}^{k_2}; x\right) &= F_{k_1-k_2,+}^\downarrow\left(\frac{-k_2}{-\lambda - 2k_2 + d + 1}; f; x\right), \\ F^\downarrow\left(\lambda, (k_2, k_2, k_3); f((\cdot)^{-1}) \det_{\mathfrak{n}_2^+}^{k_2}; x\right) &= F_{k_2-k_3,-}^\downarrow\left(\frac{-k_2}{-\lambda - 2k_2 + d + 1}; f; x\right). \end{aligned}$$

**Proposition 4.4.** *Suppose  $\mu \in \mathbb{C}$  is not a pole of  $F_{l,\pm}^\downarrow(\frac{\nu}{\mu}; f; x)$ . Then  $F_{l,\pm}^\downarrow(\frac{\nu}{\mu}; f; x)$  converges if  $x_2 = ge$  for some  $g \in K_1^{\mathbb{C}}$  and  $|g^{-1}x_1|_\infty < 1$  holds. Especially, this converges for  $x = (x_1, x_2) \in \Omega$ .*

*Proof.* By Proposition 4.2 we have

$$\begin{aligned} |F_{\mathbf{m},1}^-[f](x_1, x_2^{-1})| &\leq \frac{\sqrt{d_{\mathbf{m}^2}^{p_2^+} d_{(l, \mathfrak{Q}_{r-1})}^{p_2^+} d_{\tilde{\mathbf{m}}}^{\tilde{p}}}}{\left(\frac{d}{2}\left(\left\lfloor \frac{r}{2} \right\rfloor - 1\right) + 1\right)_{\mathbf{m},d}} (|g^{-1}x_1|_\infty)^{2|\mathbf{m}|} \|f(g(\cdot))\|_{L^2(\Sigma_2)}, \\ |F_{\mathbf{m},1}^+[f](x_1, x_2^{-1})| &\leq \frac{\sqrt{d_{\mathbf{m}^2}^{p_2^+} d_{(l, \mathfrak{Q}_{r-1})}^{p_2^+} d_{\tilde{\mathbf{m}}}^{\tilde{p}}}}{\left(\frac{d}{2}\left(\left\lfloor \frac{r}{2} \right\rfloor - 1\right) + 1\right)_{\mathbf{m},d}} (|g^{-1}x_1|_\infty)^{2|\mathbf{m}|} \|f({}^t g^{-1}(\cdot))\|_{L^2(\Sigma_2)}, \end{aligned}$$

and we have

$$\begin{aligned} d_{\mathbf{m}^2}^{p_2^+} &= \dim \mathcal{P}_{\mathbf{m}^2}(\mathfrak{p}_2^+) \leq \dim \mathcal{P}_{2|\mathbf{m}|}(\mathfrak{p}_2^+) = \binom{2|\mathbf{m}| + n_2 - 1}{n_2 - 1}, \\ d_{\tilde{\mathbf{m}}}^{\tilde{p}} &= \dim \mathcal{P}_{\tilde{\mathbf{m}}}(\tilde{\mathfrak{p}}) \leq \dim \mathcal{P}_{|\mathbf{m}|}(\tilde{\mathfrak{p}}) = \binom{|\mathbf{m}| + \tilde{n} - 1}{\tilde{n} - 1}, \end{aligned}$$

where  $n_2 := \dim \mathfrak{p}_2^+$ ,  $\tilde{n} := \dim \tilde{\mathfrak{p}}$ . Then the convergence for  $|g^{-1}x_1|_\infty < 1$  follows from standard argument. Especially when  $x = (x_1, x_2) \in \Omega$ , we have

$$0 < \det_{\mathfrak{n}^+}(x) = \det_{\mathfrak{n}_2^+}(x_2) h_{\mathfrak{n}^+}(x_1, P(x_2)^{-1}x_1) = \det_{\mathfrak{n}_2^+}(x_2) h_{\mathfrak{n}^+}(P(x_2^{-1/2})x_1, P(x_2^{-1/2})x_1),$$

and hence  $P(x_2^{-1/2})x_1 \in D \cap \Omega$ , that is,  $|P(x_2^{-1/2})x_1|_\infty < 1$  holds. Thus  $F_{l,\pm}^\downarrow(\frac{\nu}{\mu}; f; x)$  converges for  $x \in \Omega$ .  $\square$

These  $F_{l,\pm}^\downarrow(\frac{\nu}{\mu}; f; x)$  has the following property.

**Proposition 4.5.** For  $\mu, \nu \in \mathbb{C}$ ,  $k, l \in \mathbb{Z}_{\geq 0}$ ,  $f(x_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^\pm)$ , we have

$$\begin{aligned} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial x_2} \right)^k F_{l,+}^\downarrow \left( \begin{matrix} \nu \\ \mu \end{matrix}; f; x \right) &= (-1)^{kr} (\nu - (\underline{0}_{r-1}, l))_{\underline{k}_r, d_2} F_{l,+}^\downarrow \left( \begin{matrix} \nu + k \\ \mu \end{matrix}; f; x \right) \\ &= (-1)^{kr} (\nu)_{\underline{k}_{\lfloor r/2 \rfloor}, d} \left( \nu - \frac{d_2}{2} \right)_{\underline{k}_{\lfloor r/2 \rfloor - 1}, d} \left( \nu - \frac{d_2}{2} (r-1) - l \right)_k F_{l,+}^\downarrow \left( \begin{matrix} \nu + k \\ \mu \end{matrix}; f; x \right), \\ \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial x_2} \right)^k F_{l,-}^\downarrow \left( \begin{matrix} \nu \\ \mu \end{matrix}; f; x \right) &= (-1)^{kr} (\nu + (l, \underline{0}_{r-1}))_{\underline{k}_r, d_2} F_{l,-}^\downarrow \left( \begin{matrix} \nu + k \\ \mu \end{matrix}; f; x \right) \\ &= (-1)^{kr} (\nu + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\underline{k}_{\lfloor r/2 \rfloor}, d} \left( \nu - \frac{d_2}{2} \right)_{\underline{k}_{\lfloor r/2 \rfloor}, d} F_{l,-}^\downarrow \left( \begin{matrix} \nu + k \\ \mu \end{matrix}; f; x \right). \end{aligned}$$

*Proof.* First, the numerator of each term of  $F_{l,\pm}^\downarrow \left( \begin{matrix} \nu \\ \mu \end{matrix}; f; x \right)$  satisfies

$$\begin{aligned} &(\nu - (\underline{0}_{r-1}, l))_{\phi_-(\mathbf{m}, \mathbf{l}) + (\underline{0}_{r-1}, l), d_2} \\ &= \begin{cases} (\nu)_{\mathbf{m}, d} \left( \nu - \frac{d_2}{2} - (\underline{0}_{r/2-1}, l) \right)_{\mathbf{m}-1 + (\underline{0}_{r/2-1}, l), d} & (r: \text{even}), \\ (\nu)_{\mathbf{m}, d} \left( \nu - \frac{d_2}{2} \right)_{\mathbf{m}-l', d} \left( \nu - \frac{d_2}{2} (r-1) - l \right)_{l-l_{\lfloor r/2 \rfloor}} & (r: \text{odd}), \end{cases} \\ &(\nu + (l, \underline{0}_{r-1}))_{\phi_+(\mathbf{m}, \mathbf{l}) - (l, \underline{0}_{r-1}), d_2} = (\nu + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1 - (l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} \left( \nu - \frac{d_2}{2} \right)_{\mathbf{m}, d}. \end{aligned}$$

Then since  $F_{\mathbf{m}, \mathbf{l}}^\mp[f](x_1, y_2) \in \mathcal{P}(\mathfrak{p}_1^+) \otimes \mathcal{P}_{\phi_\mp(\mathbf{m}, \mathbf{l})}(\mathfrak{p}_2^-)$  holds, by Lemma 2.3 we have

$$\begin{aligned} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial x_2} \right)^k &(\nu - (\underline{0}_{r-1}, l))_{\phi_-(\mathbf{m}, \mathbf{l}) + (\underline{0}_{r-1}, l), d_2} \det_{\mathfrak{n}_2^+} (x_2)^{-\nu} F_{\mathbf{m}, \mathbf{l}}^- [f](x_1, x_2^{-1}) \\ &= (-1)^{kr} (\nu + \phi_-(\mathbf{m}, \mathbf{l}))_{\underline{k}_r, d_2} (\nu - (\underline{0}_{r-1}, l))_{\phi_-(\mathbf{m}, \mathbf{l}) + (\underline{0}_{r-1}, l), d_2} \det_{\mathfrak{n}_2^+} (x_2)^{-\nu-k} F_{\mathbf{m}, \mathbf{l}}^- [f](x_1, x_2^{-1}) \\ &= (-1)^{kr} (\nu - (\underline{0}_{r-1}, l))_{\phi_-(\mathbf{m}, \mathbf{l}) + \underline{k}_r + (\underline{0}_{r-1}, l), d_2} \det_{\mathfrak{n}_2^+} (x_2)^{-\nu-k} F_{\mathbf{m}, \mathbf{l}}^- [f](x_1, x_2^{-1}) \\ &= (-1)^{kr} (\nu - (\underline{0}_{r-1}, l))_{\underline{k}_r, d_2} \\ &\quad \times (\nu + k - (\underline{0}_{r-1}, l))_{\phi_-(\mathbf{m}, \mathbf{l}) + (\underline{0}_{r-1}, l), d_2} \det_{\mathfrak{n}_2^+} (x_2)^{-\nu-k} F_{\mathbf{m}, \mathbf{l}}^- [f](x_1, x_2^{-1}), \\ \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial x_2} \right)^k &(\nu + (l, \underline{0}_{r-1}))_{\phi_+(\mathbf{m}, \mathbf{l}) - (l, \underline{0}_{r-1}), d_2} \det_{\mathfrak{n}_2^+} (x_2)^{-\nu} F_{\mathbf{m}, \mathbf{l}}^+ [f](x_1, x_2^{-1}) \\ &= (-1)^{kr} (\nu + \phi_+(\mathbf{m}, \mathbf{l}))_{\underline{k}_r, d_2} (\nu + (l, \underline{0}_{r-1}))_{\phi_+(\mathbf{m}, \mathbf{l}) - (l, \underline{0}_{r-1}), d_2} \det_{\mathfrak{n}_2^+} (x_2)^{-\nu-k} F_{\mathbf{m}, \mathbf{l}}^+ [f](x_1, x_2^{-1}) \\ &= (-1)^{kr} (\nu + (l, \underline{0}_{r-1}))_{\phi_+(\mathbf{m}, \mathbf{l}) + \underline{k}_r - (l, \underline{0}_{r-1}), d_2} \det_{\mathfrak{n}_2^+} (x_2)^{-\nu-k} F_{\mathbf{m}, \mathbf{l}}^+ [f](x_1, x_2^{-1}) \\ &= (-1)^{kr} (\nu + (l, \underline{0}_{r-1}))_{\underline{k}_r, d_2} \\ &\quad \times (\nu + k + (l, \underline{0}_{r-1}))_{\phi_+(\mathbf{m}, \mathbf{l}) - (l, \underline{0}_{r-1}), d_2} \det_{\mathfrak{n}_2^+} (x_2)^{-\nu-k} F_{\mathbf{m}, \mathbf{l}}^+ [f](x_1, x_2^{-1}). \end{aligned}$$

Hence the 1st and 3rd equalities follow from the definition of  $F_{l,\pm}^\downarrow \left( \begin{matrix} \nu \\ \mu \end{matrix}; f; x \right)$ . The 2nd and 4th equalities are easy.  $\square$

## 4.2 Results on weighted Bergman inner products

For  $\lambda \in \mathbb{C}$ ,  $k, l \in \mathbb{Z}_{\geq 0}$ , we set

$$C_{r,+}^{d,d_2}(\lambda, k, l) := \begin{cases} \frac{(\lambda + k - \frac{d}{4}r + \frac{d_2}{2} + (l, \underline{0}_{r/2-1}))_{\underline{k}_{r/2}, d}}{(\lambda)_{(2k+l, \underline{2k}_{r/2-1}, \underline{k}_{r/2}), d}} & (r: \text{even}), \\ \frac{(\lambda - \frac{d}{2}[\frac{r}{2}] + \max\{2k, k+l\})_{\min\{k, l\}} (\lambda + k - \frac{d}{2}[\frac{r}{2}] + \frac{d_2}{2})_{\underline{k}_{\lfloor r/2 \rfloor}, d}}{(\lambda)_{(2k+l, \underline{2k}_{\lfloor r/2 \rfloor-1}, \min\{2k, k+l\}, \underline{k}_{\lfloor r/2 \rfloor}), d}} & (r: \text{odd}), \end{cases} \quad (4.6)$$

and when  $k \geq l$  we set

$$C_{r,-}^{d,d_2}(\lambda, k, l) := \begin{cases} \frac{(\lambda + k - \frac{d}{4}r + \frac{d_2}{2})_{(\underline{k}_{r/2-1}, k-l), d}}{(\lambda)_{(2k-l, \underline{2k}_{r/2-1}, k-l), d}} & (r: \text{even}), \\ \frac{(\lambda + k - \frac{d}{2}[\frac{r}{2}] + \frac{d_2}{2} + (k-l, \underline{0}_{\lfloor r/2 \rfloor}))_{(l, \underline{k}_{\lfloor r/2 \rfloor-1}, k-l), d}}{(\lambda)_{(2k-l, \underline{k}_{\lfloor r/2 \rfloor}, k-l), d}} & (r: \text{odd}). \end{cases} \quad (4.7)$$

If  $r = 3$ , then since  $d = 2d_2$  holds,  $C_{3,\pm}^{d,d_2}(\lambda, k, l)$  and  $C^{d,d_2}(\lambda, \mathbf{k})$  in (3.3) are related as

$$\begin{aligned} C^{d,d_2}(\lambda, (k_1, k_2, k_2)) &= C_{3,+}^{d,d_2}(\lambda, k_2, k_1 - k_2), \\ C^{d,d_2}(\lambda, (k_2, k_2, k_3)) &= C_{3,-}^{d,d_2}(\lambda, k_2, k_2 - k_3). \end{aligned}$$

Also, for general  $r$  we have

$$C_{r,+}^{d,d_2}(\lambda, k, 0) = C_{r,-}^{d,d_2}(\lambda, k, 0) = C_{r+1,-}^{d,d_2}(\lambda, k, k) = \frac{(\lambda + k - \frac{d}{2}[\frac{r}{2}] + \frac{d_2}{2})_{\underline{k}_{\lfloor r/2 \rfloor}, d}}{(\lambda)_{(2k, \underline{k}_{\lfloor r/2 \rfloor}), d}}.$$

Now, for  $\det_{\mathfrak{n}_2^+}(x_2)^k f(x_2) \in \mathcal{P}_{(k+l, \underline{k}_{r-1})}(\mathfrak{p}_2^+)$ , the following holds.

**Theorem 4.6.** *Let  $k, l \in \mathbb{Z}_{\geq 0}$ ,  $f(x_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ .*

(1) *For  $\operatorname{Re} \lambda > \frac{2n}{r} - 1$  we have*

$$\left\langle \det_{\mathfrak{n}_2^+}(x_2)^k f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} = C_{r,+}^{d,d_2}(\lambda, k, l) F_{l,+}^{\downarrow} \left( \begin{matrix} -k \\ -\lambda - 2k + \frac{n}{r}; f; z \end{matrix} \right).$$

(2) *As functions of  $\lambda$ ,*

$$\begin{aligned} (\lambda)_{(2k+l, \underline{2k}_{r/2-1}, \underline{k}_{r/2}), d} \left\langle \det_{\mathfrak{n}_2^+}(x_2)^k f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} & \quad (r: \text{even}), \\ (\lambda)_{(2k+l, \underline{2k}_{\lfloor r/2 \rfloor-1}, \min\{2k, k+l\}, \underline{k}_{\lfloor r/2 \rfloor}), d} \left\langle \det_{\mathfrak{n}_2^+}(x_2)^k f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} & \quad (r: \text{odd}) \end{aligned}$$

*are holomorphically continued for all  $\lambda \in \mathbb{C}$ , and give non-zero polynomials in  $z \in \mathfrak{p}^+$  for all  $\lambda \in \mathbb{C}$  if  $f(x_2) \neq 0$ .*

(3) *For  $\mu, \nu \in \mathbb{C}$  we have*

$$F_{l,+}^{\downarrow} \left( \begin{matrix} \nu \\ \mu; f; z \end{matrix} \right) = \det_{\mathfrak{n}^+}(z)^{\mu-2\nu} F_{l,+}^{\downarrow} \left( \begin{matrix} \mu - \nu \\ \mu; f; z \end{matrix} \right).$$

Especially if  $\mu = a - 2k$  and  $\nu = -k$  with  $a, k \in \mathbb{Z}_{\geq 0}$ ,  $a \leq k$ , then  $F_{l,+}^{\downarrow}(\nu; f; z)$  is factorized as

$$F_{l,+}^{\downarrow}\left(\begin{matrix} -k \\ a - 2k \end{matrix}; f; z\right) = \det_{n^+}(z)^a F_{l,+}^{\downarrow}\left(\begin{matrix} a - k \\ a - 2k \end{matrix}; f; z\right).$$

Theorem 4.6 (1) and (3) for  $\nu = -k \in \mathbb{Z}_{\geq 0}$  case are already proved in [34, Theorem 6.3 (1)], and we can prove (3) for general  $\nu \in \mathbb{C}$  by using the Zariski denseness of  $-\mathbb{Z}_{\geq 0} \subset \mathbb{C}$ . For Theorem 4.6 (2), their holomorphy for general  $r, k, l$  and non-zerosness for  $r$  even or  $kl = 0$  are given in [34, Corollary 6.6 (1)], and the only new result is the non-zerosness for odd  $r$  with  $k, l \neq 0$ . Next, for  $\det_{n_2^+}(x_2)^k f(x_2^{-1}) \in \mathcal{P}_{(\underline{k}_{r-1}, k-l)}(\mathfrak{p}_2^+)$ , the following holds.

**Theorem 4.7.** *Let  $k, l \in \mathbb{Z}_{\geq 0}$  with  $k \geq l$ , and  $f(x_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ .*

(1) *For  $\operatorname{Re} \lambda > \frac{2n}{r} - 1$  we have*

$$\left\langle \det_{n_2^+}(x_2)^k f(x_2^{-1}), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} = C_{r,-}^{d,d_2}(\lambda, k, l) F_{l,-}^{\downarrow}\left(-\lambda - 2k + \frac{n}{r}; f; z\right).$$

(2) *As functions of  $\lambda$ ,*

$$\begin{aligned} (\lambda)_{(\underline{2k}_{r/2-1}, 2k-l, \underline{k}_{r/2-1}, k-l), d} \left\langle \det_{n_2^+}(x_2)^k f(x_2^{-1}), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} & \quad (r: \text{even}), \\ (\lambda)_{(\underline{2k}_{\lfloor r/2 \rfloor}, \underline{k}_{\lfloor r/2 \rfloor}, k-l), d} \left\langle \det_{n_2^+}(x_2)^k f(x_2^{-1}), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} & \quad (r: \text{odd}) \end{aligned}$$

*are holomorphically continued for all  $\lambda \in \mathbb{C}$ , and give non-zero polynomials in  $z \in \mathfrak{p}^+$  for all  $\lambda \in \mathbb{C}$  if  $f(z_2) \neq 0$ .*

(3) *For  $\mu, \nu \in \mathbb{C}$  we have*

$$F_{l,-}^{\downarrow}\left(\begin{matrix} \nu \\ \mu \end{matrix}; f; z\right) = \det_{n^+}(z)^{\mu-2\nu} F_{l,-}^{\downarrow}\left(\begin{matrix} \mu - \nu \\ \mu \end{matrix}; f; z\right).$$

Especially if  $\mu = a - 2k$  and  $\nu = -k$  with  $a, k \in \mathbb{Z}_{\geq 0}$ ,  $a \leq k - l$ , then  $F_{l,-}^{\downarrow}(\nu; f; z)$  is factorized as

$$F_{l,-}^{\downarrow}\left(\begin{matrix} -k \\ a - 2k \end{matrix}; f; z\right) = \det_{n^+}(z)^a F_{l,-}^{\downarrow}\left(\begin{matrix} a - k \\ a - 2k \end{matrix}; f; z\right).$$

The holomorphy in Theorem 4.7 (2) is already proved in [35, Theorem 6.2], but the other results are new except for  $l = 0$  (Example 4.10) or  $r = 2$  (Example 4.11).

**Remark 4.8.** *For + case, in [34, Theorem 6.3 (1)] we proved*

$$\begin{aligned} & \left\langle \det_{n_2^+}(x_2)^k f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\ &= \frac{1}{(\lambda)_{(2k+l, \underline{2k}_{r-1}), d}} \det_{n^+}(z)^{-\lambda + \frac{n}{r}} \det_{n_2^+}\left(\frac{\partial}{\partial z_2}\right)^k \det_{n^+}(z)^{\lambda + 2k - \frac{n}{r}} f(z_2) \\ &= \frac{1}{(\lambda)_{(2k+l, \underline{2k}_{r-1}), d}} \det_{n^+}(z)^{-\lambda + \frac{n}{r}} \det_{n_2^+}\left(\frac{\partial}{\partial z_2}\right)^k F_{l,+}^{\downarrow}\left(\begin{matrix} -\lambda - 2k + \frac{n}{r} \\ -\lambda - 2k + \frac{n}{r} \end{matrix}; f; z\right) \\ &= C_{r,+}^{d,d_2}(\lambda, k, l) \det_{n^+}(z)^{-\lambda + \frac{n}{r}} F_{l,+}^{\downarrow}\left(\begin{matrix} -\lambda - k + \frac{n}{r} \\ -\lambda - 2k + \frac{n}{r} \end{matrix}; f; z\right) \\ &= C_{r,+}^{d,d_2}(\lambda, k, l) F_{l,+}^{\downarrow}\left(\begin{matrix} -k \\ -\lambda - 2k + \frac{n}{r} \end{matrix}; f; z\right). \end{aligned}$$

Similarly, for  $-$  case, by [35, Theorem 3.3 (1)] we have

$$\begin{aligned} & \left\langle \det_{n_2^+}(x_2)^k f(x_2^{-1}), e^{(x|\bar{z})_{p^+}} \right\rangle_{\lambda, x} \\ &= \frac{\det_{n^+}(z)^{-\lambda + \frac{n}{r}}}{(\lambda)_{\underline{2(k-l)}_{r,d}}} \det_{n_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k-l} \det_{n^+}(x)^{\lambda + 2(k-l) - \frac{n}{r}} \left\langle \det_{n_2^+}(x_2)^l f(x_2^{-1}), e^{(x|\bar{z})_{p^+}} \right\rangle_{\lambda + 2(k-l), x}, \end{aligned} \quad (4.8)$$

and combining with Proposition 4.5 and Theorem 4.7 (1), (3), we have

$$\begin{aligned} & \left\langle \det_{n_2^+}(x_2)^k f(x_2^{-1}), e^{(x|\bar{z})_{p^+}} \right\rangle_{\lambda, x} \\ &= \frac{C_{r,-}^{d,d_2}(\lambda + 2(k-l), l, l)}{(\lambda)_{\underline{2(k-l)}_{r,d}}} \det_{n^+}(z)^{-\lambda + \frac{n}{r}} \det_{n_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k-l} \det_{n^+}(z)^{\lambda + 2(k-l) - \frac{n}{r}} \\ & \quad \times F_{l,-}^\downarrow \left( \begin{matrix} -l \\ -\lambda - 2k + \frac{n}{r}; f; z \end{matrix} \right) \\ &= \frac{(\lambda + 2k - l - \frac{d}{2} \lfloor \frac{r}{2} \rfloor + \frac{d_2}{2})_{\lfloor \frac{r}{2} \rfloor - 1, d}}{(\lambda)_{(2k_{\lfloor \frac{r}{2} \rfloor - 1}, 2k - l_{\lfloor \frac{r}{2} \rfloor}, 2k - 2l), d}} \det_{n^+}(z)^{-\lambda + \frac{n}{r}} \det_{n_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k-l} \\ & \quad \times F_{l,-}^\downarrow \left( \begin{matrix} -\lambda - 2k + l + \frac{n}{r} \\ -\lambda - 2k + \frac{n}{r}; f; z \end{matrix} \right) \\ &= C_{r,-}^{d,d_2}(\lambda, k, l) \det_{n^+}(z)^{-\lambda + \frac{n}{r}} F_{l,-}^\downarrow \left( \begin{matrix} -\lambda - k + \frac{n}{r} \\ -\lambda - 2k + \frac{n}{r}; f; z \end{matrix} \right) \\ &= C_{r,-}^{d,d_2}(\lambda, k, l) F_{l,-}^\downarrow \left( \begin{matrix} -k \\ -\lambda - 2k + \frac{n}{r}; f; z \end{matrix} \right). \end{aligned}$$

First we prove Theorem 4.7 (1). By [35, Theorem 6.1] with  $\mathbf{k} = (k_{r-1}, k-l)$ ,  $k_{r+1} = 0$ , when  $d = 2d_2$  we have

$$\begin{aligned} & \frac{\left\langle \det_{n_2^+}(x_2)^k f(x_2^{-1}), e^{(x|\bar{z})_{p^+}} \right\rangle_{\lambda, x}}{\det_{n_2^+}(z_2)^k f(z_2^{-1})} = \frac{\prod_{a=2}^{2r-2} \prod_{i=\max\{1, a+1-r\}}^{\lfloor a/2 \rfloor} (\lambda - \frac{d}{4}(a-1))_{k_i + k_{a+1-i}}}{\prod_{a=1}^{2r-1} \prod_{i=\max\{1, a+1-r\}}^{\lfloor a/2 \rfloor} (\lambda - \frac{d}{4}(a-1))_{k_i + k_{a+2-i}}} \\ &= \prod_{a=1}^{r-2} \frac{\prod_{i=1}^{\lfloor a/2 \rfloor} (\lambda - \frac{d}{4}(a-1))_{2k}}{\prod_{i=1}^{\lfloor a/2 \rfloor} (\lambda - \frac{d}{4}(a-1))_{2k}} \prod_{a=r-1}^{r-1} \frac{\prod_{i=1}^{\lfloor a/2 \rfloor} (\lambda - \frac{d}{4}(a-1))_{2k}}{(\lambda - \frac{d}{4}(a-1))_{2k-l} \prod_{i=2}^{\lfloor a/2 \rfloor} (\lambda - \frac{d}{4}(a-1))_{2k}} \\ & \quad \times \prod_{a=r}^{2r-3} \frac{(\lambda - \frac{d}{4}(a-1))_{2k-l} \prod_{i=a+2-r}^{\lfloor a/2 \rfloor} (\lambda - \frac{d}{4}(a-1))_{2k}}{(\lambda - \frac{d}{4}(a-1))_k (\lambda - \frac{d}{4}(a-1))_{2k-l} \prod_{i=a+3-r}^{\lfloor a/2 \rfloor} (\lambda - \frac{d}{4}(a-1))_{2k}} \\ & \quad \times \prod_{a=2r-2}^{2r-2} \frac{(\lambda - \frac{d}{4}(a-1))_{2k-l}}{(\lambda - \frac{d}{4}(a-1))_k} \prod_{a=2r-1}^{2r-1} \frac{1}{(\lambda - \frac{d}{4}(a-1))_{k-l}} \\ &= \frac{1}{\prod_{a=1, \text{odd}}^{r-2} (\lambda - \frac{d}{4}(a-1))_{2k}} \frac{\prod_{a=r-1, \text{even}}^{r-1} (\lambda - \frac{d}{4}(a-1) + 2k-l)_l}{\prod_{a=r-1, \text{odd}}^{r-1} (\lambda - \frac{d}{4}(a-1))_{2k-l}} \\ & \quad \times \frac{\prod_{a=r, \text{even}}^{2r-3} (\lambda - \frac{d}{4}(a-1) + k)_k}{\prod_{a=r, \text{odd}}^{2r-3} (\lambda - \frac{d}{4}(a-1))_k} \frac{\prod_{a=2r-2}^{2r-2} (\lambda - \frac{d}{4}(a-1) + k)_{k-l}}{\prod_{a=2r-1}^{2r-1} (\lambda - \frac{d}{4}(a-1))_{k-l}} \end{aligned}$$

$$= \begin{cases} \frac{(\lambda - \frac{d}{4}(r-1) + k)_{(\underline{k}_{r/2-1}, k-l), d}}{(\lambda)_{(2\underline{k}_{r/2-1}, 2k-l, \underline{k}_{r/2-1}, k-l), d}} = \frac{(\lambda + k - \frac{d}{4}r + \frac{d_2}{2})_{(\underline{k}_{r/2-1}, k-l), d}}{(\lambda)_{(2\underline{k}_{r/2-1}, 2k-l, \underline{k}_{r/2-1}, k-l), d}} & (r: \text{even}), \\ \frac{(\lambda - \frac{d}{4}(r-2) + (2k-l, \underline{k}_{\lfloor r/2 \rfloor}))_{(l, \underline{k}_{\lfloor r/2 \rfloor - 1}, k-l), d}}{(\lambda)_{(2\underline{k}_{\lfloor r/2 \rfloor}, \underline{k}_{\lfloor r/2 \rfloor}, k-l), d}} = \frac{(\lambda + k - \frac{d}{2} \lfloor \frac{r}{2} \rfloor + \frac{d_2}{2} + (k-l, \underline{0}_{\lfloor r/2 \rfloor}))_{(l, \underline{k}_{\lfloor r/2 \rfloor - 1}, k-l), d}}{(\lambda)_{(2\underline{k}_{\lfloor r/2 \rfloor}, \underline{k}_{\lfloor r/2 \rfloor}, k-l), d}} & (r: \text{odd}), \end{cases}$$

and again by [35, Theorem 6.1] this also holds for  $r = 2$ ,  $d \neq 2d_2$  case. Therefore, to prove (1), it is enough to prove that  $\langle \det_{\mathfrak{n}_2^+}(x_2)^k f(x_2^{-1}), e^{(x|\bar{z})_{\mathfrak{p}^+}} \rangle_{\lambda, x}$  is proportional to  $F_{l,-}^\downarrow(-\lambda - 2k + \frac{n}{r}; f; z)$ , and by the F-method, enough to prove

$$\left( \det_{\mathfrak{n}_2^+}(x_2)^k f(x_2^{-1}) \mapsto F_{l,-}^\downarrow(-\lambda - 2k + \frac{n}{r}; f; z) \right) \in \text{Hom}_{K_1}(\mathcal{P}_{(\underline{k}_{r-1}, k-l)}(\mathfrak{p}_2^+), \text{Sol}_{\mathcal{P}(\mathfrak{p}^+)}((\mathcal{B}_\lambda)_1)), \quad (4.9)$$

where  $(\mathcal{B}_\lambda)_1$  is the orthogonal projection of  $\mathcal{B}_\lambda = \mathcal{B}_\lambda^{\mathfrak{p}^+} : \mathcal{P}(\mathfrak{p}^+) \rightarrow \mathcal{P}(\mathfrak{p}^+) \otimes \mathfrak{p}^+$  given in (2.24) (with the identification  $\mathfrak{p}^- \simeq \mathfrak{p}^+ = \mathfrak{n}^{+\mathbb{C}}$ ) onto  $\mathfrak{p}_1^+$ .

**Proposition 4.9.** *Let  $\mu, \nu \in \mathbb{C}$ ,  $l \in \mathbb{Z}_{\geq 0}$ ,  $f(x_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ .*

- (1) *For  $z = z_1 + z_2 \in \Omega$ ,  $a_2 \in \Omega_2$  with  $z_1 + a_2 \in \Omega$  and for  $\text{Re } \mu > l + \frac{2n_2}{r} - 1$ ,  $\text{Re } \nu > l + \frac{n_2}{r} - 1$ , we have*

$$F_{l,+}^\downarrow\left(\begin{matrix} \nu \\ \mu \end{matrix}; f; z\right) = \frac{1}{(2\pi\sqrt{-1})^{n_2}} \frac{\Gamma_r^{d_2}(\mu - (\underline{0}_{r-1}, l))}{\Gamma_r^{d_2}(\nu - (\underline{0}_{r-1}, l))} \int_{\Omega_2} e^{-(y_2|z_2)_{\mathfrak{n}_2^+}} \det_{\mathfrak{n}_2^+}(y_2)^{\nu-\mu} \\ \times \left( \int_{a_2 + \sqrt{-1}\mathfrak{n}_2^+} e^{(x_2|y_2)_{\mathfrak{n}_2^+}} \det_{\mathfrak{n}^+}(z_1 + x_2)^{-\mu} f(x_2) dx_2 \right) dy_2.$$

Similarly, for  $\text{Re } \mu > \frac{d_2}{2} + \frac{2n_2}{r} - 1$ ,  $\text{Re } \nu > \frac{n_2}{r} - 1$ , we have

$$F_{l,-}^\downarrow\left(\begin{matrix} \nu \\ \mu \end{matrix}; f; z\right) = \frac{1}{(2\pi\sqrt{-1})^{n_2}} \frac{\Gamma_r^{d_2}(\mu - \frac{d_2}{2} + (l, \underline{0}_{r-1}))}{\Gamma_r^{d_2}(\nu + (l, \underline{0}_{r-1}))} \int_{\Omega_2} e^{-(y_2|z_2)_{\mathfrak{n}_2^+}} \det_{\mathfrak{n}_2^+}(y_2)^{\nu-\mu+\frac{d_2}{2}} \\ \times \left( \int_{a_2 + \sqrt{-1}\mathfrak{n}_2^+} e^{(x_2|y_2)_{\mathfrak{n}_2^+}} \det_{\mathfrak{n}_2^+}(x_2)^{-\frac{d_2}{2}} \det_{\mathfrak{n}^+}(z_1 + x_2)^{-\mu+d_2} f(x_2^{-1}) dx_2 \right) dy_2.$$

- (2) *Suppose  $\mu \in \mathbb{C}$  is not a pole of  $F_{l,\pm}^\downarrow(\begin{matrix} \nu \\ \mu \end{matrix}; f; z)$ . Then for  $g \in \widetilde{K}_1^{\mathbb{C}}$  we have*

$$F_{l,+}^\downarrow\left(\begin{matrix} \nu \\ \mu \end{matrix}; f(g(\cdot)); z\right) = \det_{\mathfrak{n}_2^+}(ge)^\nu F_{l,+}^\downarrow\left(\begin{matrix} \nu \\ \mu \end{matrix}; f; gz\right), \\ F_{l,-}^\downarrow\left(\begin{matrix} \nu \\ \mu \end{matrix}; f({}^t g^{-1}(\cdot)); z\right) = \det_{\mathfrak{n}_2^+}(ge)^\nu F_{l,-}^\downarrow\left(\begin{matrix} \nu \\ \mu \end{matrix}; f; gz\right).$$

- (3)  *$F_{l,\pm}^\downarrow(\begin{matrix} \nu \\ \mu \end{matrix}; f; z)$  satisfies the differential equation*

$$(\mathcal{B}_{-\mu+2\nu+\frac{n}{r}})_1 F_{l,\pm}^\downarrow\left(\begin{matrix} \nu \\ \mu \end{matrix}; f; z\right) = 0.$$

For  $F_{l,+}^\downarrow(\nu; f; z)$ , this proposition is a repost of [34, Proposition 6.4], and we only prove this for  $F_{l,-}^\downarrow(\nu; f; z)$ .

*Proof.* (1) By (4.2) and the definition of  $F_{\mathbf{m},\mathbf{l}}^+[f](x_1, y_2)$ , we have

$$\begin{aligned} \det_{\mathbf{n}^+}(z_1 + x_2)^{-\mu+d_2} f(x_2^{-1}) &= \det_{\mathbf{n}_2^+}(x_2)^{-\mu+d_2} h_{\mathbf{n}^+}(z_1, P(x_2^{-1})z_1)^{(-\mu+d_2)/2} f(x_2^{-1}) \\ &= \det_{\mathbf{n}_2^+}(x_2)^{-\mu+d_2} \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} (\mu - d_2)_{\mathbf{m},d} \tilde{\Phi}_{\mathbf{m}}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(z_1, x_2^{-1}) f(x_2^{-1}) \\ &= \det_{\mathbf{n}_2^+}(x_2)^{-\mu+d_2} \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{>0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} (\mu - d_2)_{\mathbf{m},d} F_{\mathbf{m},\mathbf{l}}^+[f](z_1, x_2^{-1}), \end{aligned}$$

and hence by Lemma 2.2 we get

$$\begin{aligned} & \frac{1}{(2\pi\sqrt{-1})^{n_2}} \frac{\Gamma_r^{d_2}(\mu - \frac{d_2}{2} + (l, \underline{\mathbf{0}}_{r-1}))}{\Gamma_r^{d_2}(\nu + (l, \underline{\mathbf{0}}_{r-1}))} \int_{\Omega_2} e^{-(y_2|z_2)_{\mathbf{n}_2^+}} \det_{\mathbf{n}_2^+}(y_2)^{\nu - \mu + \frac{d_2}{2}} \\ & \quad \times \left( \int_{a_2 + \sqrt{-1}\mathbf{n}_2^+} e^{(x_2|y_2)_{\mathbf{n}_2^+}} \det_{\mathbf{n}_2^+}(x_2)^{-\frac{d_2}{2}} \det_{\mathbf{n}^+}(z_1 + x_2)^{-\mu+d_2} f(x_2^{-1}) dx_2 \right) dy_2 \\ &= \frac{1}{(2\pi\sqrt{-1})^n} \frac{\Gamma_r^{d_2}(\mu - \frac{d_2}{2} + (l, \underline{\mathbf{0}}_{r-1}))}{\Gamma_r^{d_2}(\nu + (l, \underline{\mathbf{0}}_{r-1}))} \int_{\Omega_2} e^{-(y_2|z_2)_{\mathbf{n}_2^+}} \det_{\mathbf{n}_2^+}(y_2)^{\nu - \mu + \frac{d_2}{2}} \\ & \quad \times \left( \int_{a_2 + \sqrt{-1}\mathbf{n}_2^+} e^{(x_2|y_2)_{\mathbf{n}_2^+}} \det_{\mathbf{n}_2^+}(x_2)^{-\mu + \frac{d_2}{2}} \sum_{\mathbf{m},\mathbf{l}} (\mu - d_2)_{\mathbf{m},d} F_{\mathbf{m},\mathbf{l}}^+[f](z_1, x_2^{-1}) dx_2 \right) dy_2 \\ &= \frac{\Gamma_r^{d_2}(\mu - \frac{d_2}{2} + (l, \underline{\mathbf{0}}_{r-1}))}{\Gamma_r^{d_2}(\nu + (l, \underline{\mathbf{0}}_{r-1}))} \int_{\Omega_2} e^{-(y_2|z_2)_{\mathbf{n}_2^+}} \det_{\mathbf{n}_2^+}(y_2)^{\nu - \frac{n_2}{r}} \sum_{\mathbf{m},\mathbf{l}} \frac{(\mu - d_2)_{\mathbf{m},d} F_{\mathbf{m},\mathbf{l}}^+[f](z_1, y_2)}{\Gamma_r^{d_2}(\mu - \frac{d_2}{2} + \phi_+(\mathbf{m}, \mathbf{l}))} dy_2 \\ &= \frac{1}{\Gamma_r^{d_2}(\nu + (l, \underline{\mathbf{0}}_{r-1}))} \int_{\Omega_2} e^{-(y_2|z_2)_{\mathbf{n}_2^+}} \sum_{\mathbf{m},\mathbf{l}} \frac{(\mu - d_2)_{\mathbf{m},d} \det_{\mathbf{n}_2^+}(y_2)^{\nu - \frac{n_2}{r}} F_{\mathbf{m},\mathbf{l}}^+[f](z_1, y_2)}{(\mu - \frac{d_2}{2} + (l, \underline{\mathbf{0}}_{r-1}))_{\phi_+(\mathbf{m},\mathbf{l}) - (l, \underline{\mathbf{0}}_{r-1}), d_2}} dy_2 \\ &= \frac{1}{\Gamma_r^{d_2}(\nu + (l, \underline{\mathbf{0}}_{r-1}))} \int_{\Omega_2} e^{-(y_2|z_2)_{\mathbf{n}_2^+}} \sum_{\mathbf{m},\mathbf{l}} \frac{\det_{\mathbf{n}_2^+}(y_2)^{\nu - \frac{n_2}{r}} F_{\mathbf{m},\mathbf{l}}^+[f](z_1, y_2)}{(\mu - \frac{d_2}{2} + (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1 - (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}), d}} dy_2 \\ &= \sum_{\mathbf{m},\mathbf{l}} \frac{\Gamma_r^{d_2}(\nu + \phi_+(\mathbf{m}, \mathbf{l}))}{\Gamma_r^{d_2}(\nu + (l, \underline{\mathbf{0}}_{r-1}))} \frac{\det_{\mathbf{n}_2^+}(z_2)^{-\nu} F_{\mathbf{m},\mathbf{l}}^+[f](z_1, z_2^{-1})}{(\mu - \frac{d_2}{2} + (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1 - (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}), d}} \\ &= \sum_{\mathbf{m},\mathbf{l}} \frac{(\nu + (l, \underline{\mathbf{0}}_{r-1}))_{\phi_+(\mathbf{m},\mathbf{l}) - (l, \underline{\mathbf{0}}_{r-1}), d_2}}{(\mu - \frac{d_2}{2} + (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1 - (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}), d}} \det_{\mathbf{n}_2^+}(z_2)^{-\nu} F_{\mathbf{m},\mathbf{l}}^+[f](z_1, z_2^{-1}) \\ &= \sum_{\mathbf{m},\mathbf{l}} \frac{(\nu + (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1 - (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}), d} (\nu - \frac{d_2}{2})_{\mathbf{m},d}}{(\mu - \frac{d_2}{2} + (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1 - (l, \underline{\mathbf{0}}_{\lfloor r/2 \rfloor - 1}), d}} \det_{\mathbf{n}_2^+}(z_2)^{-\nu} F_{\mathbf{m},\mathbf{l}}^+[f](z_1, z_2^{-1}) \\ &= F_{l,-}^\downarrow\left(\begin{smallmatrix} \nu \\ \mu \end{smallmatrix}; f; z\right). \end{aligned}$$

(2) Since  $F_{\mathbf{m},\mathbf{l}}^+[f](z_1, z_2^{-1})$  satisfies

$$F_{\mathbf{m},\mathbf{l}}^+[f(tg^{-1}(\cdot))](z_1, z_2^{-1}) = F_{\mathbf{m},\mathbf{l}}^+[f](gz_1, (gz_2)^{-1}),$$

we get the desired formula.

(3) As in the proof of [34, Proposition 6.4], we can show that

$$\begin{aligned}
& (\mathcal{B}_{-\mu+2\nu+\frac{n}{r}})_1 \int_{\Omega_2} e^{-(y_2|z_2)_{\mathfrak{n}_2^+}} \det_{\mathfrak{n}_2^+}(y_2)^{\nu-\mu+\frac{d_2}{2}} \left( \int_{a_2+\sqrt{-1}\mathfrak{n}_2^+} e^{(x_2|y_2)_{\mathfrak{n}_2^+}} \right. \\
& \quad \left. \times \det_{\mathfrak{n}^+}(z_1+x_2)^{-\mu+d_2} \det_{\mathfrak{n}_2^+}(x_2)^{-\frac{d_2}{2}} f(x_2^{-1}) dx_2 \right) dy_2 \\
&= \int_{\Omega_2} e^{-(y_2|z_2)_{\mathfrak{n}_2^+}} \det_{\mathfrak{n}_2^+}(y_2)^{\nu-\mu+\frac{d_2}{2}} \left( \int_{a_2+\sqrt{-1}\mathfrak{n}_2^+} e^{(x_2|y_2)_{\mathfrak{n}_2^+}} \right. \\
& \quad \left. \times \det_{\mathfrak{n}^+}(z_1+x_2)^{-\mu+d_2} (\mathcal{B}_{-\mu+d_2+\frac{n}{r}})_1 \det_{\mathfrak{n}_2^+}(x_2)^{-\frac{d_2}{2}} f(x_2^{-1}) dx_2 \right) dy_2.
\end{aligned}$$

Hence it is enough to prove  $(\mathcal{B}_\lambda)_1 \det_{\mathfrak{n}_2^+}(x_2)^{-d_2/2} f(x_2^{-1}) = 0$ . In the following we write  $(z_1, x_2) = (\zeta, X)$ , let  $\{E_\alpha\} \subset \mathfrak{p}_2^+$  be a basis with the dual basis  $\{E_\alpha^\vee\} \subset \mathfrak{p}_2^+$ , and let  $\frac{\partial}{\partial X_\alpha}$ ,  $\frac{\partial}{\partial Y_\alpha^\vee}$  denote the directional derivatives along  $E_\alpha$  and  $E_\alpha^\vee$ . Then we have

$$\begin{aligned}
& (\mathcal{B}_\lambda)_1 \det_{\mathfrak{n}_2^+}(X)^{-d_2/2} f(X^{-1}) = \frac{1}{2} \sum_{\alpha\beta} P(E_\alpha^\vee, E_\beta^\vee) \zeta \frac{\partial^2}{\partial X_\alpha \partial X_\beta} \det_{\mathfrak{n}_2^+}(X)^{-d_2/2} f(X^{-1}) \\
&= \frac{1}{2} \sum_{\alpha\beta} P(E_\alpha^\vee, E_\beta^\vee) \zeta \det_{\mathfrak{n}_2^+}(X)^{-d_2/2} \left( \left( \frac{d_2^2}{4} (E_\alpha|X^{-1})_{\mathfrak{n}_2^+} (E_\beta|X^{-1})_{\mathfrak{n}_2^+} \right. \right. \\
& \quad \left. \left. + \frac{d_2}{2} (E_\beta|P(X)^{-1}E_\alpha)_{\mathfrak{n}_2^+} \right) f(X^{-1}) - d_2 (E_\beta|X^{-1})_{\mathfrak{n}_2^+} \frac{\partial}{\partial X_\alpha} f(X^{-1}) + \frac{\partial^2}{\partial X_\alpha \partial X_\beta} f(X^{-1}) \right) \\
&= \det_{\mathfrak{n}_2^+}(X)^{-d_2/2} \left( \left( \frac{d_2^2}{4} P(X^{-1}) \zeta + \frac{d_2}{4} \sum_{\alpha} P(E_\alpha^\vee, P(X)^{-1}E_\alpha) \zeta \right) f(X^{-1}) \right. \\
& \quad \left. + \frac{d_2}{2} \sum_{\alpha} P(E_\alpha^\vee, X^{-1}) \zeta \sum_{\gamma} (E_\gamma|P(X)^{-1}E_\alpha)_{\mathfrak{n}_2^+} \frac{\partial f}{\partial Y_\gamma^\vee}(X^{-1}) \right. \\
& \quad \left. + \frac{1}{2} \sum_{\alpha\beta} P(E_\alpha^\vee, E_\beta^\vee) \zeta \left( \sum_{\gamma\delta} (E_\gamma|P(X^{-1})E_\alpha)_{\mathfrak{n}_2^+} (E_\delta|P(X^{-1})E_\beta)_{\mathfrak{n}_2^+} \frac{\partial^2 f}{\partial Y_\gamma^\vee \partial Y_\delta^\vee}(X^{-1}) \right. \right. \\
& \quad \left. \left. + \sum_{\gamma} (E_\gamma|P(X^{-1}, P(X)^{-1}E_\alpha)E_\beta)_{\mathfrak{n}_2^+} \frac{\partial f}{\partial Y_\gamma^\vee}(X^{-1}) \right) \right) \\
&= \det_{\mathfrak{n}_2^+}(X)^{-d_2/2} \left( \left( \frac{d_2^2}{4} P(X)^{-1} \zeta + \frac{d_2}{4} \sum_{\alpha} P(E_\alpha^\vee, P(X)^{-1}E_\alpha) \zeta \right) f(X^{-1}) \right. \\
& \quad \left. + \frac{d_2}{2} \sum_{\gamma} P(P(X)^{-1}E_\gamma, X^{-1}) \zeta \frac{\partial f}{\partial Y_\gamma^\vee}(X^{-1}) \right. \\
& \quad \left. + \frac{1}{2} \sum_{\gamma\delta} P(P(X)^{-1}E_\gamma, P(X)^{-1}E_\delta) \zeta \frac{\partial^2 f}{\partial Y_\gamma^\vee \partial Y_\delta^\vee}(X^{-1}) \right. \\
& \quad \left. + \frac{1}{2} \sum_{\alpha\gamma} P(E_\alpha^\vee, P(X^{-1}, P(X)^{-1}E_\alpha)E_\gamma) \zeta \frac{\partial f}{\partial Y_\gamma^\vee}(X^{-1}) \right).
\end{aligned}$$

Then at the 5th term, since  $\sum_{\alpha} P(E_\alpha^\vee, P(X^{-1}, P(X)^{-1}E_\alpha)E_\gamma) \zeta$  does not depend on the choice of  $\{E_\alpha\}$  and  $\{E_\alpha^\vee\}$ , we may replace these with  $\{P(X^{1/2})E'_\alpha\}$  and  $\{P(X^{-1/2})E'_\alpha\}$  by using an orthonormal basis  $\{E'_\alpha\} \subset \mathfrak{n}_2^+$ . Then by using the equality  $X^{-1} = P(X^{-1/2})E$ ,

where  $E \in \mathfrak{n}_2^+$  is the unit element, and  $P(P(X)Y, P(X)Z) = P(X)P(Y, Z)P(X)$ , we have

$$\begin{aligned}
& \sum_{\alpha} P(E_{\alpha}^{\vee}, P(X^{-1}, P(X)^{-1}E_{\alpha})E_{\gamma})\zeta \\
&= \sum_{\alpha} P(P(X^{-1/2})E'_{\alpha}, P(P(X^{-1/2})E, P(X^{-1/2})E'_{\alpha})E_{\gamma})\zeta \\
&= \sum_{\alpha} P(X^{-1/2})P(E'_{\alpha}, P(E, E'_{\alpha})P(X^{-1/2})E_{\gamma})P(X^{-1/2})\zeta \\
&= P(X^{-1/2}) \sum_{\alpha} (P(E'_{\alpha})D_{\mathfrak{n}^+}(P(X^{-1/2})E_{\gamma}, E) + D_{\mathfrak{n}^+}(E, P(X^{-1/2})E_{\gamma})P(E'_{\alpha}))P(X^{-1/2})\zeta \\
&= P(X^{-1/2}) \left( -\frac{d_2}{2}D_{\mathfrak{n}^+}(P(X^{-1/2})E_{\gamma}, E) - \frac{d_2}{2}D_{\mathfrak{n}^+}(E, P(X^{-1/2})E_{\gamma}) \right) P(X^{-1/2})\zeta \\
&= -d_2P(X^{-1/2})P(P(X^{-1/2})E_{\gamma}, E)P(X^{-1/2})\zeta = -d_2P(P(X)^{-1}E_{\gamma}, X^{-1})\zeta,
\end{aligned}$$

where at the 3rd equality we have used [7, Part V, Proposition I.2.1 (J2.3)], at the 4th equality  $\sum_{\alpha} P(E'_{\alpha})\eta = -\frac{d_2}{2}\eta$  follows from direct computation with an explicit basis, and at the 5th equality we have used  $D_{\mathfrak{n}^+}(Y, E) = D_{\mathfrak{n}^+}(E, Y) = P(Y, E)$ . Similarly, at the 2nd term we have

$$\begin{aligned}
& \sum_{\alpha} P(E_{\alpha}^{\vee}, P(X)^{-1}E_{\alpha})\zeta = \sum_{\alpha} P(P(X^{-1/2})E_{\alpha}^{\vee}, P(X^{-1/2})E_{\alpha})\zeta \\
&= P(X^{-1/2}) \sum_{\alpha} P(E'_{\alpha}, E'_{\alpha})P(X^{-1/2})\zeta = -d_2P(X^{-1/2})^2\zeta = -d_2P(X)^{-1}\zeta.
\end{aligned}$$

Therefore we get

$$\begin{aligned}
& (\mathcal{B}_{\lambda})_1 \det_{\mathfrak{n}_2^+}(X)^{-d_2/2} f(X^{-1}) \\
&= \det_{\mathfrak{n}_2^+}(X)^{-d_2/2} \left( \left( \frac{d_2^2}{4}P(X)^{-1}\zeta - \frac{d_2^2}{4}P(X)^{-1}\zeta \right) f(X^{-1}) \right. \\
&\quad + \frac{d_2}{2} \sum_{\gamma} P(P(X)^{-1}E_{\gamma}, X^{-1})\zeta \frac{\partial f}{\partial Y_{\gamma}^{\vee}}(X^{-1}) \\
&\quad + \frac{1}{2} \sum_{\gamma\delta} P(P(X)^{-1}E_{\gamma}, P(X)^{-1}E_{\delta})\zeta \frac{\partial^2 f}{\partial Y_{\gamma}^{\vee} \partial Y_{\delta}^{\vee}}(X^{-1}) \\
&\quad \left. - \frac{d_2}{2} \sum_{\gamma} P(P(X)^{-1}E_{\gamma}, X^{-1})\zeta \frac{\partial f}{\partial Y_{\gamma}^{\vee}}(X^{-1}) \right) \\
&= \frac{1}{2} \det_{\mathfrak{n}_2^+}(X)^{-d_2/2} P(X)^{-1} \sum_{\gamma\delta} P(E_{\gamma}, E_{\delta})P(X)^{-1}\zeta \frac{\partial^2 f}{\partial Y_{\gamma}^{\vee} \partial Y_{\delta}^{\vee}}(X^{-1}).
\end{aligned}$$

Now, let  $\mathfrak{p}^+ = \bigoplus_{1 \leq i < j \leq r} \mathfrak{p}_{ij}^+$  be the simultaneous Peirce decomposition given in Section 2.4 with respect to a Jordan frame  $\{e_1, \dots, e_r\} \subset \mathfrak{n}_2^+ \subset \mathfrak{n}^+$ . If  $f(Y) = (Y_{11})^l \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ , then since  $\mathfrak{p}_{11}^+ \cap \mathfrak{p}_1^+ = \{0\}$ , for  $\eta \in \mathfrak{p}_1^+$  we have

$$\sum_{\gamma\delta} P(E_{\gamma}, E_{\delta})\eta \frac{\partial^2 f}{\partial Y_{\gamma}^{\vee} \partial Y_{\delta}^{\vee}}(Y) = l(l-1)P(E_{11}, E_{11})\eta(Y_{11})^{l-2} = 0,$$

and by the  $K_1$ -equivariance,  $\sum_{\gamma\delta} P(E_{\gamma}, E_{\delta})\eta \frac{\partial^2 f}{\partial Y_{\gamma}^{\vee} \partial Y_{\delta}^{\vee}}(Y) = 0$  holds for all  $f \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ . Hence we get  $(\mathcal{B}_{\lambda})_1 \det_{\mathfrak{n}_2^+}(x_2)^{-d_2/2} f(x_2^{-1}) = 0$  for all  $f \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ , and also get

$(\mathcal{B}_{-\mu+2\nu+\frac{n}{r}})_1 F_{l,-}^{\downarrow}(\nu; f; z) = 0$  for  $\operatorname{Re} \mu > \frac{d_2}{2} + \frac{2n_2}{r} - 1$ ,  $\operatorname{Re} \nu > \frac{n_2}{r} - 1$ . Then by analytic continuation, this holds for all  $\mu, \nu \in \mathbb{C}$  except for poles.  $\square$

Especially, when  $\mu = -\lambda - 2k + \frac{n}{r}$ ,  $\nu = -k$  with  $k \in \mathbb{Z}_{\geq 0}$ ,  $k \geq l$ , we have (4.9), and this proves Theorem 4.7 (1). Next we prove Theorems 4.6 (2) and 4.7 (2).

*Proof of Theorem 4.6 (2).* Let  $\mu := -\lambda - 2k + \frac{n}{r} = -\lambda - 2k + 1 + \frac{d}{2}(r-1)$ . We recall from the proof of [34, Corollary 6.6 (1)] that, by Theorem 4.6 (1), for  $f(x_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ , for even  $r$  we have

$$\begin{aligned}
& (\lambda)_{(2k+l, \underline{2k}_{r/2-1}, \underline{k}_{r/2}, d)} \left\langle \det_{\mathfrak{n}_2^+}(x_2)^k f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\
&= \left( \lambda + k - \frac{d}{4}r + \frac{d_2}{2} + (l, \underline{0}_{r/2-1}) \right)_{\underline{k}_{r/2}, d} F_{l,+}^{\downarrow} \left( \begin{matrix} -k \\ \mu \end{matrix}; f; z \right) \\
&= (-1)^{kr/2} \left( \mu - \frac{d_2}{2} - (\underline{0}_{r/2-1}, l) \right)_{\underline{k}_{r/2}, d} \det_{\mathfrak{n}_2^+}(z_2)^k \\
&\quad \times \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} \frac{(-k)_{\mathbf{m}, d} \left( -k - \frac{d_2}{2} - (\underline{0}_{r/2-1}, l) \right)_{\mathbf{m}-\mathbf{l}+(\underline{0}_{r/2-1}, l), d}}{\left( \mu - \frac{d_2}{2} - (\underline{0}_{r/2-1}, l) \right)_{\mathbf{m}-\mathbf{l}+(\underline{0}_{r/2-1}, l), d}} F_{\mathbf{m}, \mathbf{l}}^{-}[f](z_1, z_2^{-1}),
\end{aligned} \tag{4.10}$$

and for odd  $r$  we have

$$\begin{aligned}
& (\lambda)_{(2k+l, \underline{2k}_{\lfloor r/2 \rfloor-1}, \min\{2k, k+l\}, \underline{k}_{\lfloor r/2 \rfloor}, d)} \left\langle \det_{\mathfrak{n}_2^+}(x_2)^k f(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\
&= \left( \lambda - \frac{d}{2} \left\lfloor \frac{r}{2} \right\rfloor + \max\{2k, k+l\} \right)_{\min\{k, l\}} \left( \lambda + k - \frac{d}{2} \left\lfloor \frac{r}{2} \right\rfloor + \frac{d_2}{2} \right)_{\underline{k}_{\lfloor r/2 \rfloor}, d} F_{l,+}^{\downarrow} \left( \begin{matrix} -k \\ \mu \end{matrix}; f; z \right) \\
&= (-1)^{k\lfloor r/2 \rfloor + \min\{k, l\}} \left( \mu - \frac{d_2}{2} \right)_{\underline{k}_{\lfloor r/2 \rfloor}, d} \left( \mu - \frac{d_2}{2}(r-1) - l \right)_{\min\{k, l\}} \det_{\mathfrak{n}_2^+}(z_2)^k \\
&\quad \times \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} \frac{(-k)_{\mathbf{m}, d} \left( -k - \frac{d_2}{2} \right)_{\mathbf{m}-\mathbf{l}, d} \left( -k - \frac{d_2}{2}(r-1) - l \right)_{l-l_{\lfloor r/2 \rfloor}}}{\left( \mu - \frac{d_2}{2} \right)_{\mathbf{m}-\mathbf{l}, d} \left( \mu - \frac{d_2}{2}(r-1) - l \right)_{l-l_{\lfloor r/2 \rfloor}}} F_{\mathbf{m}, \mathbf{l}}^{-}[f](z_1, z_2^{-1}).
\end{aligned} \tag{4.11}$$

These are holomorphically continued for all  $\mu \in \mathbb{C}$ . Moreover, all non-zero  $F_{\mathbf{m}, \mathbf{l}}^{-}[f](z_1, z_2^{-1})$  are linearly independent, and when  $r$  is even, the coefficient of (4.10) for

$$F_{\underline{k}_{r/2}, (\underline{0}_{r/2-1}, l)}^{-}[f](z_1, z_2^{-1}) = \tilde{\Phi}_{\underline{k}_{r/2}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(z_1, z_2^{-1}) f(z_2)$$

is independent of  $\mu$  and non-zero. Hence (4.10) is non-zero for all  $\mu \in \mathbb{C}$  when  $f(x_2) \neq 0$ . Similarly, when  $r$  is odd, the coefficients of (4.11) for  $(\mathbf{m}, \mathbf{l}) = (\underline{k}_{\lfloor r/2 \rfloor}, (\underline{0}_{\lfloor r/2 \rfloor}, l))$  and

$$(\mathbf{m}, \mathbf{l}) = (\underline{k}_{\lfloor r/2 \rfloor}, (\underline{0}_{\lfloor r/2 \rfloor - 1}, \min\{k, l\}, \max\{l - k, 0\})),$$

$$\begin{aligned} & \frac{(\mu - \frac{d_2}{2})_{\underline{k}_{\lfloor r/2 \rfloor}, d} (\mu - \frac{d_2}{2}(r-1) - l)_{\min\{k, l\}}}{(\mu - \frac{d_2}{2})_{\underline{k}_{\lfloor r/2 \rfloor} - \underline{0}_{\lfloor r/2 \rfloor}, d} (\mu - \frac{d_2}{2}(r-1) - l)_{l-l}} = \left( \mu - \frac{d_2}{2}(r-1) - l \right)_{\min\{k, l\}}, \\ & \frac{(\mu - \frac{d_2}{2})_{\underline{k}_{\lfloor r/2 \rfloor}, d} (\mu - \frac{d_2}{2}(r-1) - l)_{\min\{k, l\}}}{(\mu - \frac{d_2}{2})_{\underline{k}_{\lfloor r/2 \rfloor} - (\underline{0}_{\lfloor r/2 \rfloor - 1}, \min\{k, l\}), d} (\mu - \frac{d_2}{2}(r-1) - l)_{l - \max\{l-k, 0\}}} \\ & = \left( \mu - \frac{d_2}{2}(r-2) + \max\{0, k-l\} \right)_{\min\{k, l\}} \end{aligned}$$

do not vanish simultaneously, and if  $f(x_2) = (x_2|w_2)_{\mathfrak{n}_2^+}^l$  for some  $w_2 \in \mathfrak{p}_2^+$  of rank 1, then by Proposition 4.3 (3) we have

$$F_{\underline{k}_{\lfloor r/2 \rfloor}, (\underline{0}_{\lfloor r/2 \rfloor}, l)}^- [f](z_1, z_2^{-1}) \neq 0, \quad F_{\underline{k}_{\lfloor r/2 \rfloor}, (\underline{0}_{\lfloor r/2 \rfloor - 1}, \min\{k, l\}, \max\{l-k, 0\})}^- [f](z_1, z_2^{-1}) \neq 0.$$

By the  $K_1^{\mathbb{C}}$ -equivariance these hold for all non-zero  $f(x_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ . Hence (4.11) is non-zero for all  $\mu \in \mathbb{C}$  if  $f(x_2) \neq 0$ .  $\square$

*Proof of Theorem 4.7 (2).* Again let  $\mu := -\lambda - 2k + \frac{n}{r} = -\lambda - 2k + 1 + \frac{d}{2}(r-1)$ . By Theorem 4.7 (1), for even  $r$  we have

$$\begin{aligned} & (\lambda)_{(2\underline{k}_{r/2-1}, 2k-l, \underline{k}_{r/2-1}, k-l), d} \left\langle \det_{\mathfrak{n}_2^+}(x_2)^k f(x_2^{-1}), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\ & = \left( \lambda + k - \frac{d}{4}r + \frac{d_2}{2} \right)_{(\underline{k}_{r/2-1}, k-l), d} F_{l, -}^{\downarrow} \left( \begin{matrix} -k \\ \mu \end{matrix}; f; z \right) \\ & = (-1)^{kr/2-l} \left( \mu - \frac{d_2}{2} + (l, \underline{0}_{r/2-1}) \right)_{(k-l, \underline{k}_{r/2-1}), d} \det_{\mathfrak{n}_2^+}(z_2)^k \\ & \quad \times \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} \frac{(-k + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} (-k - \frac{d_2}{2})_{\mathbf{m}, d}}{(\mu - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d}} F_{\mathbf{m}, \mathbf{l}}^+ [f](z_1, z_2^{-1}), \end{aligned} \tag{4.12}$$

and for odd  $r$  we have

$$\begin{aligned} & (\lambda)_{(2\underline{k}_{\lfloor r/2 \rfloor}, \underline{k}_{\lfloor r/2 \rfloor}, k-l), d} \left\langle \det_{\mathfrak{n}_2^+}(x_2)^k f(x_2^{-1}), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\ & = \left( \lambda + k - \frac{d}{2} \left\lfloor \frac{r}{2} \right\rfloor + \frac{d_2}{2} + (k-l, \underline{0}_{\lfloor r/2 \rfloor}) \right)_{(l, \underline{k}_{\lfloor r/2 \rfloor - 1}, k-l), d} F_{l, -}^{\downarrow} \left( \begin{matrix} -k \\ \mu \end{matrix}; f; z \right) \\ & = (-1)^{k\lfloor r/2 \rfloor} \left( \mu - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor}) \right)_{(k-l, \underline{k}_{\lfloor r/2 \rfloor - 1}, l), d} \det_{\mathfrak{n}_2^+}(z_2)^k \\ & \quad \times \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} \frac{(-k + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} (-k - \frac{d_2}{2})_{\mathbf{m}, d}}{(\mu - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d}} F_{\mathbf{m}, \mathbf{l}}^+ [f](z_1, z_2^{-1}). \end{aligned} \tag{4.13}$$

These are holomorphically continued for all  $\mu \in \mathbb{C}$ . Moreover, all non-zero  $F_{\mathbf{m}, \mathbf{l}}^+ [f](z_1, z_2^{-1})$  are linearly independent. When  $r$  is even, the coefficient of (4.12) for  $(\mathbf{m}, \mathbf{l}) = ((\underline{k}_{r/2-1},$

$k-l$ ),  $(\underline{\mathbb{Q}}_{r/2-1}, l)$ ) is independent of  $\mu$  and non-zero, and when  $r$  is odd, the coefficient of (4.13) for  $(\mathbf{m}, \mathbf{l}) = (\underline{k}_{\lfloor r/2 \rfloor}, (\underline{\mathbb{Q}}_{\lfloor r/2 \rfloor}, l))$  is independent of  $\mu$  and non-zero. Moreover, if  $f(x_2) = (x_2|e')_{\mathfrak{n}_2^+}^l$  for some primitive idempotent  $e' \in \mathfrak{n}_2^+$ , then for even  $r$ , by Proposition 4.3 (1), (4) and Example 4.1 we have

$$\begin{aligned} & \det_{\mathfrak{n}_2^+}(z_2)^k F_{(\underline{k}_{r/2-1}, k-l), (\underline{\mathbb{Q}}_{r/2-1}, l)}^+ [(\cdot|e')_{\mathfrak{n}_2^+}^l](z_1, z_2^{-1}) \\ &= \frac{1}{(-(k-l, \underline{k}_{r/2-1}))_{\underline{k-l}_{r/2}, d}} \det_{\mathfrak{n}^+}(z_1)^{k-l} \det_{\mathfrak{n}_2^+}(z_2)^l F_{(\underline{l}_{r/2-1}, 0), (\underline{\mathbb{Q}}_{r/2-1}, l)}^+ [(\cdot|e')_{\mathfrak{n}_2^+}^l](z_1, z_2^{-1}) \\ &= \frac{(-k)_l}{(-k)_{(k, \underline{k-l}_{r/2-1}), d}} \frac{(-l)_{\underline{l}_{r/2-1}, d}}{(-l - \frac{d}{2})_{\underline{l}_{r/2-1}, d}} \det_{\mathfrak{n}^+}(z_1)^{k-l} \det_{\mathfrak{n}_2^{+''}}(z_2'')^l \tilde{\Phi}_{\underline{l}_{r/2-1}}^{\mathfrak{p}_1^{+''}, \mathfrak{p}_2^{-''}}(z_1'', (z_2'')^{-1}) \\ &= \frac{(-k)_l}{(-k)_{\underline{k}_{r/2}, d}} \det_{\mathfrak{n}^+}(z_1)^{k-l} ((z_1'')^\# | z_2''^l)_{\mathfrak{n}_2^{+''}} \neq 0, \end{aligned}$$

and for odd  $r$ , by Proposition 4.3 (2) we have

$$\begin{aligned} & \det_{\mathfrak{n}_2^+}(z_2)^k F_{\underline{k}_{\lfloor r/2 \rfloor}, (\underline{\mathbb{Q}}_{\lfloor r/2 \rfloor}, l)}^+ [(\cdot|e')_{\mathfrak{n}_2^+}^l](z_1, z_2^{-1}) \\ &= \frac{(-1)^l (-k)_l (-l)_l}{(-k)_{\underline{k}_{\lfloor r/2 \rfloor}, d} (-k - \frac{d_2}{2}(r-1))_l l!} (z_2 | (z_1)^\#)_{\mathfrak{n}_2^+}^{k-l} ((z_1)^\# | e')_{\mathfrak{n}_2^+}^l \\ &= \frac{(-k)_l}{(-k)_{(\underline{k}_{\lfloor r/2 \rfloor}, l), d}} (z_2 | (z_1)^\#)_{\mathfrak{n}_2^+}^{k-l} ((z_1)^\# | e')_{\mathfrak{n}_2^+}^l \neq 0, \end{aligned}$$

and by the  $K_1^{\mathbb{C}}$ -equivariance,

$$\begin{aligned} F_{(\underline{k}_{r/2-1}, k-l), (\underline{\mathbb{Q}}_{r/2-1}, l)}^+ [f](z_1, z_2^{-1}) &\neq 0 & (r: \text{even}), \\ F_{\underline{k}_{\lfloor r/2 \rfloor}, (\underline{\mathbb{Q}}_{\lfloor r/2 \rfloor}, l)}^+ [f](z_1, z_2^{-1}) &\neq 0 & (r: \text{odd}) \end{aligned}$$

hold for all non-zero  $f(x_2) \in \mathcal{P}_{(l, \underline{\mathbb{Q}}_{r-1})}(\mathfrak{p}_2^+)$ . Hence (4.13) is non-zero for all  $\mu \in \mathbb{C}$  if  $f(x_2) \neq 0$ .  $\square$

*Proof of Theorem 4.7 (3).* Combining Theorem 4.7 (1) and (4.8), for  $\text{Re } \lambda > \frac{2n}{r} - 1$ ,  $k, l \in \mathbb{Z}_{\geq 0}$ ,  $k \geq l$  we have

$$\begin{aligned} C_{r, -}^{d, d_2}(\lambda, k, l) F_{l, -}^\downarrow \left( \begin{matrix} -k \\ -\lambda - 2k + \frac{n}{r}; f; z \end{matrix} \right) &= \frac{C_{r, -}^{d, d_2}(\lambda + 2(k-l), l, l)}{(\lambda)_{\underline{2(k-l)}_r, d}} \det_{\mathfrak{n}^+}(z)^{-\lambda + \frac{n}{r}} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k-l} \\ &\quad \times \det_{\mathfrak{n}^+}(z)^{\lambda + 2(k-l) - \frac{n}{r}} F_{l, -}^\downarrow \left( \begin{matrix} -l \\ -\lambda - 2k + \frac{n}{r}; f; z \end{matrix} \right), \end{aligned}$$

that is,

$$\begin{aligned} F_{l, -}^\downarrow \left( \begin{matrix} -k \\ -\lambda - 2k + \frac{n}{r}; f; z \end{matrix} \right) &= \frac{\det_{\mathfrak{n}^+}(z)^{-\lambda + \frac{n}{r}}}{(\lambda - \frac{d}{4}r + \frac{d_2}{2} + (\underline{k}_{r-1}, k-l))_{\underline{k-l}_r, d_2}} \det_{\mathfrak{n}_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k-l} \\ &\quad \times \det_{\mathfrak{n}^+}(z)^{\lambda + 2(k-l) - \frac{n}{r}} F_{l, -}^\downarrow \left( \begin{matrix} -l \\ -\lambda - 2k + \frac{n}{r}; f; z \end{matrix} \right). \end{aligned}$$

Then this is meromorphically continued for all  $\lambda \in \mathbb{C}$ , and if  $\lambda = \frac{n}{r} - a = \frac{d}{2}(r-1) + 1 - a$ ,  $a = 1, 2, \dots, k-l$ , then the left hand side of

$$\det_{n^+}(z)^{-a} F_{l,-}^\downarrow \left( \begin{matrix} -k \\ a-2k \end{matrix}; f; z \right) = \frac{1}{\left( \frac{d_2}{2}(r-1) + 1 - a + (\underline{k}_{r-1}, k-l) \right)_{\underline{k-l}, d_2}} \det_{n_2^+} \left( \frac{\partial}{\partial z_2} \right)^{k-l} \\ \times \det_{n^+}(z)^{2(k-l)-a} F_{l,-}^\downarrow \left( \begin{matrix} -l \\ a-2k \end{matrix}; f; z \right)$$

becomes a polynomial (note that  $d_2 = d/2$  or  $r = 2$  hold). Hence  $F_{l,-}^\downarrow \left( \begin{matrix} -k \\ a-2k \end{matrix}; f; z \right)$  is divisible by  $\det_{n^+}(z)^a$ . Also, by  $\mathcal{B}_{\frac{n}{r}-a} \det_{n^+}(z)^a = \det_{n^+}(z)^a \mathcal{B}_{\frac{n}{r}+a}$  (see the proof of [9, Proposition XV.2.4]), we have

$$(\mathcal{B}_{\frac{n}{r}+a})_1 \det_{n^+}(z)^{-a} F_{l,-}^\downarrow \left( \begin{matrix} -k \\ a-2k \end{matrix}; f; z \right) = \det_{n^+}(z)^{-a} (\mathcal{B}_{\frac{n}{r}-a})_1 F_{l,-}^\downarrow \left( \begin{matrix} -k \\ a-2k \end{matrix}; f; z \right) = 0,$$

and hence

$$\left( \det_{n_2^+}(x_2)^{k-a} f(x_2^{-1}) \mapsto \det_{n_2^+}(z)^{-a} F_{l,-}^\downarrow \left( \begin{matrix} -k \\ a-2k \end{matrix}; f; z \right) \right) \\ \in \text{Hom}_{K_1^{\mathbb{C}}}(\mathcal{P}_{(\underline{k-a}_{r-1}, k-l-a)}(\mathfrak{p}_2^+), \text{Sol}_{\mathcal{P}(\mathfrak{p}^+)}((\mathcal{B}_{\frac{n}{r}+a})_1)) \\ \simeq \mathbb{C} \left( \det_{n_2^+}(x_2)^{k-a} f(x_2^{-1}) \mapsto F_{l,-}^\downarrow \left( \begin{matrix} a-k \\ a-2k \end{matrix}; f; z \right) \right)$$

holds. Then comparing the values at  $z_1 = 0$ , for  $a, k \in \mathbb{Z}_{\geq 0}$  with  $a \leq k-l$ , we get

$$F_{l,-}^\downarrow \left( \begin{matrix} -k \\ a-2k \end{matrix}; f; z \right) = \det_{n^+}(z)^a F_{l,-}^\downarrow \left( \begin{matrix} a-k \\ a-2k \end{matrix}; f; z \right) \quad (4.14)$$

(see [35, Theorem 6.6] for more general case). Now we want to prove this for general  $(a, k) \in \mathbb{C}^2$ . We recall that the left hand side of (4.14) is given by

$$F_{l,-}^\downarrow \left( \begin{matrix} -k \\ a-2k \end{matrix}; f; z \right) = \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} \frac{(-k + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} (-k - \frac{d_2}{2})_{\mathbf{m}, d}}{(a-2k - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d}} \\ \times \det_{n_2^+}(z_2)^k F_{\mathbf{m}, \mathbf{l}}^+[f](z_1, z_2^{-1}). \quad (4.15)$$

Similarly, by (4.2), the right hand side is computed as

$$\det_{n^+}(z)^a F_{l,-}^\downarrow \left( \begin{matrix} a-k \\ a-2k \end{matrix}; f; z \right) \\ = \sum_{\mathbf{m}' \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l}' \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}'|=l}} \frac{(a-k + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}'+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} (a-k - \frac{d_2}{2})_{\mathbf{m}', d}}{(a-2k - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}'+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d}} \\ \times \det_{n_2^+}(z_2)^{k-a} F_{\mathbf{m}', \mathbf{l}'}^+[f](z_1, z_2^{-1}) \det_{n_2^+}(z_2)^a h_{n^+}(z_1, P(z_2^{-1})z_1)^{a/2} \\ = \sum_{\mathbf{m}' \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l}' \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}'|=l}} \frac{(a-k + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}'+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} (a-k - \frac{d_2}{2})_{\mathbf{m}', d}}{(a-2k - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}'+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d}} \\ \times \det_{n_2^+}(z_2)^k F_{\mathbf{m}', \mathbf{l}'}^+[f](z_1, z_2^{-1}) \sum_{\mathbf{m}'' \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} (-a)_{\mathbf{m}'', d} \tilde{\Phi}_{\mathbf{m}''}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(z_1, z_2^{-1}).$$

Then we have

$$\begin{aligned}
& (f \mapsto F_{\mathbf{m}', \mathbf{l}'}^+[f](z_1, y_2) \tilde{\Phi}_{\mathbf{m}''}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(z_1, y_2)) \\
& \in \text{Hom}_{K_1^{\mathbb{C}}}(\mathcal{P}_{(l, \underline{0}_{r-1})}(\mathbf{p}_2^-), \mathcal{P}_{\langle \mathbf{m}' \rangle}(\mathbf{p}_1^+) \otimes \mathcal{P}_{\phi_+(\mathbf{m}', \mathbf{l}')}(\mathbf{p}_2^-) \otimes \mathcal{P}_{\langle \mathbf{m}'' \rangle}(\mathbf{p}_1^+) \otimes \mathcal{P}_{\mathbf{m}''2}(\mathbf{p}_2^-)) \\
& \subset \bigoplus_{\substack{\mathbf{k} \\ |\mathbf{k}| = |\langle \mathbf{m}' \rangle| + |\langle \mathbf{m}'' \rangle| \\ k_j \geq \max\{\langle \mathbf{m}' \rangle_j, \langle \mathbf{m}'' \rangle_j\}}} \bigoplus_{\substack{\mathbf{k}' \in \mathbb{Z}_{++}^r \\ |\mathbf{k}'| = |\phi_+(\mathbf{m}', \mathbf{l}')| + |\mathbf{m}''2| \\ k'_j \geq \max\{\phi_+(\mathbf{m}', \mathbf{l}')_j, \langle \mathbf{m}''2 \rangle_j\}}} \text{Hom}_{K_1^{\mathbb{C}}}(\mathcal{P}_{(l, \underline{0}_{r-1})}(\mathbf{p}_2^-), \mathcal{P}_{\mathbf{k}}(\mathbf{p}_1^+) \otimes \mathcal{P}_{\mathbf{k}'}(\mathbf{p}_2^-)),
\end{aligned}$$

where  $\mathbf{k} \in \mathbb{Z}_{++}^{\lfloor r/\varepsilon_1 \rfloor}$  (Case 1 ( $n' \neq 2$ ), Case 2) or  $\mathbf{k} \in (\mathbb{Z}_{++}^{\lfloor r/2 \rfloor})^2$  (Case 1 ( $n' = 2$ ), Case 3). Now since  $\text{Hom}_{K_1^{\mathbb{C}}}(\mathcal{P}_{(l, \underline{0}_{r-1})}(\mathbf{p}_2^-), \mathcal{P}_{\mathbf{k}}(\mathbf{p}_1^+) \otimes \mathcal{P}_{\mathbf{k}'}(\mathbf{p}_2^-)) \neq \{0\}$  implies  $(\mathbf{k}, \mathbf{k}') = (\langle \mathbf{m} \rangle, \phi_+(\mathbf{m}, \mathbf{l}))$  for some  $(\mathbf{m}, \mathbf{l}) \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor} \times (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor}$  satisfying  $|\mathbf{l}| = l$  and (4.3), we set

$$\begin{aligned}
F_{\mathbf{m}', \mathbf{l}', \mathbf{m}'', \mathbf{m}, \mathbf{l}}^+[f](z_1, y_2) & := \text{Proj}_{\phi_+(\mathbf{m}, \mathbf{l}), y_2}^{\mathbf{p}_2^-} (F_{\mathbf{m}', \mathbf{l}'}^+[f](z_1, y_2) \tilde{\Phi}_{\mathbf{m}''}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(z_1, y_2)) \\
& \in \mathcal{P}_{\langle \mathbf{m} \rangle}(\mathbf{p}_1^+)_{z_1} \otimes \mathcal{P}_{\phi_+(\mathbf{m}, \mathbf{l})}(\mathbf{p}_2^-)_{y_2},
\end{aligned}$$

so that

$$F_{\mathbf{m}', \mathbf{l}'}^+[f](z_1, y_2) \tilde{\Phi}_{\mathbf{m}''}^{\mathbf{p}_1^+, \mathbf{p}_2^-}(z_1, y_2) = \sum_{\substack{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor} \\ |\mathbf{m}| = |\mathbf{m}'| + |\mathbf{m}''| \\ m_j \geq \max\{m'_j, m''_j\}}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}| = l \\ m_j + l_j \geq m'_j + l'_j}} F_{\mathbf{m}', \mathbf{l}', \mathbf{m}'', \mathbf{m}, \mathbf{l}}^+[f](z_1, y_2).$$

Then the right hand side of (4.14) becomes

$$\begin{aligned}
& \det_{n^+}(z)^a F_{l, -}^{\downarrow} \left( \begin{matrix} a - k \\ a - 2k \end{matrix}; f; z \right) \\
& = \det_{n_2^+}(z_2)^k \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}'| = l}} \sum_{\substack{\mathbf{m}', \mathbf{m}'' \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor} \\ |\mathbf{m}'| + |\mathbf{m}''| = |\mathbf{m}| \\ m'_j, m''_j \leq m_j}} \sum_{\substack{\mathbf{l}' \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}'| = l \\ m'_j + l'_j \leq m_j + l_j}} (-a)_{\mathbf{m}'', d} \\
& \quad \times \frac{(a - k + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}' + \mathbf{l}' - (l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} (a - k - \frac{d_2}{2})_{\mathbf{m}', d}}{(a - 2k - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}' + \mathbf{l}' - (l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d}} F_{\mathbf{m}', \mathbf{l}', \mathbf{m}'', \mathbf{m}, \mathbf{l}}^+[f](z_1, z_2^{-1}).
\end{aligned} \tag{4.16}$$

If  $a, k \in \mathbb{Z}_{\geq 0}$ ,  $a \leq k - l$ , then in (4.15) only  $m_1 + l_1 \leq k$  terms remain, and both in (4.15) and (4.16), all denominators in the terms with  $m_1 + l_1 \leq k$  are non-zero. Hence for  $m_1 + l_1 \leq k$ , by comparing the both formulas we get

$$\begin{aligned}
& \frac{(-k + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m} + \mathbf{l} - (l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} (-k - \frac{d_2}{2})_{\mathbf{m}, d}}{(a - 2k - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m} + \mathbf{l} - (l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d}} F_{\mathbf{m}, \mathbf{l}}^+[f](z_1, z_2^{-1}) \\
& = \sum_{\substack{\mathbf{m}', \mathbf{m}'' \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor} \\ |\mathbf{m}'| + |\mathbf{m}''| = |\mathbf{m}| \\ m'_j, m''_j \leq m_j}} \sum_{\substack{\mathbf{l}' \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}'| = l \\ m'_j + l'_j \leq m_j + l_j}} (-a)_{\mathbf{m}'', d} \\
& \quad \times \frac{(a - k + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}' + \mathbf{l}' - (l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} (a - k - \frac{d_2}{2})_{\mathbf{m}', d}}{(a - 2k - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathbf{m}' + \mathbf{l}' - (l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d}} F_{\mathbf{m}', \mathbf{l}', \mathbf{m}'', \mathbf{m}, \mathbf{l}}^+[f](z_1, z_2^{-1}).
\end{aligned}$$

Then since  $\{(a, k) \in (\mathbb{Z}_{\geq 0})^2 \mid k \geq a + l, k \geq m_1 + l_1\} \subset \mathbb{C}^2$  is Zariski dense, this holds for all  $(a, k) \in \mathbb{C}^2$  without the assumption  $m_1 + l_1 \leq k$ , and hence (4.14) holds for all  $(a, k) \in \mathbb{C}^2$ . This completes the proof of Theorem 4.7 (3).  $\square$

**Example 4.10.** Suppose  $l = 0$ ,  $f(x_2) = 1 \in \mathcal{P}_{(0, \dots, 0)}(\mathfrak{p}_2^+)$ . Then we have

$$\begin{aligned} F_{\mathfrak{m}, \mathfrak{Q}_{\lceil r/2 \rceil}}^- [1](z_1, z_2^{-l}) &= F_{\mathfrak{m}, \mathfrak{Q}_{\lceil r/2 \rceil}}^+ [1](z_1, z_2^{-l}) = \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(z_1, z_2^{-l}), \\ F_{0, \pm}^\downarrow \left( \begin{matrix} \nu \\ \mu \end{matrix}; 1; z \right) &= \det_{\mathfrak{n}_2^+}(z_2)^{-\nu} \sum_{\mathfrak{m} \in \mathbb{Z}_{++}^{\lceil r/2 \rceil}} \frac{(\nu)_{\mathfrak{m}, d} (\nu - \frac{d_2}{2})_{\mathfrak{m}, d}}{(\mu - \frac{d_2}{2})_{\mathfrak{m}, d}} \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(z_1, z_2^{-l}). \end{aligned}$$

Especially, for  $k \in \mathbb{Z}_{\geq 0}$ ,  $\operatorname{Re} \lambda > \frac{2n}{r} - 1$ , we have

$$\begin{aligned} \left\langle \det_{\mathfrak{n}_2^+}(x_2)^k, e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} &= C_{r, \pm}^{d, d_2}(\lambda, k, 0) F_{0, \pm}^\downarrow \left( \begin{matrix} -k \\ -\lambda - 2k + \frac{n}{r} \end{matrix}; 1; z \right) \\ &= \frac{(\lambda + k - \frac{d}{2} \lceil \frac{r}{2} \rceil + \frac{d_2}{2})_{\underline{k}_{\lceil r/2 \rceil}, d}}{(\lambda)_{(\underline{2k}_{\lceil r/2 \rceil}, \underline{k}_{\lceil r/2 \rceil}), d}} \det_{\mathfrak{n}_2^+}(z_2)^k \sum_{\mathfrak{m} \in \mathbb{Z}_{++}^{\lceil r/2 \rceil}} \frac{(-k)_{\mathfrak{m}, d} (-k - \frac{d_2}{2})_{\mathfrak{m}, d}}{(-\lambda - 2k + \frac{n}{r} - \frac{d_2}{2})_{\mathfrak{m}, d}} \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(z_1, z_2^{-l}). \end{aligned}$$

In addition, Theorems 4.6 (3), 4.7 (3) are equivalent to

$$\begin{aligned} &\sum_{\mathfrak{m} \in \mathbb{Z}_{++}^{\lceil r/2 \rceil}} \frac{(\nu)_{\mathfrak{m}, d} (\nu - \frac{d_2}{2})_{\mathfrak{m}, d}}{(\mu - \frac{d_2}{2})_{\mathfrak{m}, d}} \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(z_1, z_2^{-l}) \\ &= h_{\mathfrak{n}^+}(z_1, P(z_2)^{-1} z_1)^{(\mu - 2\nu)/2} \sum_{\mathfrak{m} \in \mathbb{Z}_{++}^{\lceil r/2 \rceil}} \frac{(\mu - \nu)_{\mathfrak{m}, d} (\mu - \nu - \frac{d_2}{2})_{\mathfrak{m}, d}}{(\mu - \frac{d_2}{2})_{\mathfrak{m}, d}} \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^+, \mathfrak{p}_2^-}(z_1, z_2^{-l}). \end{aligned}$$

**Example 4.11.** Suppose  $r = 2$ . We fix a Jordan frame  $\{e', e''\} \subset \mathfrak{n}_2^+$ , and consider  $f(x_2) = (x_2|e')_{\mathfrak{n}_2^+}^l$  or  $f(y_2) = (y_2|e'')_{\mathfrak{n}_2^+}^l$ . Then we have

$$\begin{aligned} F_{m, l}^- [(\cdot|e')_{\mathfrak{n}_2^+}^l](z_1, z_2^{-l}) &= \frac{1}{m!} \left( -\frac{\det_{\mathfrak{n}^+}(z_1)}{\det_{\mathfrak{n}^+}(z_2)} \right)^m (z_2|e')_{\mathfrak{n}_2^+}^l, \\ F_{m, l}^+ [(\cdot|e'')_{\mathfrak{n}_2^+}^l](z_1, z_2^{-l}) &= \frac{1}{m!} \left( -\frac{\det_{\mathfrak{n}^+}(z_1)}{\det_{\mathfrak{n}^+}(z_2)} \right)^m (z_2^{-l}|e'')_{\mathfrak{n}_2^+}^l, \\ F_{l, +}^\downarrow \left( \begin{matrix} \nu \\ \mu \end{matrix}; (\cdot|e')_{\mathfrak{n}_2^+}^l; z \right) &= \det_{\mathfrak{n}^+}(z_2)^{-\nu} \sum_{m=0}^{\infty} \frac{(\nu)_m (\nu - l - \frac{d_2}{2})_m}{(\mu - l - \frac{d_2}{2})_m m!} \left( -\frac{\det_{\mathfrak{n}^+}(z_1)}{\det_{\mathfrak{n}^+}(z_2)} \right)^m (z_2|e')_{\mathfrak{n}_2^+}^l \\ &= \det_{\mathfrak{n}^+}(z_2)^{-\nu} {}_2F_1 \left( \begin{matrix} \nu, \nu - l - \frac{d_2}{2} \\ \mu - l - \frac{d_2}{2} \end{matrix}; -\frac{\det_{\mathfrak{n}^+}(z_1)}{\det_{\mathfrak{n}^+}(z_2)} \right) (z_2|e')_{\mathfrak{n}_2^+}^l, \\ F_{l, -}^\downarrow \left( \begin{matrix} \nu \\ \mu \end{matrix}; (\cdot|e'')_{\mathfrak{n}_2^+}^l; z \right) &= \det_{\mathfrak{n}^+}(z_2)^{-\nu} \sum_{m=0}^{\infty} \frac{(\nu + l)_m (\nu - \frac{d_2}{2})_m}{(\mu + l - \frac{d_2}{2})_m m!} \left( -\frac{\det_{\mathfrak{n}^+}(z_1)}{\det_{\mathfrak{n}^+}(z_2)} \right)^m (z_2^{-l}|e'')_{\mathfrak{n}_2^+}^l \\ &= \det_{\mathfrak{n}^+}(z_2)^{-\nu - l} {}_2F_1 \left( \begin{matrix} \nu + l, \nu - \frac{d_2}{2} \\ \mu + l - \frac{d_2}{2} \end{matrix}; -\frac{\det_{\mathfrak{n}^+}(z_1)}{\det_{\mathfrak{n}^+}(z_2)} \right) (z_2|e')_{\mathfrak{n}_2^+}^l. \end{aligned}$$

Especially, for  $\mathbf{k} \in \mathbb{Z}_{++}^2$ ,  $\operatorname{Re} \lambda > \frac{2n}{r} - 1$ , we have

$$\begin{aligned}
& \left\langle \Delta_{\mathbf{k}}^{\mathfrak{n}_2^+}(x_2), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\
&= \left\langle (x_2|e')_{\mathfrak{n}_2^+}^{k_1-k_2} \det_{\mathfrak{n}_2^+}(x_2)^{k_2}, e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} = \left\langle (x_2^{-1}|e'')_{\mathfrak{n}_2^+}^{k_1-k_2} \det_{\mathfrak{n}_2^+}(x_2)^{k_1}, e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} \\
&= C_{2,+}^{d,d_2}(\lambda, k_2, k_1 - k_2) F_{k_1-k_2,+}^{\downarrow} \left( \begin{matrix} -k_2 \\ -\lambda - 2k_2 + \frac{n}{2}; (\cdot|e')_{\mathfrak{n}_2^+}^{k_1-k_2}; z \end{matrix} \right) \\
&= C_{2,-}^{d,d_2}(\lambda, k_1, k_1 - k_2) F_{k_1-k_2,-}^{\downarrow} \left( \begin{matrix} -k_1 \\ -\lambda - 2k_1 + \frac{n}{2}; (\cdot|e'')_{\mathfrak{n}_2^+}^{k_1-k_2}; z \end{matrix} \right) \\
&= \frac{(\lambda + k_1 - \frac{d-d_2}{2})_{k_2}}{(\lambda)_{(k_1+k_2, k_2), d}} {}_2F_1 \left( \begin{matrix} -k_2, -k_1 - \frac{d_2}{2} \\ -\lambda - k_1 - k_2 + \frac{d-d_2}{2} + 1; -\frac{\det_{\mathfrak{n}^+}(z_1)}{\det_{\mathfrak{n}^+}(z_2)} \end{matrix} \right) \Delta_{\mathbf{k}}^{\mathfrak{n}_2^+}(z_2).
\end{aligned}$$

**Example 4.12.** Suppose  $r \geq 3$ ,  $-\nu = k = l \in \mathbb{Z}_{\geq 0}$ ,  $f(y_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ . Then since

$$\begin{aligned}
& (-l + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathfrak{m}+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} F_{\mathfrak{m}, \mathbf{l}}^+[f](z_1, z_2^{-1}) \\
&= ((0, \underline{-l}_{\lfloor r/2 \rfloor - 1}))_{\mathfrak{m}+1-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} F_{\mathfrak{m}, \mathbf{l}}^+[f](z_1, z_2^{-1}) \neq 0
\end{aligned}$$

implies  $m_1 + l_1 = l$  and  $\phi_+(\mathbf{m}, \mathbf{l}) \in \mathbb{Z}_+^r$ , that is,

$$m_1 \leq l, \quad m_{\lfloor r/2 \rfloor} = 0 \quad (\text{for even } r),$$

$$\mathbf{l} = \mathbf{l}(\mathbf{m}) := (l - m_1, m_1 - m_2, m_2 - m_3, \dots, m_{\lfloor r/2 \rfloor - 2} - m_{\lfloor r/2 \rfloor - 1}, m_{\lfloor r/2 \rfloor - 1}),$$

so that  $\phi_+(\mathbf{m}, \mathbf{l}(\mathbf{m})) = (l, \mathbf{m}^2)$ ,  $\mathbf{m} + \mathbf{l}(\mathbf{m}) = (l, \mathbf{m})$ , we have

$$\begin{aligned}
& F_{l,-}^{\downarrow} \left( \begin{matrix} -l \\ \mu; f; z \end{matrix} \right) \\
&= \det_{\mathfrak{n}_2^+}(z_2)^l \sum_{\mathfrak{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor - 1}} \frac{((0, \underline{-l}_{\lfloor r/2 \rfloor - 1}))_{\mathfrak{m}+1(\mathbf{m})-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d} (-l - \frac{d_2}{2})_{\mathfrak{m}, d} F_{\mathfrak{m}, \mathbf{l}(\mathbf{m})}^+[f](z_1, z_2^{-1})}{(\mu - \frac{d_2}{2} + (l, \underline{0}_{\lfloor r/2 \rfloor - 1}))_{\mathfrak{m}+1(\mathbf{m})-(l, \underline{0}_{\lfloor r/2 \rfloor - 1}), d}} \\
&= \det_{\mathfrak{n}_2^+}(z_2)^l \sum_{\mathfrak{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor - 1}} \frac{(-l - \frac{d}{2})_{\mathfrak{m}, d} (-l - \frac{d_2}{2})_{\mathfrak{m}, d} F_{\mathfrak{m}, \mathbf{l}(\mathbf{m})}^+[f](z_1, z_2^{-1})}{(\mu - \frac{d+d_2}{2})_{\mathfrak{m}, d}}
\end{aligned}$$

and hence for  $\operatorname{Re} \lambda > \frac{2n}{r} - 1$  we have

$$\begin{aligned}
& \left\langle \det_{\mathfrak{n}_2^+}(x_2)^l f(x_2^{-1}), e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} = C_{r,-}^{d,d_2}(\lambda, l, l) F_{l,-}^{\downarrow} \left( \begin{matrix} -l \\ -\lambda - 2l + \frac{n}{r}; f; z \end{matrix} \right) \\
&= \frac{(\lambda + l - \frac{d}{2} \lfloor \frac{r}{2} \rfloor + \frac{d_2}{2})_{\lfloor r/2 \rfloor - 1, d}}{(\lambda)_{(2\lfloor r/2 \rfloor - 1, \lfloor r/2 \rfloor), d}} \\
&\quad \times \det_{\mathfrak{n}_2^+}(z_2)^l \sum_{\mathfrak{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor - 1}} \frac{(-l - \frac{d}{2})_{\mathfrak{m}, d} (-l - \frac{d_2}{2})_{\mathfrak{m}, d} F_{\mathfrak{m}, \mathbf{l}(\mathbf{m})}^+[f](z_1, z_2^{-1})}{(-\lambda - 2l + \frac{d}{2}(r-2) + 1 - \frac{d_2}{2})_{\mathfrak{m}, d}}.
\end{aligned}$$

Especially, we fix a primitive idempotent  $e' \in \mathfrak{n}_2^+$  and let  $\mathfrak{p}_2^+(e')_0 =: \mathfrak{p}_2^{+''}$ ,  $\mathfrak{p}^+(e')_0 \cap \mathfrak{p}_1^+ =: \mathfrak{p}_1^{+''}$  be as in (2.2). If  $f(y_2) = (y_2|e')_{\mathfrak{n}_2^+}^l$  so that  $\det_{\mathfrak{n}_2^+}(x_2)^l f(x_2^{-1}) = \det_{\mathfrak{n}_2^{+''}}(x_2'')^l$ , then by

Proposition 4.3 (4) we have

$$\begin{aligned} \left\langle \det_{\mathfrak{n}_2^{+''}}(x_2'')^l, e^{(x|\bar{z})_{\mathfrak{p}^+}} \right\rangle_{\lambda, x} &= C_{r, -}^{d, d_2}(\lambda, l, l) F_{l, -}^{\downarrow} \left( -\lambda - 2l + \frac{n}{r}; (\cdot | e')_{\mathfrak{n}_2^+}; z \right) \\ &= \frac{(\lambda + l - \frac{d}{2} \lfloor \frac{r}{2} \rfloor + \frac{d_2}{2})_{\lfloor \frac{r}{2} \rfloor - 1, d}}{(\lambda)_{(2\lfloor \frac{r}{2} \rfloor - 1, \lfloor \frac{r}{2} \rfloor), d}} \\ &\quad \times \det_{\mathfrak{n}_2^{+''}}(z_2'')^l \sum_{\mathfrak{m} \in \mathbb{Z}_{++}^{\lfloor \frac{r}{2} \rfloor - 1}} \frac{(-l)_{\mathfrak{m}, d} (-l - \frac{d_2}{2})_{\mathfrak{m}, d}}{(-\lambda - 2l + \frac{d}{2}(r-2) + 1 - \frac{d_2}{2})_{\mathfrak{m}, d}} \tilde{\Phi}_{\mathfrak{m}}^{\mathfrak{p}_1^{+''}, \mathfrak{p}_2^{-''}}(z_1'', (z_2'')^{-1}). \end{aligned}$$

This fits with Example 4.10 applied for  $\mathfrak{p}_2^{+''}$ .

### 4.3 Results on restriction of $\mathcal{H}_\lambda(D)$ to subgroups

In this subsection we consider the decomposition of  $\mathcal{H}_\lambda(D)$  under  $\tilde{G}_1$ . Let  $V_{\mathbf{k}}$  be an irreducible  $K_1$ -module isomorphic to  $\mathcal{P}_{\mathbf{k}}(\mathfrak{p}_2^+)$ . Then  $\mathcal{H}_\lambda(D)$  is decomposed under  $\tilde{G}_1$  as

$$\mathcal{H}_\lambda(D)|_{\tilde{G}_1} \simeq \sum_{\mathbf{k} \in \mathbb{Z}_{++}^r}^{\oplus} \mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{\mathbf{k}}).$$

For each case,  $\mathcal{H}_\lambda(D)$  has the minimal  $\tilde{K}$ -type

$$\chi^{-\lambda} \simeq \begin{cases} \mathbb{C}_{-\lambda} \boxtimes V_{\underline{0}}^{[n]\vee} & (G = SO_0(2, n)), \\ V_{\underline{\lambda}/2}^{(r)\vee} \boxtimes V_{\underline{\lambda}/2}^{(r)} \simeq V_{\underline{\lambda}_r}^{(r)\vee} \boxtimes V_{\underline{0}_r}^{(r)} \simeq V_{\underline{0}_r}^{(r)\vee} \boxtimes V_{\underline{\lambda}_r}^{(r)} & (G = SU(r, r)), \\ V_{\underline{\lambda}/2_{2r}}^{(2r)\vee} & (G = SO^*(4r)), \end{cases}$$

and  $\mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{\mathbf{k}})$  has the minimal  $\tilde{K}_1$ -type

$$\chi_1^{-\varepsilon_1 \lambda} \otimes V_{\mathbf{k}} \simeq \begin{cases} \mathbb{C}_{-(\lambda+k_1+k_2)} \boxtimes V_{\underline{0}_{[n'/2]}}^{[n']\vee} \boxtimes V_{(k_1-k_2, \underline{0}_{[n''/2]-1})}^{[n'']\vee} & (G_1 = SO_0(2, n') \times SO(n''), n' \geq 3), \\ \mathbb{C}_{-(\lambda+k_1+k_2)} \boxtimes \mathbb{C}_{-(\lambda+k_1+k_2)} \boxtimes V_{(k_1-k_2, \underline{0}_{[n''/2]-1})}^{[n'']\vee} & (G_1 = SO_0(2, n') \times SO(n''), n' = 2), \\ \mathbb{C}_{-2(\lambda+k_1+k_2)} \boxtimes V_{(k_1-k_2, \underline{0}_{[n''/2]-1})}^{[n'']\vee} & (G_1 = SO_0(2, n') \times SO(n''), n' = 1), \\ V_{\underline{\lambda}_r + 2\mathbf{k}}^{(r)\vee} & (G_1 = SO^*(2r)), \\ V_{\underline{\lambda}/2_r + \mathbf{k}}^{(r)\vee} \boxtimes V_{\underline{\lambda}/2_r + \mathbf{k}}^{(r)\vee} & (G_1 = SO^*(2r) \times SO^*(2r)) \end{cases}$$

(note that  $SO_0(2, 2) \simeq SL(2, \mathbb{R}) \times SL(2, \mathbb{R})$ ,  $SO_0(2, 1) \simeq SL(2, \mathbb{R})$  hold up to covering). In this section we only deal with the cases  $\mathbf{k} = (k + l, \underline{k}_{r-1})$  or  $\mathbf{k} = (\underline{k}_{r-1}, k - l)$ . Let  $V_l := V_{(l, \underline{0}_{r-1})}$ , and let  $V_l^\vee$  be its contragredient. Then we have

$$\mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{(k+l, \underline{k}_{r-1})}) \simeq \mathcal{H}_{\varepsilon_1(\lambda+2k)}(D_1, V_l), \quad \mathcal{H}_{\varepsilon_1 \lambda}(D_1, V_{(\underline{k}_{r-1}, k-l)}) \simeq \mathcal{H}_{\varepsilon_1(\lambda+2k)}(D_1, V_l^\vee).$$

To describe the intertwining operators, for  $\mu \in \mathbb{C}$ ,  $l \in \mathbb{Z}_{\geq 0}$  and for  $f(x_2) \in \mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+)$ , we define a function  $F_{l,+}^\uparrow(\bar{\mu}; f; y_1, x_2)$  on  $\mathfrak{p}_1^- \oplus \mathfrak{p}_2^+$  by

$$F_{l,+}^\uparrow \left( \bar{\mu}; f; y_1, x_2 \right) := \sum_{\mathfrak{m} \in \mathbb{Z}_{++}^{\lfloor \frac{r}{2} \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor \frac{r}{2} \rfloor} \\ |\mathbf{l}| = l}} \frac{F_{\mathfrak{m}, 1}^+[f](y_1, x_2)}{(\mu - \frac{\delta}{2} + (l, \underline{0}_{\lfloor \frac{r}{2} \rfloor - 1}))_{\mathfrak{m}+1-(l, \underline{0}_{\lfloor \frac{r}{2} \rfloor - 1}), d}}, \quad (4.17)$$

where  $\delta$  is given in (4.1), and define a function  $F_{l,-}^\uparrow(\bar{\mu}; f; y_1, x_2)$  on  $\mathfrak{p}_1^- \oplus \mathfrak{p}_2^+$  by

$$F_{l,-}^\uparrow\left(\bar{\mu}; f; y_1, x_2\right) := \begin{cases} \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} \frac{F_{\mathbf{m},1}^-[f](y_1, x_2)}{\left(\mu - \frac{\delta}{2} - (\mathbb{Q}_{\lfloor r/2 \rfloor - 1}, l)\right)_{\mathbf{m}-\mathbf{1}+(\mathbb{Q}_{\lfloor r/2 \rfloor - 1}, l), d}} & (r: \text{even}), \\ \sum_{\mathbf{m} \in \mathbb{Z}_{++}^{\lfloor r/2 \rfloor}} \sum_{\substack{\mathbf{l} \in (\mathbb{Z}_{\geq 0})^{\lfloor r/2 \rfloor} \\ |\mathbf{l}|=l}} \frac{F_{\mathbf{m},1}^-[f](y_1, x_2)}{\left(\mu - \frac{\delta}{2}\right)_{\mathbf{m}-\mathbf{1}', d} \left(\mu - l - \frac{\delta}{2} - \frac{d}{2}(\frac{r}{2} - 1)\right)_{l-l_{\lfloor r/2 \rfloor}}} & (r: \text{odd}), \end{cases} \quad (4.18)$$

where for odd  $r$  let  $\mathbf{1}' := (l_1, \dots, l_{\lfloor r/2 \rfloor})$ .

*where  $C_{r,+}^{d, d_2}(\lambda, k, l)$  is as in (4.6).*

**Theorem 4.14.** *Let  $\operatorname{Re} \lambda > \frac{2n}{r} - 1$ ,  $k, l \in \mathbb{Z}_{\geq 0}$  with  $k \geq l$ .*

(1) ([33, Theorems 5.7 (4), 5.19 (1), 7.2]). *Let  $K_l^\vee(y_2) \in (\mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^-) \otimes \operatorname{Hom}(V_l^\vee, \mathbb{C}))^{K_1}$ . Then the linear map*

$$\begin{aligned} \mathcal{F}_{\lambda, k, l, -}^\uparrow &: \mathcal{H}_{\varepsilon_1(\lambda+2k)}(D_1, V_l^\vee)_{\tilde{K}_1} \longrightarrow \mathcal{H}_\lambda(D)_{\tilde{K}}|_{(\mathfrak{g}_1, \tilde{K}_1)}, \\ (\mathcal{F}_{\lambda, k, l, -}^\uparrow f)(x) &:= \det_{\mathfrak{n}^+}(x_2)^k F_{l,-}^\uparrow\left(\begin{array}{c} - \\ \lambda + 2k; K_l^\vee; \frac{1}{\varepsilon_1} \frac{\partial}{\partial x_1} \end{array}; x_2\right) f(x_1) \end{aligned}$$

*intertwines the  $(\mathfrak{g}_1, \tilde{K}_1)$ -action, where  $F_{l,-}^\uparrow$  is as in (4.18).*

(2) Let  $K_l(x_2) \in (\mathcal{P}_{(l, \underline{0}_{r-1})}(\mathfrak{p}_2^+) \otimes V_l^\vee)^{K_1}$ . Then the linear map

$$\begin{aligned} \mathcal{F}_{\lambda, k, l, -}^\downarrow &: \mathcal{H}_\lambda(D)|_{\tilde{G}_1} \longrightarrow \mathcal{H}_{\varepsilon_1(\lambda+2k)}(D_1, V_l^\vee), \\ (\mathcal{F}_{\lambda, k, l, -}^\downarrow f)(x_1) &:= F_{l, -}^\downarrow \left( -\lambda - 2k + \frac{n}{r}; K_l^\vee; \frac{\partial}{\partial x} \right) f(x) \Big|_{x_2=0} \end{aligned}$$

intertwines the  $\tilde{G}_1$ -action, where  $F_{l, -}^\downarrow$  is as in (4.5).

(3) ([35, Corollary 6.7]). Suppose  $c_{k, l, -}, c_{k, l, -}^\vee \in \mathbb{R}_{>0}$  satisfy, for  $v \in V_l^\vee$ ,

$$\begin{aligned} \|\det_{\mathfrak{n}_2^+}(x_2)^k K_l^\vee(x_2^{-1})v\|_{F, x_2}^2 &= c_{k, l, -} |v|_{V_l^\vee}^2, \\ \|\det_{\mathfrak{n}_2^+}(x_2)^k (v, K_l(\overline{x_2^{-1}}))\|_{F, x_2}^2 &= c_{k, l, -}^\vee |v|_{V_l^\vee}^2. \end{aligned}$$

Then the operator norms of  $\mathcal{F}_{\lambda, k, l, -}^\uparrow, \mathcal{F}_{\lambda, k, l, -}^\downarrow$  are given by

$$c_{k, l, -}^{-1} \|\mathcal{F}_{\lambda, k, l, -}^\uparrow\|_{\text{op}}^2 = c_{k, l, -}^\vee \|\mathcal{F}_{\lambda, k, l, -}^\downarrow\|_{\text{op}}^{-2} = C_{r, -}^{d, d_2}(\lambda, k, l),$$

where  $C_{r, -}^{d, d_2}(\lambda, k, l)$  is as in (4.7).

The differential operators  $\mathcal{F}_{\lambda, k, l, \pm}^\downarrow$  are meromorphically continued for all  $\lambda \in \mathbb{C}$ , and give  $\tilde{G}_1$ -intertwining operators

$$\mathcal{F}_{\lambda, k, l, +}^\downarrow : \mathcal{O}_\lambda(D)|_{\tilde{G}_1} \longrightarrow \mathcal{O}_{\varepsilon_1(\lambda+2k)}(D_1, V_l), \quad \mathcal{F}_{\lambda, k, l, -}^\downarrow : \mathcal{O}_\lambda(D)|_{\tilde{G}_1} \longrightarrow \mathcal{O}_{\varepsilon_1(\lambda+2k)}(D_1, V_l^\vee)$$

for all  $\lambda \in \mathbb{C}$  except for poles. Then by Theorems 4.6 (3), 4.7 (3), for special  $\lambda$  the following holds.

**Theorem 4.15** ([34, Theorem 8.9 (1)], [35, Corollary 6.8 (4)]). *Let  $k, l \in \mathbb{Z}_{\geq 0}$ . For  $a = 1, 2, \dots, k$  we have*

$$\mathcal{F}_{\frac{n}{r}-a, k, l, +}^\downarrow = \mathcal{F}_{\frac{n}{r}+a, k-a, l, +}^\downarrow \circ \det_{\mathfrak{n}^-} \left( \frac{\partial}{\partial x} \right)^a : \mathcal{O}_{\frac{n}{r}-a}(D)|_{\tilde{G}_1} \longrightarrow \mathcal{O}_{\varepsilon_1(\frac{n}{r}-a+2k)}(D_1, V_l).$$

Similarly, when  $k \geq l$ , for  $a = 1, 2, \dots, k-l$  we have

$$\mathcal{F}_{\frac{n}{r}-a, k, l, -}^\downarrow = \mathcal{F}_{\frac{n}{r}+a, k-a, l, -}^\downarrow \circ \det_{\mathfrak{n}^-} \left( \frac{\partial}{\partial x} \right)^a : \mathcal{O}_{\frac{n}{r}-a}(D)|_{\tilde{G}_1} \longrightarrow \mathcal{O}_{\varepsilon_1(\frac{n}{r}-a+2k)}(D_1, V_l^\vee).$$

For  $\lambda > \frac{n}{r} - 1$  we have

$$\begin{aligned} \mathcal{H}_{\varepsilon_1(\lambda+2k)}(D_1, V_l)|_{\tilde{K}_1} &\simeq d\tau_\lambda(\mathcal{U}(\mathfrak{g}_1))\mathcal{P}_{(k+l, \underline{k}_{r-1})}(\mathfrak{p}_2^+) \subset \mathcal{H}_\lambda(D)|_{\tilde{K}}, \\ \mathcal{H}_{\varepsilon_1(\lambda+2k)}(D_1, V_l^\vee)|_{\tilde{K}_1} &\simeq d\tau_\lambda(\mathcal{U}(\mathfrak{g}_1))\mathcal{P}_{(\underline{k}_{r-1}, k-l)}(\mathfrak{p}_2^+) \subset \mathcal{H}_\lambda(D)|_{\tilde{K}}, \end{aligned}$$

but this does not hold for smaller  $\lambda$  in general. For such  $\lambda$ , by Theorems 4.6 (2), 4.7 (2), the following holds. For  $i = 1, 2, \dots, r$ ,  $\lambda \in \frac{d}{2}(i-1) - \mathbb{Z}_{\geq 0}$ , let  $M_i^{\mathfrak{g}}(\lambda)$  be the  $(\mathfrak{g}, \tilde{K})$ -submodule given in (2.18).

**Theorem 4.16.** (1) *Let  $k, l \in \mathbb{Z}_{\geq 0}$ . For  $i = 1, 2, \dots, r$ ,*

$$d\tau_\lambda(\mathcal{U}(\mathfrak{g}_1))\mathcal{P}_{(k+l, \underline{k}_{r-1})}(\mathfrak{p}_2^+) \subset M_i^{\mathfrak{g}}(\lambda)$$

*holds if and only if*

$$\lambda \in \begin{cases} \frac{d}{2}(i-1) - (2k+l) - \mathbb{Z}_{\geq 0} & (i=1), \\ \frac{d}{2}(i-1) - 2k - \mathbb{Z}_{\geq 0} & (2 \leq i \leq \lfloor r/2 \rfloor), \\ \frac{d}{2}(i-1) - \min\{2k, k+l\} - \mathbb{Z}_{\geq 0} & (r: \text{odd}, i = \lceil r/2 \rceil), \\ \frac{d}{2}(i-1) - k - \mathbb{Z}_{\geq 0} & (\lceil r/2 \rceil + 1 \leq i \leq r). \end{cases}$$

(2) Let  $k, l \in \mathbb{Z}_{\geq 0}$  with  $k \geq l$ . For  $i = 1, 2, \dots, r$ ,

$$d\tau_\lambda(\mathcal{U}(\mathfrak{g}_1))\mathcal{P}_{(k_{r-1}, k-l)}(\mathfrak{p}_2^+) \subset M_i^{\mathfrak{g}}(\lambda)$$

holds if and only if

$$\lambda \in \begin{cases} \frac{d}{2}(i-1) - 2k - \mathbb{Z}_{\geq 0} & (1 \leq i \leq \lceil r/2 \rceil - 1), \\ \frac{d}{2}(i-1) - (2k-l) - \mathbb{Z}_{\geq 0} & (r: \text{even}, i = r/2), \\ \frac{d}{2}(i-1) - k - \mathbb{Z}_{\geq 0} & (\lfloor r/2 \rfloor + 1 \leq i \leq r-1), \\ \frac{d}{2}(i-1) - (k-l) - \mathbb{Z}_{\geq 0} & (i = r). \end{cases}$$

Here, “if” follows from the holomorphy in Theorems 4.6 (2), 4.7 (2), and these are already given in [34, Section 7], [35, Corollary 6.8(1)]. On the other hand, “only if” follows from the non-zerosness in Theorems 4.6 (2), 4.7 (2), and these are new except for  $r$  even or  $kl = 0$  for  $+$  case.
