**Abstract:** Let  $\{\tau_n\}_{n=1}^\infty$  and  $\{\omega_m\}_{m=1}^\infty$  be two modular Parseval frames for a Hilbert  $C^*$ -module  $\mathcal{E}$ . Then for every  $x \in \mathcal{E} \setminus \{0\}$ , we show that

$$(1) \quad \|\theta_\tau x\|_0 \|\theta_\omega x\|_0 \geq \frac{1}{\sup_{n,m \in \mathbb{N}} \|\langle \tau_n, \omega_m \rangle\|^2}.$$

We call Inequality (1) as **Noncommutative Donoho-Stark-Elad-Bruckstein-Ricaud-Torrésani Uncertainty Principle**. Inequality (1) is the noncommutative analogue of breakthrough Ricaud-Torrésani uncertainty principle [*IEEE Trans. Inform. Theory, 2013*]. In particular, Inequality (1) extends Elad-Bruckstein uncertainty principle [*IEEE Trans. Inform. Theory, 2002*] and Donoho-Stark uncertainty principle [*SIAM J. Appl. Math., 1989*].

**Keywords:** Uncertainty principle, Parseval frame, Hilbert  $C^*$ -module.

**Mathematics Subject Classification (2020):** 42C15, 46L08.

---

1. INTRODUCTION

In 1989, Donoho and Stark derived following uncertainty principle which is one of the greatest inequality of all time in both pure and applied Mathematics [3]. For  $h \in \mathbb{C}^d$ , let  $\|h\|_0$  be the number of nonzero entries in  $h$ . Let  $\hat{\cdot}: \mathbb{C}^d \rightarrow \mathbb{C}^d$  be the Fourier transform defined by

$$\widehat{(a_j)_{j=0}^{d-1}} := \frac{1}{\sqrt{d}} \left( \sum_{j=0}^{d-1} a_j e^{-\frac{2\pi i j k}{d}} \right)_{k=0}^{d-1}, \quad \forall (a_j)_{j=0}^{d-1} \in \mathbb{C}^d.$$

**Theorem 1.1. (Donoho-Stark Uncertainty Principle)** [3, 12] For every  $d \in \mathbb{N}$ ,

$$(2) \quad \left( \frac{\|h\|_0 + \|\hat{h}\|_0}{2} \right)^2 \geq \|h\|_0 \|\hat{h}\|_0 \geq d, \quad \forall h \in \mathbb{C}^d \setminus \{0\}.$$

By noting that Fourier transform is unitary and unitary operators are in one to one correspondence with orthonormal bases, in 2002, Elad and Bruckstein generalized Inequality (2) to arbitrary orthonormal bases [5]. To state the result we need some notations. Given a collection  $\{\tau_j\}_{j=1}^n$  in a finite dimensional Hilbert space  $\mathcal{H}$  over  $\mathbb{K}$  ( $\mathbb{R}$  or  $\mathbb{C}$ ), we define

$$\theta_\tau : \mathcal{H} \ni h \mapsto \theta_\tau h := (\langle h, \tau_j \rangle)_{j=1}^n \in \mathbb{K}^n.$$

**Theorem 1.2.** (*Elad-Bruckstein Uncertainty Principle*) [4, 5] Let  $\{\tau_j\}_{j=1}^n, \{\omega_j\}_{j=1}^n$  be two orthonormal bases for a finite dimensional Hilbert space  $\mathcal{H}$ . Then

$$\left( \frac{\|\theta_\tau h\|_0 + \|\theta_\omega h\|_0}{2} \right)^2 \geq \|\theta_\tau h\|_0 \|\theta_\omega h\|_0 \geq \frac{1}{\max_{1 \leq j, k \leq n} |\langle \tau_j, \omega_k \rangle|^2}, \quad \forall h \in \mathcal{H} \setminus \{0\}.$$

In 2013, Ricaud and Torrésani showed that orthonormal bases in Theorem 1.2 can be improved to Parseval frames [9]. Recall that a collection  $\{\tau_j\}_{j=1}^n$  in a finite dimensional Hilbert space  $\mathcal{H}$  is said to be a Parseval frame for  $\mathcal{H}$  [1] if

$$\|h\|^2 = \sum_{j=1}^n |\langle h, \tau_j \rangle|^2, \quad \forall h \in \mathcal{H}.$$

**Theorem 1.3.** (*Ricaud-Torrésani Uncertainty Principle*) [9] Let  $\{\tau_j\}_{j=1}^n, \{\omega_j\}_{j=1}^n$  be two Parseval frames for a finite dimensional Hilbert space  $\mathcal{H}$ . Then

$$\left( \frac{\|\theta_\tau h\|_0 + \|\theta_\omega h\|_0}{2} \right)^2 \geq \|\theta_\tau h\|_0 \|\theta_\omega h\|_0 \geq \frac{1}{\max_{1 \leq j, k \leq n} |\langle \tau_j, \omega_k \rangle|^2}, \quad \forall h \in \mathcal{H} \setminus \{0\}.$$

The main purpose of this paper is to generalize and derive a noncommutative version of Theorem 1.3. For this we want generalization of Hilbert spaces known as Hilbert C\*-modules. Hilbert C\*-modules are first introduced by Kaplansky [7] for modules over commutative C\*-algebras and later developed for modules over arbitrary C\*-algebras by Paschke [8] and Rieffel [10].

**Definition 1.4.** [7, 8, 10] Let  $\mathcal{A}$  be a unital C\*-algebra. A left module  $\mathcal{E}$  over  $\mathcal{A}$  is said to be a (left) Hilbert C\*-module if there exists a map  $\langle \cdot, \cdot \rangle : \mathcal{E} \times \mathcal{E} \rightarrow \mathcal{A}$  such that the following hold.

- (i)  $\langle x, x \rangle \geq 0, \forall x \in \mathcal{E}$ . If  $x \in \mathcal{E}$  satisfies  $\langle x, x \rangle = 0$ , then  $x = 0$ .
- (ii)  $\langle x + y, z \rangle = \langle x, z \rangle + \langle y, z \rangle, \forall x, y, z \in \mathcal{E}$ .
- (iii)  $\langle ax, y \rangle = a \langle x, y \rangle, \forall x, y \in \mathcal{E}, \forall a \in \mathcal{A}$ .
- (iv)  $\langle x, y \rangle = \langle y, x \rangle^*, \forall x, y \in \mathcal{E}$ .
- (v)  $\mathcal{E}$  is complete w.r.t. the norm  $\|x\| := \sqrt{\|\langle x, x \rangle\|}, \forall x \in \mathcal{E}$ .

We are going to use the following inequality.

**Lemma 1.5.** [8] (Noncommutative Cauchy-Schwarz inequality) If  $\mathcal{E}$  is a Hilbert C\*-module over  $\mathcal{A}$ , then

$$\langle x, y \rangle \langle y, x \rangle \leq \|\langle y, y \rangle\| \langle x, x \rangle, \quad \forall x, y \in \mathcal{E}.$$

Given a unital C\*-algebra  $\mathcal{A}$ , define

$$\ell^2(\mathbb{N}, \mathcal{A}) := \left\{ \{a_n\}_{n=1}^\infty : a_n \in \mathcal{A}, \forall n \in \mathbb{N}, \sum_{n=1}^\infty a_n a_n^* \text{ converges in } \mathcal{A} \right\}.$$

Modular  $\mathcal{A}$ -inner product on  $\ell^2(\mathbb{N}, \mathcal{A})$  is defined as

$$\langle \{a_n\}_{n=1}^\infty, \{b_n\}_{n=1}^\infty \rangle := \sum_{n=1}^\infty a_n b_n^*, \quad \forall \{a_n\}_{n=1}^\infty, \{b_n\}_{n=1}^\infty \in \ell^2(\mathbb{N}, \mathcal{A}).$$

Hence the norm on  $\ell^2(\mathbb{N}, \mathcal{A})$  becomes

$$\|\{a_n\}_{n=1}^\infty\| := \left\| \sum_{n=1}^\infty a_n a_n^* \right\|^{\frac{1}{2}}, \quad \forall \{a_n\}_{n=1}^\infty \in \ell^2(\mathbb{N}, \mathcal{A}).$$

## Noncommutative Donoho-Stark-Elad-Bruckstein-Ricaud-Torrésani Uncertainty Principle

### 2. NONCOMMUTATIVE DONOHO-STARK-ELAD-BRUCKSTEIN-RICAUD-TORRÉSANI UNCERTAINTY PRINCIPLE

We start by recalling the definition of Parseval frames for Hilbert  $C^*$ -modules by Frank and Larson [6].

**Definition 2.1.** [6] Let  $\mathcal{E}$  be a Hilbert  $C^*$ -module over a unital  $C^*$ -algebra  $\mathcal{A}$ . A collection  $\{\tau_n\}_{n=1}^\infty$  in  $\mathcal{E}$  is said to be a **modular Parseval frame** for  $\mathcal{E}$  if

$$\langle x, x \rangle = \sum_{n=1}^{\infty} \langle x, \tau_n \rangle \langle \tau_n, x \rangle, \quad \forall x \in \mathcal{E}.$$

As shown in [6] a modular Parseval frame  $\{\tau_n\}_{n=1}^\infty$  for  $\mathcal{E}$  gives an adjointable isometry

$$\theta_\tau : \mathcal{E} \ni x \mapsto \theta_\tau x := \{\langle x, \tau_n \rangle\}_{n=1}^\infty \in \ell^2(\mathbb{N}, \mathcal{A})$$

with adjoint

$$\theta_\tau^* : \ell^2(\mathbb{N}, \mathcal{A}) \ni \{a_n\}_{n=1}^\infty \mapsto \theta_\tau^* \{a_n\}_{n=1}^\infty := \sum_{n=1}^{\infty} a_n \tau_n \in \mathcal{E}.$$

With these preliminaries we can derive noncommutative analogue of Theorem 1.3. In the following theorem, given a subset  $\Lambda \subseteq \mathbb{N}$ , we set the notation

$$o(\Lambda) := \text{Number of elements in } \Lambda.$$

**Theorem 2.2. (Noncommutative Donoho-Stark-Elad-Bruckstein-Ricaud-Torrésani Uncertainty Principle)** For any two modular Parseval frames  $\{\tau_n\}_{n=1}^\infty$  and  $\{\omega_m\}_{m=1}^\infty$  for a Hilbert  $C^*$ -module  $\mathcal{E}$ , we have

$$\left( \frac{\|\theta_\tau x\|_0 + \|\theta_\omega x\|_0}{2} \right)^2 \geq \|\theta_\tau x\|_0 \|\theta_\omega x\|_0 \geq \frac{1}{\sup_{n,m \in \mathbb{N}} \|\langle \tau_n, \omega_m \rangle\|^2}, \quad \forall x \in \mathcal{E}, x \neq 0.$$

*Proof.* Let  $x \in \mathcal{E}$  be nonzero. Using Lemma 1.5 and the well-known fact in  $C^*$ -algebra that ‘norm respects ordering of positive elements’, we get

$$\begin{aligned}
 \|x\|^2 &= \|\langle x, x \rangle\| = \left\| \sum_{n=1}^{\infty} \langle x, \tau_n \rangle \langle \tau_n, x \rangle \right\| = \left\| \sum_{n \in \text{supp}(\theta_\tau x)} \langle x, \tau_n \rangle \langle \tau_n, x \rangle \right\| \\
 &= \left\| \sum_{n \in \text{supp}(\theta_\tau x)} \left\langle \sum_{m=1}^{\infty} \langle x, \omega_m \rangle \omega_m, \tau_n \right\rangle \left\langle \tau_n, \sum_{k=1}^{\infty} \langle x, \omega_k \rangle \omega_k \right\rangle \right\| \\
 &= \left\| \sum_{n \in \text{supp}(\theta_\tau x)} \left\langle \sum_{m \in \text{supp}(\theta_\omega x)} \langle x, \omega_m \rangle \omega_m, \tau_n \right\rangle \left\langle \tau_n, \sum_{k \in \text{supp}(\theta_\omega x)} \langle x, \omega_k \rangle \omega_k \right\rangle \right\| \\
 &= \left\| \sum_{n \in \text{supp}(\theta_\tau x)} \left( \sum_{m \in \text{supp}(\theta_\omega x)} \langle x, \omega_m \rangle \langle \tau_n, \omega_m \rangle^* \right) \left( \sum_{k \in \text{supp}(\theta_\omega x)} \langle x, \omega_k \rangle \langle \tau_n, \omega_k \rangle \right)^* \right\| \\
 &\leq \left\| \sum_{n \in \text{supp}(\theta_\tau x)} \left\| \sum_{m \in \text{supp}(\theta_\omega x)} \langle \tau_n, \omega_m \rangle \langle \tau_n, \omega_m \rangle^* \right\| \left( \sum_{k \in \text{supp}(\theta_\omega x)} \langle x, \omega_k \rangle \langle \omega_k, x \rangle \right) \right\| \\
 &\leq \left\| \sum_{n \in \text{supp}(\theta_\tau x)} \sum_{m \in \text{supp}(\theta_\omega x)} \|\langle \tau_n, \omega_m \rangle \langle \tau_n, \omega_m \rangle^*\| \left( \sum_{k \in \text{supp}(\theta_\omega x)} \langle x, \omega_k \rangle \langle \omega_k, x \rangle \right) \right\| \\
 &\leq \left( \sup_{n,m \in \mathbb{N}} \|\langle \tau_n, \omega_m \rangle\|^2 \right) \left\| \sum_{n \in \text{supp}(\theta_\tau x)} \sum_{m \in \text{supp}(\theta_\omega x)} 1 \cdot \left( \sum_{k \in \text{supp}(\theta_\omega x)} \langle x, \omega_k \rangle \langle \omega_k, x \rangle \right) \right\| \\
 &\leq \left( \sup_{n,m \in \mathbb{N}} \|\langle \tau_n, \omega_m \rangle\|^2 \right) \left\| o(\text{supp}(\theta_\tau x)) o(\text{supp}(\theta_\omega x)) \left( \sum_{k \in \text{supp}(\theta_\omega x)} \langle x, \omega_k \rangle \langle \omega_k, x \rangle \right) \right\| \\
 &= \left( \sup_{n,m \in \mathbb{N}} \|\langle \tau_n, \omega_m \rangle\|^2 \right) \|\theta_\tau x\|_0 \|\theta_\omega x\|_0 \left\| \sum_{k \in \text{supp}(\theta_\omega x)} \langle x, \omega_k \rangle \langle \omega_k, x \rangle \right\| \\
 &= \left( \sup_{n,m \in \mathbb{N}} \|\langle \tau_n, \omega_m \rangle\|^2 \right) \|\theta_\tau x\|_0 \|\theta_\omega x\|_0 \|\langle x, x \rangle\| \\
 &= \left( \sup_{n,m \in \mathbb{N}} \|\langle \tau_n, \omega_m \rangle\|^2 \right) \|\theta_\tau x\|_0 \|\theta_\omega x\|_0 \|x\|^2.
 \end{aligned}$$

By canceling  $\|x\|$  we get the stated inequality.  $\square$

Using Chebotarev theorem, in 2005, Tao [2, 11] improved Theorem 1.1 for prime dimensions  $d$ .

**Theorem 2.3. (Tao Uncertainty Principle) [11]** For every prime  $p$ ,

$$\|h\|_0 + \|\widehat{h}\|_0 \geq p + 1, \quad \forall h \in \mathbb{C}^p \setminus \{0\}.$$

In view of Theorem 2.3 we make the following conjecture.

**Conjecture 2.4.** Let  $p$  be a prime and  $\mathcal{A}$  be a unital  $C^*$ -algebra with invariant basis number property. Let  $\hat{\cdot}: \mathcal{A}^p \rightarrow \mathcal{A}^p$  be the noncommutative Fourier transform defined by

$$\widehat{(a_j)_{j=0}^{p-1}} := \frac{1}{\sqrt{p}} \left( \sum_{j=0}^{p-1} a_j e^{-\frac{-2\pi i j k}{p}} \right)_{k=0}^{p-1}, \quad \forall (a_j)_{j=0}^{p-1} \in \mathcal{A}^p.$$

---

## Noncommutative Donoho-Stark-Elad-Bruckstein-Ricaud-Torrésani Uncertainty Principle

---

Then

$$\|x\|_0 + \|\widehat{x}\|_0 \geq p + 1, \quad \forall x \in \mathcal{A}^p \setminus \{0\}.$$
